This policy was akin to that adopted in London, where the District and Underground Railways were mulcted in crippling rates and taxes as a reward for taking millions of ton miles of traffic off the streets.

In recent years, in accordance with the modern progressive policy of reaping where they have not sown, many municipalities have taken over tramways from the companies that did pioneer work in city transport, only to realise that the tramways departments had then to pay those heavy charges which were, of course, perfectly justifiable when they had to be paid by others. Municipal trading has to show good results on paper in order to be popular, and that is one of the reasons why in a number of quarters tramway tracks have been allowed to get into very bad condition, money which ought to have gone for their upkeep having been utilised in relief of rates.

To-day, therefore, municipal tramway authorities find it necessary to make paper transactions by which they hand large sums over to the highways authorities, being "hoist by their own petard" of fifty years ago, and in many cases have to face heavy sums for making good the fruits of past neglect to tramway tracks.

If the tramways are pulled up and trackless trolleys or motor buses substituted then the bus department pays nothing whatsoever directly to the highways department and only pays indirectly such money as comes in from government grants out of motor taxes or sums from any local licence fees. Many tram tracks, therefore, have been taken up in order to rob Peter to pay Paul.

In America many of the street tramways are in a bad way as they have had to pay heavy sums for concession rights and upkeep costs, and run on their own tracks, while their motor bus competitors run on the ratepayers' roads and, as a rule, do not pay their fair share of the costs thus incurred.

Where a tramway is in the hands of a municipality people of the working class on the one hand are prone to support through the ballot-box the demands of traction employees for increased wages and burdensome rules, out of a feeling of so-called class loyalty; but when the bill has to be paid working men object to pay out of their own pockets the amount sufficient to make up what they demand for others, so one arrives at the absurdity of taking thousands of workpeople to and from their work at a loss, and sponging on the ratepayers for the balance; that is one reason for the decline of municipal tramways; it is easier to balance matters where road traffic is concerned.

From the point of view of traction as such for carrying large numbers of people around large cities, electric tramways can still hold their own, but only when conditions which apply are fair as between them and other competing methods of surface passenger traffic.

WORLD POWER CONFERENCE.

Subjects of the General Addresses.

AS mentioned in the summary of the provisional timetable of the second World Power Conference to be held in Berlin in June, which appeared in our issue of April 11, a series of general addresses is to be given in addition to the papers to be read before the various sections of the conference. The first of these general addresses will be delivered on June 16 by Dr. Einstein, the subject being "The Physical Problem of Space and the Ether." On June 17 Dr. Surruys will give an address on "Different Conceptions of Rationalisation in Various Countries." On June 18, Mr. H. F. Bain will speak on "The Place of Minerals in a Power-sustained World." On June 19, Dr. Oliver will address the Conference on a European Grid (Europas Grosskraftlinien). On June 23, Professor Eddington's address on "Subatomic Energy" will be given, and on June 24 Mr. D. N. Dunlop will speak on "Power and Civilisation."

SURGES ON OVERHEAD LINES AND CABLE SYSTEMS.*

Measurements under Working Conditions on 33 kV Lines—Effect of Salt Deposits—Value of Klydonograph Recorder.

By S. W. MELSOM, M.I.E.E., A. N. ARMAN, B.Sc., A.M.I.E.E., and W. BIBBY, B.Sc., A.M.I.E.E.

THE paper describes measurements of surge voltages made under actual working conditions on 33 kV transmission lines both overhead, underground and composite.

The apparatus used for the measurements was the klydonograph, and the paper gives a description of this instrument in its final form and a discussion of its working principles.

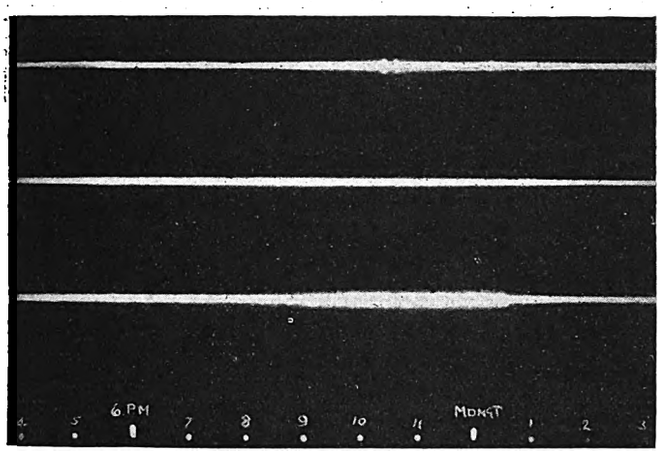

Fig. 1.—Nightly surges on 33 kV line in South Wales.

The specially designed auxiliary condensers required to subdivide the line voltage are also described.

The first set of gear was erected in South Wales, to investigate the conditions on a most troublesome overhead line feeding a number of collieries and villages. The line pressure was 33 kV. The line was a composite one in so far as the terminal poles were in each case some distance from the substation, the current from the pole to the substation being carried by 3-core belted-type cable.

Inspection and consideration suggested that the most suitable place for the erection of the gear would be at one of the terminal poles, where the abrupt change in line characteristics from the overhead line, of high inductance and low capacity, to the cable, of high capacity and low inductance, might be expected to be the point of maximum surge value, and the gear was erected on the hillside at this pole.

The main fact that emerged was that during most nights there was a distinct thickening of the line, a sample of which is shown in Fig. 1, where for a period of nearly four hours a series of almost continuous surges occurred. It will be seen that the effect was greatest on one phase, and that the phase recorded on the middle line of the record is practically immune. An oscillograph was installed more definitely to analyse the characteristics of the surges. These results proved that apart from switching surges of a momentary nature, with which the line was fully capable of dealing, there was no disturbance due to the machinery, and that the frequency of the surges was well above 3 000 cycles per sec.

In November, 1927, at a time when the klydonograph was in temporary use on another system, a series of shut-downs occurred during a heavy storm, or rather immediately after it. Investigation led to the conclusion that salt brought from the sea was the cause of the major part of the trouble.

Heavy brushing was noticed at the sealing ends and it was not until the weather changed that the line would give continuous service. Dr. G. C. Simpson, F.R.S., showed that the line trouble coincided with the somewhat rare occurrence of an abnormally dry south-westerly wind, and this led to the conclusion that a salt deposit was the trouble, not only on this but on many other lines throughout the country. This particular part of the line was 20 miles from the coast, and everything pointed to the conclusion that while with a normal moist south-west wind the salt taken from the sea would fall out quickly owing to its being wet, and therefore heavy, with the drier wind the salt spray taken up would immediately be dried by the air and be carried for a considerable distance as a fine, almost impalpable, powder. This salt impinges on the insulator in a high wind and, helped by the electric stress, adheres firmly to the insulator and does not wash off. While the dry wind continues the danger of complete flash-over is not great, but—and this is borne out by every case observed—flash-over occurs when the humidity of the air returns to a more normal value. The particles of salt then take up moisture from the air and the surface of the insulator is covered, or partially so, with a good conducting brine. If the insulator is not cleaned after the salt storm a part of the salt remains on the surface and causes the surging shown in Fig 1 during hours when dew falls.

An insulator was removed from the line some weeks after the heavy storm, during which interval it had been exposed to much heavy rain. Analysis of the surface deposit showed that there was a total amount of approximately 0·15 gramme of solid matter on the surface, consisting of chlorides, sulphates and carbonates of sodium, nickel, lead, tin and iron. Twenty-five per cent. of the solids that were soluble in water were sodium chloride.

In Figs. 2, 3 and 4 are shown some of the records obtained during and immediately after the storms in February, 1928, when there was much trouble with overhead lines all over the country. Fig. 2 shows first the comparatively clean normal-voltage line on each phase during the heavy dry wind. The point at which the line widens corresponds to that when the wind dropped somewhat and the atmosphere became cloudy. Then for some 2½ hours surging occurred, obviously due to brushing at the insulators, and at about 8.15 p.m. the breaker tripped. When attempts were made to reset it it would not remain in and it could not be reset until the following morning. When the switch finally held there was still considerable surging (Fig. 3), and at 1 p.m., when rain fell, the circuit breaker tripped out again. Then all the

Figs. 2, 3 and 4.—Records obtained during and after the storms of February, 1928 (see text). Fig. 5.—Surge produced by fall of phase wire causing interruption.

sealing-end insulators were scrubbed clean and the line was switched in again. Fig. 4 shows that the surging had practically disappeared.

It is noteworthy that the greater part of the surging occurred on one phase. That one was the nearest to the sea and the direction of the wind. Clearly the other two insulators were to a fair extent screened by the first and did not receive the same amount of salt deposit.

A number of other surges were recorded on the South Wales line. These were often of a minor nature, due to switching operations. Fig. 5 shows the surge produced when a phase wire fell and interrupted the current.

Only one or two lightning surges were recorded, and these were due to storms some miles from the recording gear. One

* Abstract of a paper read at the Institution of Electrical Engineers on April 10.

Digitized by Google

of these is shown in Fig. 6. It should, however, be noted that during the last two or three years there have been comparatively few lightning storms in this country.

Similar investigations have been made on lines in the Midlands. The system in this case is a mixed one, consisting of a great deal of cable and several lengths of overhead line. In this case troubles with salt were not experienced, but some other interesting records were obtained. These results were not always fully explained, but in general the surging ceased when many line insulators had been replaced.

Curiously enough, the portion which consisted entirely of overhead line had, if anything, less surging than that which was partly overhead line and partly cable.

Perhaps the most outstanding record was where a cable fault occurred after a long period of surging, which latter was still evident after the fault had been repaired. Here it may be fair to say that the cable was probably injured and finally broke down as a result of many hours of oscillatory surging of comparatively small magnitude, i.e., about two or three times the normal line voltage. The beginning of the record shows the heavy surging which had started some hours previously. This continued for about 12 hours and then ceased during the hours from noon until about 8 p.m., after which it restarted and the cable broke down. On the repair being effected the surging continued for a further ten hours, fortunately without further breakdown.

Another case of a feeder breakdown occurring during periods of heavy surging is shown in Fig. 7. Here again the breakdown and repair interrupted a long period of small oscillatory surging. Again, Fig. 8 is a particularly clear example of the oscillatory surge line as compared with the normal voltage line. The surging ceased as soon as the sun had dried the insulators. Shortly after this several insulators of the older type were changed and the cracked ones renewed. When this was completed the surging ceased.

The atmospheric condition known as a silver thaw, when a slight thaw with rain occurs during a frost, followed im-

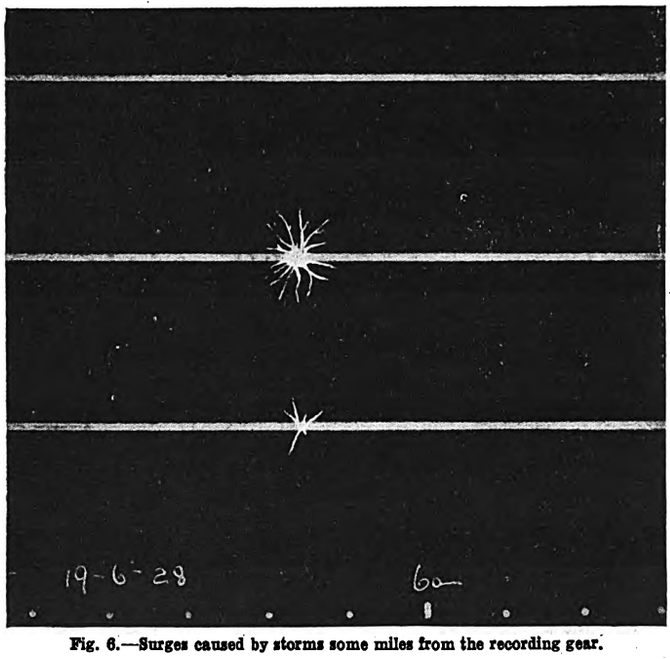

Fig. 6.—Surges caused by storms some miles from the recording gear.

mediately by another frost, often results in the formation of ice on insulators. This results in considerable surging.

While the surges recorded have not been of the magnitude experienced by American observers, the records generally show that the klydonograph, if intelligently used, is a valuable and inexpensive piece of apparatus for recording most types of surges in overhead and/or cable systems. The records in South Wales alone resulted in an enormous saving in maintenance charges due to localization of the main cause of the trouble. In addition, the serious consequences and cost of interruption of supply for considerable periods were avoided. The authors would, however, emphasize the importance of the long series of oscillatory discharges detected by the more sensitive methods used; these are apparently of more serious import than short-time surges of greater magnitude.

It is evident that the design of porcelain insulators for outdoor use requires a great deal of further consideration. It is usually found that, while pin insulators prove to be, on the whole, satisfactory in operation, the sealing-end insulators give trouble, quite severe brushing occurring at voltages less than the normal working voltage. The best design of insulator is that in which the surfaces subjected to the most fouling, i.e., the sheds in most shedded insulators, lie along equipotential lines in the electric field. With vertical sealing ends of the ordinary type this is not possible.

Fig. 9 (*a*) shows roughly the electric field surrounding a live conductor emerging from an earthed metal cylinder (the

Fig. 7.—Feeder breakdown during heavy surging. Fig. 8.—Oscillatory surge.

"box" of a sealing end), the dotted lines representing the equipotentials. Fig. 9 (*b*) shows clearly how the sheds of a vertical type sealing-end must needs lie across these equipotentials. Tests involving the determination of the field diagram and surface-potential distribution of a large number of insulators of different types and sizes, and their performance under all atmospheric conditions, have shown that, although it is not possible to make any appreciable improvement to the final flash-over voltage of an insulator, the voltage at which brushing becomes serious can be materially raised. The flash-over voltage is invariably higher than the line voltage, and it is evident from the klydonograph records that the brushing is the vital factor and that improvement must be effected in this direction.

For the lower voltages the inverted type of sealing end shown in Fig. 9 (*c*) can be employed, the performance of a properly designed insulator of this type being quite good, even under severe conditions. Experiments with a vertical sealing-end have shown that it is possible to improve the brushing voltage by inserting metal sheds between the porcelain sheds in such a way that they distort the natural field and cause the porcelain sheds to lie nearly on equipotential lines. Fig. 9 (*d*) is an example of this type of treatment. Field-controlling sheds of this sort need, however, to be very carefully applied since, if improperly placed, they may bring about a large decrease in the flash-over voltage.

A great deal can be done by systematic cleaning where the line or a portion of it can be taken out of service for the purpose. The authors understand that, in those parts of America subject to alkali dust, a steam cleaning plant is in continuous operation; as this would appear to be liable to set up small cracks in the insulators, cleaning at normal temperature would seem to be preferable. The authors have found that the vigorous use of a scrubbing brush and water is the most effective method of cleaning.

Even a larger insulator if left without cleaning will ultimately flash over, if it does not shatter owing to the heat set up by the brushing, and, moreover, for a 132 kV line we are getting near to the limit of size at which single-piece sealing-end insulators can be made. It is true that very large insulators are now advertised, but they are expensive and unwieldy.

For very bad positions special arrangements might be made, and in this connection the experience in South Wales indicates a line that may be taken. The whole of the observations showed that roughly 80 per cent. of the surging occurred on the line nearest to the direction of the dangerous wind, with the inference that the other two phases were to a great extent shielded by the first dividing box. Some intelligent shielding here might obviate a great deal of the trouble.

While there is no definite experimental work showing that high-frequency voltage of the type recorded results in damage to the dielectric of a cable connected to the line, it must be assumed that the cable is submitted to an undue stress. Whatever the frequency of the over-voltage, it is superimposed on the normal line voltage, and in the cases shown the existence of this condition for many hours is subjecting the dielectric to a stress much larger than that for which it is designed. Although the capacity of the cable results in a considerable reduction in the amplitude of the wave, it cannot eliminate

Digitized by Google

it unless the capacity is infinite, and the first part of the cable must stand up to the whole of the over-voltage. Probably if the length of cable is greater than one-quarter of the wave-length of the oscillatory voltage the latter may be reduced to as much as one-half of its initial value. A considerable length of cable is required, however, to effect even this reduction, and if cable is to be expected to take care of the surges a long length, very much over-insulated, must be used.

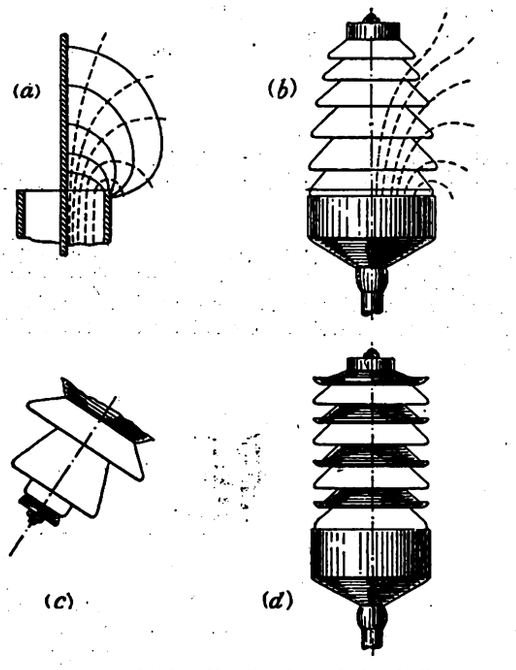

Fig. 9.—Electric fields of sealing ends (see text).

Some people hold the view that a cable having a high power factor, such as cambric cable, would deal with the surges by absorption through the wall of the dielectric, but consideration and experiment have shown definitely that this is not so.

The question of the discharges likely to occur from atmospheric conditions has been largely discussed in American publications, in which various authors, and notably Peek, have discussed atmospheric voltages, bound charges due to charged clouds, etc. The recent Kelvin Lecture by Dr. G. C. Simpson showed that the greater part of atmospheric potential had little energy and that the only condition under which appreciable energy may be discharged is by a direct lightning stroke. This clears up the situation so far as the engineer is concerned and leaves him to solve the problem of how to deal with the lightning discharge. Fortunately, in this country we are not subject to the severe lightning storms experienced in many parts of the world, but interruptions due to lightning will and do occur. The effects of lightning are not nearly so serious as the other difficulties enumerated. A lightning stroke almost invariably causes the line to trip out; one or other of the insulators flashes over and a circuit breaker operates. Apart from the short interruption, however, the line is usually undamaged and can be put back into service almost immediately. There is, however, one point to be made in connection with any system of spark gaps or weak-link insulators. For the protection of transformers and other apparatus it is essential that the protective device should operate at a definite voltage and be unaffected by weather conditions. This is hardly possible unless any gap on which operation depends is definitely under cover.

OVERHEAD LINES.

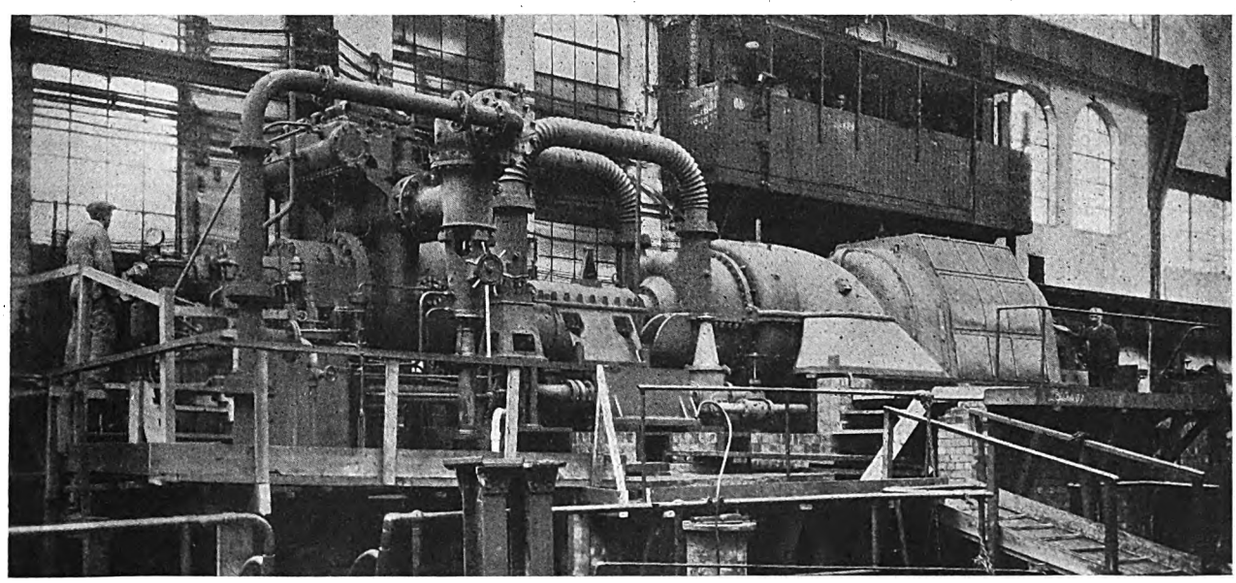
New Specification for Copper Conductors.

THE B.E.S.A. has recently issued Specification No. 125, 1930, relative to hard-drawn copper solid and stranded circular conductors for overhead power transmission purposes. This is a revision of the 1924 edition, and differs from the previous issue only in certain minor points of an editorial nature designed to bring it into line with the 1930 revision of the B.S. Specification for Aluminium Conductors for Overhead Power Transmission Purposes, No. 215. Specification No. 125 lays down standards for copper conductors with regard to the mechanical and electrical properties required for overhead power lines, and prescribes tests to ensure compliance with these requirements. The sizes of conductors are given in separate tables for primary and secondary standards respectively, these tables being unaltered from the previous edition. Copies of this specification may be obtained from the British Engineering Standards Association Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d., post free.

THERMIONIC VALVES.

In view of the rapid development that is taking place in the characteristics and uses of the thermionic valve in the various spheres in which it is now employed, the course of six lectures on "Thermionic Valves," to be given by Mr. W. H. Date, B.Sc., A.M.I.E.E., at the Polytechnic, should prove of great interest. The course begins on Wednesday, May 7, at 6.30 p.m., and the lectures, which will last for two hours, will be continued on succeeding Wednesdays except June 11. The lectures will cover the principles and working of the valve in rectifying, receiving and amplifying circuits, and will be fully illustrated by demonstrations, experiments and lantern slides. The fee for the course is 7s. 6d.

BRITISH TURBO-ALTERNATOR FOR THE UNITED STATES.



THIS high pressure 10 000 kW. 3 600 r.p.m. turbo-alternator has been made by the British Thomson-Houston Company for the Delray power station of the Detroit Edison Company, Detroit, Illinois, U.S.A.

EDUCATION OF WOMEN.

Inadequate Facilities—Dearth of Trained Electrical Demonstrators.

By CAROLINE HASLETT.

ELECTRICAL education of women naturally divides itself into two main divisions—education of women who contemplate finding a career in industry, and of the housewife who wishes to acquire sufficient practical knowledge to be able to get the best results from the electrical apparatus in her home.

My experience during the last few years has proved that the electrical industry has not taken seriously the question of training women for the latter kind of work. Most of the women who are in the industry appear to have come straight from a Domestic Science Training School or College, and although they have been quite well equipped on the domestic side they have had themselves to ferret about for information on the electrical side of their work. Now, it is really in the interests of the electrical industry that the training of these girls should be taken very seriously.

Through the work of the E.A.W. and the Headmistresses Committee of the Ministry of Labour, one or two courses of training have been begun in London called "Electrical Housecraft," where it is possible for a girl who wishes to enter the electrical industry to obtain, not only a training on the domestic side, but to get some acquaintance with the electrical side of her work as well.

It is apparent, however, that even if they have had this training it is desirable for the girls to be drafted afterwards into electrical shops and showrooms as juniors, where they might begin to familiarise themselves with the commercial aspect of the work. A few of the more progressive firms have now consented to take juniors in their showrooms and a beginning is being made to train girls on practical lines. It would be a great help, however, if more electrical undertakings having showrooms, would be prepared to take in one or two juniors for a probationary period. It is practically true at the moment to say that there is a real dearth of trained women demonstrators and unless the electrical industry becomes alive to this question and gives facilities for training juniors, we shall be faced with rather a serious problem in the near future. One or two firms do give a short intensive training to their new staff, but what we require are more facilities for general training in connection with *all* domestic electrical appliances.

In industry generally it is recognised that every trade should carry its quota of apprentices and this point of view should be taken up by the electrical industry in connection with the sale and demonstration of domestic electrical appliances.

The excellent three days' course on Domestic Electrification which was recently held demonstrated fully the value of giving women in the electrical industry a more complete knowledge of modern electrical developments. Such work is a very sound investment for future success.

Instructing Housewives at Home.

Turning now to the housewife who wishes to acquire some simple electrical knowledge, I feel that this question is inevitably bound up with the problem of the woman demonstrator. While popular lectures and demonstrations can do very much, the best work will obviously be done by the woman demonstrator who can go into the home of the housewife and give her simple instruction on the subject. Over and over again I meet women who are conducting fairly large households who would welcome a visit from a trained woman in electrical housecraft to teach them and their domestic staffs simple facts about the maintenance and careful handling of electrical appliances.

An interesting fact is that the average housewife is very keen to acquire this knowledge, but owing to her lack of technical training it is necessary that such information be given to her in the simplest possible manner. The clever and tactful woman demonstrator can also very often help in explaining to the master of the house some of the difficulties with which he concerns himself. An irate householder who telephoned a store some time ago saying that his vacuum cleaner would not work, would have been less irate if he had known the simple rules of keeping the machine oiled and removing the dust from certain vital parts.

A possible new opening for women who can lecture and talk in a simple and interesting way on electrical matters is in connection with rural electrification. The Women's Institutes throughout the country are becoming more keen on understanding all the problems connected with rural electrification and are constantly asking for lecturers who can talk to them not only about the actual uses of electricity in the home but who can explain in simple language the economic factors which determine whether the supply is possible in certain districts.

The electrical industry has hardly yet realised the valuable services which can be rendered by trained women in electrical housecraft and the time must be fast approaching when it will become necessary to establish in the industry itself some practical training scheme to meet the demand which must inevitably come.

BOOK REVIEW.

Photoelectric Cells. By N. R. CAMPBELL and D. RITCHIE. (London: Sir Isaac Pitman and Sons.) Pp. vii+209.

This book explains the theory and application of the photoelectric cell, and should be of great value to all who are interested in the cells—from the professional physicist to the wireless amateur. The general conception of this book is a model which might well be copied by authors writing on a specialist subject.

The introductory matter is lucid and interesting. Throughout the whole work the mathematics are of such a character that anyone who has attended a technical college should be able to appreciate the mathematical arguments. The book is thoughtfully written, and the reader is continually led to think instead of absorbing the matter like a sponge—a likeable quality in any book.

The section of the work dealing with the characteristics of photoelectric cells is obviously written with authority resulting from practical experience. The wireless technician will be on familiar ground, since the current voltage characteristics for photoelectric cells are similar to those of thermionic valves, while the voltage characteristics for varying illumination intensities remind one of the valve characteristics which were so successfully portrayed by Dr. Eccles in model form.

Part II of the book deals chiefly with the use of photoelectric cells, and gives careful consideration of such matters as detection, comparison and measurement employing these cells.

Part III will make an appeal to the illuminating engineer, as it deals with the applications of photoelectric cells for such purposes as the measurement and detection of luminous flux, illumination, colour and absorption. It is claimed that electric lamps can be photometred within an accuracy of one quarter of one per cent.

In the latter part of this section, the book touches on the problems of television, talkies, and the part that the photoelectric cell may play in their elucidation; the different types of photoelectric cells available are given, and an indication made of the uses for which each is specially suited.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Safety in Domestic Electrification.

[To the Editor.]

Sir,—With all respect, I cannot agree that the further paragraph quoted by Mr. Clothier has any bearing upon my argument, except still further to expose the fallacy that domestic earthing is a safety measure.

In Mr. Clothier's somewhat amended scheme (he does not mention metal-clad bell pushes in his article) if he will examine his sketch he will find that he has achieved nothing like 100% safety, nor is he even reasonably started on the road towards that ideal. For instance, his elaborate arrangement will give him no indication of a failure of an earth connection between the appliance and the plug bell push, although this trouble is far too common to be ignored. With an unearthed appliance and an earthed plug the danger has thus been immeasurably increased. To enable this indication to be given the bell push must be fitted *on the appliance itself*, and I cannot think that even the most ardent earthing absolutist would say that this would be a desirable or convenient arrangement.

Also, I cannot agree that the occurrence of the two faults shown in my Fig. 2 is highly unlikely; in actual fact one is often the cause of the other. For instance, in the event of an earth fault developing on an appliance, the circuit fuse will blow on the line side, but a precarious earth connection—anywhere in the earth circuit, flexible lead, plug, main earth connection, etc.—will be destroyed. With the renewal of the fuse the job is left working, and no indication is given as to the failure of the earth connection. As pointed out above, should this failure occur in one of the most likely places—the connections between appliance and plug—even Mr. Clothier's bell system will not cover this contingency. Incidentally, this system appears to be contrary to I.E.E. Regulation 91.

What Mr. Clothier says regarding the earthing of heavy switchgear is perfectly true: few men can speak with greater authority in this connection. But the purpose of my article was to point out that domestic conditions are unique when considered from the safety point of view, and that as soon as we attempt to introduce heavy-engineering methods of protection into domestic installations our troubles at once begin and safety becomes remote.—I am, etc.,

T. C. Gilbert.

Folkestone, April 12.

[To the Editor.]

Sir,—Mr. T. C. Gilbert would probably be the first to admit (in private) that he has intentionally exaggerated the evils of earthing in his recent articles. The cases of failure that he instances are extreme cases, and earthing exponents could certainly produce extreme illustrations of the danger of unearthed fittings. The time will never come when electricity causes no accidents—probably even now statistics, if obtainable, would show that in dwelling-houses it causes no more accidents than open fires. But it is, of course, important to decide how near we can get to the unattainable 100% of safety without incurring heavy disadvantages in the shape of expense and inconvenience.

My summing up of Mr. Gilbert's remarks is this:—

(1) The ideal is for all electrical appliances to be so well insulated, with no metal parts exposed, that a shock is impossible.

(2) In the present state of affairs, earthing is so often badly done, not thoroughly done, or unreliable, that it is better not to earth at all.

I am entirely in agreement with his ideal, and in sympathy with everything that can be done to bring it about. But are insulating enamels likely to be produced during the next five years which can be depended on not to chip, and to be suitable for covering the "business end" of irons?

It is with Mr. Gilbert's remedy for the present state of affairs that I must disagree. All-insulated apparatus is not at the present moment available, and regulations, contractors and users must face this state of affairs and cater for it. I could not discover how Mr. Gilbert proposes to deal, for instance, with an electric iron which is *not* insulated, and is to be used in a damp scullery with a concrete floor. I cannot see any alternative to earthing it.

To abandon any system because it is badly carried out is to give way to the defeatists. Let us take the objections to earthing given in The Electrician of March 28, and see whether they can be dealt with.

(*a*) A supply authority does not earth the service cutout and meter casing. Because A does the wrong thing is no reason for B to do the same. Supply authorities who do not earth are in a small minority; and propaganda could reduce their numbers. Meters, cut-outs and main switch fuses should all be earthed and *not* fixed so that a fault "is not at all unlikely!"

(*b*) "Three pin plugs and sockets are unreliable." If Messrs. Reyrolle and other manufacturers are unable to make reliable three-pin plugs and sockets after making two-pin ones for years, there is something very wrong with British mechanical designers. But I do not believe that a good British three-pin plug is unreliable, or if it is, that it must remain so.

(*c*) Three-core flexibles. I agree that these are a weak link. But if the chance of a fault on a piece of portable apparatus is 1 in 20 000 and on the earth lead 1 in 10 000 the probability of the two occurring together is getting on for 1 in 20 000 000—very near complete safety. So earthing has been of some use even if accidents are still possible.

(*d*) The use of unsuitable or unreliable wiring systems.

(*e*) Bad workmanship.

These will always and everywhere be a source of danger, whether earthing or insulating is the watchword.

(*f*) The retailing by non-electrical stores of shoddy appliances. A shoddy all-insulated article, covered with poor enamel for instance, is as dangerous as a shoddy metal one.

Mr. Gilbert has done a valuable service towards the attainment of his ideal by raising this question and encouraging people to consider their opinions. Eliminate metal as far as possible by all means, but in the thousands of articles where metal cases are still used, either from choice, inertia, or necessity, earthing will enormously increase the already high factor of safety and should be insisted upon.—I am, etc.,

R. H. Tuson.

April 11.

[*Further letters on this subject will appear next week.—Ed.*]

Mr. Quigley's Position.

[To the Editor.]

Sir,—I find that quotation has been made from articles I have written over my own signature as if they were official pronouncements of the British Electrical and Allied Manufacturers' Association. It should be noted that such articles are based wholly on my own observations and deductions, and represent, as a consequence, my own views. Any attempt to construe them into official statements of any association is strongly deprecated by the writer.—I am, etc.,

Hugh Quigley.

Esher, April 22.

"THE ELECTRICIAN" TABLES.

Statistics Relating to British, Colonial and Foreign Electricity Supply and Traction Undertakings.

The 43rd annual edition of The Electrician Tables of Electricity Undertakings will be issued on Monday, by Ernest Benn, Ltd., Bouverie House, Fleet Street, London. The information given in the tables comprises particulars of 800 British and 1 300 Dominion, colonial and foreign undertakings. Amongst the details given are the population of the district supplied, the owners and the chief engineer of the undertaking, the systems of generation, transmission and distribution, generation, transmission and consumers' voltages, public lamps in use, motors connected, total connections, maximum load, prices charged for electricity for all purposes, price of gas in the district, steam raising and generating plant at the electricity works; output for the past year, number of showrooms, schemes for hiring domestic electrical apparatus, etc.

A new and useful feature in the new edition is a section containing authoritative details of the British electric railways, which have now attained considerable importance. The volume, which has been carefully revised up to the latest possible moment and is the only publication of its kind, is issued at the usual price of 10s. net, postage: inland 9d. and abroad 1s. extra.

NEWS IN BRIEF.

Telephony to Australia—2 000 000 c.p. Beacon at Winnipeg—Canada to adopt B.B.C. System of Radio Control.

GELLYGAER U.D.C. has opened new electricity showrooms in Hanbury Road, Bargoed.

Oxford Corporation has decided to ask Mr. A. M. Sillar to report upon the electrical installation at the municipal buildings.

An England-Australia telephone service will be opened on April 30, when Mr. Scullin, the Commonwealth Premier will speak to Mr. Ramsay MacDonald.

The Post Office wireless telephone service to liners at sea is being extended to the "Leviathan" and "Homeric" from April 22 and May 3 respectively.

At the last meeting of the session of the Television Society at University College, Gower Street, London, on May 6, Mr. R. Neville Gray will lecture on "Liquid Photo-electric Cells."

Bermondsey (London) electricity department proposes to lay mains in two disused tramway ducts.

Glasgow Corporation has passed amended plans for the reconstruction of the Waterloo Street premises of the electricity department.

At the meeting of the Western Centre of the Institution of Electrical Engineers, at Cheltenham last week, the secretary, Mr. C. T. Allan, reported that the membership had been maintained at 677.

During the first nine months of 1929 wireless sets and parts exported from the United Kingdom to Estonia were valued at 6 715 kroons, compared with 13 552 and 13 690 for the whole of 1928 and 1927, respectively.

Dundee Electricity Committee recommends the placing of contracts for cable amounting to £3 301 with British tenderers, although foreign quotations amounting to £370 less have been received for foreign cables.

An inquiry is to be made by the Department of Justice, Washington, into the merger of the Westinghouse and General Electric radio interest with the Radio Corporation of America. The inquiry will determine whether the anti-trust laws have been violated.

In connection with night flying operations now established on the prairies, the Hudson's Bay Company has devoted the roof of its store at Winnipeg to the installation of a beacon visible for about 125 miles, and consisting of a 2 000 000 c.p. beam incandescent direction light surmounting a series of long neon tubes.

The twentieth annual May lecture of the Institute of Metals will be given on May 7, by Major F. A. Freeth, F.R.S., on "The Influence of Technique on Research." An election of members is due to be held on the same day, and persons then elected are entitled to membership privileges, in exchange for their first annual subscription, for the extended period ending June 30, 1931.

A portable demonstration set, to be used for the instruction of schoolchildren in the use of the telephone, has been designed by the Telephone Development Association. It comprises two dial telephones, battery, etc. Thirty of these sets are available for supply to education authorities who apply for them. Mr. Powell-Jones, director of the Telephone Development Association, is prepared to visit the chief centres of educational districts using the apparatus, and to give an explanatory talk to the teachers.

The National Safety First Association has inaugurated a special accident prevention service for industrial undertakings. This consists of an intensive campaign each month against one of the principal risks of industry. The series starts with "Handling Goods," and a bulletin and posters dealing with that subject have been issued. A new monthly magazine, "On Guard," is also published by the Association, and single copies can be obtained, price 2d, post free, from the offices of the Association, 119, Victoria Street, London, S.W.1.

The conference of the Association of Public Lighting Engineers will be held at Leicester from September 8 to 11.

In the Eynsham Institute Cup competition, the Oxford Electric Co.'s football club were defeated by the East Oxford Corinthians by 7 goals to 1.

The Des Moines, Iowa, Football Team expects to play all its home games during the present year, except Sunday games, by electric light at night.

Morecambe Corporation has opened new electrical showrooms, with a lecture room in which demonstrations of the use of domestic electrical apparatus are given.

Mr. J. W. Beauchamp addressed the South Wales and Monmouthshire Branch of the Electrical Association for Women on April 15, his subject being "Tariffs."

Walthamstow T.C. has decided to establish an installation department in connection with its electricity undertaking.

It is reported that the Government of Iceland proposes to terminate the contract with the Great Northern Telegraph Co. as from January, 1932.

New Zealand's imports of electrical equipment and machinery in 1929 were valued at £1 596 095, and the value of telephones and accessories imported was £390 756.

The operation of the deferred duty on electric dish-washing machines, which was to have come into force under the Australian Import Tariff on April 1, 1930, is further postponed to October 1, 1930.

The lily ponds at the Hotel Huntington, Pasadena, Cal., are now lighted by electric flood lights, and this has had the effect of stopping the croaking of frogs in the ponds which had previously been found to disturb the rest of residents in the hotel.

The annual meeting of the North Midland Students' Section of the Institution of Electrical Engineers will be held on April 29 at the Hotel Metropole, Leeds. The new committee will be elected, and the activities of the section will be discussed.

Members of the I.E.E. who desire to take part in the summer meeting in Ireland from June 2 to 6, but have not yet sent in their applications, should do so without delay. The railway companies in Great Britain have agreed to supply members of the party with railway and steamship tickets to and from Ireland at two-thirds the ordinary fare.

Middlesbrough Employment Committee takes the view that Middlesbrough and Tees-side generally will benefit little in the matter of reduction of unemployment by the conversion of electrical plant in the area to meet the requirements of the National scheme for North-East England. The Committee states that there are no firms in the district equipped for the manufacture of electrical goods on an economic scale, although a certain amount of employment may come to Tees-side in the form of contracts for steel standards for cables.

According to a speaker at a monthly luncheon of the Radio Manufacturers' Association, the Canadian Government is introducing a Bill to reorganise the radio system on our B.B.C. basis of Government control. Mr. Reginald Stewart, the Canadian conductor-pianist, who came to this country to conduct the London Symphony Orchestra at the Royal Albert Hall, stated at the luncheon that the Canadian Government was seeking to take over the present 63 stations existing in the Dominion and only use three powerful ones as a chain from coast to coast. The only difference between the proposed policy and the B.B.C. system is that the Canadian Government will be prepared to accept a limited number of advertising programmes which will be subjected to strict supervision and censorship.

LOOKING BACKWARD.

FIFTY years ago, in THE ELECTRICIAN *of April* 24, 1880, *reference was made to a proposal to floodlight the city of Boston, Mass., by means of a series of towers carrying powerful electric lights and reflectors.*

Electric lighting was used in one of the halls of the South Kensington Museum with satisfactory results.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of April* 28, 1905, *reported that a* 200 *line automatic telephone exchange on the Strowger system had been experimentally in use at the Berggasse exchange in Vienna since April* 1.

It was also mentioned that a horizontal type turbine of 11 340 H.P. (*described as the largest yet built*) *had just been assembled at the Niagara Falls power house of the Ontario Power Company.*

PERSONAL.

MR. William Hollinghurst, electrical engineer, of High Street, Rayleigh, Essex, has been elected a member of the Urban District Council.

The marriage took place on April 5, at Chingford, Essex, of Mr. R. F. Winder, A.M.I.E.E., of Croydon, and Miss Doris Joan Gravatt.

The late Dr. H. L. Callendar, professor of physics at the Imperial College of Science, London, left £8 154, with net personalty £7 298.

Mr. Stanley A. Young, contract manager of the Post Office Telephones for the Reading district, has been appointed district manager at Aberdeen.

Mr. P. J. Pybus has consented to serve on the panel of representative industries, appointed to assist the Overseas Trade Development Court recently set up.

Mr. Osborne Mitchell, editor of the *Electrical News* (Canada) has sailed for London, was due to arrive in England on April 22, and expects to remain in this country until May 17.

Mr. F. H. Howell, assistant engineer in the Battersea electricity department, has resigned, and applications are being invited for the vacancy at a salary of £490 per annum.

Mr. E. W. Houghton has been re-elected chairman of the Radio Wholesalers' Federation, while Messrs. T. Beadle, E. J. Collier and P. L. Davies have been elected members of the council.

St. Helens Town Council has appointed Mr. H. L. Greer, of St. Helens, as shift charge engineer at the electricity works, and Mr. N. W. Kenwright to succeed Mr. Greer as switchboard attendant.

Congratulations to Mr. John Benn, a director of Benn Brothers, Ltd. (proprietors of THE ELECTRICIAN) and Ernest Benn, Ltd., and the eldest son of Sir Ernest Benn, upon the birth of a daughter on Easter Sunday.

Obituary.

Mr. NICHOLAS F. BRADY, on April 3, in his 52nd year. He was formerly president, and more recently chairman of the New York Edison Co. He established modern lighting systems in Tokyo and Osaka, and was a chief adviser to the Italian Government on electrical matters.

Mr. FREDK. KING, electrical engineer, proprietor of the firm of King and Co., Park Row, Bristol. He was 82 years of age.

Mr. ANDREW WILSON TAIT, on April 21, at the age of 54. Mr. Tait was chairman of the Metropolitan Electric Supply Co., Ltd., Ferranti, Ltd., the Delhi Electric Tramways and Lighting Co., Ltd., and other companies. He was also chairman of the British Aluminium Co. until a few months ago.

Mr. GEORGE WRIGHT, on March 17, 1930. Mr. Wright was a member of the Toronto Hydro-Electric Commission from 1918 until the time of his death, and had been chairman of the Commission since last April. Until about two years ago he was also one of the City of Toronto Transportation Commissioners.

ENTRANCE SCHOLARSHIPS.

AS a result of the Entrance Scholarship Examination held at Faraday House Electrical Engineering College on April 8, 9 and 10, the following awards have been made by the Governors of the College: John A. Evans (County School, Carnarvon) "Faraday" Scholarship of 80 guineas a year, tenable for two years in college, and one year in one of the works affiliated with the college. Nicholas Worobjeff (University College School) "Maxwell" Scholarship of 60 guineas a year, tenable for two years in college and one year in works. David A. Lamb (Downside School) an Exhibition of 40 guineas a year, tenable for two years in college and one year in works. Charles W. Sex (Tiffin Boys' School, Kingston-on-Thames) an Exhibition of 30 guineas a year, tenable for two years in college, and one year in works. William N. Bennett (Epsom College) an Exhibition of 20 guineas a year, tenable for two years in college, and one year in works. Eric M. Davey (Towyn County School, Merioneth) Entrance Prize of ten guineas, Kenneth A. Watson (Dollar Academy) Entrance Prize of ten guineas.

At the annual general meeting of the Mersey and North Wales (Liverpool) centre of the I.E.E. at the University on April 14, the following were elected for the 1930/31 session: Chairman: Mr. A. J. Pratt; Vice-chairmen: Mr. F. V. L. Mathias and Mr. P. M. Hogg; Ordinary Members of Committee: Mr. J. E. Allan, Mr. A. E. Malpas, Mr. R. A. Harrison Watson, and Mr. A. S. Wilson; Hon. Treasurer: Mr. L. Breach; Hon. Secretary: Mr. O. C. Waygood.

BUSINESS ITEMS.

J. G. STATTER AND CO. announce that as from May 1 the London office address will be 16, Great George Street, Westminster, London, S.W.1. The telephone number will remain unchanged.

THE LONDON ELECTRIC FIRM, Brighton Road, South Croydon, announces that, with reference to the lighting scheme of the Tilbury Docks, the lowering gear is of their make and has been supplied to all the principal installations, and consists of the "One working part Contact Suspension Device" and self-sustaining winches.

Among the important contracts recently received by the ENGLISH ELECTRIC CO., Stafford, may be mentioned 450 type CDB.2 Form F hand-operated camshaft tramcar controllers for Glasgow Corporation. These will be similar to those previously supplied; the value of the contract is £26 000; 94 maximum traction type tramcar trucks fitted with roller bearings, 28 in. diameter driving wheels, 4 ft. 6 in. wheel base, for the Union Construction Co. for service on the London United Tramways (the value of this order is about £14 000); also three additional double deck bus bodies, to seat 50 passengers, mounted on A.E.C. Regent chassis, for Newcastle Corporation."

We understand that SIEMENS BROTHERS AND CO., LTD., Woolwich, have recently completed the following telephone contracts:—*Great Moor, Stockport, (Cheshire).*—A new C.B. manual switchboard of the No. 10 type was brought into use for the public service at Great Moor on the 1st instant. This switchboard has 11 operators' positions. The initial equipment is for 1 520 lines and ultimate capacity for 1 900 lines. It was made and installed to the order of the General Post Office. *Italy.*—A new automatic telephone exchange for the public system was brought into use at Taranto on the 1st instant. The automatic equipment was made and installed by Siemens Brothers and Co., Ltd., and is of their No. 16 type with switching apparatus for 760 lines and an ultimate capacity for 3 000 lines.

THE SOCIAL SIDE.

THE tramway employees of the Lanarkshire Transport Co. held their annual staff dance at Harthill last Friday evening, when some 90 couples were present.

The fourth annual dinner and dance of Evershed's Social and Athletic Association was held on April 4 at Chiswick Town Hall, under the chairmanship of Mr. Vines, president of the Association. More than 230 members and friends were present.

The G.E.C. Dramatic Society opened its first season very successfully on April 9 with a series of sketches entitled "The Man in the Bowler Hat," "Tea for Three," "The Cook" and "Evening Dress Indispensable," which were produced by Mr. Dudley C. Pearman and Mr. Christopher F. Mayson. The artistes, who all acquitted themselves well, played to an appreciative Magnet House audience numbering about 350.

The final tie of the London Business Houses Amateur Sports Association (Football), for the Buchanan Cup, took place on April 12, between Johnson and Phillips, Ltd., and Centels (Central Telegraph G.P.O.) on the Sports Ground of Messrs. Van Den Berghs, Ltd., at Wimbledon Park. One outstanding feature of the game was the J. and P. defence, and they were the winners by three goals to nil. The Buchanan Cup was presented by Major Cokey, M.C., of Van Den Berghs, Ltd., to the J. and P. Captain, Mr. H. D. Parsons.

The Electrical Association for Women, Bristol and District branch, were entertained at an electrical play entitled "A King in Amber," by A. B. Wright, presented by the members of the Bristol Electricity Department Dramatic Society on April 14. The first scene opens in a peasant's cottage in the village of Athelney, Somerset, where the old dame (Miss C. Curry) is discovered soundly rating King Alfred (Mr. I. Robins) for burning her cakes. An Eastern salesman (Mr. R. Tomey) appears with a time-switch, which enables the King to do his cooking "whilst at his study, or engaged in battle with the Danes." Thus relieved of culinary cares, he musters his forces to do battle with the Danes again. This time he effects a glorious victory by the use of electricity. The final scene portrays the conversion of the cottage into a demonstration house, and leads up to mutual peace being declared between the Saxons and Danes by the adoption of the South West England Electricity Scheme.

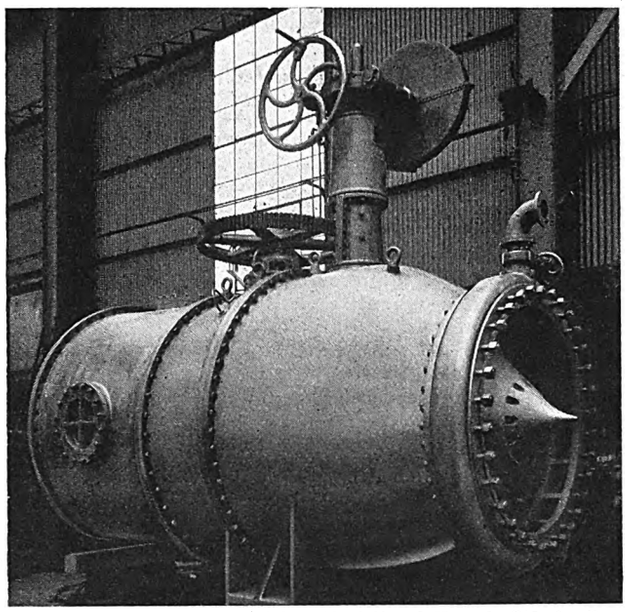
NEW MADRAS SCHEME.

A New Hydro-electric and Irrigation Scheme in India.

WE are able to give herewith an interesting photograph showing an 8 ft. 6 in. inlet diameter needle valve, with both mechanical and hand operation, for the Cauvery Metur scheme in Madras Province, India. This is one of four



An 8 ft. 6 in. needle valve supplied by Glenfield and Kennedy, Ltd., for the Metur Cauvery hydro-electric scheme.

valves being supplied by Glenfield and Kennedy, Ltd., Kilmarnock, along with other extensive equipment, and the subject is interesting because this is essentially an irrigation scheme, but with part of the water, because of the head and the volume, used for the generation of electricity by means of water turbines. This new scheme is on the Cauvery river, near the township of Metur, and a dam is being built 175 ft. high. This will form a lake of 59¼ square miles of water surface, with a capacity of 93 500 000 000 cubic feet, for the irrigation of 30 000 acres of land. Further, the dam will have 16 " Glenfield " roller sluice gates, 60 ft. wide between piers and 20 ft. deep, passing through the surplus water as usual, along with culvert sluices, an entirely new design of emergency sluice gate, and various other equipment. Also four turbines are to be installed, each with an inlet culvert of 8 ft. 6 in. diameter, lined with 9 ft. lengths of 8 ft. 6 in. diameter flanged cast iron pipe. Each of the culvert entrances is bifurcated, so that altogether there 8 inlets, of rectangular section, with a special cast iron taper connection piece, weighing 16 tons, forming the connection between the 8 ft. 6 in. diameter pipes, and the emergency gate frame. It is interesting to note that until the turbines are installed the 8 ft. 6 in. needle valves are to be provided with a 6 ft. effective diameter " Glenfield " jet disperser, each designed to discharge 2 000 cusecs of water, at 180 ft. head, harmlessly to the river. In this way all the water impounded as the work proceeds will be passed through without any trouble, these dispersers, it will be remembered, being on the " free vortex " principle, so that energy of thousands of horse power can be discharged harmlessly. For example, two dispersers are being supplied to the Arapuni station in New Zealand, each with 3 000 cusecs capacity, equal to 25 000 H.P., enabling this volume of water to be passed down to the Waikato river as an emergency installation until such time as corresponding water turbines are installed.

At the annual dinner of the Chartered Institute of Patent Agents last week, Sir Wm. Jarratt, Comptroller-General of Patents, etc., said the volume of work in the Patent Office had surpassed all previous records. Sir Duncan Kerly, K.C., said he thought a blot on our patent law was that claims were admitted which were too ambiguous. Sir Horace Hamilton (Board of Trade), said the profession of patent agent seemed to be in a happy position, for he was told that adversity acted as a spur to invention, and when times were good industry had more to spend on research, which also led to invention.

ITALIAN BROADCASTING.

New Short-Wave Transmitter for Long Distance Work.

IN accordance with the Italian Broadcasting Company's policy of modernising the Italian broadcasting system, a short-wave transmitting station has been erected near Rome to enable the Italian transmissions to be heard in those overseas countries outside the range of the broadcasting stations operating on the normal broadcast wave-band. The new station, which in its main features follows the design of the short-wave Beam transmitter has been supplied by MARCONI'S WIRELESS TELEGRAPH CO., LTD. The station is now completed, and tests made on 25.4 metres were observed in the Italian Colonies and elsewhere. Reports received from India, Australia, South Africa and New York were satisfactory. Arrangements have also been made to enable the transmitter to operate on a second wave length of 80 metres, which is suitable for reception throughout the whole of Italy and neighbouring countries, where the normal broadcast wave-band is indifferently received. The transmissions will normally take place on either 25.4 metres or 80 metres, the wave range of the transmitter. The equipment is rated to deliver from 9 to 12 kW of unmodulated carrier power to the aerial feeder system. The maximum degree of modulation is 70% and at this setting the transmitter is rated at 9 kW unmodulated input to the feeder. With 12 kW to the feeder the maximum degree of modulation is 55% to 60%. The complete transmitter consists of four panels. The first is the main magnifier unit operative over the whole wave band of 25 to 80 metres; the second contains the intermediate magnifier and drive units for the wave band 25 to 40 metres; the third comprises the intermediate magnifier unit and drive units for the wave band of 40 to 80 metres, and the fourth is the modulator and sub-modulator unit. Two separate transmitting aerials of the " Uniform " type are provided, both being suspended and insulated from a triatic slung between two masts 200 ft. in height and 400 ft. apart. The energy from the transmitter is conveyed to the two aerials by two separate copper feeder systems identical with those used in the Beam system. The feeders consist of two concentric copper tubes insulated from each other through porcelain insulators and accurately spaced throughout their whole length. The inner tube carries the high frequency energy, while the outer tube, which is carried on iron stanchions, is at earth potential. The aerial ends of the feeders terminate in aerial coupling boxes situated under the vertical aerials. These boxes contain inductances which are used to couple the aerials in the correct impedance relation to the feeders, in such a manner that the aerials act as pure resistance loads on the transmitter, thus avoiding reflected waves with their attendant losses. The speech or musical programmes received over the landlines from the studio in Rome will be amplified by two separate speech amplifiers.

INSTITUTE OF METALS.

Seaport Meeting and Coming Visit to France—Metallurgists and America.

SOUTHAMPTON will be the scene of this year's meeting of the Institute of Metals, which is being held from September 9-12. At the morning sessions a dozen papers of metallurgical and engineering interest will be presented for discussion. The afternoons will be devoted to visits to works in the neighbourhood and to Portsmouth Dockyard. There will be a luncheon on board the " Mauretania," also social functions each evening. On September 12, motor trips will take place in the New Forest and round the Isle of Wight. An excursion is being arranged for the week-end following the meeting, in the form of a trip to France and back in Atlantic liners.

Plans for an American meeting, to be held by the Institute of Metals in the United States and Canada two years hence, are now taking definite shape. The visit will include official meetings of the Institute in New York and joint meetings with allied societies in Detroit and Toronto. Other places to be visited include Pittsburgh, Cleveland, Chicago, Niagara and Montreal. In all of these, works will be thrown open for the inspection of the visitors. The party is expected to leave Southampton on September 3, 1932. The meeting in New York will begin on September 11, and the return journey will start from Montreal on September 30. Persons desirous of taking part in the seaport meeting and/or visit to America should communicate with the Secretary of the Institute of Metals, 36, Victoria Street, London, S.W.1.

IN PARLIAMENT.

Points from Replies to Recent Questions in House of Commons.

ALL the "one-piece" telephone instruments supplied by the Post Office are manufactured in England.

The Government of the Federated Malay States recently advanced £850 000 to the Perak River Hydro-Electric Power Co.

During 1929 the number of new rural telephone exchanges opened was 165. The net increase of telephones in use throughout the United Kingdom was 125 885.

The Postmaster-General is advised that the Rugby and Baldock wireless stations are capable of maintaining telephone services for as many hours as the beam stations, and probably for more.

A new electrification law in Yugoslavia contemplates certain concessions for the attraction of foreign capital. Everything possible will be done with a view to obtaining orders for British goods.

The number of wireless receiving licences in force on March 31, 1930, was approximately 3 093 000. There were no statistics available showing how many licencees used portable receiving sets.

It is expected that the further investigation undertaken by the committee which is examining the question of constructing a tidal barrage across the River Severn for the purpose of an electrical power scheme will take about two years to complete.

It is impossible to separate the results of Telephone Development Association publicity and those of other causes promoting telephone development. The Post Office relies mainly on personal canvassing, supplemented by literature, for popularising the telephone.

Experiments have shown that telephonic communication from railway trains is practicable, but at present the demand for such communication does not seem likely to be sufficient to justify the expense involved to the railway companies in the provision of facilities.

An application under the Development (Loan Guarantees and Grants) Act in regard to the project of the electrification of the Great Northern lines of the L.N.E.R. from King's Cross to Welwyn Garden City is being considered by the Advisory Committee. It is understood that the work could be commenced in about nine months.

In accordance with the agreement between the Government of India and the Indian Broadcasting Co. the annual wireless licence fee was fixed at 10 rupees, of which 20% was retained by Government. The Secretary for India (Mr. Wedgwood Benn) has seen it stated that the total number of licences issued up to the beginning of this year was about 9 000.

Up to the present about 3 500 telephone subscribers have ordered the new micro-telephone receivers. The extra rental of 4s. a quarter for these instruments is due to the fact that it is a delicate instrument and requires more looking after than the original instruments. If it is found, after 12 months, that any undue profit is made, the cost will be reduced.

The question of utilising the telephone system for the reception of broadcasting has been considered on several occasions, but the conclusion has been reached that the disadvantages would outweigh the advantages. Such a scheme has been adopted for some time in Holland, and, it is understood, there have recently been some new developments.

Great Britain has through telephone circuits to Austria, Belgium, Denmark, France, Germany, Holland, Irish Free State, Italy, Spain, Sweden, Switzerland, and the U.S.A. By switching in an intermediate country a telephone service is provided to Canada, Cuba, Czecho-Slovakia, Danzig Free City, Gibraltar, Hungary, Luxembourg, the Sarre Territory and certain parts of Spanish Morocco, the Argentine, Finland, Lithuania, Mexico, Portugal, Norway and Poland.

The Postmaster-General, in a written answer to a Parliamentary question, states that the capital expenditure involved in the proposal to establish telephone services with Canada, Australia, South Africa, India and the Argentine is about £125 000, exclusive of land lines. This, however, depends on an agreement with the distant countries concerned as to the hours per day they wish the service to be open and the number of alternative wave-lengths they are prepared to use. The dates of opening, also, depend on the negotiations now proceeding with the telephone administrations concerned. In regard to India and South Africa it is doubtful whether those countries will be in a position to co-operate in opening a service for some time to come.

TRADE PUBLICATIONS.

THE ASEA ELECTRIC, LTD., 5, Chancery Lane, London, W.C.2, has issued a new motor price list.

Specification No. A 402, dealing with transformers, has been published by CROMPTON PARKINSON, LTD., Guiseley, Leeds.

The current stock list of the A.E.G. ELECTRIC CO., at Bay 9A, 1/3, Brixton Road, London, S.W.9, has been received.

Street lighting is the subject of Catalogue No. L.19, by the WARDLE ENGINEERING CO., LTD., Elsinore Road, Old Trafford, Manchester.

THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, has published two new issues, Nos. K 71 and K 78, entitled respectively "Metalclad Switchgear" and "Variable Speed A.C. Motors."

Two new publications of the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C., are No. 6 650, describing the company's switch adaptor, and No. 6 653, relative to the "Neutrosonic" seven-valve receiver.

FERRANTI, LTD., Hollinwood, Lancs., have published a new descriptive catalogue for 1929/30, detailing meters, d.c. and a.c.; non-magnetic iron (Nomag); transformers; instruments and instrument transformers; radio; radiant heat fires, thermal storage tanks and equipment. These sections appear in the order given, and as the lists are numbered consecutively, the index at the beginning gives a ready means for identifying the position of each list. This catalogue has been issued under the company's master system, and will be kept up to date by means of loose leaf additions.

SCIENTIFIC AND TECHNICAL BOOKS.

THE Spring issue of the Classified Catalogue of Scientific and Technical Books, published by Ernest Benn, Ltd., includes a number of publications of electrical interest, as will be seen from the following list:—

ELECTRICAL ENGINEERING.—"Insulated Electric Cables," Parts I, II, and III, by C. J. Beaver, 36s. net; "Electric Winders," by H. H. Broughton, 52s. 6d. net; "The Electrical Handling of Materials," by H. H. Broughton, Vols. I and II, 25s. each, Vols. III and IV, 50s. each; "Primary Batteries: Their Theory, Construction and Use," by W. R. Cooper, 10s. 6d. net; "An Introduction to the Theory of Eddy-Current Heating," by N. Ryland Davis and C. R. Burch, with an Introduction by A. P. M. Fleming, 12s. 6d. net; "Electrical Measuring Instruments," Parts I to IV, by C. V. Drysdale and A. C. Jolley, 55s. net per volume; "Electric Shock Cards," 1s. 6d. each, or 50 copies, £3, post free; "Electrical Trades Directory and Handbook," 25s. net; "ELECTRICIAN Tables of Electricity Undertakings," 10s. net; "Electric Lighting of Shop Windows," by G. K. Fletcher, 3s. 6d. net; "Electric Switch and Controlling Gear," by C. C. Garrard, 63s. net.; "Electricity Meters," by C. H. W. Gerhardi, 18s. net; "Elementary Theory of Alternate Current Working," by Major G. L. Hall, 7s. 6d. net; "Electro-Magnetic Theory," by Oliver Heaviside, F.R.S., £5 5s., set of three volumes; "The New Electricity Act, 1926: A Popular Exposition for Municipal Officers, Electrical Engineers, and Others,', by W. S. Kennedy, 6s. net; "Electric Welding: Its Theory' Practice, Application and Economics," by H. S. Marquand, 12s. 6d; net; "Electro-Farming," by R. Borlase Matthews, 25s. net. "Wiring Calculations; for Electric Light and Power Installations," by G. W. Lummis Paterson, 5s. net; "Notes on the Theory and Design of Continuous Current Machines," by Stanley Parker Smith, 5s. net; "Sir Joseph Wilson Swan, F.R.S.: A Memoir," by M. E. S. and K. R. BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

AYRSHIRE EDUCATION COMMITTEE.—Electrical work in connection with the erection of new school at Annbank. Particulars from Mr. William Reid, master of works, Education Offices, Ayr.

BOSTON CORPORATION.—Electric light installation at Fever Hospital. Particulars from the Town Clerk.

DUMFRIES CORPORATION.—Electrical work in connection with lavatories to be constructed at St. Michael's Bridge. Particulars from the burgh surveyor, Mr. John Barker.

BIRMINGHAM CORPORATION, April 25—May 8.—Electric light and power wiring of City Sanatorium, Rednal Road, West Heath, Birmingham. Specification, etc., from Mr. F. H. C. Wiltshire, town clerk, Council House, Birmingham, until April 25; deposit £1 1s.

LIVERPOOL CORPORATION, April 25.—Supply of tramway rails and fishplates (schedule No. 1); fishbolts (No. 2) and tiebars (No. 3). Applications for tender forms, stating No. of schedule, to the City Engineer, Municipal Buildings, Dale Street, Liverpool.

DARTFORD URBAN DISTRICT COUNCIL, April 26.—Supply of approximately, 785 yds. of 0·1 sq. in. h.t., three-core, and 640 yds. of l.t. four-core lead covered and armoured cable. Further particulars from the Electrical Engineer, Electricity Works, Dartford.

ECCLES CORPORATION, April 26.—Supply of 500 kVA, three-phase, oil cooled transformer, ratio 6 600-400 V, 50 cycles. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Cawdor Street, Patricroft.

NEWTOWNARDS (CO. DOWN). GUARDIANS, April 26.—Electrical plant and wiring, etc., in connection with conversion of workhouse into a district hospital. Specification from Mr. John Warden, clerk to the Guardians; deposit £2 2s.

AYLESBURY CORPORATION, April 28.—Two vertical a.c. motors and sewage pumps. Specification from the Borough Engineer; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, April 28.—Supply and erection of 33 kV, 11 kV and 6·6 kV switchgear, for connecting Board's supply to electricity supply undertakings, under N.W. England and North Wales scheme. Specification (No. N.W.E.—G.S.4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit, £2 2s.

ILFORD CORPORATION, April 28.—Supply and erection of (*a*) rotary convertor plant of 500 kW capacity, with automatic control; (*b*) rectifier plant. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

WORTHING CORPORATION, April 28.—Borehole pump, coupled to electric motor, to deliver 60 000 gallons of water per hour. Specification, etc., from the Borough Water Engineer.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, April 30.—Supply and erection of h.t. and l.t. switchgear. Specification, etc., from Mr. David J. Keep, town clerk; deposit £2 2s.

WALTHAMSTOW CORPORATION, May 3.—Supply and erection of 2 500 kW motor-convertor. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, London, E.17; deposit £1.

GOLBORN URBAN DISTRICT COUNCIL, May 3.—Electric light installation in 54 houses on Edge Green Lane site. Tender forms from the clerk, Mr. H. Eckersley.

CENTRAL ELECTRICITY BOARD, May 5.—Supply and erection of 33·kV transmission line crossing of the river Witham. Boston, under Mid-East England scheme. Specification (No, M.E.E.—S.L. 3) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

MANCHESTER CORPORATION, May 5.—Twelve months' supply of 125, 250, 500, 750 and 1 000 kVA static transformers. Specification (No. 278) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

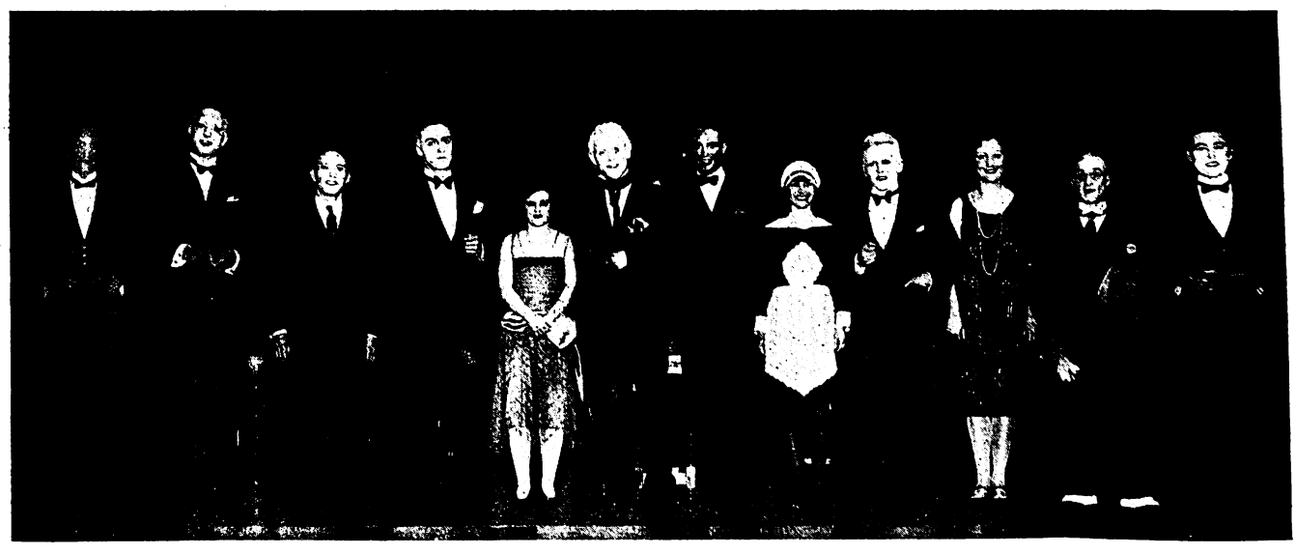
ST. MARYLEBONE (LONDON) BOROUGH COUNCIL, May 5.—Supplies of l.t. and e.h.t. underground cables for 12 months. Tender form, etc., from the Chief Electrical Engineer, Town Hall, St. Marylebone, London, W.1.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, May 6.—Supply and erection of induction voltage regulator. Specification from Mr. R. W. Willis, 37, High Street, Cheadle; deposit £2 2s.

TYNE IMPROVEMENT COMMISSION, May 6.—Supply of five 3-ton electric, hand travelling, semi-portal, level luffing cranes, for Prince Edward Dock. Specifications, etc., from Mr. Albert Blacklock, secretary, Bewick Street, Newcastle-on-Tyne; deposit £3 3s.

DUNDEE CORPORATION, May 10.—Supply and erection of two electrically driven, vertical spindle, main circulating water pumps, in pump room, in connection with Carolina Port generating station. Specification, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

BILSTON URBAN DISTRICT COUNCIL, May 12.—Electric light installation in Market Hall and Yard. Specification from



THE above picture shows the members of the Dramatic and Musical Section of Callender's Cable and Construction Co.'s Athletic and Social Club (London), who gave an excellent performance of the comedy-drama "Grumpy" at the Guildhall School of Music, London, on Tuesday of last week. This was the first public performance given by the Section.

Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s. Only firms on the National Register are invited to tender.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.—G.S. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.—S.L. 2) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply of 33 kV and other cables, in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EPSOM URBAN DISTRICT COUNCIL, May 12.—Kiosks and converting plant (section I); e.h.t. and l.t. cables and laying (section II); and supply only of l.t. cables (section III). Specification and form of tender from Mr. H. W. Watts, Electricity Works, Depot Road, Epsom; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 19.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme (London Area). Specification (No. S.E.E.-L.F.4.) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

STAFFORDSHIRE EDUCATION COMMITTEE, May 24.—Electric light installation in existing Infants' Council School, Pelsall, near Walsall, which is to be enlarged and converted into a Senior Mixed Council School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice,* essential.

CHRISTCHURCH (N.Z.) MUNICIPALITY, April 25.—Supply of electricity meters. (Reference B.X. 6 309.)

ST. GILLES (BRUSSELS) MUNICIPALITY, April 26.—Supply of 6 000 metres of 10 sq. mm. armoured cable, 100 metres of 35 sq. mm. and 1 000 metres of 70 sq. mm. Cahier des Charges (fr. 5) from Service de l'Electricité, 40, Rue de Bethléem, St. Gilles, Brussels.

ANTWERP MUNICIPALITY, April 28.—Supply of cables and junction boxes. (Reference B.X. 6 312.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, April 28.—Supply and erection of electrically driven high lift and low lift pumping plants, etc., for South-West Tableland Water Supply (tender No. 51, 1929/1930). Reference A.X. 9 219.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29.—Supply of single-phase transformers, with accessories, for Lake Coleridge Power Scheme, section 219. (Reference B.X. 6 035.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

ANDERLECHT MUNICIPALITY, April 30.—Supply of high and low pressure cable. Cahier des Charges (fr. 3) from Régie de l'Electricité, 4, Rue Van Lint, Anderlecht, Brussels.

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

GHENT PORT AUTHORITIES, May 3.—Eight electric portal cranes. Cahier des Charges (No. W.4). (Reference A.X. 9 444).

VICTORIAN ELECTRICITY COMMISSION, May 5.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19). (Reference B.X. 6 226.)

CAIRO MAIN DRAINAGE DEPARTMENT, May 17.—Supply of electric lamps, etc., for one year. Particulars from the Department, 2, Sharia Maleka, Nazli.

INDIAN STORES DEPARTMENT, May 26.—Two vertical and two horizontal centrifugal pumps, switchgear, etc. (Reference A.X. 9 416.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 8.—Supply of telephonists' telephones. (Reference B.X. 6 352.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1. (£10 5s., not returnable.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

Tenders Accepted.

AIR MINISTRY.—British Thomson-Houston Co., Ltd., supply of Mazda lamps for three months, or longer if required.

GENERAL POST OFFICE.—Telephone exchange equipment: Southall, Standard Telephones and Cables, Ltd.; Clerkenwell, Automatic Telephone Mfg. Co., Ltd.

GLASGOW CORPORATION.—General Electric Co., Ltd., electrical equipments in connection with tramcar re-building scheme, comprising 450 60 H.P. motors, 600 V, with resistances and circuit breakers.

BLACKBURN CORPORATION.—Material required by electricity department during 1930: 6 600 V paper insulated and lead-covered cables, Edison-Swan Cables, Ltd.; 660 V paper insulated lead-covered cables, Derby Cables, Ltd.; v.i.r. taped and braided wires and lead sheathed cables, Mersey Cables Works, Ltd.; flexibles, Siemens Bros. and Co., Ltd.; consumers' meters, Ferranti, Ltd.; gas-filled and vacuum lamps, General Electric Co., Ltd. and British Thomson-Houston Co., Ltd.

TORQUAY CORPORATION.—British Thomson-Houston Co., Ltd., supply and erection of one 7 500 kW, m.c.r., turbo-alternator and condensing plant, £26,595. Also tendered: Richardsons, Westgarth and Co., Ltd.; Metropolitan-Vickers Electrical Co., Ltd.; Brush Electrical Engineering Co., Ltd.; C. A. Parsons and Co., Ltd.; General Electric Co., Ltd.; English Electric Co., Ltd.; Peter Brotherhood, Ltd.; British Brown Boveri, Ltd.; Escher, Wyss and Co., S.A.; Oerlikon, Ltd.; Siemens-Schuckert, Ltd.

MANCHESTER CORPORATION.—Twelve months' supply of electrical goods: Manchester Armature Repair Co., Ltd., armature coils; Metropolitan-Vickers Electrical Co., Ltd., insulated blocks for motor brush-holders, shoes for electro-mechanical brakes, and lightning arresters; British Thomson-Houston Co., Ltd., controller reversing fingers; Fairless Engineering Supplies Co., Ltd., B.510 two-way connectors; General Electric Co., Ltd., conduit tubing, switches for car lighting, thumb-turns and china covers for switches, gongs, magnet coils, backs for bell presses, cable for motor buses, and green and opal shades; Siemens Electric Lamps and Supplies, Ltd., two-way switches and lampholders; Taskers' Engineering Co., Ltd., tumbler type switches; S. Gratrix, Junr., and Brother, Ltd., fuses, bell presses, shades, etc.; Edison Swan Electric Co., Ltd., two-way switches for bells, porcelain fuses, etc.; Ward and Goldstone, Ltd., portable lamps, plug adaptors, etc.; Metro-Vick Supplies, Ltd., cells for bell circuits.

GLASGOW CORPORATION.—Thomas Bolton and Sons, Ltd., and F. Smith and Co., Ltd., copper trolley wire; Sturtevant Engineering Co., Ltd., and Met.-Vick. Supplies, Ltd., suction plant for depots; W. C. Yuille and Co., Ltd., electric magnet crack detector; Mather and Platt, Ltd., two new rotary convertors, £8 062; General Electric Co., Ltd., 35 new motors, two new portable drills, etc., £1 571 9s. 6d.; Harland Engineering Co., Ltd., 86 new and three reconditioned motors, £7 111; John Grieve and Co., six new crane motors, £350; English Electric Co., Ltd., 12 new motors, £223 15s. 6d.; Brook Motors, Ltd., eight new motors, £114 19s. 11d.; A.S.E.A. Century Motors, 12 new motors, £139 2s. 6d.; Metropolitan-Vickers Electrical Co., Ltd., 16 reconditioned and three new motors, etc., £1 456 3s. 6d.; J. Bennie, Ltd., two lift motors, exchanged including fitting, £317 10s.; T. Harding, Churton and Co., five new motors, £204 10s.; Wm. M'Gee and Co., six new motors, £414; Lancashire Dynamo and Motor Co., Ltd., 15 new motors, £781 10s.; British Thomson-Houston Co., Ltd., 29 new motors, £2 437 18s.

With reference to the advertisement of the Telegraph Condenser Co. which appeared in our last issue on page XXIV, the condenser illustrated is type H.F. and not H.S. as printed.

ELECTRICITY SUPPLY.

Dumfries Hire-Purchase Scheme—Loan for Nottingham Extensions—Ballymena's Bulk Supply—Carlisle's Rural Extensions—Supply Commenced at Sorn—Discontinuance of Plymouth Free Wiring.

GLASGOW Electricity Committee has authorised mains extensions at a cost of £21 636.

Dumfries Town Council has approved of a hire-purchase scheme for wiring houses.

Buckie Gas Lighting Co. has lodged an objection to the electricity scheme put forward by the T.C.

Stoke Newington (London) Electricity Committee has obtained sanction for a loan of £10 000 for mains and services.

Malvern U.D.C. has applied for loans of £7 000 for mains and services, £2 000 for transformers and sub-stations, and £1 000 for meters.

Hastings T.C. is to extend the l.t. overhead lines to supply the Waites Farm estate at Fairlight and the Warren estate, at an estimated cost of £630.

Nottingham Corporation has approved the provision of a further sum of £150 000 for extension of mains and for works in connection with the assisted wiring scheme.

Uttoxeter U.D.C. has received sanction to a loan of £22 349 for carrying out an electricity scheme, under which energy will be obtained in bulk from Burton-on-Trent Corporation.

Northfleet U.D.C. has been informed by the Central Electricity Board that the erection of the Tunbridge Wells and Croydon transmission lines on one line of towers is not practicable.

Following the report of the Electricity Committee at a recent meeting of Ballymena U.D.C., it was agreed that a supply of electricity for the town be taken from the Antrim Electricity Supply Co.

Carlisle City Council has approved an expenditure of £13 238 for the extension of electricity supplies to the townships of Wetheral, Heads Nook, Warwick Bridge, and Brampton, on the eastern side of the city.

At a recent meeting of Sorn P.C. a letter was read from the Ayrshire Electricity Board stating that the electric lighting scheme for the village was nearly completed and at the close of the meeting the first of the lights were turned on.

Negotiations have been completed between the Tanganyika Government and the Power Securities Corporation, of London, for a supply of electricity, generated at the Pangani Falls, to townships in the district between the coast of East Africa and Lakes Victoria and Tanganyika.

The chairman of Exeter Electricity Committee and officials have been informed by the Central Electricity Board, that no obligation will be imposed upon the City Council to bring its undertaking within the South-West scheme unless circumstances prove that it is to the benefit of the city.

A Ministry of Transport inquiry has been held with regard to an application by the Central Electricity Board for sanction to erect a transmission line between Leicester and Loughborough. Col. N. H. Firmin, for the Board, said the line would be a portion of a loop which ran from Nottingham to Leicester.

Plymouth Electricity Committee recommends the discontinuance of the free wiring scheme, and that persons whose orders have not yet been executed be recommended to wire their houses under the Corporation's assisted scheme. The Electrical Engineer is to report regarding the existing system of supplying electricity through prepayment meters.

The Isle of Man Legislative Council has passed the Isle of Man Electric Light and Power Bill, which grants a monopoly to the Electrical Securities Trust, Ltd., to distribute electricity for lighting and heating purposes throughout the Isle of Man. The Bill has yet to be considered by the Manx Lower House—the House of Keys. The Manx Government reserves the right to acquire the undertaking after 50 years.

The Committee of Inquiry appointed by the Punjab Government has reported on the progress of the Uhl River (Mandi State) hydro-electric scheme. The Committee does not recommend the abandonment of the scheme. The supply of power to the public should begin by July, 1933. It is estimated that the ultimate cost will be 6¼ crores of rupees (about £4 688 000, instead of the original estimate of £3,200 000). It is recommended that an expert committee should, before the second stage of the scheme is started, examine the merits of an extension by means of additional storage pipes and plant to increase the output from 36 000 kW to 70 000 kW, compared with the generation of energy from canal falls and fuel-driven plant.

In view of the urgent need for more power at the Lurgan Corporation's electricity station, a deputation has been appointed to wait on the Ministry of Home Affairs. At a recent meeting of the Council, Mr. Lewis said it was evident there were influences at work to compel urban authorities to take a bulk supply. This would not be available for at least four years, and Lurgan could not wait that time.

A Ministry of Transport inquiry was held on April 10, relative to the application of the Scarborough T.C. to extend its electricity supply to Filey by means of overhead lines. It was stated that the North and East Riding County Councils, Scarborough R.D.C. and the Scalby and Filey Urban Councils had agreed to the scheme. One objection was that the poles would hinder the development of a building estate, and there was opposition to the payment of only 1s. per annum as pole rent. The Town Clerk said the Council would pay a fair sum for wayleaves, to be decided by the Ministry

The Kent Electric Power Co. has placed before Rochester and Chatham Corporations proposals in exchange for which the company asks for a 42 years' extension of tenure. The company offers to reduce the price of electricity for lighting from 6½d. to 6d. and for power from 2d. to 1½d., and the rent of meters up to 10A from 3s. to 2s. 6d. per quarter, to introduce a two-part alternative tariff and to provide a hire-purchase scheme for installations. The company offers to extend the distributing cables in Rochester, Chatham and Strood. The total cost of the work scheduled is estimated at £35 000. A Joint Lighting Committee of the Corporations has decided that the proposals made are quite inadequate.

Guildford Electricity Committee has received a deputation consisting of officials of the Central Electricity Board upon the proposed route of the Board's overhead transmission line from Guildford to Godalming and Hindhead. The Committee approved the proposed route, but strongly urged the deputation that the line should be placed underground where it is to cross the Hog's Back.—The Committee has granted an application for a supply of electricity to the Stonebridge Estate, Shalford. In order to give a supply it will be necessary to extend the mains, at an estimated cost of £273 11s.—Mains are also to be extended at an estimated cost of £393, to give a supply to 44 houses proposed to be erected at Stoughton recreation ground.

Col. T. C. Ekin held an inquiry at Burscough, recently, into the application of Lathom and Burscough U.D.C. for an Order to supply electricity in the district and the application by the Lancashire Electric Power Co. for an Order to supply current for domestic purposes in Lathom, Burscough, Skelmersdale, Wigan and West Lancashire. Mr. W. Gorman, for the company, said they could not supply Skelmersdale and the adjacent rural area unless they were allowed to carry out the whole of their scheme, which also included Lathom and Burscough. Mr. C. D. Tate, engineer to the company, said they proposed to spend £12 330 on cables in the districts they proposed to supply. They would take their supply from their station at Ormskirk and lay mains where there was a demand sufficient to warrant them. The company's application was supported by the East Lancashire Electricity Board.

Sanction to borrow £9 160 for electricity mains has been obtained by St. Pancras (London) Electricity Committee. The Committee reports that the Electrical Engineer advocates the adoption of the remote control system for a new sub-station in Arlington Road, as, although the necessary equipment would cost practically 50% more to instal, it would almost eliminate operating costs at the station. The Committee is advised that the most comprehensive and effective equipment offered is that of the General Electric Co., the total for h.t. and l.t. switchgear being £16 423. Certain of the apparatus, however, will not be needed, and the reduced total will therefore be £14 798. The Engineer has been impressed by the efficiency of the apparatus and its wholly automatic action. Two different types of reflectors have been used experimentally on street lamps in the borough, with a view to finding the best means of improving the lighting. Two adjacent circuits of lamps of equal wattage are being fitted with such reflectors, for purposes of comparison, and the Sub-Committee which is considering the matter will submit its recommendations after it has inspected them.

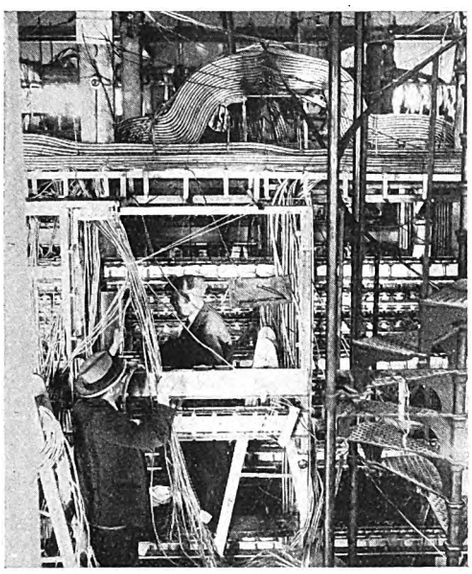
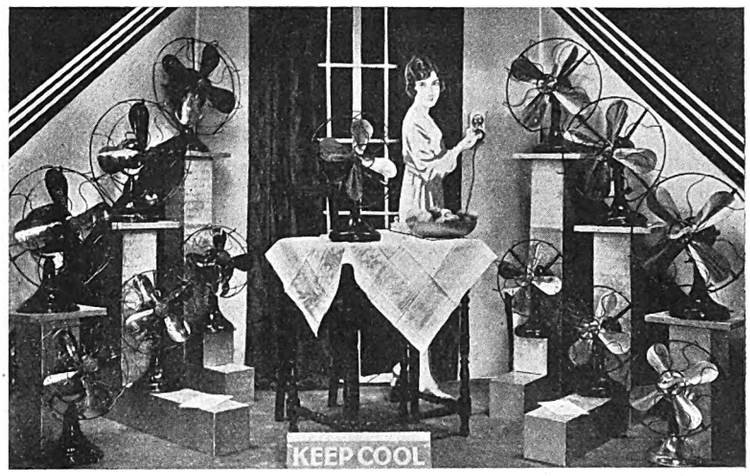
ELECTRICAL PICTURES OF THE WEEK.

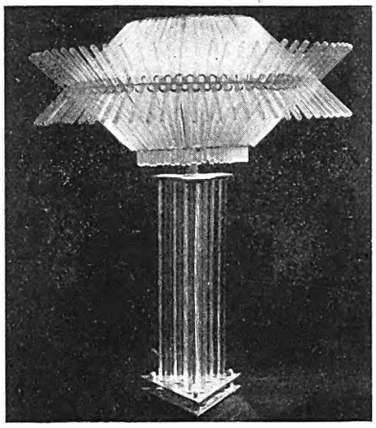


Part of the internal wiring of the Newmarket totalisator which is now in operation. The equipment is capable of handling a field of as many as forty horses.



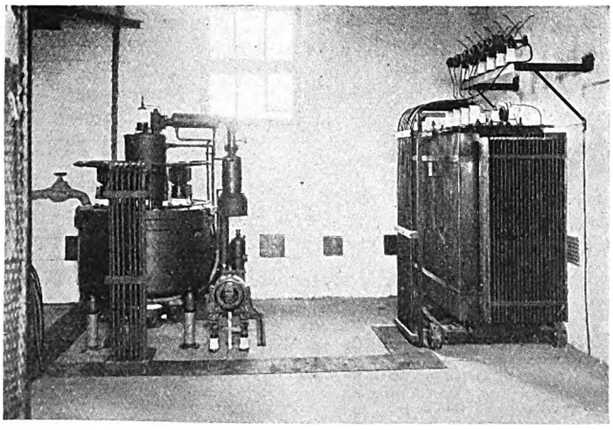
The April window display designed by the Electrical Development Association in connection with the Selling Campaign was devoted to electric irons. The May window is concerned with fans, and, as this reproduction shows, the same simple lines are retained.

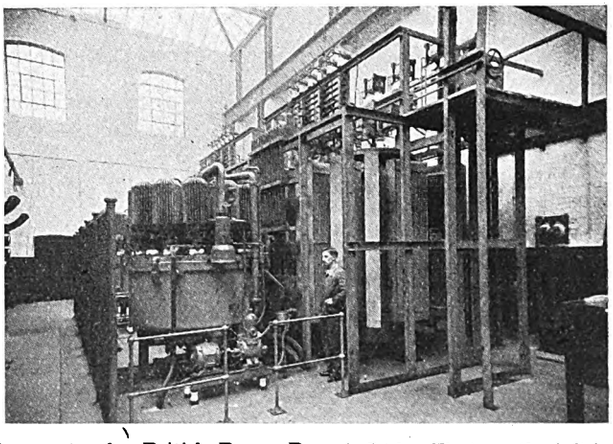
The latest electrical addition in the medical world is an apparatus for sterilising and drying the hands of operating staffs.



A " Dimea " table standard lamp made from fluted glass tubes. The tubes are so arranged that only diffused light is radiated.

Electrical penetration in the circus world has resulted in the adoption of modern methods of lighting, even to the use of appropriate reflectors.





Two of the latest high power rectifier plants to be put down in this country by British Brown Boveri, Ltd. That on the left is a 400 kW plant supplied to the Wycombe (Borough) Electric Light and Power Co., Ltd., and supplies 420 V d.c. to the High Wycombe network. The h.t. supply is three-phase, 5 300 V, 50 cycles. The second picture is an installation in the Blandford Street sub-station of St. Marylebone (London) B.C. Each set is rated at 3 000 kW, 490/530 V d.c., the incoming supply being three-phase, 6 600/6 900 V, 50 cycles. It is claimed that these units are the largest in operation in this country.

Directors' Reports, etc.

SOCIETA IDRO-ELETTRICA PIEDMONTE (TURIN).—This company has arranged with Blair and Co., of New York, for a loan of $14 000 000 in 6½% mtge. bonds.

MONTREAL TRAMWAYS CO.—Operatg. rev. for 1929. $15 311 138, agst. $£14 826 622 ; and special rev. $358 773, Net earngs., $3 795 098, agst. $3 435 363.

AMERICAN TELEPHONE AND TELEGRAPH CO.—Shhldrs. have been offered the right to subscribe to new stk. at par, in ratio of one new sh. for each six owned. This is expected to give the company $235 000 000 of new money.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. on ord. sh. cap. of 7% actual for half-year ended Dec. 31, 1929, mkg. 12% actual for year, and a cash bonus of 5d. per ord. sh., both less tax at rate of 2s. in £, are recommended.

RADIO CORPORATION OF AMERICA.—The president of the corporation, Mr. David Sarnoff, announced on April 16 that it had purchased the radio business of the General Electric Co. of New York and the Westinghouse Electric and Manufacturing Co.

MID-CHESHIRE ELECTRICITY SUPPLY CO.—The shhldrs. have been advised that it will be approximately two months before the annual general mtg. will be held, by which time will be known the result of certain arbitration proceedings affecting the year 1929.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—It is reported that the International Telephone and Telegraph Corporation has arranged to acquire 36 000 fully-paid non-assessable shs. of the cap. stk. of the Standard Villa Mossagi concern, of Budapest.

GREAT NORTHERN TELEGRAPH CO., LTD.—Total div. and bonus, 20%, includg. 5% already paid, for year 1929. To res. and renewal fund £33 333 ; to pensn. fund, £38 889 ; fwd., £229 923, increased by £83 893 which appeared in last year's blce. sheet under " reserved for taxes."

WEST KOOTENAY POWER AND LIGHT CO.—Gross earngs. for 1929, $2 309 650, agst. $2 133 526. Deductg. exes., bond int., depreciatn. ($725 213), sinkg. fund appropriatn. and divs., left surplus $657 836, agst. $772 824 ; previous surplus brt. in $1 844 906 ; net pft. and loss blce., $2 502 740.

BRITISH COLUMBIA POWER CORPORATION, LTD.—Messrs. Nesbitt, Thomson and Co., Ltd., of Montreal, are offering for sale $10 000 000 of 5½% 1st refunding and collateral trust sinking fund gold bonds, series " A," of the British Columbia Power Corporation, Ltd., at 98 and accrued interest.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.—Pft. for 1929, £365 961, agst. £258 772, before provisn. for deb. stk. int. and depreciation. Deb. int., £41 454 ; written off works, plant, etc., £62 659, agst. £56 655 ; to gen. res., £15 273, agst. £25 000. Ord. div. 6%. Tradg. results include pfts. from subsidiaries to extent to which divs. have been declared. All works of the group have been comparatively well employed. Orders in hand have increased.

PUBLIC UTILITY HOLDING CORPORATION.—The corporation has acquired controllg. stk. int. in South American Railways Co., which was formed to finance and acquire a substantial interest in the Buenos Aires Central Railroad and Terminal Co. The latter company operates a steam railway 200 miles in length and also owns and operates the Lacroze Tramways Co. of Buenos Aires, and the Lacroze Light and Power Co. The Buenos Aires Central Railroad Co. is constructing an underground railway from the present terminus to a point in the business centre of Buenos Aires.

EVERLITE, LTD.—Rpt. for period from Oct. 16, 1928, to March 15, 1930, states that cap. is £100 000, divided into 2 000 000 shs. of 1s. each, all of which have been issued and are fully paid. After mtg. expenditure on purchase of inventns., experimental work, directors' fees, etc., cash in hand is £47 397, and stock is valued at £11 112. Much experimental work has been carried on, a suitable type of container has been evolved, and lamps are in commercial productn.

KOLSTER-BRANDES, LTD.—First rpt. states that net pft. for period of 14 months ended Feb. 28 (includg. pfts. of Brandes, Ltd., for two months prior to incorporatn. of company) amtd. to £32 195, to which is added premium of £8 250 received on issue of 66 000 shs. Income tax required £7 400, and £30 296 has been written off prelim. exes. Fwd. £2 748. Issued cap. is £1 166 000. Patents stand in blce. sheet at £103 130 and tradg. rights and developmt. at £618 169, while properties, plant, etc., are valued at £79 193, and stocks, work in progress, etc., at £257 836.

WESTERN UNION TELEGRAPH CO.—Gross operatg. rev. for 1929, $145 667 196, exceeded that of previous record year, 1928, by $9 217 682. Cable revs. increased 9·6%. Volume of traffic transmitted over the company's ocean cables in 1929 exceeded that of any other year. Operatg. exes., $129 364 897, Addg. income from divs. and int. and deductg. int. on bonds, left $15 474 894 to transfer to surplus acct., makg. total surplus $95 635 228. In conformity with company's policy to regulate wages according to individual merit, substantial increases were agreed to, and wage expense was further increased to meet demands of a greater volume of business and further to improve quality of service. Additional provisn. was also made for depreciatn., and larger sums were spent for repairs and rents. As a result of the reductns. in overnight and week-end cable letter rates, there has been substantial increase in volume of deferred service over North Atlantic system, and all classes of deferred services have now been extended to Germany and Belgium. Duplexing experimts. were successfully carried out in connection with company's high-speed cable laid in 1928 between Newfoundland and Horta, Azores Islands. A speed of 1 400 letters per min. in each directn. simultaneously was recorded, by far the highest record of any known existg. cable. This is the first time a loaded cable has been successfully duplexed. Controllg. int. in stock of American Telegraph and Cable Co. has been purchased at about $27·00 p. sh., and negotiatns. are in progress for acquisitn. of that company's property, consisting principally of two trans-Atlantic cables now held by Western Union under lease expiring in 1932.

Company Meetings.

BIDEFORD AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Presiding at the recent annual meeting, Sir Hugh Stucley (chairman) stated that, following conversations between the directors and the representatives of a great electrical combine, the former recommended the shareholders to accept the offer of the Whitehall Securities Corporation, Ltd., to purchase the shareholders' interest at the rate of 32s. per ordinary share and 23s. 6d. per fully paid preference share, in each case ex dividend. The acquisition of the property by the Corporation was subject to 75% of each class of shareholders accepting the offer.

LONDON ELECTRIC WIRE CO. AND SMITHS, LTD.—At the meeting on April 15, Sir George H. Fisher-Smith, chairman, said land, buildings, plant and machinery had a considerably higher value than the total appearing in the balance sheet. Value of stock showed a decrease of £32 561, accounted for by increased trade towards the end of the year. There was still further development to be carried through in their subsidiary, the Liverpool Cable Co., Ltd., and its buildings and plant could be quickly extended to meet any increased business. Net profit amounted to £111 854, making, with transfer fees and £22 759 brought in, a total of £134 630, and after making the distributions shown on the debit side of the profit and loss account, the profit balance was £70 329. He thought they could look to the future with every confidence. The report and the ordinary dividend of 7½% were approved.

METDURO, LTD.—The Marquis of Winchester, presiding at the first annual meeting on April 16, said it would be noticed that 40 253 preference shares were fully paid, of which 250 were paid for in full by the managing director and 40 000 were allotted fully paid to the vendors, Metropole Developments, Ltd., who undertook, in consideration of receiving those shares and 490 000 1s. ordinary shares, to discharge the whole of the cash consideration payable to the inventor, and the whole of the five yearly instalments of his salary. Uncalled capital amounted to £224 873, which, with cash in hand, £64 275, left them with available resources of £289 148. Expenditure on development accounted for £17 551, in which there was a debit item of £7 500, part of the consideration of the original contract with Metropole Developments. No payment, however, had yet been made to Prof. Schmid in respect of this transaction. The company had acquired the British Empire rights of a product made by Herold A.G., of Hamburg, and having the same basis as Metduro, and it would be produced at their Waltham Abbey factory by September next. This material, under the name of " Ivorax " was largely used for the manufacture of many articles, and was non-inflammable, always retained its colour and withstood heat to almost any extent. They had had to make considerable trials before definitely deciding upon the best form of alterations to the large rotary plant at the Papyroplast factory at Penig, in Germany, in which they had an interest. Two of his colleagues who had visited the factory were confident that the plant, when the improvements were complete,p

Digitized by Google

would enable the manufacture of the containers to become a commercially profitable enterprise.

EVERLITE, LTD.—The Marquis of Winchester, presiding at the first annual meeting on April 16, said the amount due to associated companies—Metropole Industries, Metropole Developments and Metduro, Ltd.—was £7 541, and trade creditors and provision for accrued expenses amounted to £6 757. On the credit side, inventions, patents, plant, etc., amounted to £53 658. Their patents and trade marks were registered in over 70 countries. As they had not yet begun to trade, no profit and loss account was presented. Loan to director upon security and guarantee furnished by company, £30 000, had since been repaid. Their associated company, Metduro, Ltd., possessed a valuable factory at Waltham Abbey, and they had been able to take on lease from that company a self-contained factory on a repairing lease at a rental of £1 500 per annum. When, in dealing with the accounts, he referred to the amount spent on development, he had no doubt many of the shareholders might have thought that they ought to have been able to show trading results. It would be remembered that when the inventor, Prof. Schmid, gave his demonstration of the lamps in London in December, 1928, they appeared to have all the attractions worthy of the labours they had since expended upon it. The Everlite lamp was, they believed, the only hermetically sealed wet battery, but it had to compete against the dry cell battery which had been in common use for a number of years. It was necessary, therefore, that they should make a lamp that would compare favourably in quality and price with any other form of portable electric lamp. During the early part of 1929 they manufactured a certain number of lamps, but these were found to be too expensive to command a wide market, and they therefore deferred placing the lamp on the market until they could produce a more suitable one and at a competitive price. They could now offer the trade a lamp which could be utilised for many purposes by the addition of special fittings.

BRITISH THOMSON-HOUSTON CO., LTD.—Mr. Wm. Lusk, presiding at the meeting last week, said the profit for the past year was £458 381, compared with £422 729 for the previous year, and the amount brought forward £203 066, made the total to be dealt with £661 447. Deducting interest on debentures and loans, depreciations and directors' fees, there was a balance of £369 262. Out of this a dividend on the preference shares at 7% per annum had been paid, and the directors recommended a dividend on the ordinary shares at the rate of 5% per annum, less tax, compared with 4% for the previous year, leaving £205 262 to be carried forward. Their manufacturing plants had, as usual, been maintained in good condition. The number of their employees at the end of the year, not including employees of their subsidiary companies, was over 13 000. Both the orders received and the shipments from their factories during the year were greater than for the previous year, but the continuation of excessive competition at home and abroad resulted in an unreasonably low level of prices. Co-operation with the other companies of the Associated Electrical Industries Group had been pursued during the year, and that policy would be steadily followed and extended. The Chairman then referred to a number of important contracts carried out or being executed by the company, including a 30 000 kW turbo-alternator for the Ford Motor Co.'s Dagenham works, and two turbo-alternators each of 67 200 kW which are being made by the company and the Metropolitan-Vickers Co., for the London Power Co.'s Battersea station.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.

Previous Records Broken—Development of New Areas—Second Section of Barking Power House Running Satisfactorily.

THE thirty-sixth ordinary general meeting of the County of London Electric Supply Co., Ltd., was held at River Plate House, Finsbury Circus, London, E.C.2, on Wednesday, April 16, 1930, Sir Bernard E. Greenwell, Bart., presiding in the unavoidable absence of the chairman and managing director, Sir. Harry Renwick, Bart., K.B.E.

The manager and secretary, Mr. John C. Dalton, having read the notice convening the meeting and the auditors' report, Sir Bernard Greenwell read the speech prepared by Sir Harry Renwick as follows :—

Ladies and gentlemen,—You are no doubt aware that the ideal electric supply undertaking is one that can show the greatest diversity over the widest area, and I venture to claim that virtue for your company, seeing that we have an area of approximately 1 500 square miles.

If we include the areas of our associated companies to whom we give bulk supplies, the total area over which your company has supply rights is upwards of 3 200 square miles. There is an increase of 51 448 147 in the units sold for the year, making a total for all purposes of 374 910 784 units. There is an increase of over 46 000 kW in the new business secured, as compared with some 40 000 kW for last year, making a total of over 333 000 kW connected, while there is an increase of over 40 000 in the number of new consumers obtained during the year, as compared with an increase of 20 000 consumers for the preceding year.

The net revenue is satisfactory, seeing that we are proposing to pay an increase of 1% in the dividend, and that the carry forward is some £80 000 in excess of last year's figure. The revenue from sale of current, after making provision for bad and doubtful debts, is £1 678 522, while the receipts from other sources amount to £195 526, being a considerable increase over last year's figure, with the result that we get an increase of £14 889 in the total revenue. To the reserve account for taxation we are placing the sum of £10 000, and to the reserve for investments we are placing the sum of £15 000, while the reserves for depreciation and sinking funds under the 1925 Act absorb the sum of £284 953. This leaves a balance for appropriation of £1 003 058, out of which the interim and final dividends on the preference shares, amounting to £199 291, have been paid, and the interim dividend on the ordinary shares, and we are proposing to pay a further 8% on the ordinary share capital of the company, making 11% for the year on the capital as and when issued and paid up, thus leaving a balance to be carried forward of £445 036 10s.

I agree that our consumers should share in our prosperity. The reductions made during the past year both in our flat rate and two-part tariff charges amounted approximately to no less than £265 000.

As to the technical and engineering side of your undertaking, the Barking power house is, as you know, the heart and pulse of your business, around which most of the problems we have to deal with revolve, either directly or indirectly. The second section of the power house was not in full commercial use before the close of the year, but I am able to record now that it has since been practically completed, and is to-day running satisfactorily. In connection with distribution, I may add that a considerable amount of work has been done in our Essex area during the year, and supplies have been established at a number of points. We have acquired control of the Folkestone undertaking. We have also purchased the Wickford undertaking, and have obtained a Special Order for Burnham-on-Crouch and district, while, under a friendly arrangement with the Barking Urban District Council, we have taken a transfer from that Council of part of their area of supply.

Turning again to the figures of our own company, you will see that we show an increase for 1929 over 1928, as regards units sold for all purposes, of 16%. This compares with the national increase of 13%.

You will see on the fringe of London small places which were, at the end of the War, just mere villages or small settlements. To-day Coulsdon and Purley, Sanderstead, Morden, Buckhurst Hill, Romford, Woodford, and similar places in our areas of supply are highly urbanised, and they have a large share of the 123 000 new houses which have been built since 1926, and a correspondingly large share of the new population of over 600 000 people who have settled on the outskirts of London and in our areas of supply.

As to the progress for the current year, I am still optimistic, and in spite of the extraordinarily mild winter which has been experienced, I find that, as a matter of fact, for the first three months of this year, ended March 31, there is an increase of 20% in the units sold over the corresponding period last year, and an increase of 10 051 in kilowatts of new connections, while the number of new consumers has increased by 4 447.

The report and accounts were adopted

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

EALING MOTOR CO., Plant House, Ealing, electrical engineer. £16 17s. 7d. March 4.

TAYLOR, Mr. H., 24, The Arcade, Waterfoot, wireless dealer. £29 14s. 7d. February 7.

WYCHERLEY, Percy Wilson, 52, Cork Street, Leicester (trading as HIGHFIELDS ELECTRIC CO.), electrician. £11 1s. 11d. March 5.

Bills of Sale.

BENNETT, Albert Richard, 4, Norfolk Street, Blackfriars Road, S.E., electrician. Dated April 7, filed April 14. £100.

BIGGS, Charles Cooper, 1, White's Avenue, Newbury Park, electrical engineer. Dated April 9, filed April 10. £185 7s. 11d.

Deeds of Arrangement.

HOULT, John Reginald, 9, Peru Street, Higher Broughton, and CONNOR, John, 44, George Street, Cheetham Hill, Manchester, trading at 396/8, Cheetham Hill Road, Cheetham Hill, Manchester, as STATIC ELECTRIC CO., wireless and electrical dealer. Dated April 5, filed April 11. Trustee, H. Sharp, 30, Brown Street, Manchester. Liabilities unsecured, £516; assets, less secured claims, £176.

MITCHENHALL, Reginald Arthur, trading as MITCHENHALL BROS., 187, Trafalgar Road, Greenwich, and residing at 23, Lenham Road, Lee, electrical engineer and wireless contractor. Dated April 9, filed April 15. Trustee, W. Porter, 17, Soho Square, W. Liabilities unsecured, £430; assets, less secured claims, £70.

SHAW, Thomas Ronald, trading as CESTRIAN ELECTRICAL CO., 138, Northgate Street, Chester, late trading as SHAW, FLETCHER AND CO., King Street, Wrexham, electrical engineer. Dated April 2, filed April 9. Trustee, J. Davies, 1, Bank Street, Wrexham. Secured creditors, £605; liabilities unsecured, £1 815; assets, less secured claims, £1 205.

Receiverships.

ALLITE, LTD.—J. W. Rochester, of 5, Dysart Street, E.C.3, was appointed receiver on March 25, 1930, under powers contained in debentures dated March 15, 1929.

BRITISH ELECTRICAL INSTRUMENTS, LTD.—J. W. Shepherd, incorporated accountant, of 78, King Street, Manchester, was appointed receiver on April 4, 1930, under powers contained in debenture dated August 30, 1929.

ESSANESS RADIO AND ELECTRICAL CO., LTD. R. H. Hopkins, C.A., 418, Strand, W.C.2, was appointed receiver and manager on March 31, 1930, under powers contained in debentures dated February 16, 1928.

HENDERSON (W. J.) AND CO., LTD.—A.C. Lucas, of 167, Strand, W.C.2, was appointed receiver and manager on April 7, 1930, under powers contained in debenture dated November 12, 1929.

MERRITONE, LTD.—H. Nickson, of Lea House, Ponders End, was appointed receiver and manager on March 31, 1930, under powers contained in debenture dated December 20, 1929.

VOLTRON CO., LTD.—F. T. Smith, chartered accountant, of Premier House, Southampton Row, W.C.1, was appointed receiver and manager on April 3, 1930, under powers contained in debenture dated March 14, 1929, and second debenture dated March 26, 1930.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

ADELAIDE ELECTRIC SUPPLY CO., LTD., London, E.C.—Registered April 4, acknowledgement of indebtedness (supplemental to trust deeds dated June 11, 1918, etc.), securing £150 000 debenture stock; general charge (excluding dividend equalisation fund and uncalled capital). *£1 535 191. December 5, 1929.

DOBBING, Anthony Chapman, and ROTHERY, Arnold Lloyd, trading as THE RIPON ELECTRICAL CO., 39, Kirkgate, Ripon, Yorks, electrical engineers. Receiving order, April 10. Debtor's petition.

DOUDNEY, Edward, 93, East Street, Chichester, and 40, South Street, Chichester, Sussex, wireless wholesale and retail salesman. Receiving order, April 11. Debtor's petition.

HEMBER, Lionel Edwin, Pepper Street, Lymm, Chester, electrical engineer. Receiving order, April 11. Debtor's petition.

SHEPHERD, Cyril, 69, Micklegate, York, radio engineer and dealer in wireless accessories. Receiving order, April 10. Debtor's petition.

Notices of Intended Dividends.

DEAN, Joseph Holcombe, Bryn Road, Aberystwyth, Cardigan, electrician. Last day for receiving proofs, April 29. Trustee, H. W. Thomas, 4, Queen Street, Carmarthen.

THORNTON, William Haigh, 25, Bridge Street, Burnley, electrical and wireless engineer. Last day for receiving proofs, May 6. Trustee, J. W. Carter, District Bank Chambers, Blackburn, Official Receiver.

Bankruptcy Proceedings.

M.E.D.A.S., LTD., electrical engineers and contractors, 185, Hammersmith Road, London. Under a winding-up order made against this company on March 10, on the petition of a creditor, the statutory meetings were held last week at the Board of Trade Offices, Carey Street. The Official Receiver said that the company was registered on January 11 of last year and was formed to acquire as a going concern the business of electrical engineers and contractors previously carried on by A. L. C. Covell and D. J. Quenzer at the above address. The nominal capital was £3 150. Covell and Quenzer were appointed the managing directors at a remuneration of £208 per annum each. They had conducted the business in partnership for about a year, and it was decided to form the company to raise capital subscriptions for which had been promised. The purchase consideration was the allotment of £970 in shares to the vendors and an undertaking to pay the debts of the business as at October 1, 1928. The shares in question comprised the whole of the issued capital and the company's working fund chiefly consisted of moneys advanced on loan account to the amount of £785. The trading had resulted in a net loss owing to unremunerative contracts and heavy expenses in connection with an agency which proved unsuccessful. The failure of the company was attributed to losses on contracts, particularly one with the Hammersmith Borough Council for the wiring of dwelling houses. The statement of affairs showed unsecured debts £1 094, debenture loans £1 714, preferential claims £52, assets £840, and a total deficiency of £2 991 with reference to the shareholders. A resolution was passed for the appointment of Mr. O. G. Sunderland, 15, Eastcheap, City, as liquidator.

NEW DISTRIBUTORS OF EDISON STORAGE BATTERIES, LTD., Victoria House, Southampton Row, London, W.C.1, will be pleased to receive inquiries for their general catalogue describing the Edison steel-alkaline battery. They ask us to remind our readers that it is only from them that the Edison battery which has been used so successfully in this country for the past fifteen to twenty years can be obtained. The catalogue is a handsome brochure of forty pages describing the battery in detail and outlining its many applications to commerce and industry.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

HERCULES.—503 135. Class 13. Axles and axle caps for carriages; balls for ball bearings; bells and gongs; bolts, nuts, locking bolts, locks and latches; brackets, wire brushes, bushes, burners (lamp and stove), chains and chain rollers, clamps; cotter pins and linch pins; crow bars, dies without a cutting edge, electric lighting fittings; hinges, keys, key blanks, key rings, labels, letters, name plates, numerals and signs; lamps (ordinary), lantern reflector shades, levers, lubricators, oil cans, match boxes, ratchets, rims for wheels, rivets, bicycle saddle frames; screws, shackles, spokes, staples, and hasps; steel toys, swivels, badges, trouser clips, turnscrews; washers and wedges; all being goods of ordinary metal. The Hercules Cycle and Motor Co., Ltd., Britannia Works, Rocky Lane, Aston, Birmingham; manufacturers. May 29, 1929. To be associated with No. 459 738 (2 474) and others.

TENALAN.—496 658. Class 50. Electrical insulating materials and insulating parts of electrical apparatus made from such material. Allgemeine Elektricitäts-Gessellschaft, 2-4, Freidrich Karl-Ufer, Berlin, N.W.40; manufacturers. November 3, 1928.

PHILIPS.—B494 880. Class 8. Rectifiers, rectifying tubes and resistance tubes, battery chargers for accumulators and battery eliminators, all being goods for use in wireless telegraphy and telephony. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, 1A, Emmasingel, Eindhoven, Noord-Brabant, Holland; manufacturers. September 10, 1928. User claimed from March 24, 1925, in respect of rectifiers, rectifying tubes and resistance tubes; battery chargers for accumulators; and from June 19, 1925, in respect of battery eliminators for wireless. The applicants undertake that this Mark when registered, and the Mark No. B424 535 (2 368) xiii shall be assigned or transmitted only as a whole and not separately.

PHILIFLOOD.—509 637. Class 18. Electric lighting installations for flood-lighting and for projection purposes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, 13D, Emmasingel, Noord-Brabant, Eindhoven; manufacturers. January 20, 1930. (Date claimed under International Convention, November 15, 1929.) To be associated with No. 509 636 (2 714) xiii.

METDURO.—500 759. Class 50. Electrical insulating materials and picture frames, all made of synthetic resin; and combs for the hair, and brushes (except artists' brushes and brushes of metal). Metropole Developments, Ltd., Metropole House, Finsbury Square, London, E.C.2; manufacturers. March 7, 1929. To be associated with No. 500 750 (2 668) i and others.

NORTHLIGHT. (Sign.) 506 832. Class 8. Electrical cells and batteries (not for medical purposes). George M. Ilhagga, trading as The Northlight Razor Blade Co., 180, North Street, Belfast; merchant. October 11th, 1929.

HYPERNIK. 510 462. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth, Middlesex; manufacturers.—February 18, 1930.

L.E.C. (Sign.) 505 074. Class 13. Electric switches (ordinary), service fuse boxes, electric irons and electric conduits, all made wholly or mainly of ordinary metal. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. August 6, 1929. To be associated with No. 472 163 (2 536) and others. (By consent.) Registration of this trade mark shall give no right to the exclusive use of the letters "L.E.C."

TENACIT. 496 226. Class 50. Electrical insulating materials and insulating parts of electrical apparatus made from such materials. Allgemeine Elektricitats-Gesellschaft, 2-4, Friedrich Karl-Ufer, Berlin, N.W.40; manufacturers.—October 22, 1928.

SINGER.—500 779. Class 6. Sewing machines and parts of sewing machines; embroidering machines and parts of embroidering machines; electric motors and parts thereof (for use with sewing and the like machines, and not being parts of or accessories for motor vehicles and cycles); electric fans and parts thereof; power benches for sewing machines, and parts thereof; machines for skiving, taping, making binding, strap-pressing, pounding and beading, thread-drawing and kilting and parts thereof; all being goods included in Class 6. The Singer Manufacturing Co., 149, Broadway, New York; manufacturers and dealers. March 8, 1929. To be associated with No. 154 051 (682) and others. Advertised before acceptance, the applicants alleging distinctiveness.

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate* .. Ton £25 to £25 10s.
,, Roll, ,, £10 10 0 *Boric Acid* (Crystals) ,, £30 0 0

Sulphuric Acid (168° Tw.) Ton £6 15 0 *Sodium Chlorate*—per lb., 2¾d

Sodium Bichromate—Per lb., 3¾d.

Rubber—Para fine, 8¾d.; plantation, 1st latex, 7¾d.

*** The metal prices are supplied by British Insulated Cables, Ltd.

GOVERNMENT PUBLICATIONS.

The following publications have been issued and can be obtained at H.M. Stationery Office, London, etc. (The titles of the publications are given in the order in which they were issued):

General Post Office (Engineering Department).—Technical Instructions: XXV. Automatic Telephone Exchange Systems: Part 6A, The Director System. Exchanges installed by Automatic Telephone Manufacturing Co., Ltd. (System H). Letterpress. 6d.

Admiralty.—Electrical Manual, Naval, Vol. I: Addendum No. 2, B.R.183(2).

Scientific and Industrial Research Department.—Water Pollution Research: Summary of Current Literature; Vol. III, No. 4, April, 1930—Abstracts Nos. 369-485. 1s. 3d.

General Post Office (Engineering Department).—Technical Instructions: XXV. Automatic Telephone Exchange Systems, Part 6A, The Director System; Exchanges Installed by Messrs. Automatic Telephone Manufacturing Co., Ltd. (System H), Diagrams. 6d.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

300 917 E. G. O. PRESSLER, A. E. M. PRESSLER, and K. E. H. PRESSLER (trading as PRESSLER THURENGER VAKUUMROHRENFABRIK UND FABRIK WISENSSCHAFTLICHER APPARATE, O. (Firm of)). Photo-electric cells. (17/10/27)
323 610 S. G. S. DICKER (N.V. ELECTRICITEITS MAATSCHAPPIJ ELECTROSTROM). Manufacture of means for joining electric conductors. (21/11/28.)
301 433 BRITISH THOMSON-HOUSTON CO., LTD. Electric gaseous beacon lamps. (29/11/27.)
307 393 J. DIEUX. Amplifiers or wireless telegraphic apparatus operating on the mains. (6/3/28.)
303 419 INTERNATIONAL GENERAL ELECTRIC CO., INC. Vacuum cleaner brush bearings. (3/1/28.)
323 639 GENERAL ELECTRIC CO., LTD., and N. R. CAMPBELL. Photo-electric cells. (3/1/29.)
323 646 G. PAILIN and FERGUSON, PAILIN, LTD. Plug-and-socket type electrical connections. (9/1/29.)
319 312 R. PFAUTZ. Electrically driven washing machines. (20/9/28.)
323 653 C. E. JOHNSTON. Electrical contact-breakers. (14/1/29.)
307 335 BRANDES, LTD. Electrical condensers. (5/3/28.)
304 789 M. DE WRANGELL. Combined electric and mechanical motor control for phonographs. (27/1/28.)
323 666 H. D. FITZPATRICK (NAAMLOOZE VENNOOTSCHAP KODOWA REFRIGERATOR CO.). Generator for absorption, refrigerating-apparatus. (1/2/29.)
305 471 L. FLANDRIN and G. C. LEVY. Mercury switch. (4/2/28.)
323 667 S. G. BROWN. Electrical make-and-break devices. (2/2/29.)
305 640 SOC. D'ELECTRO-CHEMIE D'ELECTRO-METALLURGIE ET DES ACIERES ELECTRIQUES D'UGINE. Manufacture of aluminium silicon alloys. (8/2/28.)
307 060 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Aerial systems. (3/3/28.
306 146 BRITISH THOMSON-HOUSTON CO., LTD. Heat-dissipating devices for immersed electrical apparatus. (17/2/28.)
323 675 IMPERIAL CHEMICAL INDUSTRIES, LTD., and J. H. PATERSON. Electrode for use in arc-welding. (18/2/29.)
308 580 MASCHINENFABRIK OERLIKON. Pressure-gauge for high vacua. (23/3/28.)
323 678 F. C. SHRIMPTON and T. R. HOLLIS. Suspension chains for electroliers and the like. (23/2/29.)
323 679 F. C. SHRIMPTON and T. R. HOLLIS. Suspension chains for electroliers and the like. (23/2/29.)
306 849 R. BERTRAND. Electric-wave apparatus for the production of music. (25/2/28.)
306 964 L. M. TELEFONAKTIEBOLAGET ERICSSON. Selector contact banks. (28/2/28.)
307 352 BRANDES, LTD. Contact terminals for electron tubes. (5/3/28.)
323 682 L. W. BARNES. Cooling-apparatus for use with refrigerators and the like. (4/3/29.)
307 404 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Earth-boring systems. (6/3/28)
315 387 GENERAL ELECTRIC CO., LTD. Luminous electric discharge tubes. (14/7/28.)
318 222 NOMANU ELEKTRISCHE APPARATE GES. Appliance for scraping parquetry floors and other wooden surfaces. (1/9/28.)
315 391 GENERAL ELECTRIC CO., LTD. Luminous electric discharge tubes. (14/7/28).
309 152 L. M. TELEFONAKTIEBOLAGET ERICSSON. Intercommunication telephone apparatus. (5/4/28.)
310 329 WESTINGHOUSE LAMP CO. Cathode-ray and like tubes. (23/4/28.)
323 699 M. B. FIELD. Magnetic compasses. (20/4/29.)
311 272 I.G. FARBENINDUSTRIE AKT.-GES. Efficiency of galvanic battery depolarising-compositions comprising manganese dioxide and graphite. (8/5/28.)
311 818 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Vacuum electric tube devices. (17/5/28.)
313 519 BRITISH THOMSON-HOUSTON CO., LTD. Condenser microphones. (13/6/28.)
315 879 INTERNATIONAL GENERAL ELECTRIC CO., INC. Devices for preventing pumping in centrifugal compressors. (20/7/28.)
323 514 I. E. MCCABE. Thermally-operated electric switches of the fluid-pressure type. (3/9/28.)
323 549 B. C. VON PLATEN and L. A. G. REILAND. Dynamo-electric machines. (3/7/28.)
323 550 B. C. VON PLATEN and L. A. G. REILAND. Dynamo-electric machines. (3/7/28.)
323 551 B. C. VON PLATEN and L. A. G. REILAND. Dynamo-electric machines. (3/7/28.)
323 765 B. LEECH and F. HAMMOND. Electrolytic deposition of alloys. (1/7/28.)
323 714 L. MARTI-SCHLAEFLI. Electrical terminal. (5/7/28.)
302 643 NEON LIGHTS, Inc., C. Electric discharge devices. (19/12/27.)
323 718 S. G. S. DICKER (NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN). Method of preparing alkali metals and alkaline earth metals. (3/8/28.)
323 766 S. G. S. DICKER (NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN). Electric discharge tubes. (3/8/28.)
323 787 E. T. TUSON. Spot-light mounting brackets and traversing attachments. (6/9/28.)
323 789 BRITISH THOMSON-HOUSTON CO., LTD., and H. C. HEATH. Electric circuit breakers. (10/9/28.)
323 752 T. S. KEMBLE. Controllers for electric motors. (3/10/28.)
323 772 W. HOLMES and FERRANTI, LTD. Electrical testing-sets. (5/10/28.)
298 481 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Radio-transmitting systems. (8/10/27.)
323 742 C. S. FRANKLIN, J. G. ROBB, and L. J. GOLDING. Thermionic valves. (8/10/28.)
323 744 S. G. S. DICKER (NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN). Wireless recciving arrangements. (8/10/28.)
300 497 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (12/11/27.)
299 802 STANDARD TELEPHONES AND CABLES, LTD. Loaded transmission systems for telephony and the like. (1/11/27.)
323 794 STANDARD TELEPHONES AND CABLES, LTD., and E. P. G. WRIGHT. Automatic or semi-automatic telephone exchange systems. (10/10/28.)
301 820 LANDIS ET GYR SOC. ANON. Time switches for electric circuits. (6/12/27.)
323 799 C. A. JEFFERS and J. R. WHINCOP. Electric junction-boxes and the like, and insulators therefor. (10/10/28.)
323 804 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.) Impulse-controlling arrangements for use in electrical signalling systems. (11/10/28.)
298 576 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric rectifier systems. (11/10/27.)
323 814 BRITISH ELECTRIC TRANSFORMER CO., LTD., and J. L. THOMPSON. Cooling of oil-immersed electric transformers. (13/10/28.)
323 822 B. J. HALL. Reflector for use with mercury-vapour lamps. (18/10/28.)
323 823 S. G. S. DICKER (N.V. PHILIPS' GLOEILAMPENFABRIEKEN). Arrangements for amplifying electrical oscillations. (18/10/28.)
323 826 A. PREEN. Thermionic valves of the screened-grid type. (18/10/28.)
299 704 N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Electric discharge tubes. (29/10/27.)
323 837 C. RUSS. Method of winding and constructing electrical heating-elements. (27/10/28.)
323 849 C. S. FRANKLIN. Thermionic valves. (2/11/28.)
323 853 C. S. FRANKLIN. Frequency-control devices suitable for radio and the like transmitters. (6/11/28.)
323 854 J. A. CRABTREE. Electrical plug-and-socket couplings. (7/11/28.)

38 154 Associated Electrical Industries, Ltd., and J. Collinson. Welded butt joints.
38 085 W. W. Buck. Tuners for wireless receiving sets.
38 150 A. G. Bullen and E. L. Lee. Method for testing insulation of electrical apparatus.
38 128 Callenders' Cable and Construction Co., Ltd. Apparatus for twisting wires together.
38 100, 38 101 S. Gilchrist. Electric cut-out for internal combustion engines.
38 165 H. A. Hankey and J. Robinson. Wireless direction finding systems.
38 090 W. Leckey. Apparatus for sealing fractures in telephone cable, etc.
38 160 Marconi's Wireless Telegraph Co., Ltd., and F. Woods. Directional aerial systems.
38 169, 38 170, 38 171 B. C. von Platen and L. A. G. Reiland. Electrical machines. (3/7/28.)
38 099 H. J. J. M. de Regnauld de Bellescize. Electric relays. (12/12/28, France.)
38 145 Rheinische Metallwaaren und Maschinenfabrik. Charging device for electric fuses. (6/6/29, Germany.)
38 166 J. Robinson. High frequency apparatus.
38 132 J. Sinclair-Ross and J. Zetsche. Speed regulation of electric motors.
38 164 Soc. Anon Brevetti Italiani Esteri S.A.B.I.E. Telegraphic transmission systems. (14/12/28, Italy.)
38 104 C. P. Uhlig. Electrolytes for accumulators.

December 13th.

38 181 R. J. Aiken. Device for controlling electric circuit.
38 295 British Thomson-Houston Co., Ltd. Rotors for electrical machines. (22/12/28, U.S.)
38 297 British Thomson-Houston Co., Ltd., and G. S. C. Lucas. Thermionic valve amplifying systems.
38 198 A. C. Catherall and Darwins, Ltd. Permanent magnets.
38 258 Chubbs Automatic Manufacturing Co., Ltd., and J. H. A. Spaink. Electric switches.
38 194 F. H. Cobb. Electric lamp.
38 188 C. W. Cox. Fusible elements for electric fuses.
38 228 Creed and Co., Ltd., and R. D. Salmon. Keyboard telegraph transmitters.
32 229 Creed and Co., Ltd., and R. D. Salmon. Mechanical relay.
38 189 V. Hope. Electric switches.
38 273 W. H. Middle. Electric air-heating appliances.
38 260 C. Berrage-Moulton. Combined thermionic relay and record sound reproducing apparatus.
38 277 E. Savill. Holders for flexible conductors.
38 282 Siemens and Halske Akt.-Ges. Coupling contrivance for high-frequency amplifiers. (14/12/28, Germany.)
38 290 Telehor Akt.-Ges. Synchronisation of television receiving apparatus. (13/12/28, Germany.)
38 291 Telehor Akt.-Ges. Apparatus for production of alternating currents for driving synchronous motors for television, etc. (13/12/28, Germany.)
38 193 B. Walters. Transmission gear for magnetos.
38 206 T. L. Watkins. Protective boxes for electric cables.

December 14th.

38 393 R. Baker and C. W. Parsons. Electric switches.
38 386 British Thomson-Houston Co., Ltd. Electroresponsive control apparatus. (14/12/28, U.S.)
38 387 British Thomson-Houston Co., Ltd. Control of induction machines. (14/12/28, U.S.)
38 372 W. A. Burns. Thermionic valves, etc.
38 319 J. R. Chambers. Electric cables.
38 361 W. L. Colassi. Electrical sound reproducing apparatus.
38 358 C. J. Cracker. Wireless apparatus.
38 350 G. Fischer. Pantograph current-collecting apparatus.
38 397 E. Fries. Variable resistances, etc.
38 314 A. Graham and Co., Ltd., and C. H. Vaughan. Electric signalling devices for ships.
38 389 J. Lightfoot. Electric heating apparatus.
38 369 J. S. Lyall, E. K. Sandeman, Standard Telephones and Cables, Ltd., and A. H. Reeves. Thermionic valve circuits.
38 396 A. H. Midgley. Thermionic valve amplifying systems, etc.
38 364 N. V. Philips' Gloeilampenfabrieken. Toroidal coils. (15/12/28, Holland.)
38 388 Siemens and Halske Akt.-Ges. Circuit arrangements for alarm installations. (15/12/28, Germany.)
38 381 W. Warnier. Circuit breakers, etc.

COMING EVENTS.

Friday, April 25 (To-day).

Institution of Electrical Engineers (West Wales Sub-Centre).—Swansea. Paper by Messrs. S. W. Melson, A. N. Arman and W. Bibby on "Surge Investigations on Overhead Line and Cable Systems."

Faraday Society.—Rooms of the Chemical Society, Burlington House, Piccadilly, London. Annual general meeting. 2.15 *p.m.*

National Register of Electrical Installation Contractors.—Institution of Electrical Engineers, Victoria Embankment, London. Annual general meeting. 2.30 *p.m.*

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. General meeting. Paper by Mr. F. Carnegie on "The Economical Production and Distribution of Steam in Large Factories." 6 *p.m.*

Birmingham Electric Club.—Grand Hotel, Colmore Row, Birmingham. Paper by Mr. J. W. Donovan on "Some Aspects of American Low Tension Control Practice." 7 *p.m.*

Monday, April 28.

Institution of Electrical Engineers (South Midland Students' Section).—Joint meeting, at Rugby, with the Rugby Engineering Society. Paper by Mr. N. F. T. Saunders on "The Speed Torque Curve of the Squirrel Cage Induction Motor."

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Wednesday, April 30.

Electrical Contractors' Association (West of London Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Croydon Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Belfast Branch).—Ordinary meeting.

Thursday, May 1.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Twenty-first Kelvin Lecture, by Mr. R. H. Fowler, F.R.S., on "Some Recent Advances in the Electron Theory of Metals." 6 *p.m.*

Iron and Steel Institute.—Institution of Civil Engineers, Great George Street, Westminster. Annual meeting. 10 *a.m.*; annual dinner in the Grand Hall, Connaught Rooms, Great Queen Street, London, W.C. 7 for 7.30 *p.m.*

Friday, May 2.

Iron and Steel Institute.—Institution of Civil Engineers, Great George Street, Westminster. Annual meeting. 10 *a.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Lecture by Mr. C. W. Marshall on "The Metering Arrangements for the 'Grid' Transmission System in Great Britain." (To be followed by a discussion.) 7 *p.m.*

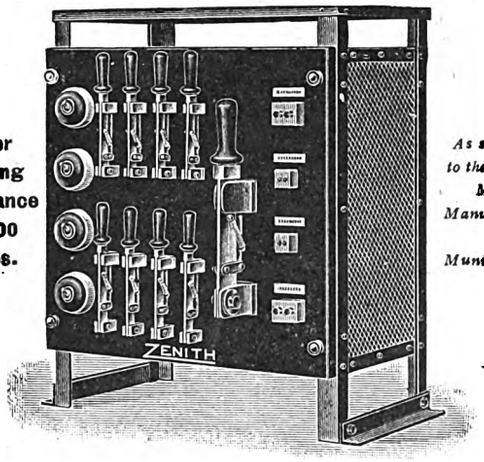
ZENITH

(REGISTERED TRADE MARK)

REGULATING RESISTANCES



Meter Testing Resistance 10-600 amps.

As supplied to the leading Meter Manufacturers and Municipalities

TYPES FOR EVERY CONCEIVABLE PURPOSE

ROBUST CONSTRUCTION, CORRECT DESIGN, COMPETITIVE PRICES & PROMPT DELIVERIES.

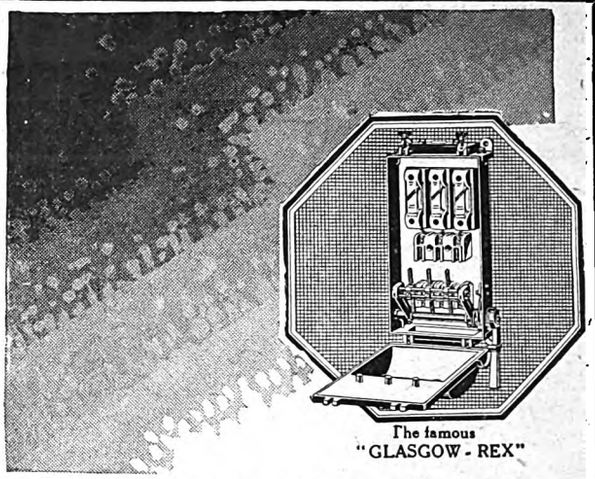
CATALOGUE OF ALL TYPES POST FREE

THE ZENITH ELECTRIC CO. LTD.

Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to the Admiralty, War Offices, Air Ministry, G.P.O., L.C.C., &c.

ZENITH WORKS, Villiers Road, Willesden Green, LONDON, N.W.2



The famous "GLASGOW-REX"

The M.E.M. "Glasgow" was the first switch to be sold at commercial prices to comply with the exacting demands of the City of Glasgow.

The new "Glasgow-Rex" pattern embodies every recent improvement.

There is no better switch for important installations.

Send for List No. 155.

MIDLAND ELECTRIC MFG. CO. LIMITED,

BARFORD ST., BIRMINGHAM.

—And all Electrical Wholesalers—

"TERRY" Spannerage

means a light, compact, convenient high-grade range of grips such as you really need. Each spanner accurately fits two nuts and ensures against burring. The complete set is Whitworth ⅛" to ½", and ¼" and 7/16" flats, but any spanner may be bought separately. Blued set 5, **3/6**; Plated, **6/-**. Why not get your spanner needs standardised? We can give you what you require.

LISTS FREE.

The exclusive Terry "de luxe" Saddle gives 100 % comfort.

May we quote for Springs of accuracy, long life . . . . and of low service cost? Send prints or samples, and quantities required. List free.

Herbert Terry & Sons, Ltd., Manufacturers, Redditch, Eng. **Est. 1855.**

As installed in

City of London, Glasgow, Liverpool, Manchester, Bristol, Hull, Chatham, Eastbourne, Hove, Guildford, Hertford, Boston, Windsor, Wandsworth, Egham, Brixham, etc.

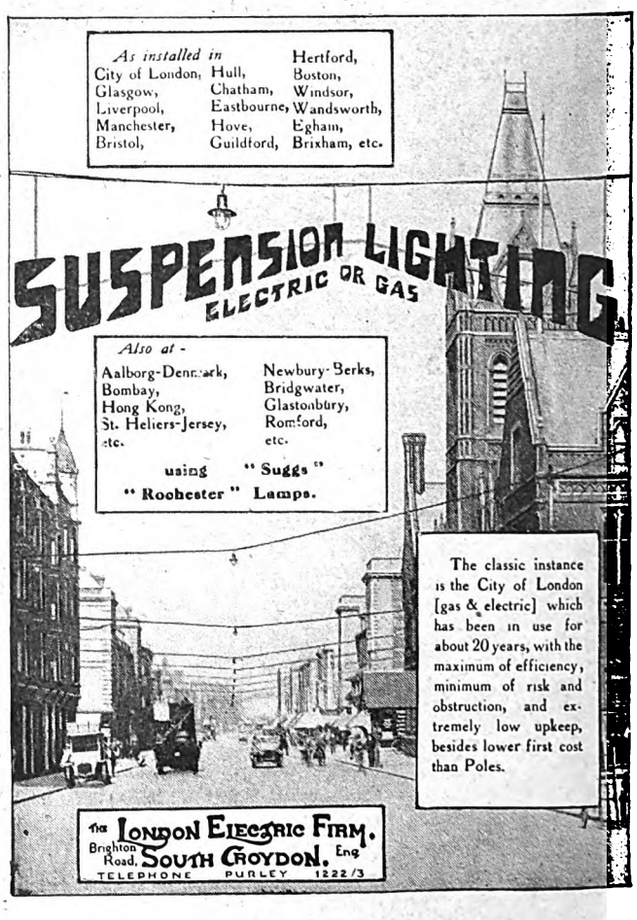
SUSPENSION LIGHTING

ELECTRIC OR GAS

Also at -

Aalborg-Denmark, Bombay, Hong Kong, St. Heliers-Jersey, etc. Newbury-Berks, Bridgwater, Glastonbury, Romford, etc.

using "Suggs" "Rochester" Lamps.



The classic instance is the City of London [gas & electric] which has been in use for about 20 years, with the maximum of efficiency, minimum of risk and obstruction, and extremely low upkeep, besides lower first cost than Poles.

Hydro-Electric Power in Africa.

ALTHOUGH Africa is by no means deficient in waterfalls and contains one which ranks with Niagara both as a spectacle and a potential source of energy, most of the African cataracts, including the great Victoria Falls of the Zambezi, are remote from any large centres of population or industrial activity. For this reason hydro-electric development in Africa has not yet attained much importance. Here and there small installations exist; there is one at the Howick Falls, in Natal, in connection with a factory; the township of Zomba, in Nyasaland, is lighted by a neighbouring fall; the Belgians have utilised water power in Katanga to supply current for the copper mines; there is an important development at Mulungushi, also in connection with copper mining in Northern Rhodesia, and there are installations in French North Africa and West Africa. Adding all the existing hydro-electric plants in Africa together, however, would hardly give a total output equal to that of a single first-class installation, and the day when water-generated electricity will play a large part in African development is still a long way ahead. Apart from the lack of demand for power in the vicinity of the possible sites for hydro-electric stations, there is also a serious difficulty in the form of great seasonal and year-to-year variations in the flow of streams, so that extensive and costly storage works are required; the high evaporation is also a serious factor to be considered.

Yet another reason which has held back the utilisation of water power in South Africa, where the greatest industrial development has taken place, is the existence of plentiful supplies of cheap and easily worked coal. The Witwatersrand goldfield has one of the best coalfields in Africa practically next door. In East Africa, on the other hand, there is no local coal or oil yet being worked, and the growing scarcity and cost of wood fuel makes it very desirable that, whenever possible, such water power as is capable of economic development should be turned to account. The only East African project of immediate importance is the Pangani Falls scheme in Tanganyika Territory, which was described in THE ELECTRICIAN of January 3. These falls are in a district where there are a number of sisal estates which require an appreciable amount of power for operating their decorticating mills, and there are also prospective loads to be secured from the ports of Tanga, Dar-es-Salaam and Mombasa, and points on the Central Railway between the coast and Kilosa.

Commenting on the plans of the Power Securities Corporation for the harnessing of the Pangani Falls, we expressed the opinion that it would be unwise of the Tanganyika Government to seek to restrict the area in which power from Pangani could be distributed to the district served by the Tanga-Arusha railway. At that time it appeared to be the official intention to extend the ramshackle generating station which was erected by Indian Sappers and Miners at Dar-es-Salaam after the capture of the port by the British. This would have been an uneconomic policy, since the fuel used at Dar-es-Salaam must be carried long distances by sea, and the restriction of the market for the water-developed electricity from the Pangani river would have increased the cost per unit supplied to consumers in the area served by that development. It is, therefore, satisfactory to learn that negotiations have been successfully completed between the Tanganyika Government and Major C. L. WALSH, representing the Power Securities Corporation, for the development of the Pangani Falls on a basis which will permit the supply of electricity to the entire area of Tanganyika Territory between the Indian Ocean and the Great Lakes. This will greatly enhance the economic value of the Pangani Falls scheme as a means of stimulating agricultural and industrial development in the northern half of the Territory, and we congratulate the Tanganyika administration on the good sense which it has displayed in coming to terms with the company concerned, instead of pursuing the ill-advised course which it had originally adopted.

Current Topics.

Law-created Unemployment.

THIS week we print the first instalment of a series of articles by Sir ERNEST BENN entitled "Unemployment and Work," which will, we believe, both interest and stimulate thought. Since unemployment became an issue out of which party capital could be extracted, the subject has been confused with clamour and cant to such an extent that other nations such as Germany and the United States, which have at least as large a proportion of their populations out of work, must wonder what has become of the traditional character of the Englishman. Parenthetically it must in fairness be remarked that most of the outcry about unemployment comes from Wales and Scotland—Lancashire, Yorkshire and the North-East Coast are much less vocal on the subject. In his first article Sir ERNEST BENN calls attention to the effects of legislation and trade restrictions in creating difficulties for the man or woman who is really anxious to find work. He points out that in his lifetime 5 000 Acts of Parliament, each restricting the activities of somebody or some trade, have received the Royal Assent, and asks whether we cannot have an inquiry into obstructive and obsolete legislation.

G.E.C. Journal.

WE extend a hearty welcome to the "G.E.C. Journal," the first number of which makes its appearance this week. It is to be issued quarterly, and the appearance of the initial issue warrants the expectation that it will prove a useful addition to the growing list of similar periodicals produced by large industrial enterprises in this country and abroad. The first (May) number of the "G.E.C. Journal" (obtainable from Magnet House, Kingsway, price 1s.), contains a foreword by Sir HUGO HIRST, who, we are delighted to learn, is again actively at work, a review of electrical progress in 1929, and technical articles on High Temperature Resistance Alloys, Materials Handling Equipment for Modern Coke Ovens, Diesel-electric Locomotives for the Indian State Railways and Balanced Protection of High Tension Parallel Interconnectors. In his foreword Sir HUGO HIRST declares his opinion that "modern business should be systematically articulate about its activities, technical as well as commercial," a policy which has always been acted upon by the G.E.C. We feel sure his hope that the new journal will be welcomed in technical schools and universities will be realised.

Telephone Charges.

COMPARATIVE figures relating to telephone charges, tabulated by the Engineering Department of the Post Office, indicate that London enjoys a substantial advantage over New York. In the inner area of New York the business rate is £14 7s. 6d. per annum for any number of calls up to 900. In London the corresponding charge ranges from £8 15s., for 180 calls, to £11 15s. for 900 calls. For 1 800 calls the New York charge is £22 16s. 3d., against £15 10s. in London. The residence rate in the outer area of New York is £10 10s. for any number of calls up to 792. Comparable rates in London are £6 5s. for 180 calls and £8 16s. for 792 calls. For larger numbers of calls London's advantage is much greater, the respective rates for 1 692 calls being £18 10s. 9d. and £12 1s. It is stated that in the opinion of good judges the quality of the local service is very similar in both cities.

Trend of Business in America.

ACCORDING to figures received each week by the Statistical Research Department of N.E.L.A., electric power output is running somewhat below last year's levels throughout the Middle West, New England, up-state New York, a large part of the Rocky Mountain region, and in the South. The largest losses continue to be registered in the areas serving the automotive and mining industries. The outlook for the next few months indicates that the total production of electric power may continue to run somewhat below last year's figures for the United States as a whole. This is hardly to be considered as a reflection of subnormal industrial activity at the present time, but rather as an after effect of the extraordinary and unusually expanded conditions at this time last year.

Our Electrified Neighbours.

IN Belgium 2 470 out of a total of 2 677 communes are now served with electric distribution networks and it is anticipated that with a few exceptions, all will be so served within the next two or three years. The Belgian Government is considering methods of assisting by grants the electrification of isolated hamlets and farms. In France on January 31, 1929, it was estimated that 73 per cent. of the communes were provided with distribution networks, 86 per cent. (36 000 000) of the population of the country being able to obtain a supply of current. The average number of inhabitants in the French Communes which are not yet electrified is 300; in Belgium the corresponding figures are 900 to 1 000, so that the problem in the latter country is much less difficult. According to "Eclairage et Force Motrice," if the Moyersoen law, which expired on December 31 last, were re-enacted, the complete electrification of Belgium would be very rapidly achieved without any financial aid from the State. This law provided for the revision and prolongation of concession agreements, subject to stipulations assuring important advantages to consumers, but it was allowed to lapse because it was held that it unduly favoured the concessionaires.

Price Movements.

SOME interesting figures relating to wholesale price movements are given in the "Board of Trade Journal" of April 24. These indicate that the violent downward plunge which carried the aggregate index number from 81·9 in October last to 74·9 in March has lost its momentum in the past few weeks. In the case of industrial materials there was little change between the second half of March and the first half of April. The tendency towards stabilisation, if maintained, should assist a recovery in business activity. One of the chief courses of the decline in consuming power all over the world is the excessive spread between wholesale and retail prices. This is partly due to high taxation and partly to the ever increasing cost of selling goods. The effect is to reduce purchasing power and so to contract demand. The cost of living to the average householder has certainly not fallen to anything like the extent of the decline in commodity prices. Consequently manufacturers and primary producers are faced with the problem of how to make ends meet with a smaller output and a lower unit price while their overhead and working expenses remain practically unchanged.

CENTRAL SCOTLAND GRID OPENED.

Wednesday's Dual Ceremony in Edinburgh—Extensions to Portobello Power Station—234 Route Miles of 132 kV Overhead Transmission Line—Silver Pylon Presented to Minister of Transport.

ON Wednesday Edinburgh was the scene of an important dual ceremony marking a milestone in the electrical history of Great Britain. The inauguration of the Central Scotland grid was officially celebrated in conjunction with the opening of large extensions to the Edinburgh Corporation's generating station at Portobello, one of the selected stations for feeding the grid.

At 11.15 a.m. Lieut.-Col. the Right Hon. Wilfrid Ashley, M.P., ex-Minister of Transport, who was introduced by Councillor Couston, Convener of the Edinburgh Corporation Electricity Committee, and presented with a souvenir of the occasion, formally opened the new plant at the Portobello station, which was then inspected by the assembled company. An hour later, at the Central Electricity Board's sub-station across the street, Sir Andrew Duncan introduced Mr. Herbert Morrison, M.P., Minister of Transport, who inaugurated the Central Scotland Electricity Scheme by closing a 132 000 V oil break switch, which energised the transmission lines from Portobello station. Mr. Morrison was also presented with a souvenir. After inspecting the sub-station the party were entertained to luncheon at the North British Hotel by the Lord Provost, Magistrates and Council of the City of Edinburgh, and the Central Electricity Board.

As Mr. Morrison closed the switch which energised the grid, a large disc rotated until the words "Grid alive at 132 000 Volts" were displayed. The Lords Provosts of Edinburgh and Glasgow then shook hands. The souvenir presented to Mr. Herbert Morrison was a silver model of a pylon, and in acknowledging the gift Mr. Morrison humorously referred to the trouble he had experienced in connection with pylons on the Sussex Downs. The guests at the luncheon which was held subsequently included the Lady Provost, Lord Polwarth, the Solicitor-General, Sir Alex. M. Kennedy, Sir W. L. Sleigh, the Lords Provosts of Glasgow and Dundee, Lord Elgin, Alderman Huntsman, Mr. W. B. Woodhouse, Mr. Frank Hodges, Lord Barnby, Sir Archibald Page, Sir John Brooke, Sir Reginald Blomfield, Sir Duncan Watson, Sir James Devonshire, Sir W. E. Whyte, Sir Robert Stewart, Sir Alex. Stevenson, Sir Hudson Beare, Sir Frederick Henderson, Sir Frederick Gardiner, and Alderman Walker.

Lord Provost of Edinburgh, the Right Hon. Thomas B. Whitson, who presided, proposed the toast of "Electricity." He said that in some ways electricity was the greatest socialising medium of our time, and when the Central Electricity Board had linked up the whole country a great uplift in the social conditions of the people would have been effected. They looked forward to smokeless cities, and Edinburgh would be healthier and Princes Street more beautiful if the awful smoke from the railway engines could be abolished. He pressed upon the Minister of Transport the need of railway electrification. What they had done to-day made this more possible and brought the eventful day nearer. The health of citizens would be improved, better transport would cheapen commodities, and thus raise real wages. Electricity had so developed as to be completely out of the most optimistic vision of fifty years ago, and might not the same be true of the future? Edinburgh was proud of the fact that its power station had been selected as one of the grid stations.

Mr. Herbert Morrison, replying, said, old conditions involved tragic and needless waste of power over the greater part of the 24 hours. The completion of the work under the Act of 1926 would still occupy some time, although he could congratulate the Electricity Commissioners and the Central Electricity Board on the rapidity of the work. Generation was not the only problem to be faced. There were economies to be effected in distribution, and he believed that in due time the establishment of bigger distributing units would be found advantageous. The national grid was involving considerable capital expenditure, as well as necessitating economy in the use of existing capital. It had been incurred in the belief that average electrical consumption per head would advance from 176 units to 500 units in 10 or 12 years' time. It was necessary that the

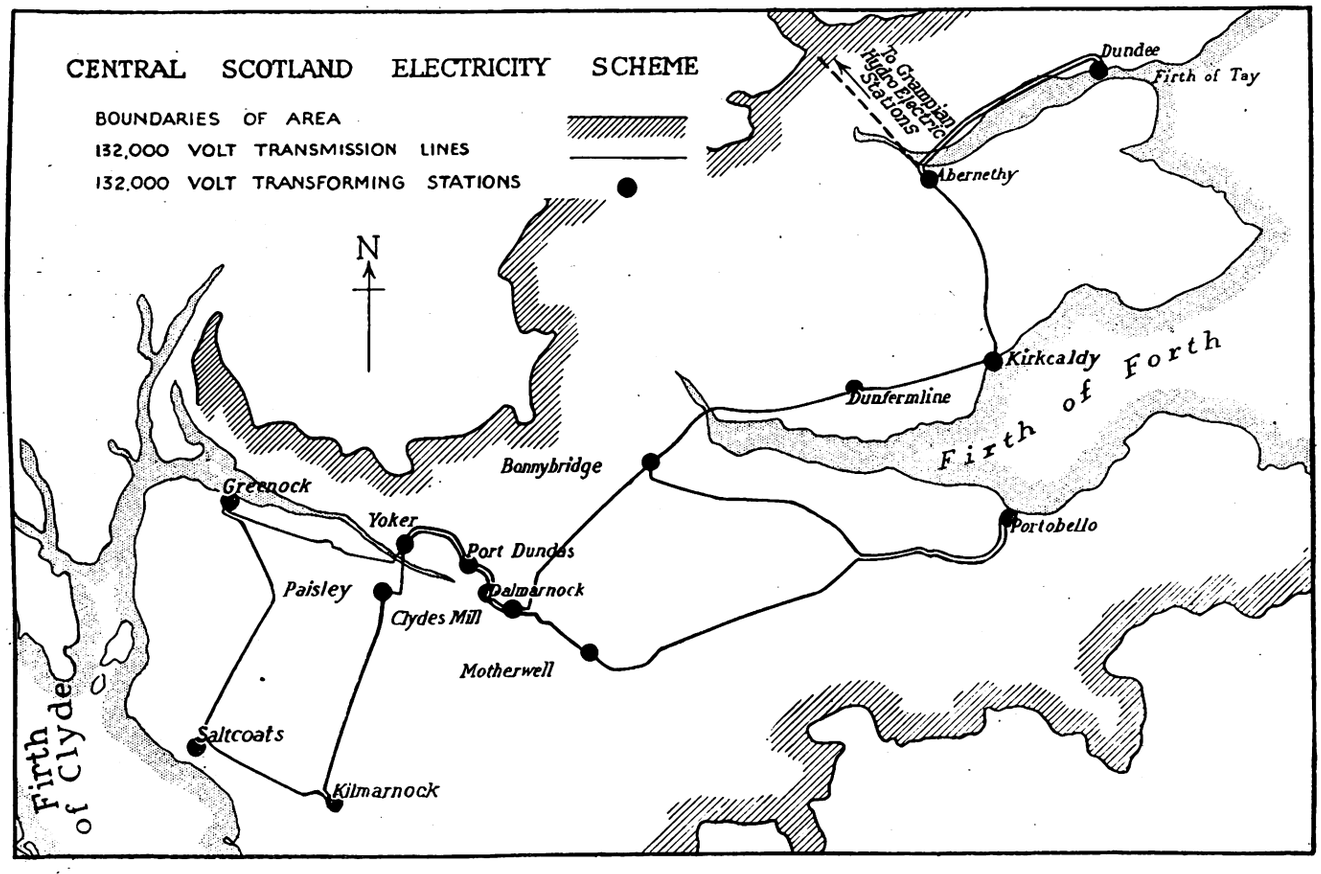

Fig. 1.—The 132 kV transmission system of the Central Scotland grid.

Digitized by Google

public demand should grow with much greater rapidity than even the present remarkable figures indicated. Local authorities and landowners in Scotland had been very helpful in furthering the progress of the national scheme. So far as he was concerned, he stood for the rapid, and, wherever advantageous, universal electrification of industry. He was a believer in the electrification of frequent suburban railway services. He appealed to the whole electrical industry

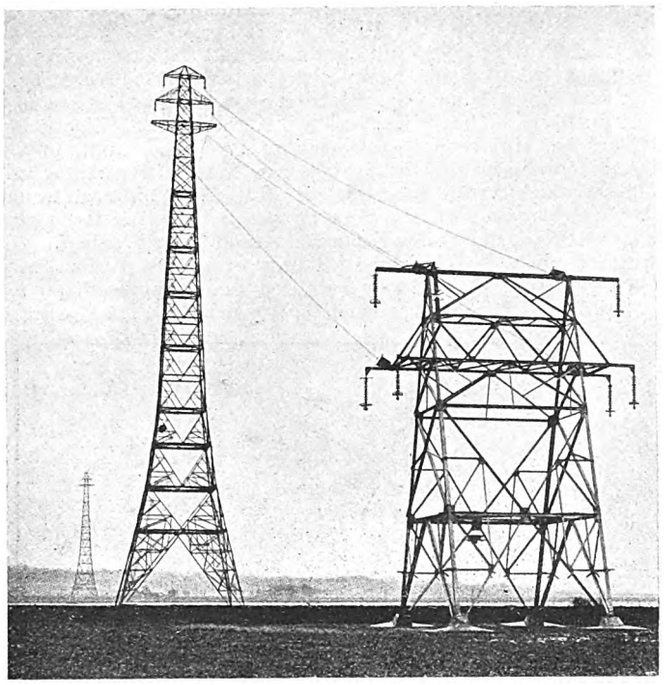

Fig. 2.—The Forth crossing, showing anchor tower.

to unite in a big publicity push for the wider use of this wonderful power and to supply undertakings to take the greatest pains in cultivating industrial and domestic demand, acting as consulting engineer to all and sundry who were faced with power problems. In considering electricity supply we should act on the basis that individual unrelated generating units were uneconomic. Electric power was of such vast importance to the nation that they could not allow the industry to be carried on haphazard or recklessly for individual gain or profit. It must be organised for the nation and by the nation in the interests of all classes and all types of industry and transport. He paid a tribute to the work of Sir John Snell and Sir Andrew Duncan.

Lieut.-Col. Wilfred Ashley proposed the toast of "The Central Scotland Area," and said that the Central Electricity Board was the most harmonious board that ever existed. They, and the Electricity Commissioners who prepared the schemes, deserved the greatest credit while the late Government could also take credit for having displayed foresight in connection with the national scheme. Speaking of the grid towers, he said that he was all for amenities, but they had to consider the practical aspect as well. He looked forward to the time when instead of the 338 ft. towers of the Forth crossing they would have 500 ft. towers carrying the grid across the estuary of the Thames. In the past ten years Edinburgh had increased its output of electricity by the remarkable figure of 350 per cent. In regard to propaganda, the electrical industry could learn a lot from the gas industry, in that they must interest the housewife. There need be no antagonism between gas and electricity. He begged both to realise that co-operation was the secret of success. He was most anxious that electricity should be extended as rapidly as possible into rural areas. In Ireland the Shannon scheme was going to be a great success by developing rural load. If the Bedford scheme proved successful, as he believed it would, the Government would be able to say to other districts, "Go and do likewise."

Councillor Couston, replying, said electricity and transport were matters which should be outside party politics. He thanked Sir John Snell and Sir Archibald Page for the help they had given in planning the Edinburgh scheme, which was a miniature of the Central Scotland scheme. Dean of Guild Robertson, a director of the Clyde Valley Electrical Power Co., also replied.

Sir James Lithgow proposed the toast of "The Guests," to which Sir John Snell and Mr. Thomas Kelly, Lord Provost of Glasgow, replied.

Sir John Snell referred to the progress of hydro-electric schemes in the past ten years, and said he was confident that many other sources of water power could be used for the benefit of the county without destroying its beauty. Electricity was rapidly becoming indispensable for domestic uses. He looked forward to the time when our railways would gain a new lease of life from intensive electrification.

Sir Andrew Duncan proposed the toast of "The Chairman."

Lord Weir wrote to Sir Andrew, regretting his inability to be present, and drew attention to the fact that completion of the grid would place Great Britain in the position of having the largest and most perfect system of generating high-tension energy of any country where the capacity of supplying energy at a lower cost than the average of any other country even where hydro-electric energy predominated. The day of the private generator ought soon to pass. If electricity were offered at a cheap rate all would use it, costs would come down and margins go up. The great lesson in world progress in electricity supply was to have faith in the country's absorptive ability of cheap energy.

The contract for the erection of the overhead lines of the Central Scotland grid is the largest contract for electrical transmission ever carried out in Great Britain. The overhead work, consisting of 246·6 route miles of 132 kV line carried on steel towers, has been carried out by British Insulated Cables Ltd., Prescot, who supplied the material. Field surveys were begun in March, 1928, the first towers being erected near Edinburgh in June last. Four standard types of tower are used for the circuit lines—straight line, small angle, medium angle and semi-strain. For double circuit lines there are three types—straight line, medium angle and semi-strain. Each type has three standard extensions, 10 ft., 17 ft. 6 in. and 25 ft., to meet ground irregularities. Many special high towers and a 90° double circuit angle tower have had to be designed. Approximately 5 000 tons of steelwork, 1 200 miles of stranded conductor and 70 000 porcelain disc insulators were required. The steel structures were designed by Milliken Bros., London, the steel was rolled by William Beardmore, Glasgow, and the structures were fabricated by William Bain and Co., Coatbridge. Bullers, Ltd., and the Canadian Porcelain Company supplied the insulators. Aluminium for the conductors was supplied by the British Aluminium Co., Ltd., and steel wire for cores by Rylands Bros., Ltd., Warrington. The line con-

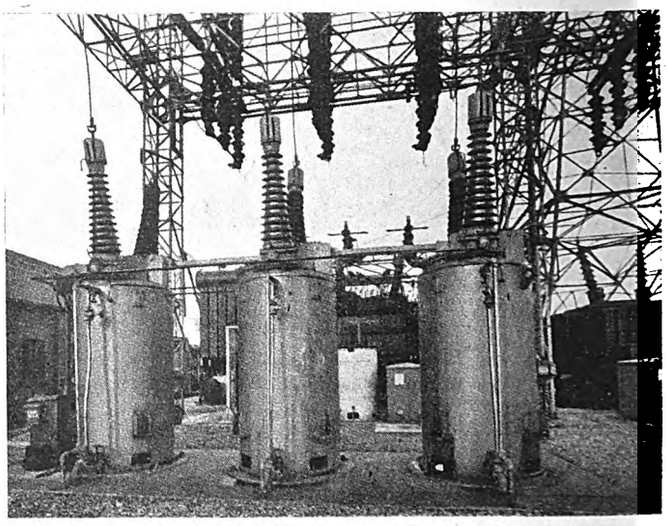

Fig. 3.—View of 132 kV circuit breakers—rupturing capacity 1 500 000 kVA.

ductors, which have a sectional area equivalent to ·175 sq. in. copper, are of steel cored aluminium, consisting of 30/·110 in. aluminium wires and 7/·110 in. galvanised steel wires, in accordance with B.E.S.A. specification No. 215–1925. A conductor of this section is generally understood to have a carrying capacity of 50 000 kW, corresponding to 219 amperes, but, where considerations of pressure drop on short distance transmission do not enter, the transmission capacity is very much greater than this figure. The critical corona voltage does not appear until a pressure of 184 000 V has been reached. Pairard type joints made under strain are used. A continuous

Digitized by Google

longitudinal steel-cored aluminium earth wire, made up of 12/·110 in. aluminium wires over a 7/·110 in. compounded and galvanised steel core, is run above the conductors. Suspension insulators having nine 10 in. diameter discs in series, fitted with arcing horns at the earth end and an elliptical guard ring at the conductor end of the string, are used on all straight line towers and on single circuit towers where the angle does not exceed 10° change of direction. Double strings are used at larger angles on single lines and at all angles on double circuit lines. The minimum flash-over under worst unit conditions for which the tension insulators are designed is 280 kV.

The Central Scotland scheme covers an area of about 4 980 sq. miles with a population of 3¾ million. It contains almost the whole of the industrial belt of Scotland. The main transmission lines connect the following power stations: —Carolina Port (Dundee Corporation); Kirkcaldy (Kirkcaldy Corporation); Townhill, Dunfermline (Fife E.P. Co.); Bonnybridge, (Scottish Central E.P. Co.); Portobello (Edinburgh Corporation); Motherwell, Clyde's Mill and Yoker (Clyde Valley E.P. Co.); Stonebyres and Bonnington (Lanarkshire Hydro-Electric Co.); Dalmarnock and Port Dundas (Glasgow Corporation); Blackhall (Paisley Corporation); Kilmarnock (Ayrshire Electricity Board) and Dellingburn (Greenock Corporation). Grid points have also been established at Saltcoats and Abernethy, the former to give a supply to the Ayrshire Electricity Board and the latter for receiving a bulk supply from the Rannoch hydro-electric station of the Grampian Power Company. The eight selected stations in the scheme are Carolina Port, Townhill, Bonnybridge, Portobello, Clyde's Mill and Yoker, Dalmarnock, Kilmarnock, Stonebyres and Bonnington. Two new power stations, one in the east and the other in the west of the area, are contemplated.

The contracts for transmission lines, transformers, switchgear, cabling, etc., amounted to £1 434 979. The Metropolitan Vickers Electrical Co., Ltd., and the British Thomson-Houston Co., Ltd., supplied the switchgear. The central control station will be located near the Board's Dalmarnock sub-station in Glasgow. This will be in telephonic communication with every power station and sub-station in the area. The transformers used range in size from 10 000 kVA to 60 000 kVA, and have been designed for pressures of 132 000/3 300 V, 132 000/6 600 V, 132 000/11 000 V, 132 000/20 000 V, and 132 000/22 000 V. All transformers having a 6 600 V secondary pressure have the secondary winding in two sections, which can be paralleled to give a secondary pressure of 3 300 V if required. Transformers wound for 22 000 V can be similarly arranged for 11 000 V. At Portobello, with a busbar pressure of 6 600 V and transformers each of 45 000 kVA capacity, the low pressure grid connection has to carry 4 000 amperes. Two switches have been installed at this point for each transformer bank, as it was thought inadvisable to handle all this current on one 6 600 V circuit breaker. All transformer banks up to 30 000 kVA are of three-phase type. Larger capacity banks are made up of three single-phase units. It is an indication of the advance made since orders were placed for the Central Scotland scheme that British firms are now prepared to build three-phase units up to 75 000 kVA, and of sizes which can be carried by rail. By adopting a solidly grounded neutral point for the high pressure winding or all transformers the first cost was reduced, and it has been made possible to employ potential regulating apparatus operating directly on taps brought out from the neutral point end of the main 132 kV winding. The equipment at undertakers' stations provides for a plus or minus boost of 10% on the standard pressure of 132 kV. Natural air cooling is used with transformers of 10 000 kVA, and on 15 000 kVA transformers natural oil circulation and forced air blast are employed. On the larger sizes oil circulation and forced air blast are used in combination. The transformers were supplied by Ferranti, Ltd., the Metropolitan-Vickers Electrical Co., Ltd., and the English Electric Co., Ltd.

Until standardisation of frequency in the areas of the Glasgow Corporation and the Clyde Valley E.P. Co. (the two largest authorised undertakers in Central Scotland) is completed the full benefits of interconnection will not be realised. The ultimate cost of standardisation is estimated at £3 000 000, and by accelerating the programme it is hoped to have a uniform frequency established in two years' time. On March 31 last 37 600 H.P. of consumers' motors and 40 500 kW of rotary convertor plant had been changed over to 50 cycles periodicity. The actual 50-cycle demand corresponding to this horse-power of changed-over plant was 26 800 kW.

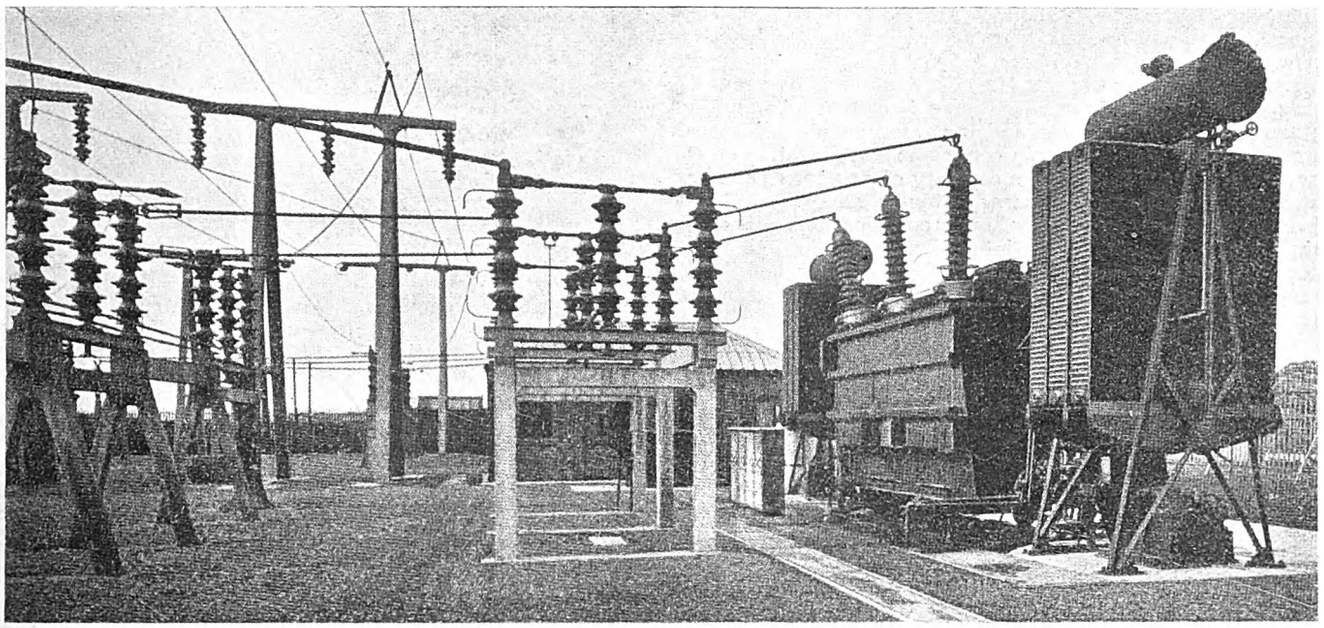

Fig. 4.—20 000 kVA transformer with cooling equipment and isolating switchgear, Bonnybridge sub-station.

New Plant at Portobello.

Although the site of the Portobello generating station was purchased in 1914, the plans prepared for the erection of the power-house work could not be begun until the war-time embargo on such activities was raised in the spring of 1919. After due consideration the Edinburgh Corporation decided to revise the original plans and construct a station on a much larger scale, capable of supplying a wide area. The Electricity Commissioners determined that the area of supply should include the City and Royal Burgh of Edinburgh and the counties of East Lothian and Midlothian, the whole being known as the Edinburgh and Lothians Electricity District. Outside the Edinburgh Corporation's area of supply, distribution is in the hands of the National Electrical Construction Company through the Lothians Electric Power Company, which takes a supply in bulk from the Edinburgh Corporation's station at Portobello.

On July 11, 1923, the first section of the Portobello station, comprising three 12 500 kW. M.C.R., three-phase, 50-period, 6 600 V, 1 500 r.p.m. turbo-alternator sets, was officially

Digitized by Google

opened by the King. These generating sets are fed by six tri-drum water tube boilers designed for a maximum continuous capacity of 80 000 lb. of steam per hour at 300 lb. per sq. in., and a total temperature of 700 deg. F. The coal is discharged from the railway wagons by rotary tipplers and conveyed from the underground hoppers by a belt conveyor, 720 ft. long, passing under two roads and a railway. A short cross conveyor and two gravity bucket elevators carry the coal to the boiler house bunkers.

Owing to the rapid growth of the load, a fourth 12 500 kW turbo-generator was installed in 1925, with its complement of boilers and switchgear, and in the same year a 5 000 kW set was reconditioned and transferred to Portobello from the McDonald Road station, raising the total capacity at Portobello to 55 000 kW and completing the equipment of the first section.

After it had become apparent that a further generating unit would be required by 1928 the Portobello station was selected as one of the feeding stations for the Central Scotland grid. In close co-operation with the Electricity Commissioners and the Central Electricity Board, the Corporation decided to instal two 31 250 kW turbo-generators with the necessary complement of boilers, switchgear and auxiliary plant. This involved large building extensions covering two-thirds of the remaining land available. It was decided to construct a foundation raft for the station in its final form in one operation and confine the building and structural work to that required by the present extensions of plant. To augment the existing facilities for handling sea water a fourth sea tunnel 1 625 ft. long has been driven for discharge purposes. Two new circulating pumps each of 30 000 gallons capacity, driven by 625 B.H.P. 6 600 V motors, have been installed. The coal sidings have been extended by an additional 1 800 yds. of single track, and it is now possible to unload 1 000 tons a day. The main conveyors and elevators on the new handling system have a capacity of 100 tons per hour, and the sub-conveyors can carry 60 tons per hour.

Each of the two new boiler houses contains four units of the tin-drum type, fitted with integral superheaters, tin-drum economisers and air heaters. Four of the new boilers are designed for 80 000 lb. and four for 90 000 lb. of steam per hour. The steam conditions are the same as those of the previously installed plant.

The new 31 250 kW turbo-alternators, supplied by the British Brown Boveri Co., are of three-cylinder type with double exhaust and two separate condensers per set. Each is equipped with two steam charts. The alternator windings are three-phase star connected with normal terminal voltage of 6 600 V between phases, the neutral point being earthed through a remote electrically controlled oil switch and a 4·5 Ω limiting

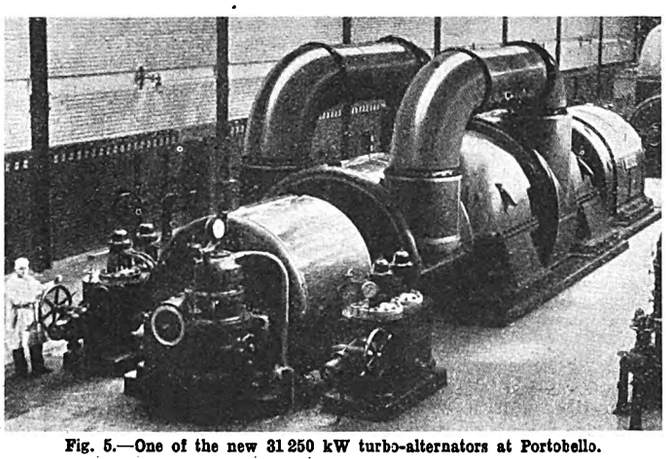

Fig. 5.—One of the new 31 250 kW turbo-alternators at Portobello.

resistance. Stator windings are equipped with Merz Price circulating current protection and an automatic field suppression switch.

The main switchgear is of the metal clad compound filled type with duplicate busbars. Complete phase separation has been maintained by assembling each phase busbar in a separate metal enclosing trunk and providing independent tanks on each phase of the main oil circuit breaker, the busbar selectors and cable isolating switches. There are 12 tanks per three-phase unit requiring 980 gallons of oil in all. The main tanks are cylindrical in section constructed of welded steel plate ¾ in. thick, secured by eight 2 in. diameter bolts. The rupturing capacity of each circuit breaker is 1 500 000 kVA. There is a very complete system of interlocking. The main generator switches are designed to carry 3 500 A continuously, and the weight of each three-phase unit complete with oil is 31 tons. As the Edinburgh system will eventually be divided into two sections, each supplied from one set of busbars, a set of 2 000 A reactors has been installed as busbar couplers to enable effective coupling between the two sets to be effected. These reactors can be isolated or short circuited when desired.

The new work at Portobello, which has cost £827 849, bringing the total cost of the station to £2 090 400, has been

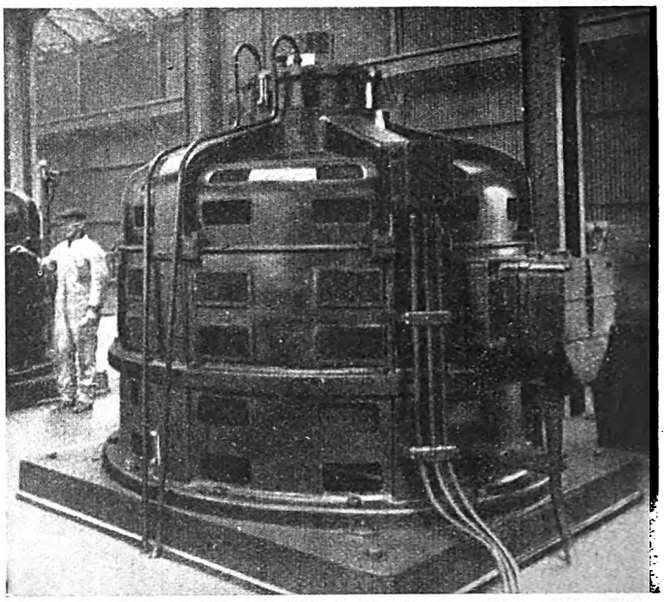

Fig. 6.—One of the two 625 h.p. 6 600 V circulating pump motors, Portobello.

carried out to plans prepared by Mr. Edwin Seddon, M.I.E.E., M.I.Mech.E., the engineer and manager. Mr. E. J. MacRae, A.R.I.B.A., the City Architect, designed the foundations and buildings in co-operation with Messrs. Macdonald and Partners and Mr. George Fraser, M.Inst.C.E. The sea tunnels and shafts were designed by Messrs. J. and A. Leslie and Reid, and the sidings were constructed to plans prepared by Mr. W. A. Macartney, Burgh Engineer.

The principal contractors were :—Raft, buildings, culverts and coal sidings, John Angus and Sons ; reinforced concrete work in boilerhouse, Stuart's Granolithic Co., Ltd. ; structural steelwork, Redpath, Brown and Co., Ltd. ; sea work, John Best (Edinburgh), Ltd. ; circulating water pumping plant, W. H. Allen Sons and Co., Ltd. ; coaling plant, Babcock and Wilcox, Ltd., and Ritchie-Atlas Engineering Co. ; electric capstans, James A. Liddle ; boilerhouse coal bunkers, Caledon Shipbuilding and Engineering Co. ; boilers and economisers, Stirling Boiler Co., Ltd. ; chain grate stokers, Babcock and Wilcox, Ltd., and Underfeed Stoker Co., Ltd.; air heaters, Carrier Engineering Co., Ltd., Babcock and Wilcox, Ltd., and Underfeed Stoker Co., Ltd. ; grit arresters and fans, Davidson and Co., Ltd. ; flue dust extraction plant, Pneumatic Conveyance and Extraction (1929), Ltd. ; ash telphers, General Electric Co., Ltd. ; boiler feed pumps, Mather and Platt, Ltd., and Harland Engineering Co., Ltd. ; steam and water pipework, Aiton and Co., Ltd., John Spencer, Ltd., Brightside Foundry and Engineering Co., Ltd. ; steam valves, Dewrance and Co. ; water valves, Glenfield and Kennedy, Ltd.. and J. Blakeborough and Sons, Ltd. ; de-ærating plant, W. H. Allen Sons and Co., Ltd., and Mirrlees-Watson Co., Ltd. ; turbo-alternators, British Brown-Boveri, Ltd. ; condensers and air pumps, W. H. Allen Sons and Co., Ltd. ; main and auxiliary switchgear, Metropolitan-Vickers Electrical Co., Ltd. ; auxiliary motors, Bruce Peebles and Co., Ltd., English Electric Co., Ltd., and British Thomson-Houston Co., Ltd.

The total capacity of the generating plant at Portobello is now 117 500 kW. In 1928–29 the number of units generated by the Edinburgh undertaking was 138 470 575, of which 112 722 006 units were sold. The load was distributed as follows :—Private lighting, 24 917 932 ; power, 60 410 148 ; traction, 16 400 746 ; bulk supply, 8 636 928 ; public lighting, 2 296 252. The revenue of the undertaking in 1928–29 was £616 778, against £556 887 in the previous year.

MODERN BOILER HOUSE PRACTICE—III (a).*

Pulverised Fuel in Power Houses—Burners—Types of Burners—Furnace Design—Grid-iron Water Screens.

By F. JOHNSTONE TAYLOR.

THERE is every indication that pulverised fuel will be adopted in the majority of the large steam stations in the near future. As a means of burning coal, and especially the cheaper grades of coal, its superior efficiency over other methods is definitely proved, and it enables boilers to be constructed of a size which would otherwise be limited by the practical exigencies of mechanical stokers. Pulverised fuel is an important subject which can be barely touched upon in a short

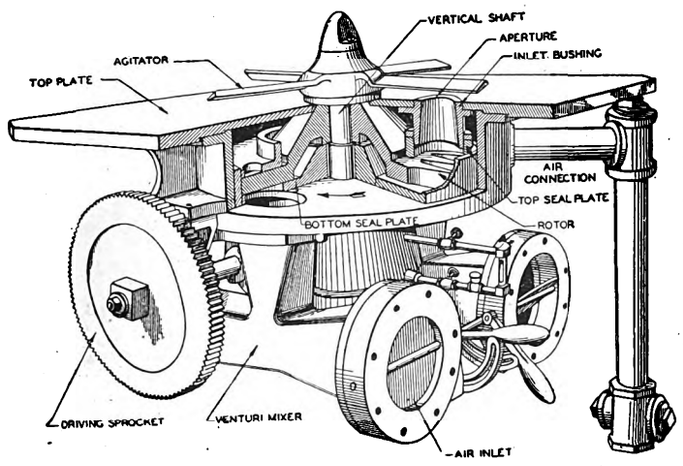

Fig. 1.—Lopulco "R" type feeder.

article, and the system itself is quite new, so that present-day methods, while eminently satisfactory, are no doubt capable of considerable improvement.

Briefly, it amounts to this. The powdering of the fuel and combining it in the burner with highly-heated air, which incidently is so much waste heat abstracted from the flue gases, enable the coal to issue from the burner in the form of a controllable gas flame and it burns as nearly as possible as a gas flame does, and partakes of all the advantages of blast furnace gas or oil as a boiler fuel. A properly constructed boiler can be kept perfectly clean externally, so much so in fact that there is no real need for a separate boiler house. In the Peterborough station turbines and boilers are housed in the same building, an arrangement which facilitates supervision.

The mechanical equipment of a pulverised fuel boiler plant comprises in the main the pulverisers, bins, feeders, etc., and the boilers themselves, which for all practical purposes can be regarded as entirely independent; that is to say, the type of boiler installed does not indicate the class of equipment used for powdering the coal. The latter in the main falls into two categories, the central in which the pulverisers feed the powdered coal into storage bins, and the unit in which the coal is fed direct to the burners. The use of storage bins renders the whole system more flexible, and is in general better suited to large boilers; on the other hand, the unit system, being simple and cheap, is perhaps better suited to boilers of moderate output, even though the cost of pulverisation may be somewhat higher. In fact, the recent improvements made in the various types of pulveriser or mill now on the market have been to some extent dictated by the necessity for reducing this cost, which at one time was apt to be high.

Coal Differences.

Then again, local conditions have to be considered, and while American methods are of considerable interest, the successful application of pulverised fuel firing in Great Britain calls for essentially different methods from those usually associated with American practice. British coals, for instance, are generally harder and contain a higher percentage of ash than other coals, and frequently contain considerable amounts of pyrites. The question of pulverising equipment maintenance, therefore, is of prime importance, and the proper consideration of this point is reflected in the success of the Fuller Bonnot slow speed mill with British coals.

As the initial moisture, too, in British coals is relatively high, the drying of stored coal is necessary, and in this connection the absorption of moisture from the atmosphere by the stored coal is apt to be troublesome. Hence the tendency towards the adoption of direct fired systems, amongst which may be mentioned the recent installation at the Lister Drive Power Station, Liverpool, by Babcock and Wilcox, each comprising four C.T.M. units rated at 125 000 lb. hour, and each having four mills.

Methods of Pulverisation.

Some mills break up the coal by means of a series of beaters, as in the case of Clarke Chapmans' "Resolutor" pulveriser and Herbert's "Atritor," and one type made by Simon Carves. The general action of this type of machine lies in a number of hammers or beaters which catch the incoming coal and break it up by impact. The principal alternative type of machine is the ball mill, which is a cylinder lined as a rule with manganese steel. It functions on the "tumbler" principle, being charged with hard steel balls and rotated slowly, so as to break up the coal in an obvious manner. One could hardly say at the present moment that one system had any material advantages over the other. The same remarks apply to feeders which are necessary when the powdered coal is stored in bins to which it must be propelled by some form of mechanical feed. Of these again, there are two representative types, one working on the screw conveyor system, and the other through the medium of a star or paddle wheel.

Fig. 1 shows the Lopulco "R" type feeder as arranged, with two outlets, which may supply two burners independently or may be joined to supply one large burner. Either of these outlets may be closed by means of small easily-operated hand gates which shear the coal in place of compressing it. The

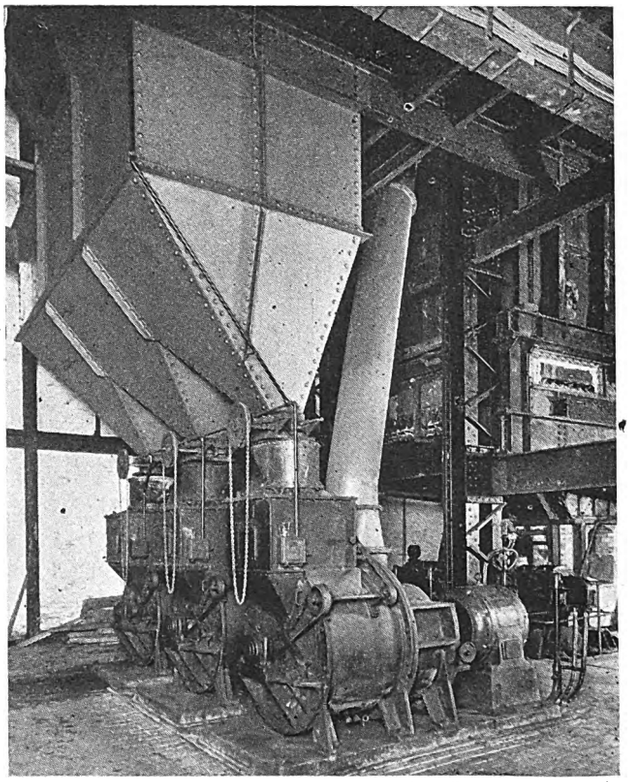

Fig. 2.—Pulverisers and part of boiler plant at Wallasey erected by Simon Carves.

closing of one gate does not interfere with the other, so that one burner may be entirely shut off if required. Steady feed is ensured by having a small reserve of coal between the agitator and the measuring rotor. Packing of the coal is

* Previous articles of this series appeared in THE ELECTRICIAN of March 7 and April 4, and the second part of this article will appear in our issue to be dated June 6.

Digitized by Google

prevented by thorough agitation and clogging of the feeder is eliminated by blowing air through the rotor which is of heavy cast steel and turns slowly.

None of this equipment, which includes dryers when necessary and other minor accessories, has any appreciable effect on the performance of the boiler, the more important business beginning when, combined with the secondary air, the fuel issues from the burner and combustion commences.

A typical lay-out of a central pulverised fuel system was instanced by Mr. Chattock in a paper read before the I.E.E. on April 18, 1929: In the unit system, which dispenses with driers, bunkers, storage bins, etc., the coal is fed straight to the burners, as Fig. 2 shows, this being a view of the pulverisers and part of the boiler plant erected by Simon Carves at Wallasey.

Of burners there must be a score or more in general use apart from probably an equal number being experimented with. A good burner must fulfil a number of conditions. It should:

Deliver to the furnace coal uniformly distributed throughout the primary or propulsion air.

The secondary air streams should impinge against each other on entering the furnace so that the coal is further distributed uniformly throughout all of the air for combustion.

The velocities and directions of the different streams of air should be such that the resultant flame will be broken up into eddies and unequal jets to induce turbulence and mixing without excessive flame velocity.

It will be seen from the illustrations in part two of this article that many burners are disposed vertically or nearly

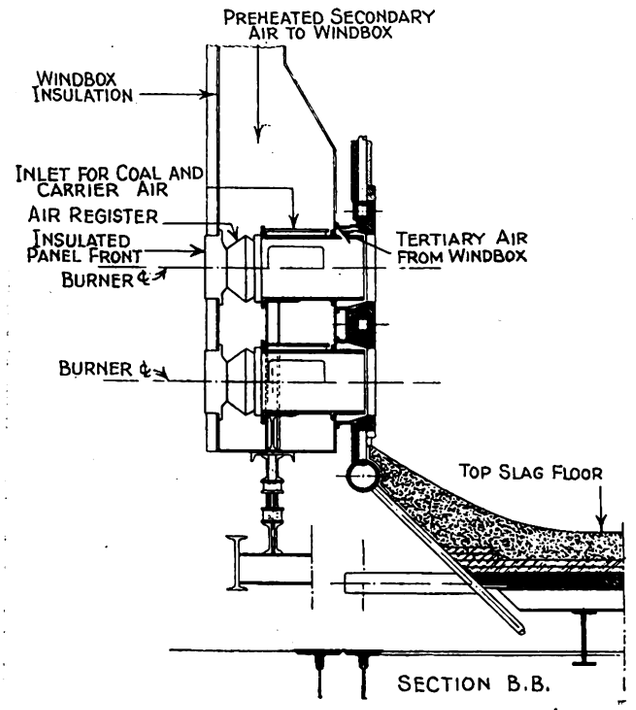

Fig. 3.—Arrangement of Peabody burners.

so. In fact, it might be said that the first important step in burner development, apart from those which have lately been devised for internally fired boilers of the Lancashire and Scotch marine type, came when its location was changed, so that the coal was fed vertically downwards into the furnace. Then the round nozzle was more or less discarded in favour of a flat one, to give a wide coal stream which effected more rapid ignition and better mixture of the coal and air in the furnace. To give further turbulence, rifled nozzles came into being, combined with a higher value for the primary air pressure, turbulence being an important matter, especially in the case of horizontal burners and more particularly still when they are used with small furnaces.

In fact, horizontally disposed short-flame burners fall into the general category of turbulent burners in which an intimate mixing of the pulverised fuel and the combustion air and the rapid spreading of the flame throughout the mixture after it is ignited is brought about by inducing a turbulent condition in the fuel and air in its passage through the burner or at its mouth, which is continued after the mixture has entered the furnace.

In the vertical type of burner, the primary air carrying the powdered coal injects it into the furnace through a long

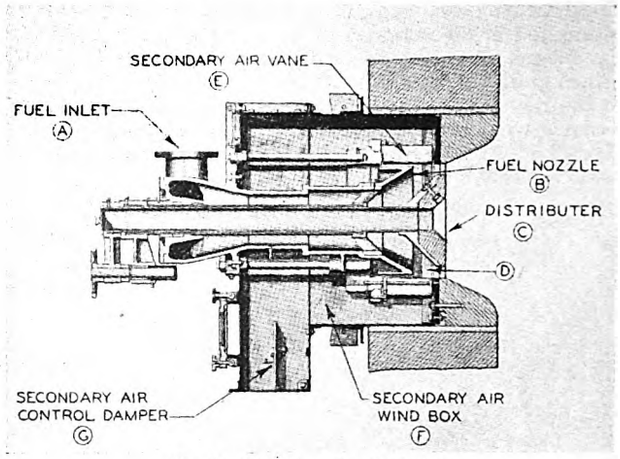

Fig. 4.—Couch type Lopulco burner.

narrow vertical slot between the water cooling tubes, though the amount of primary air is only a percentage of the total volume required for combustion. The secondary air enters through ports arranged on either side of the primary fuel slot, and they are so disposed that the secondary air comes into contact with the primary fuel and air mixture at an angle while refractory faced plates separate the air ports, of which there are several on each side.

A concern which appears to have devoted a considerable amount of experiment to the evolution of the perfect burner is the Peabody Engineering Co., of New York. The principal point of interest in their most recent developmnt consists of: (*a*) An increase in the capacity of the individual unit; (*b*) the application to the coal burner of the insulated panel front register for highly pre-heated air and (*c*) the introduction of a stream of so-called tertiary air. The arrangement of these burners in the front wall of a furnace is shown in Fig. 3. It will be noted that the tertiary air stream for providing additional control of the flame is admitted from the windbox and impinges on the stream of coal and air leaving the burner barrel. The volume of tertiary air is controlled by a damper at the point where the air from the windbox is admitted to the tertiary air burner.

The arrangement shown in Fig. 4 is that of the Couch type Lopulco burner as adapted for use where forced draft is available, and it is also of the horizontal type. The pressure and flow of the secondary air to the burner casing is controlled by a damper. The secondary air vanes which impart a whirling motion to the air as it leaves the burner are adjustable, while the primary air nozzle and distributor can be moved forward or backward either individually or together. This combined with variation of the opening between the secondary vanes enables the closest possible adjustment of the flame to be effected, in fact the underlying principle of the

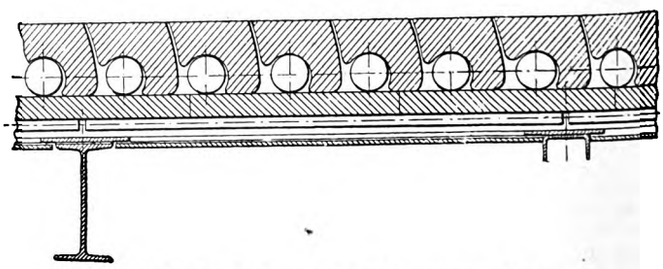

Fig. 5.—Section of furnace wall, Wallasey (Simon Carves).

design of all burners is to enable close adjustment to be made while keeping the construction as simple as possible.

In this respect the Hay burner as developed by Fraser and Chalmers is of interest. It incorporates a Venturi contraction between the pipe and the splayed casting forming the upper part of the burner. The mouth is formed of a casting lined

Digitized by Google

with fire-brick, and it is embedded in the brickwork of the combustion chamber arch. Inside are two hinged cast-iron flaps covered with fire brick on the back, and these flaps are adjustable by independent levers. This enables them so to be set while the boiler is in operation as to regulate the width of the opening and to determine the direction of the flame. The latter facility is claimed to be an advantage in affording protection to the combustion chamber walls from slag accumulations.

An all important feature of a water tube boiler fired with pulverised fuel is the matter of furnace design. Important as slagging and erosion are in furnaces fired by the more usual methods these difficulties are greatly enhanced in the case of pulverised fuel. A large furnace volume is required because pulverised fuel is burned in suspension in the combustion air necessitating a sufficient length of flame path to ensure complete combustion of the solid carbon and volatile hydrocarbons prior to the gases coming into contact with the boiler heating surface. Apart from this the amount of excess air required is much less than with stoker firing which leads to a very high furnace temperature, while as pulverised fuel can be produced from very inferior coal its ash content is high and may reach 30% or more. Present day furnaces, therefore, are the result of practical experiment to design types which will avoid the ever troublesome slagging, and with the early solid wall furnaces the rapid erosion was a serious matter unless it was kept down by too much excess air. The cavity wall furnace, which is kept cool by its functioning as an air heater, is successful except in respect of the bottom, where the slag still often had to be removed by a pick. It is such conditions that have brought into being the now generally used water cooled furnace wall in the form of a gridiron type of water screen, and in one form or another this arrangement may well be said to have made possible the modern pulverised fuel boiler of the types to be now described.

A further development and one incorporated in the Wallasey plant previously mentioned is that shown in Fig. 5, where it will be observed that the tubes themselves are not directly exposed to the fire, the inner face of the wall being covered with a refractory material fitted round the tubes and keyed to them while the joints between the blocks are inclined to the plane of the wall and curved as shown. This enables expansion and contraction to take place without undue stress coming on either the blocks or the tubes and at the same time it eliminates any tendency to bulging. The thickness of the material so arranged must be such that the cooling effect of the tubes will be sufficient to prevent overheating and spalling while at the same time facilitating the absorption of the radiant heat and there must be a steady red heat on the inner surface of the walls so as to ensure good combustion with the minimum of excess air. *(To be continued.)*

AUSTRALIAN TELEPHONE SERVICE.

Public Service Inaugurated by the Premiers of the United Kingdom and Australia.

THE public wireless telephone service between England and Australia was inaugurated on Wednesday morning, when Mr. Ramsay MacDonald, in London carried on a conversation with Mr. J. H. Scullin, the prime minister of the Australian Commonwealth at Canberra. Conversation was perfectly audible in both directions.

For the present the service will be available on weekdays only from 7 a.m. to 10.30 a.m., and, with the exception of Saturdays, 4.30 p.m. to 10 p.m. The charge for a call from any place in Great Britain to Melbourne or Sydney will be £2 a minute, with a minimum of £6. The report charge, where applicable, will be 12s. Subscribers wishing to book a call to Australia should ask their local operator for "Australian Service" (subscribers on an automatic exchange should dial "trunks" and then ask for "Australian Service"). In other respects the procedure will be same as in the trans-atlantic telephone service to North America. The period allowed on any individual call will be limited to 12 minutes, when other callers are waiting to use the service. Callers, particularly those desiring conversation at a particular time, are advised to book their calls as early as possible on the day on which they are required, or preferably on the previous day. Every effort will be made to connect a call at the time required, where this is specified, but no guarantee can be given that a call will mature at a given hour. Calls may be booked at any hour of the day or night. Further information may be obtained by asking for "Australian Service Inquiry."

NOTES FROM ITALY.

Hydro-electric Developments—Imports of Electrical Goods.

(FROM AN ITALIAN CORRESPONDENT.)

TO the two hydro-electric stations of the Coghinas River and Tirso River another large hydro-electric plant is to be added in Sardinia. It will utilise the northern part of the Flumendosa River near the large village of Villagrande Strisalli in the province of Nuoro. This new plant includes a large lock which will create a hydro-electric reservoir of about 50 000 000 cu. m. of water. The water retained by this large reservoir, which will have the character of a lake, will be diverted from its natural course and brought through a tunnel 6 km. long on the eastern side above Tortoli, producing with a fall of about 800 m., 140 000 000 kW. The dam will be 55 m. high.

In Julian Venetia a plant is to be built near Trieste to utilise the Timavo River; a development of 120 000 H.P. being contemplated.

The Italian hydro-electric industry is progressing. Consumption of electricity had increased to 775 296 000 kWh in December, 1929, against 766 443 000 kWh in December, 1928, and 654 627 000 kWh in December, 1927. The index number of quotations of shares of Italian electric enterprises has reached 155·76 (1922 = 100) and it is understood that American interests are still showing interest in the possibility of making further investments in Italian industry.

Imports of electric machinery and apparatus have not shown much change recently, as can be seen from the following figures :—

IMPORTS OF ELECTRICAL GOODS.

Germany maintains a very important position in the Italian market. Although the total imports of generators have shown a decrease, imports from Germany have risen, so that Germany has captured part of the share of other countries. The reason for this predominance is that the Germans have had their own branch offices established in Italy since before the war. Swiss manufacturers have their own erecting shops in several Italian centres. Other manufacturers have simply entrusted their representation to individuals or firms in the trade without exhibition or even samples.

Italian industries are protected by the recommendation of the Government to use as far as possible Italian goods, but many foreign manufacturers have overcome this difficulty by establishing assembling shops for motors, factories for electric lamps, and so forth. The existence of local branch offices has enabled many German manufacturers of stoves, electric water heating apparatus, and domestic electric appliances in general, to sell them by monthly instalments, but the fact that many Italian industries have tried to imitate this method has caused great competition and lowered prices so that there are stocks of unsold material. The Government has acquired a certain number of electric vacuum cleaners, which are used at the railway stations to clean passenger cars. There has been an effort from Germany to sell electric steering gear and similar ship's appliances but it does not appear to have met with much success.

In connection with electricity in shipbuilding it may be noted that the Lloyd Sabaudo has sent technical experts to New York to study the question of electric propulsion, and that Italian firms have built the electric propelling machinery for the Royal Italian Navy training ships "Cristoforo Colombo" and "Amerigo Vespucci." These ships have two electric motors of 800 H.P. each, built by Marelli and Co., coupled to two Tosi Diesel engines.

UNEMPLOYMENT AND WORK—I.

The Plight of the Unemployed.

By SIR ERNEST J. P. BENN.

IF there were a rule which made it necessary to define one's terms before opening a discussion, a large proportion of discussion itself would automatically disappear. It happens all too often that parties to a debate are talking all the time about totally different things, and then they wonder at their failure to arrive at a common conclusion. The word Unemployment as it is used to-day, has two distinct and very different meanings. I propose to discuss the term in both its senses, but I shall try to exercise care to discriminate between them. In its older sense, the word denotes the condition of a man or woman for whom no work exists, but its later meaning covers the case of a person who by any one of numerous ways has contrived to get his or her name entered upon the register of a Labour Exchange. There is a vast difference between the two, and inside these extremes there are numerous smaller grades of difference.

When Sentiment is Dangerous.

It is hard to imagine a more terrible plight than that of the man with a wife and family, who, being able and willing to work, through no fault of his own is yet unable to find any sort of remunerative employment. Most of us are completely unable to realise the frightfulness of such a position, and nothing that I shall say must be taken to indicate a lack of appreciation of its inhuman horrors. On the other hand, to approach the problem except in a critical and scientific spirit is to do it less than justice. Sentiment is dangerous stuff when the need is for a surgical operation. In so far as there is a real absence of work, it is a grave public scandal and one which the Government may very properly be asked to remove. But note the terms of our definition and see how seriously they reduce the area of discussion. "Able and willing," "no fault of his own" "unable to find any sort of employment." No statistics are available, but I should be surprised to know that there were 200 000 men and women who, on a strict interpretation of this definition, could be properly described as Unemployed.

It is a comparatively simple matter for the nation with all its resources to deal with a problem affecting 200 000 persons, but we have now made the matter anything but simple by adding seven times as many other people who are without work for other reasons and treating them all alike as if they were all unemployed in the old sense of the term. If we go on as at present we shall presently have to face the problem of two million people (five per cent. of the whole population), who, because they happen to be standing in the same queue outside the Labour Exchange, are assumed, quite wrongly, to be of the same class and to be suffering from the same trouble. Parliament is pursuing two very different objects at the same time. The first is to help the man for whom no work exists, and the second to multiply benefits for all those who are not considered to be well enough off.

The awful plight of the real unemployed man is intensified by this confusion. Many people who are genuinely anxious to help him are prevented because they cannot approve of the wholesale distribution of new benefits which the nation cannot, at present, afford. Let me give an illustration—a very extreme one. The other day a young woman, who had worked for six months in a small business, asked her employer to sack her and to take in her place a younger sister who was helping mother at home. The girl explained that her sister did not care for housework, while she herself was tired of factory work. A change over would suit them both, and have the additional advantage of insurance benefit to the new domestic help.

The employer obliged. It was probably very wrong of him to do so, but he argued that since he always arranged his own affairs to get what benefits he could from the technicalities of taxation, the girl was equally entitled to arrange her affairs with a view to enjoying benefits offered by the State. In this way one more person was added to what are called the unemployed.

We shall never be able to do justice to any of these people until we sort them out into categories. Meanwhile, the piling up of the figures by reducing ages, extending benefits, shortening periods and other similar devices, is pushing further and further into the background the unfortunate people on whose backs and in whose name all these new beneficiaries are getting themselves entered on the public payroll.

It is very necessary that we should in so grave a matter take only such steps as are founded upon sound principles or reliable experience. In particular, every new proposal should be carefully examined to see whether it arises from a genuine interest in the unemployed or from a desire to promote some political interest. For example. Some people look forward to what they regard as an ideal when the State shall be the only employer of labour. Every name entered upon an unemployment register and every dole handed out by the Minister of Labour brings us a little nearer to that position. It may be observed, without throwing accusations at anybody, that people who hold these views are subject to the disturbing mental play of two opposing loyalties. If they reduce the unemployed and push people back into private service, they are delaying the arrival of their particular millennium. Unless, therefore, we also believe in the idea of universal State employment we are doing no service to the unemployed by leaving their interests in the hands of this sort of thinker. The same sort of argument can be used with justice not only against Socialists, but against every political party.

Unemployment as a party asset is one of the most disgusting of the many degrading features of modern politics. There are grounds for the hope that we have touched bottom in this beastly business. Every political party has its unemployment policy, and now even the unemployed are beginning to see the worthlessness of all these plans. When that truth dawns, then the first big step will have been taken towards better things and better times. But the plight of the unemployed will not be altogether ended when politicians have found something else to do. We shall then have to get rid of the helpless political mentality represented by the phrase "through no fault of his own." In modern politics, no seeker after suffrages ever tells any electors that there is anything wrong with them. The fault is always with somebody else, some other class, and must be remedied at the expense of those others. This universal pose will not appeal to our sensible people when we pass out of the present post-war slough of political despondency.

There will arise a new class of politician making an appeal to our better selves and flattering us by an honest emphasis on our shortcomings. When we begin to get it into our heads that it is possible for a man to be out of work from his own fault, then another big step towards the end of our plight will have been taken. Then, as a further step towards economic health, we may begin to look round to find whether we are putting any unnecessary obstacles in the way of employment. We shall begin to see that the removal of obstacles is better than the provision of new forms of relief.

Very few of us realise how difficult we have made it for a man to secure "permission" to work. There are numerous occasions when an unemployed man is willing to work, a customer is waiting for something to be done, and somebody else steps in and says "No." Many of these arrangements may be very wise, others may be merely unnecessary, and others again may be simply foolish. But all of them must be gall and wormwood to the able-bodied man anxious and willing to work and condemned by them to the degradation of the dole. It should never be forgotten that so long as there is a want in the world, there is work to be done, and that unemployment is an unnatural disease due to unnatural conditions.

Too Many Laws.

If I want a box of chocolates for my children after the legal hour, the law says "No." In that way a certain amount of unemployment is created among chocolate makers. I do not desire to discuss the merits or demerits of this particular sample of modern grandmotherly legislation, but let us understand quite clearly that we are reaping the benefits, whatever they are, of this particular Act of Parliament at the expense of some unfortunate unemployed person.

The Statute Book is bulging with this sort of thing. Parliament has passed an average of two Acts a week—a hundred a year—ever since the century opened, and, in my lifetime, 5 000 Acts have received the Royal Assent, each of them

Digitized by Google

restricting the activities of somebody or some trade, making its quota of unemployment and thus keeping down the general level of wages.

Most of the building work of the moment is delayed weeks and months by the new formalities of the Town Planning Acts. Delay is definite and permanent loss to a man seeking work. Again, I am not arguing the case for or against town planning, but I question whether those who advocate this further development of bureaucratic supervision have given adequate consideration to its effect upon the employment question. A political party that would undertake to repeal a thousand Acts of Parliament which have been proved to be merely useless obstructions, would solve unemployment and restore the nation's prosperity. Committees of inquiry are the fashion. Can we not have an inquiry into obstructive and obsolete legislation ?

The subject of barriers to employment leads us on to all those trade union arrangements, which, while they may bring temporary benefit to those actually in work, bar the prospects of the man in search of employment. If, as is undoubtedly sometimes the case, these union rules and regulations enhance the cost of goods and limit the demand for them, then a further section of our unemployment is explained. There is, in addition, a vast quantity of rules and regulations contrived by employers' and merchants' federations having in them, no doubt, some benefit for those inside the ring, but, in so far as they limit markets, they are also responsible for some part of our problem.

We are living in an era when the practice of restraining trade has become a fine art. Anyone who would understand from personal experience how far this sort of thing has gone can easily make a practical experiment for himself. Let him make the endeavour to buy and sell a ton of coal, a hundredweight of seed potatoes, a gallon of milk, or twenty-five copies of a popular novel. The barriers that stand in his way may give him a fresh understanding of some of the difficulties of the unemployed.

BOOK REVIEWS.

Raddrizzatori a Vapore di Mercurio. By D. C. PRINCE and F. B. VOGDES. (Milan : Ulrico Hoepli.) 243 pp. Lire 30.

This is the first Italian edition of the important work by Messrs Prince and Vogdes, of the American G.E.C.'s Research Laboratories on the theory and circuits of mercury arc rectifiers. It contains a preface by Professor of Engineering Angelo Barbagelata.

Commercial A.C. Measurements. By G. W. STUBBINGS. (London : Chapman and Hall.) Pp. 320. 15s. net.

This work is very welcome, Mr. Stubbings being an acknowledged expert on a.c. measurements. It is divided into ten chapters, the first of which deals with the principles of alternating currents. From the generation of voltage, the student is conducted to three-phase systems ; here, vectors, power factor and harmonic quantities are dealt with in a comprehensive manner. The second chapter may be said to be confined to the measurement of power in three-phase circuits. Two and three watt meters are shown and numerical examples are given. The diagrams and vectors in this chapter are very clear. In chapter 3 the measurement of current and voltage are dealt with. The construction and characteristics of various types of instruments form the basis of the subject-matter in this chapter. The fourth chapter deals exclusively with the measurement of power. This is an important section ; correct and incorrect vectors are given. The fifth chapter discusses that important subject, instrument transformers—the circuit diagrams and calculations are valuable. The sixth chapter is confined to the measurement of energy ; an important section of this chapter discusses the errors to which induction meters are subject. The seventh chapter deals with the measurement of power factor, a subject with which Mr. Stubbings is specially familiar. The section dealing with the testing of power factor meters is particularly instructive. The eighth chapter discusses the measurement of reactive power ; in this chapter is included a section dealing with reactive meters for four-wire, three-phase circuits. The ninth chapter is confined to kVA measurements, and the last chapter deals, very rightly, with test room equipment. The appendix is not a collection of matter which has been forgotten in the previous chapters. It deals with the trigonometry of a.c. theory. It might, with advantage, have been placed before the first chapter, to enable students to digest it before beginning the subject-matter proper. The book is sure to find favour among central station and mains engineers, and should also become a favourite among students in technical schools and colleges.

CYRIL SYLVESTER.

Vorschriftenbuch des Verbandes Deutsches Electrotechniker, 17th edition, 1930. (Berlin : Verband Deutscher Elektrotechniker). Pp. xviii+1153. 18 marks.

In Germany, the work corresponding to that done by the British Engineering Standards Association is carried out, so far as electrical engineering is concerned, by the V.D.E. (Verband Deutscher Elektrotechniker, or Association of German Electrical Engineers). Though this association has not the standing of the Institution of Electrical Engineers as regards professional qualifications, it has, since its formation in 1893, been steadily engaged on the formulation and publication of rules, regulations and specifications relating to electrical engineering practice. The reports, etc., now number 107, and many of them have been revised several times. They are first published in the periodical of the V.D.E., the Elektrotechnische Zeitschrift (E.T.Z.), which enables the views of those outside the respective committees to be put forward and considered. The complete set of rules, etc., is periodically collected and published in book form. It is the seventeenth edition of these collected rules which is now under review, the sixteenth edition having appeared in 1929. In this way the members of the V.D.E. are kept up to date with all revisions and new reports. Furthermore, the rules are officially accepted by the police and other authorities in Germany. Probably it would be helpful if our own B.S. Specifications were also broadcast and given wider official recognition.

The German reports fall into different classes. In addition to rules and standards, certain reports contain guiding principles and recommendations. Thus Report No. 9, on recommendations for the protection of electrical installations against excess voltages, contains information on the origin and behaviour of excess voltages and the prevention of disturbances from such voltages. Report No. 58 illustrates beetles and the ravages caused by them to wood poles. Fire extinguishers first aid, electric toys, safety first (including " thou shalt not " commandments for children), Christmas-tree illumination, etc., are rightly deemed worthy of consideration. Communication, broadcast, X-ray, and other electro-medical installations also come under the rules and regulations of the V.D.E. Nor are the technical education and practical training of electrical engineers and artisans overlooked.

From this brief account, the reader will see that the activities of the several committees are not confined to specifications of plant, etc., but cover a very wide field of interest to electrical engineers. Yet there still seems to be one great gap to be filled. With the spreading use of electricity, an authoritative body should issue a small pamphlet for layfolk, telling them the few important facts concerning electrical appliances in simple language—for example, telling them why electric applicances in the bathrooms and kitchens should be earthed, to switch off before connecting or disconnecting appliances, to keep flexibles in good repair and so on. If with such simple advice 90 % of the accidents were avoided, not much would be heard of the remaining 10 %.

S. PARKER SMITH.

Motor Repair and Overhauling. Edited by GEORGE T. CLARKE, 7th and 8th Parts. (London : George Newnes.) 1s. each part.

The volumes under review are two parts of a series of twenty-four parts published weekly. The first portion of the seventh part is purely mechanical ; the second portion deals with wiring and lighting faults. Examples are given for fault testing, and this includes a particular test for starter earth connection. A complete circuit wiring diagram is given, and this is supplemented by a pictorial diagram ; the latter is useful. Ignition and accumulators are included in this section. Part eight begins with a continuation of the section on accumulators from a treatment point of view. This is followed by small generator sets suitable for use in motor garages. The section concludes with hints on car wiring. The last portion of this volume deals with the automatic cut-out. The volumes are well worth their cost.

MARINE ELECTRICITY.

The Electric Propulsion Situation Clarified—Flexibility or Economy, or Both?—Electric Equipment of a Modern Motor Cargo Liner.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types.")

MARINE electrical interest at the present moment seems, perhaps naturally, to be centring very much round the application of propulsion motors to large passenger liners. Just how much attention the shipping world is giving to this question was well shown by the extremely spirited discussion which followed the paper read by Mr. Belsey of the British Thomson-Houston Co., before the Institution of Naval Architects, at their recent annual meeting. It is to be regretted that there was not a greater following to the discussion on Mr. Belsey's paper from the electrical industry itself, because here, one feels, would have been such an opportunity for the various electrical interests to present in a clear and concise form their case for the electric ship to shipowners, and, above all, to their superintendents, who were so largely represented at the meeting. For there is no doubt that at the present moment the marine world is waiting for a clearer-cut case as to the economics of the electric ship than it has yet seen. Those of us who are interested in electrical propulsion development know that in the electric ship we have something which for certain purposes and for special duties has an enormous future; but as yet the economics of such ships in actual tons of fuel per twenty-four hours are so subtle that it is a little difficult to explain them with the same clarity, for example, as that with which we can explain the economics of the Diesel-engined ship. The answer to the question, however, is without a doubt expressed in the fact that electric ships are on the increase.

Electric Ships Increasing.

Three major passenger liners de-luxe, with turbo-electric propulsion, are under construction in this country at the present time. A fast cross-Channel ship fitted with the same type of propulsion is about to be ordered. A Diesel-electric ship of similar, though somewhat slower, characteristics is, it is rumoured, being considered by an Australian shipowner. Tank ships with Diesel-electric propulsion are building, and also the extent to which electricity is being applied to vessels whose main machinery is direct connected and not electric is an indication of the very general appreciation of the flexibility combined with economy that it offers. One says advisedly "flexibility combined with economy," because it would appear that in certain ship types electricity is creating a sharp definition between the two, and while intrinsically each is inseparable from the other, yet at the same time in certain cases it is flexibility of machinery which sways the balance in favour of electricity, and in others it is economy of operation.

To explain this further, we may consider that the large turbo-electric liner has, as its principal appeal to the shipowner the essential economy of its power plant on a long voyage, different "legs" of which are run at different speeds. The economy in this case is not at the moment directly traceable to tons of fuel per twenty-four hours, although this, depending upon the technique of boiler and turbine practice adopted, is naturally in proportion to the application of modern ideas along this line. On the other hand, the economy in this connection comes from the fact that, because of the varying speeds on the varying "legs" of the voyage, only one half of the generating plant need be used, and in proportion part of the boiler plant also. If such a ship cruises, then the whole of the cruising can probably take place on one-half of the machinery. All of this tends to give a net longer life to the machinery, and if necessary makes it possible to arrange for minor routine overhauls at sea to the other half, thus cutting down materially the time which the ship requires to spend in port. Particularly is this useful on cruise work where, for example, sometimes as little as twenty-four hours is allowed for a complete turn-around at the home end.

Turbo-electric propulsion is being adopted widely in certain countries for passenger liners engaged on services such as these, although it is a little difficult, thinking along the same lines, to justify its fitting to ships which have a long ocean voyage to run at a constant speed or to ships which have a shorter ocean voyage to run, and which are, therefore, of packet-boat type. Assuming such vessels to have a high auxiliary load, such as with refrigeration plant, it seems perfectly reasonable that electric propulsion should be fitted whatever the length of voyage; but in this case it is conceivable that Diesel-electric drive would be better, because of its inherent flexibitity. The only other justification for Diesel-electric propulsion for passenger liners would appear to be on mammoth vessels of the largest transatlantic type.

It is, as Mr. Belsey very well expressed in his paper, to the smaller type of craft, other than those with a high auxiliary load which we have mentioned above, that Diesel-electric drive has its peculiar application, and here the reason for fitting would be our second requirement, namely, Flexibity; and by flexibility one does not mean flexibility of service, but flexibility of operation. The tug, for example, manœuvres so quickly and so rapidly that she becomes virtually a shunting locomotive. Particularly is this so in some of the world's harbours, such as New York, but it has a close parallel in the London river and in other parts of the world. In this connection it is interesting to note that a large steamship company which has hitherto used Diesel engines only for stand-by generating power in its steam-engine rooms is now reported to be considering the placing of orders for Diesel-electric ships for towing purposes. The same, too, applies to ferry boats.

What is the Future?

Questions of first cost, of course, must necessarily enter in, and for some time may disturb the shipowner not a little, but electrical companies should remember that their marine future, if such they desire as far as propulsion is concerned, lies essentially in offering to the shipowner an attractive proposition. This means that they may have to sacrifice considerably in price in the immediate future in the hope of obtaining substantial rewards in the later future.

It is the auxiliary electrical equipment of shipping which is going to give to the electrical contractor his biggest work in the next few years.

As an example of a recent ship fitted extensively with electrical equipment, we may consider the twin-screw, 9 000 H.P. motor meat-carrying ship "Tuscan Star," now on her maiden voyage to South America, which, it is claimed, has the largest refrigerated capacity of any vessel afloat. She has on board nearly sixty motors in all, in addition, of course, to the main generators and switchboards, cooking equipment, switches, wall plugs, sockets, cargo connection boxes, etc., electric fans and cabin heaters. Most of this material was supplied by one firm, the General Electric Co., and even a brief outline of some of the details of the total order gives an idea of what the auxiliary electrification of a ship means to a contracting firm. The main current is d.c., 220 V, and comes from four 320 kW Diesel-driven generators. The generators themselves are of standard compound-wound open type. The very fact of their being standard indicates also why auxiliary electrical equipment is so popular with electric firms, because it enables stock motors and stock generators to be placed on board. The main generators run at 250 r.p.m., and in addition there is a 15 kW emergency generator of compound-wound, enclosed ventilated type, operating at 500 r.p.m. All the motors for driving pumps, compressors, etc., are d.c. machines of enclosed ventilated, drip-proof marine type.

The modern ship, even though she be not an electrically-propelled ship, is in herself a small power station. Realise further that all this development and technique has come about virtually in the last ten or twelve years. Consider, also, that it has by no means yet reached its zenith, and then imagine further what marine electricity is going to hold out to the manufacturer in another ten or twelve years, for not only is the motor vessel which has been responsible for this development initially going to increase numerically, but also the electrically-propelled ship is going to occupy a position of increasing importance.

Wigton U.D.C. has withdrawn its opposition to the application of the Old Silkstone Collieries, Ltd., for a Special Order to supply electricity in the Council's area, as part of a scheme for West Cumberland. The promoters guarantee that mains shall be laid underground and the scheduled prices have been reduced from 8d. to 7d. per kWh for lighting, and from 3d. to 2d. for domestic and industrial purposes.

SHIP AND SHORE TELEPHONY.*

The Rugby Transmitter—How Accurate Maintenance of Transmitted Frequency is Secured—Modulation—Connection to Land Lines.

By COL. SIR THOMAS F. PURVES, President of the Institution of Electrical Engineers.

THE land transmitter installed at the P.O. Radio Station at Rugby was manufactured by Standard Telephones and Cables Co., Ltd., and is adapted for working on several frequencies. These frequencies are generated by a piezo-electric quartz oscillator, provided with interchangeable crystals to the frequency in use by changing the tuning coils and re-setting the tuning condensers.

In short-wave working it is necessary to adjust and maintain the transmitted frequency within very accurate limits—of the order of one part in 10 000. It is also essential, in the case of a telephone transmitter, that "frequency modulation" shall not occur, which means that the transmitter carrier frequency must not vary during modulation. In the case of long-distance short-wave radio telephony, the transmitted signal does not travel directly over the surface of the earth, but reaches the receiver after reflection from the upper regions of the atmosphere. Since the ionised layer causing this reflection is very far from being a uniform plane surface, it is possible to have two or more radiation paths between the transmitter and receiver. These paths will, in general, have slightly different lengths, and consequently the signals by the various paths will arrive at the receiver in different phase relationships, with more or less mutual cancellation. The number and distances of these paths may be constantly varying, and the resulting phenomenon of "fading" has become all too well known. If, at the same time, frequency modulation of the transmitter is present, it is possible to have two or more carrier

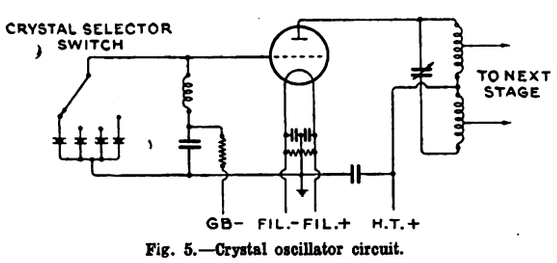

Fig. 5.—Crystal oscillator circuit.

waves of slightly different frequencies arriving simultaneously at the receiver. This will result in serious distortion of the received signals, since beats will be set up between the carriers, producing what may be called "spurious" modulation.

The most suitable means, at the moment, of ensuring the necessary stability of transmitted frequency is to use, as generator, a valve which has a quartz crystal connected between the grid and filament, and a tuned circuit between the anode and filament.

The piezo-electric quartz crystal, due to its peculiar properties, is equivalent to an electrical resonant circuit of exceedingly low decrement. If the anode circuit is adjusted to the natural resonant frequency of the crystal the valve will oscillate, and the *range* of the resulting frequency will be determined by the sharpness of the resonant curve of the crystal. Since the decrement is very low, this curve is very sharp, and any possible variation in frequency is, therefore, of a very small order.

Owing to the change in the Modulus of Elasticity for the material, the natural frequency of a crystal varies with change in temperature. To avoid this variation the crystals in the transmitter are enclosed in an oven, the temperature of which is automatically regulated within very fine limits by thermostatic control.

Fig. 5 shows the actual crystal circuit used, and indicates how the selection of the required crystal is effected. The anode d.c. input to the crystal valve is about 12 W. The natural frequency of a crystal is inversely proportional to its thickness. In the case of a crystal having a natural frequency of 3 000 kilo-cycles (100 metres) the thickness of the crystal is approximately 0·95 mm. It is not practical to reduce the thickness of a crystal much below this value without making it very fragile and liable to fracture when in use. Hence, if a frequency higher than 3 000 kilo-cycles is required, instead of cutting a crystal to generate this directly, a crystal having a lower natural frequency is used; and the frequency is multiplied in later stages of the transmitter. Thus, in the case of a frequency of 12 000 kilo-cycles, a crystal having a natural frequency of one-fourth—3 000 kilo-cycles—is used.

Fig. 6 shows a frequency-multiplying, or "harmonic-generating," circuit. A high-frequency voltage from the

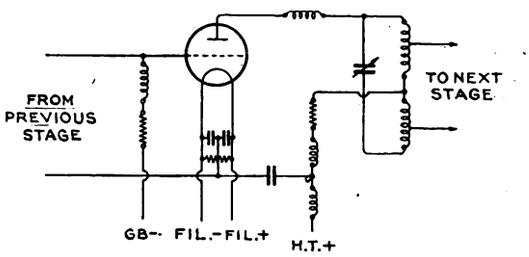

Fig. 6.—Harmonic generator circuit.

previous stage is impressed across the grid and filament of the valve, and, by applying a very high negative bias to the grid, a distorted, kicking wave-form, containing harmonics of large amplitude, is produced in the anode circuit. A considerable quantity of oscillatory energy, at one of these harmonic frequencies, will be generated if the anode circuit is tuned to the harmonic frequency. In practice the amount of energy is small if a high order of harmonic is selected, and usually only the second or third harmonic is used. The anode input to one of these stages is of the order of 150 W.

After the actual transmitted frequency has been produced by means of the harmonic generating stages, the output is stepped-up by a balanced amplifier. This amplifier operates on the well-known push-pull principle, and self-oscillation, due to the inter-electrode capacities of the valves, is prevented by cross-connecting the anodes and the grids of the two valves through variable neutralising condensers. Both grid and anode circuits are tuned to the frequency in use. The anode input to this stage is about 100 W, and the anode voltage is *modulated* at speech frequency. This is performed by means of the equipment shown in Fig. 7, modulation being effected by transformer coupling between the anode supplies to the low-frequency and high-frequency valves. The modulating

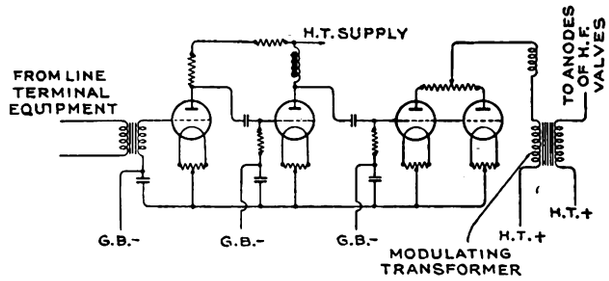

Fig. 7.—Modulating equipment.

equipment is quite straightforward, and embodies usual audio-frequency amplifier practice as used for broadcast reception, but on a larger scale. The final two valves, in parallel, handle an anode power of about 200 W.

The modulated output is then passed through two further balanced push-pull amplifying stages. These are similar to that already described, and the general arrangement is shown in Fig. 8. Both stages employ two water-cooled valves, the first taking an input of about 0·8 A at 4 500 V, and the final high-power stage an input of about 1·7 A at 8 500 V. It is noteworthy that the anode coils of these two stages are water cooled.

In order to reduce inter-action between the various stages, and also to give greater accessibility to the various components, the latter two amplifiers are each housed in independent screen cubicles, and are separated from the low-

* Abstract of the presidential address to the Students' and Graduates' Section of the I.E.E., delivered on April 11. The first part of this abstract appeared in THE ELECTRICIAN of April 25.

Digitized by Google

power apparatus. Coupling between adjacent cubicles is carried out by open two-wire balanced transmission lines, and the output from the final stage is connected directly to the aerial feeder lines. The transmitter is capable of giving a high frequency carrier output to the aerial of 3½-5 kW, and under these conditions a low-frequency modulation of 90 % can be applied without distortion.

The high-tension d.c. supply for the anode of the final amplifying valves is obtained from 50 cycles alternating current, which is transformed up, rectified by three water-cooled valves, and suitably smoothed. All other supplies, including the direct current used for heating the filaments of all valves, are obtained from motor generators. This transmitter is connected to the land lines through an equipment

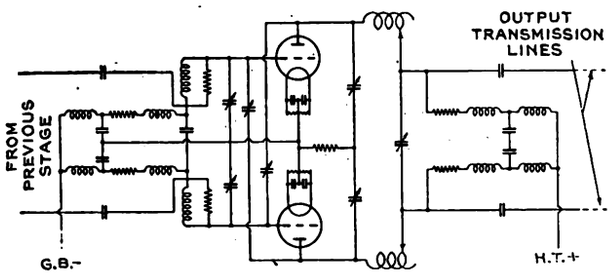

Fig. 8.—Amplifying stage.

which includes a volume indicator, an amplifier, the gain of which can be varied, and a variable attenuator, so that the transmitter can be lined up to be fully modulated by the normal line currents.

The remaining problem is that of connecting the service to the land lines of the country. The circuit is the equivalent of a four-wire circuit, that is, separate paths are used for the transmitted and for the received speech, as distinct from the ordinary two-wire circuit which exists between a subscriber's telephone and the exchange. The connection from the Rugby transmitting station to London is by 85 miles of underground cable. The receiver at Baldock is connected by over 30 miles of underground cable to London.

The special requirements of the wire-radio channel necessitate the provision of special technical control points equipped with control and testing apparatus, both at London and on the ship, at which are stationed skilled technical operators who continually observe the circuit while in commercial service. It is at this point in London that the two sides of the four-wire circuit are combined into a two-wire channel which can be connected to the ordinary telephone system of the country. On the ship separate pairs of wires are used for the two sides of the circuit, and these are connected directly to the telephone instrument in the special call box, one pair to the transmitter and one pair to the receiver. The terminal

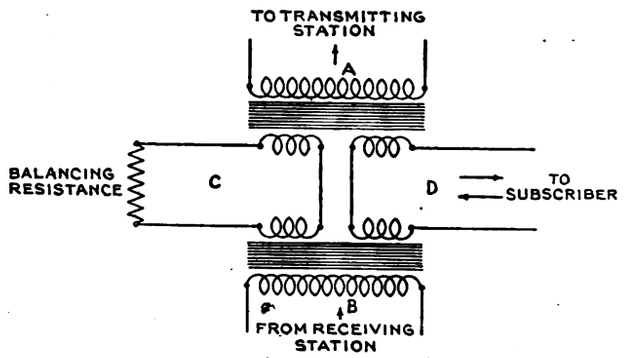

Fig. 9.—Hybrid coil.

equipment apparatus at London is grouped on two racks; the one comprising all the panels which require adjustment is known as the technical operator's position; and the other apparatus, known as the "voice operated device," is mounted on a special rack and forms a complete unit apart from the main equipment.

One of the most important duties of the technical operator is to see that the volume of speech sent to the transmitting station is constant and is such that the transmitter is always fully modulated. This ensures that the audio signal received by the ship is a maximum at all times, and that there is, therefore, a maximum ratio of signal to noise. The volume is controlled by means of a potentiometer device on the input to an amplifier, or repeater, having a gain of 40 Decibels—*i.e.*, a voltage step up of one hundred times.

The need for a voice operated controlling device arises as follows:—The ordinary four-wire telephone circuit has a multiple transformer at each end which is known as a "hybrid coil." This performs the function of combining the two sides of the four wire circuit into a two wire channel, which can be connected to the ordinary telephone system of the country. This coil has four windings, and is shown in Fig. 9. The coils "A" and "B" are connected to the transmitting and receiving lines respectively; the coil "C" is connected to a system of resistances known as the balancing network, and "D" is joined to the subscriber's line. With a coil of this type, if the impedance of the network is equal to the impedance looking towards the subscriber's telephone, there is no transmission from the receiving side to the transmitting side, although transmission is possible from "B" to "D" and from "D" to "A" with little attenuation. In practice, however, the impedance of the subscriber's circuit will differ from that of the resistance balance, and the condition of balance will not be accurately fulfilled. A certain amount of speech will therefore pass from the "receive" leg to the "transmit" leg—*i.e.*, from "B" to "A."

Assuming, for the moment, that this simple type of termination were used alone for a radio circuit, the general radio noise, picked up by the receiver from the ether, would pass to the transmitter and be re-radiated along with the speech of the land subscriber, with a degrading effect upon reception at the ship. Speech from the ship would also be radiated and would have the undesirable effect of allowing an eavesdropper to hear both sides of the conversation, as he would only need to tune to the frequency of one transmitter.

The Post Office Engineering Department has perfected a "voice operated device" which, in conjunction with the hybrid coil, prevents this defect. It consists, essentially, of a

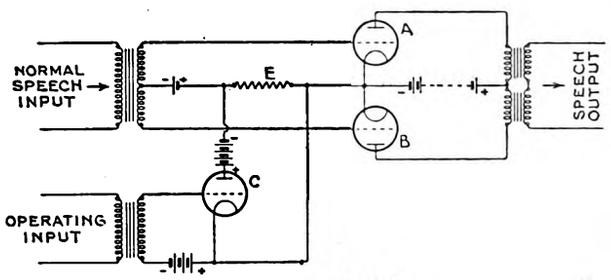

Fig. 10.—Valve relay device.

number of thermionic valve relays. Fig. 10 shows a very simple type of valve relay adapted to this purpose. Valves "A" and "B" are in a push-pull circuit and are biased normally to the mid point of their characteristics by the battery "D," when no current is flowing through the resistance "E." Valve "C" is an anode bend rectifier which, with zero input, allows no current to flow through its anode resistance "E." On the arrival of speech or tone at its grid, however, the anode current rises, a voltage being thus developed across "E" which makes the grids of the push-pull valves "A" and "B" very negative. The amplifier therefore becomes inoperative, and the passage of speech through it is prevented. The change-over operation occurs in less than three milliseconds.

A dial for remote control of the received sensitivity of the voice-operated device (dependent upon radio conditions), and a switch for varying the time hang-over of the voice-operated device for various line echoes and transmission irregularities associated with the local subscriber's connection are also included on the technical operator's position. A telegraph key is provided for use in conjunction with an oscillator to key Morse signals when lining up the circuits.

The gain control for both repeaters is in the form of a variable attenuator specially constructed in twelve steps of 2·5 dbs. from zero to 30 dbs. It may reduce the overall gain of the repeater unit by 5 dbs. for a strong talker, or increase it by 25 dbs. for a weak one. The control is varied in conjunction with the volume indicator and enables the technical operator to load the radio transmitter fully by maintaining a constant level of speech at this point in the system.

Adequate monitoring facilities are supplied to the traffic and technical operators ar various points in the four-wire

Digitized by Google

links in order to check the satisfactory operation of the terminal equipment.

The terminal equipment in London plays, therefore, a highly important part in providing radio telephony services, because of its special functions in combining the receiving and transmitting radio links, together with important equipment and operations associated with long distance lines, which, in some services, often pass through two or three Continental countries.

The remaining apparatus necessary for completing a ship-to-shore telephone conversation follows fairly standard telephone practice. Since, however, it is a " person to person " service the traffic operation is more elaborate, and a special operator concentrates her attention entirely on one channel instead of looking after about six channels, as in the case of the ordinary trunk system.

The transmitter and receiver equipments on board ship are very similar to those described for the land stations, although in the case of the transmitter one stage less of power amplification is utilised, the output being of the order of 2 kW.

One of the problems met with on board ship is the noise introduced into the receiver by the effect of the transmitter carrier. The probable explanation of this trouble is that the various mast and funnel guys are energised by the transmitter.

If they do not make good contact with the main portion of the ship minute sparks will occur across the insulating film which will excite the system at its own particular natural period. Since such oscillations will be highly damped they will cause interference over wide bands of wave lengths, including those to which the receiver is tuned. The cure is carefully to bond to the main ship structure all such elements of potential interference.

The choice of wave-lengths for this service must be a matter of careful consideration. The short wave telegraph services and the closeness of transmitter and receiver aerials render the problem of greater difficulty than is the case with services between fixed points.

CANADIAN ELECTRICAL INDUSTRY.

Advances in Design of Equipment—High Speed Turbines—Movable Blade Propeller Runners —Automatic and Remote Control.

(FROM A CANADIAN CORRESPONDENT.)

DURING the past year many advances have been made in Canada, not only in the volume of new hydro-electric power development, but in the design of the equipment used in the various power plants which have been brought into operation. Turbine designers, for instance, have paid special attention to the development of turbines with high specific speeds, and in consequence there have been progressive increases in size and head of high specific speed or propeller turbines. An outstanding example is that of the Seven Sisters Falls plant on the Winnipeg River, where propeller runners of 37 500 H.P. will be installed to operate under a head of 66 ft. at 138·5 r.p.m.

A very interesting installation was made at the plant of the Montreal Island Power Co. on the Back River (or Rivière des Prairies) a few miles from the centre of the city. Here, owing to wide variations of head and river flow, movable blade propeller runners were used to overcome the disadvantages of part gate efficiencies inherent in the propeller runner with fixed blades. There are three Canadian Allis-Chalmers Co.'s (four bladed) and three Dominion Engineering Co.'s (six bladed) turbines, each rated 12 000 H.P. maximum rating at 26 ft. head, 8 800 H.P. best effective at 26 ft. head, and 7 150 H.P. at 18 ft. head.

In the field of Francis turbines, the largest were the four units for the Chute à Caron development of the Alcoa Power Co. on the Saguenay River. These units, built by the S. Morgan Smith-Inglis Co., will each develop 75 600 H.P. at 120 r.p.m. under 165 ft. effective head. The turbines are of the single runner vertical shaft type set in 17 ft. inlet diameter plate steel spiral castings. A special feature of the casting was the heavy butt strap joint construction. The units discharge through concrete elbow type draught tubes. The runners are annealed steel cast in one piece and weigh approximately 45 tons each. Renewable steel wearing rings are provided on the curb and crown plates. The main guide bearings are of the babbitted oil lubricated type, with a bore of 33 in.

In the field of high speed axial flow turbines there has been considerable activity during the past year. One of the most important steps made in recent years in the hydraulic turbine field has been the introduction of the Kaplan automatically-adjustable blade turbine by the S. Morgan Smith-Inglis Co. This turbine has been widely used in Europe for a number of years, but the first installation in Canada, that of the Nova Scotia Power Commission at their Tusket River plant, was not made until 1929. Here three turbines operate under from 18 to 27 ft. head, and are rated at 1 050 H.P. each, at 225 r.p.m. under 20 ft. head. The runner blades, four per runner, are controlled by the turbine governor, and are so regulated that they are always held in the position for the turbine wicket gates. Lignum vitæ water-lubricated type bearings have been mostly used, but babbitted guide bearings have been gaining popularity and the recent improvements in rubber bearings have resulted in a growing use of this type with water cooling.

In the design of water wheel driven generators there is a tendency to use structural steel instead of cast parts. In form, also, the umbrella type is gaining in favour, the most notable installation last year being the 12-sided welded steel plate, 10 000 kVA units in the Montreal Island Power Co.'s new plant. Among the economic advantages of these modifications are lower first cost of the machine, reduction in head room required for handling moving parts, consequent saving in superstructure costs, and reduction in delivery time.

A great deal of attention has been given to problems of generator lubrication, the general tendency being toward unit systems, unless there are more than five units in a plant, in which case a central lubricating system is usual. Self-enclosed generators are growing in favour on account of the decreased dust accumulation therein, and because this type lends itself readily to carbon dioxide fire protection systems. Such fire protection systems have been installed in a number of large stations.

Owing to the increased cost of labour in stations of standard design it is imperative, in many instances, especially in smaller stations, to design them for complete automatic or for remote or for supervisory control from adjacent plants, while at the same time the method of control must be of as simple a nature as possible. Some of the earlier plants with supervisory control have given considerable trouble, and have not fulfilled the expectations of their designers. It is a recognised fact that there must be some attendants at a hydro electric station, and, consequently, remote or supervisory control can be very much simplified.

Self-cooled transformers are being increasingly installed, as the high cost of maintenance of a water cooling system offsets the decreased cost of the water-cooled units, especially where extremely cold weather is experienced for months at a time. In addition the ratings of the self-cooled units may be increased by the addition of blowers. Outdoor transformer stations are becoming more common at large stations. The use of outdoor switching is also increasing, and is practically universal from 100 kV upwards. There is a general tendency toward the simplification of diagrams of connections, especially with the higher voltages of the 110 and 220 kV systems.

In the design of systems for the distribution of power there appears to be a number of definite trends. Sub-stations are being built with larger capacities, and on the whole are much superior in design and protection than formerly. Transformers are, wherever possible, placed outdoors, and open bus-work is being replaced by underground cables. Distribution centres feed smaller areas with the resulting smaller losses and stresses. Municipalities are installing underground cables for primary feeders and for economic reasons are changing over from 2 300 V three-wire delta to 4 000 V four-wire star grounded. The question of rates and the practice of allowing " high peak " customers to penalise systems continues to receive attention.

It is proposed to instal at the Shropshire, Worcestershire and Staffordshire Electric Power Co.'s Stourport generating station an additional 37 500 kW turbo-alternator, which will bring the total plant installed up to 112 500 kW. Thirty miles of condenser tubes will be required.

Safety in Domestic Electrification.

[To the Editor.]

Sir,—I have read with great interest the above article by Mr. T. C. Gilbert which recently appeared in your columns. It may surprise your contributor to know that I am thoroughly in agreement with the views he has put forward on this subject. I regret that he considers I am a "well-known complete earthing advocate." I presume he gathered this impression from an article of mine, entitled "The Earthing of Domestic Portable Appliances," printed in the "Electrical Review" on February 11, 1927. I have always felt that we were on the wrong track in installing all metal-clad portable equipment in the home. In support of my contention I recently championed the cause of insulation by opening a debate entitled "To Earth or Insulate?" at the Birmingham Electric Club, Mr. R. Grierson being my opponent. If my memory serves me correctly, the majority of the members present held Mr. Gilbert's views on this question. The whole matter appears to turn on the point that the manufacturers are prepared to put forward the type of apparatus to which he refers, but the contracting and supply sections of the industry must create the demand to justify its manufacture. Co-operation and agreement are, therefore, needed in all branches of the industry dealing with domestic electrification before any headway can be made in this desirable direction of all-insulated apparatus.

The position in this matter of earthing or insulating, in the domestic sphere, appears to me to be as follows: We enclose electrical apparatus by metal which is liable to become alive, and then proceed to eliminate this danger by earthing. Surely, the common sense procedure is to enclose such appliances, fittings, etc., by material which inherently cannot become alive, that is, an insulating material should be used. The difficulty in the past appears to have been that there was no material of a practical nature which would be utilised. Manufacturers are now rising to the occasion and it is up to the other interests to create the necessary demand.—Yours faithfully,

Reg. H. Rawll, A.M.I.E.E., A.M.I.Mech.E.

Birmingham, April 14.

[To the Editor.]

Sir,—Mr. H. W. Clothier lodges a complaint against Mr. Gilbert for incomplete quotation of his remarks. I also can complain, because a brief mention, as given, may lead to misunderstanding.

From the electric shock viewpoint, Mr. Gilbert cannot deny that the safest place for anyone is on (or as close as possible to) the point protected by earthing.

The danger of accident may be carried from the e.h.t. supply through the transformations down to the l.t. domestic services and, where there is no earth circuit, or where there is considerable impedance or resistance between the supply-end earth and the domestic service installation, the danger can generally be taken as relatively greater, as also continuity for the insulated system or circuit relatively less reliable, than a system or circuit earthed in accordance with the writer's recommendations, i.e., earthed to offer the best security and a low and evenly distributed resistance.

In the writers' proposed installation, illustrated and explained in the book, "Electricity Supply Transformer Systems and their Operation," only one insulated wire and terminal are required. One insulated wire and one insulated terminal for plug, socket, holder, etc., are cheaper and more reliable than two; for equal dimensions of plug, socket, etc., the insulated circuit is much more reliable and the safety of the domestic electrification is materially increased. The metal or outer parts of wire, plug, holder, etc.—for greatest safety—are solidly earthed at one point *only*, i.e., on the water main.

The long disputed question among engineers is the manner of earthing the circuit and/or the exposed metal and/or semi-insulated parts of the installation fittings. The writer "takes the bull by the horns" by using only one insulated wire and having all exposed metal parts and/or the return wire and/or metal conduit and installation fittings form part of the earth-return circuit connected in multiple on each domestic electrification, thus offering the best help to each other from the safety standpoint for the least cost of installation. A domestic electrification of this kind offers the highest insulation for equal dimensions, etc., for the insulated circuit, the maximum safety and the least costly installation. As regards existing regulations, the writer is fully aware of their scope.—Yours faithfully,

William T. Taylor.

London, N.2., April 17.

Dark Flashes on Lightning Photographs.

Sir,—The photographs on page 368 in the March 21, 1930, issue of The Electrician, entitled "A Transvaal Thunderstorm," and particularly the explanation of the dark flashes on the first photograph as being probably due to "red flashes of low actinic power" have come to my attention.

I spent two years in the 2 000 000 V Ryan High Voltage Laboratory at Stanford University, during which time hundreds of photographs of discharges were taken, many of which showed the phenomenon of dark flashes, and was at first very puzzled. Some photographs showed flashes entirely dark; some showed the spark having a dark core; in others the spark had a dark outline, as one of the main flashes in your photograph has.

Subsequent investigation showed that such occurrences were the result of photographic reversal and re-reversal. One ordinarily thinks of the density of the photographic negative as increasing with the exposure time-intensity product. This is true up to a certain point where the density begins to decrease, reaches a minimum and then increases again. This cycle may be repeated two or more times.

Thus the branches of the main flash which were dark in the print had sufficient actinic power to cause the first reversal, and the main flash was bright enough to bring about a re-reversal except on the edges which are dark.—Yours faithfully,

Robert D. Boynton.

San Francisco, Cal., April 11.

FRENCH ELECTRICAL TRADE.

French imports of electrical goods in 1929 were valued at Fr. 629 475 000, against Fr. 422 651 000 in 1928 and Fr. 227 878 000 in 1927. Exports were valued at Fr. 453 311 000 in 1929, compared with Fr. 420 724 000 in 1928, and Fr. 374 941 000 in 1927. The adverse balance was, therefore, Fr. 176 164 000 in 1929 against Fr. 1 927 000 in 1928. In 1927 there was a favourable balance of Fr. 147 063 000.

The values of imports of the principal classes of electrical goods were :—

	In thousands of francs.		
	1929	1928	1927
Machinery and transformers	117 178	66 077	52 847
Apparatus	270 398	172 769	81 088
Lamps and valves	100 706	83 748	39 014
Cables, wires and flexibles ..	74 791	53 697	22 557
Accumulators, and parts ..	9 149	4 509	2 338

The values of exports of the same classes of goods during the same years were :—

	In thousands of francs.		
	1929	1928	1927
Machinery and transformers	85 664	108 226	86 898
Apparatus	147 411	136 960	140 865
Lamps and valves	31 363	25 414	24 920
Cables, wires and flexibles ..	65 329	46 832	31 414
Accumulators, and parts ..	31 875	18 565	20 919

LONG DISTANCE D.C. TRANSMISSION.

At a recent lecture in Berlin, reported in the "Electrotechnische Zeitschrift" of January 30, M. Réné Thury declared that the transmission of 60 000 kW over a distance of 600 miles at 300 000 V d.c. might prove simpler and more economical than by the a.c. system. Between Moutiers and Lyons d.c. transmission for 280 miles at 125 000 V at full load is actually in operation, 45 miles of the route being underground. Up to 300 miles a.c. is supreme but above that limit d.c. has attractions and M. Thury contends that the utilisation of very remote sources of water power will only be economically possible with d.c. transmission. To transmit 60 000 kW for 600 miles with two wires and earth return neutral, allowing for a voltage drop of 20 per cent. and 10 kV for commutators, nine generators, each with two commutators connected in series would be required, giving 400 A at a maximum potential of 180 000 V to earth. The diameter of the conductors would have to be ⅜ in., equivalent to 76 lb. per kW transmitted, but the cost could be reduced by the use of aluminium conductors.

NEWS IN BRIEF.

French Police Radio Service—Talkies in Palestine—Wireless Telephone Communication with Canadian Trains—Appointments Vacant.

A WAR tank has been adapted as a transformer kiosk at Ashford, Kent.

The West Gloucestershire Power Co. requires an assistant consumers' engineer.

The 57th meeting of the American Electrochemical Society will be held at St. Louis, Miss., on Thursday, Friday and Saturday, May 29, 30, and 31.

Designers with experience in the design and construction of light precision mechanical or electrical machinery are required for an Admiralty establishment near London.

On April 24, members of the Birmingham and Midlands Branch of the Electrical Association for Women heard Mr. T. Catten give an interesting lecture on "Electric Lighting in the Home and School."

Stoke-on-Trent Cpn. is to instal a fire alarm call system at the mental hospital, at a cost of £140.

The employees of the Clyde Valley Electrical Power Co. have contributed £516 to charities during the year.

St. Pancras (London) B.C. has accepted a tender, amounting to £19 470, for the erection of an electricity sub-station in Arlington Road.

A recent experiment in radio telephonic communication between Geneva and the liner "Majestic" in the North Sea is said to have given satisfactory results.

The Standing Committee appointed by the Board of Trade will hold an inquiry, on a date not yet fixed, as to whether magnetos, batteries, and ignition plugs for motor vehicles should bear an indication of the country of origin.

The next meeting of the Physical Society will take place on May 9 at the Imperial College of Science, South Kensington. Amongst the papers to be read is one by Mr. E. J. Williams on "The Inductance of Electromotive Forces in a Moving Liquid by a Magnetic Field."

The short-wave wireless station on the Eiffel Tower, Paris, is to be used as the centre of a police radio service. Receiving stations will be established all over France and at boundary towns and seaports, and broadcasts will take place at intervals of an hour at a wavelength unknown to all except the police.

At the recent annual general meeting of the Batti Wallahs Society, a sum of five guineas was voted to the Royal National Lifeboat Institution. A proposal to create a Charity Fund was not adopted, but the meeting decided that half the sums obtained from new members in entrance fees shall be set aside for charity.

Applications for technology research scholarships, each of a value not exceeding £100, and tenable during the year 1930-31 at the Manchester Municipal School of Technology, must be sent in by June 27. A preference will be given to suitably qualified Manchester students. Forms of application and further information can be obtained from the Registrar.

The Canadian National Railways have put into operation a telephone system by means of which a traveller on the "International, Limited," which runs daily between Montreal and Chicago, can complete a call to his residence or place of business. Communication with the train can also be made from Montreal, Toronto and elsewhere. A conversation between Mr. C. J. Smith, in the London Offices, and Sir Henry Thornton, in the train, took place on April 27.

At a meeting of the British Institute of Radiology in the Reid-Knox Hall, 32, Welbeck Street, London, W.1, on May 15, following the annual general meeting, which takes place at 8.30 p.m., Mr. P. J. Kerley will read a paper on "The Pathology of Early Pulmonary Tuberculosis as revealed by X-Rays." The Institute is issuing to all hospital authorities in Great Britain and Ireland a Memorandum on Hospital Policy regarding Radiological Services.

A chief engineer and manager is required for Nottingham Corporation's electricity undertaking.

A graduate assistant in electrical engineering is required at Rutherford Technical College, Newcastle-upon-Tyne.

Dorchester Markets Committee has instructed the Town Clerk to obtain estimates for the adequate lighting of the Market House.

The next luncheon of the Batti Wallahs Society will be held at the Hotel Metropole, London, on May 22, when Sir Edward T. F. Crowe will be the chief guest.

The eighth general meeting of the Society of Radiographers will be held in the Reid-Knox Hall, 32, Welbeck Street, London, W.1, on May 14, at 7 p.m. Mr. C. H. Holbeach will read a paper on "The Planning of an X-Ray Department."

A cinema house in Jerusalem and two cinemas in Telaviv have completed arrangements with the Western Electric Co. for the installation of "talkie" apparatus.

An electrical engineer is required by the Government of Burma. Application forms can be obtained from the Secretary to the High Commissioner for India, India House, Aldwych, London, W.C.2.

The British Association for the Advancement of Science, of which Prof. F. O. Bower, F.R.S., has been elected president, will hold its meeting at Bristol this year, commencing on September 3.

The Chloride Electrical Storage Co., Ltd., announces that the Exide Service Convention Banquet will be held at the North British Hotel, Waverley Station, Edinburgh, on Wednesday, May 28.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of May 1, 1880, recorded a proposal to utilise the falls of the Genesse river at Rochester, N.Y., for the generation of electricity.*

A proposal to light Regent Street, London, by electricity at a cost of 2½d. per lamp per hour was rejected by the St. James's Vestry on the ground of cost.

A method of "seeing by telegraph," suggested by Mr. Middleton, was briefly outlined.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of May 5, 1905, Mr. J. H. Rider and other correspondents were advocating the use of larger generating units, Mr. R. L. Gamlin expressing the opinion that the small station in England should soon be a relic of the past.*

Eastbourne Corporation accepted the offer of a firm to equip one of the Stirling boilers at the electricity works with a mechanical stoker and a motor-driven fan for forced draught for a three months' trial free of cost.

At a recent meeting of the Institution of Naval Architects, Mr. J. Johnson remarked that the shipowner was becoming more and more interested in the possibilities of the turbo-electric drive, and Mr. A. D. Constable, of the Admiralty, said there was no doubt in his mind as to the superiority of turbo-electric drive for the projected new fast Atlantic liners, and British engineering firms could supply it.

A further step in the progress of automatic telephony was made when the eight exchanges serving Maidstone and the surrounding district of Barming, Boughton Mouchelsea, Bearsted, Otham, Aylesford, Wateringbury and Hunton were brought into operation last Saturday. These exchanges, which were manufactured and installed by Standard Telephones and Cables, Ltd., have been designed to accommodate 3 360 subscribers' lines initially, with an ultimate capacity of 9 150.

Eighteen fast electric lifts, capable of carrying two hundred and fifty passengers at a speed of four hundred feet a minute, are being installed in the new Thames House, next to the Imperial Chemical Industries Building, Westminster. The two large central lighting courts, approximately forty feet wide and over one hundred feet long, will be flood-lighted during dark and foggy weather. All corridors will be lighted continuously through large ceiling panels by electric light of daylight quality. The artificial light will lend an impression of sunlight throughout the building, even on the dullest days.

Lord Parmoor (Lord President of the Council), with other members of the Ministry, received, on April 10th, a deputation from the Science Advisory Committee of the Labour Party, who submitted suggestions for the development of industrial research. Lord Parmoor said the primary needs of man—food, fuel, habitation and clothing—were well covered by the laboratories of the Department of Scientific and Industrial Research, and the research associations; while the Forest Products Research Laboratory, the Mines Department and the Geological Survey provided research in regard to the use of wood and minerals.

THE BATTI WALLAHS.

Should the Electrical Industry be Classed as A1?

A LUNCHEON of the Batti Wallahs' Society at the Hotel Metropole, London, on Wednesday, marked the initial meeting of Mr. W. McCelland, the newly elected President. The guest of honour was Mr. F. W. Purse, who chose as the subject of his remarks "Have We An A1 Industry?"

Mr. F. W. Purse, who was the chief guest at Wednesday's luncheon.

In opening his address, Mr. Purse, said that in his opinion the general conditions prevailing in the industry left much to be desired. He did not wish to imply that the going was not good, but we failed to remember that the going might be better. In fact, the existing conditions reminded him of that popular song "Give Yourself a Pat on the Back," etc. In the manufacturing world there were many cases where staffs of different companies were doing the same work, tackling the same problems and pursuing the same researches. There was a variety of electric cookers on the market and he could see no reason why some standard design could not serve as useful and better purpose. He quoted as an example of co-operative development the film manufacturing industry, where firms were closely co-operating to produce not a mutiplicity of films, but one film and one only. Mr. Purse also touched upon the publicity organisation of the electrical industry, comparing it with the tobacco industry, suggesting that a campaign as forceful and as national as the "Plus Two" cigarette campaign should be launched on behalf of electricity.

As far as he could see, each manufacturer and supply undertaking was lacking in that co-operative spirit necessary for the good of industry as a whole. Each and all were more concerned with gaining something over his competitor rather than with gaining something for the collective industry. It should be remembered that the fattest pig in the sty was not always the healthiest.

For good or for ill, the 1926 Act, like all other acts of Parliament, would not be rescinded until it had proved itself a failure, and so far as the 1926 Electricity Act was concerned, this need not fail unless we made it fail. If he were an electrical Mussolini, he would place a ban on all possible imports of goods which could be made in this country, and he would relegate the big men in the industry to those places appropriate to their specialist knowledge and abilities. Cable factories in the north would supply the requirements in the north, while those in the south would be met by southern factories. The fullest interchange of ideas and men would be encouraged, and so long as the industry as a whole acted in a co-operative spirit, it would receive its great reward.

Lt.-Col. W. A. Vignoles, in proposing a vote of thanks, said that he believed Mr. Purse's views were another aspect of rationalisation. There was no doubt that more would have to be done in the publicity effort required to sell electrical goods. A greater and wider use of publicity was needed for the successful selling of electrical service.

COUNTRY HOUSE LIGHTING.

The CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester, has issued a booklet entitled "Electric Light in Your Country House." This little publication reviews the problem of lighting country residences, both small and large, in a particularly entertaining and informative manner, is well produced and makes for easy reading. As its title suggests, the publication deals with self-contained generation plant for installation in houses where no public electricity supply is available. The booklet not only deals with the plant and battery problems but gives also approximate costs of the complete installation for houses of different sizes. The story, as told by the writer of this issue, opens with a noctural hunting adventure and compares the conditions under which the hunt may be pursued first by candle light and then by electric light. The publication is extremely well written and can justifiably claim to be something out of the ordinary.

PERSONAL.

SIR Edward Manville, who is in Roumania, will return to England in the middle of May.

Mr. W. T. Upton, electrical engineer, of Oxford, has been elected a life vice-president of the Oxford City cricket and bowls club.

Mr. Robert Traill, electricity engineer at Lossiemouth, has been granted an honorarium of £20 by the Town Council for extra duties.

Mr. W. G. Bedford, electrical engineer, Slough, has been elected a member of the Executive Committee of the Slough Chamber of Trade.

Mr. L. F. Fogarty, managing director of the Zenith Electric Co., Ltd., was recently elected to the Ruislip-Northwood Urban District Council.

Mr. Percy Wardle has been appointed engineer and manager to Cannock electric supply department. For ten years Mr. Wardle has been mains engineer to Walsall electricity department.

Mr. P. M. Rossdale and Mr. A. M. Sillar have been re-elected chairman and deputy chairman respectively, of the Electrical and Allied Trades' Section of the London Chamber of Commerce.

Bermondsey Borough Council has appointed as deputy engineer and manager of the electricity undertaking Mr. B. C. Ward, electricity distribution superintendent, Croydon Borough Council.

The marriage took place on April 19, at St. Luke's Church, Ramsgate, of Mr. Sydney R. H. Castle, who is on the staff at the depot of the Isle of Thanet Electric Supply Co., Ltd., and Miss L. M. Prior.

Mr. H. C. Penrose, electrical engineer, Redruth, was married recently, at Padiham Wesleyan Church, to Miss K. Isherwood. Mr. Penrose was formerly in the employ of the Lancashire Electric Power Co.

Following the retirement of Mrs. C. T. Allan from the chairmanship of the South Wales and Monmouthshire Branch of the Electrical Association for Women, Mrs. Morley New, her successor, presented Mrs. Allan on April 15 with a writing bureau.

Mr. John A. Sumner, assistant engineer to the Mid-Chester Electricity Supply Co., has been appointed distribution engineer to the West Midlands Joint Electricity Authority, which controls an area of 1 200 square miles in Shropshire and Staffordshire. See page 565.

Miss Ruth F. Kennedy, who joined the staff of Glasgow Electricity Department in 1915 as a demonstrator, and who founded the Glasgow and District Branch of the Electrical Association for Women, was the subject recently of an appreciative article in the Glasgow "Evening News."

Mr. A. R. Fyvie, superintendent of Dundee tramway works, has retired under the age limit. At a social gathering in the city he was presented with a writing desk by the employees and staff of the works. The presentation was made by Councillor George, convener of the Tramways Committee.

Mr. F. H. Howell has been appointed sales organiser to Domestic Electrification, Ltd. Mr. Howell was recently commercial assistant engineer to Battersea (London) B.C., and, had previously ,many years experience with the County of London Electric Supply Co., Falkirk Iron Co., and Hotpoint Electric Appliance Co. Mr. Howell's offices are at Townsend House, Greycoat Place, Westminster, S.W.1.

Mr. S. G. Davey, who has been tramways traffic superintendent, under the Exeter Corporation since 1924, has been appointed to a similar position under the Derby Corporation. Mr. Davey commenced his tramways career with the Rotherham Corporation in 1912. When demobilised in 1919, he resumed his post with the Rotherham Corporation, and in July of that year was appointed traffic inspector, continuing to hold the position until he went to Exeter.

Obituary.

MR. JOHN IRVINE FOSTER, on April 17, aged 23 years. Mr. Foster was studying electrical engineering at Rugby with the British Thomson-Houston Co., Ltd. His death was caused by a motor-cycling accident.

MR. OCCOLA JAMES COOPER, on April 17 at the age of 70 years. Mr. Cooper, a partner in the firm of Shiner and Cooper, electrical engineers, Winchester, had been in business in the city for over 40 years, and prior to entering into partnership with Mr. Shiner, was an electrical engineer with the late firm of Lloyd and Sons, of The Square.

Digitized by Google

BUSINESS ITEMS.

THE Leeds branch of CRYSELCO, LTD., has been moved to 43, York Place.

Mr. JAMES MCKENZIE, electrical and radio dealer, has opened his new premises at 27 and 29, Grange Road West, Birkenhead.

Plans of a new workshop in Liverpool Road, Slough, for the ST. HELEN'S CABLE CO., have been passed by the Slough U.D.C.

Mr. P. T. KING, electrical engineer, Manchester Street, Luton, is reducing his stock by means of a sale owing to the expiration of the lease of his premises.

The WHOLESALE BATTERY CO., electrical and radio engineers, Luton, have removed their business to larger premises, with modern showrooms, in Manchester Square.

The telephone numbers of GEORGE H. SCHOLES AND CO., LTD., electrical engineers, Blantyre Street, Hulme, Manchester, have been changed to: Blackfriars 5294 and 5295.

Owing to the increased demand for Tungsram products in Italy, TUNGSRAM ELECTRIC LAMP WORKS (GT. BRITAIN), LTD., has opened a new factory at Milan. Further details can be obtained from the London offices.

The address of the ATLAS ELECTRIC AND GENERAL TRUST has been changed to Pinner's Hall, Great Winchester Street, London, E.C.2. Telephone: London Wall 9690. Telegraphic address: Hydrolipo, Stock, London.

At a trade exhibition which is being held at Hastings until to-morrow (May 3), four stands are occupied by Messrs. WEBBER AND HUDGELL, electrical and wireless engineers, Hastings and Rye. They are giving demonstrations with electric washing machines, ironers, cookers, etc.

At an Industrial Trades Exhibition which was opened at Whitby on April 23, Messrs. BARRATT BROS., of Baxtergate, Whitby, displayed electric heating, cooking, lighting and labour saving apparatus, and gave information to visitors regarding the Urban District Council's new hire-purchase installation system.

We are informed that a Norwegian fisherman who always carries a PHILIPS 2502 receiver on board was one day far out at sea with a number of other fishing boats when the weather began to look threatening. He was advised to heave to and ride it out, but having heard on his radio that no storm was expected, he decided to go back to harbour, and, arriving long before the others, disposed of his catch at high prices.

On and after May 8th, the London office and show room of WM. SANDERS AND CO., switchgear manufacturers, will be removed to more suitable premises at 78, Neal Street (off Shaftesbury Avenue), W.C.2. Larger stocks of standard running lines will be carried to meet urgent needs, in addition to those normally held by the firm's authorised wholesale stockists. Telephone: Temple Bar 8984; telegrams (as before): Sandecco, Westcent, London.

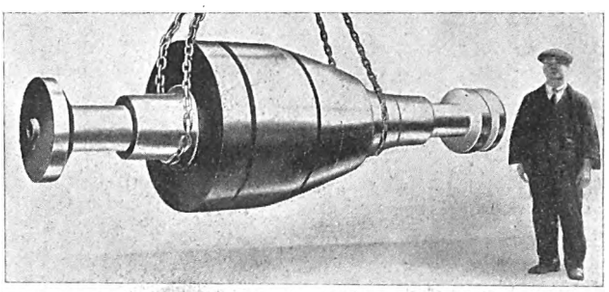
With reference to the ship-to-shore radio telephony service now in operation between this country and the White Star liners "Olympic" and "Majestic," the International Marine Radio Co., Ltd., advise us that this is now extended to France, Belgium and Holland. Arrangements are also completed for the facilities to be further extended in the course of a few days to Germany, Switzerland and Spain immediately the approval of the respective administrations is received. The same land line service is being employed as is used for the England-U.S.A. transatlantic service.

The contract for the electric lighting of Brighton's new super cinema and cafés, the Savoy, Junction Parade, for Associated British Cinemas, Ltd., has been placed with W. DRAPER AND CO., LTD., of Glasgow. The auditorium takes the form of a Japanese garden, and the lighting effects are arranged to give an even and diffused form of illumination. All the lighting will be controlled through specially designed switchboards with dimmers. The same firm recently completed the installation of the lighting scheme in the Ritz Cinema, Edinburgh, for the same company.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have called our attention to an appreciation by Pietro Mascagni, composer of Cavalleria Rusticana, of radio transmission of music. He said recently when attending to the amplification adjustment of a broadcast of his famous opera that it seemed to him as if he had created a new intermezzo entirely different from the old and familiar one. He believes that radio not only reproduces music, but even improves it and brings entirely new possibilities for its development. Accordingly he is giving the new 50 kW transmitter at Rome his full support.

LARGE ROTORS.

THE increasing size of turbo-alternator sets with one-piece rotors for the turbine or alternator is to a large extent governed by mechanical stresses permissible in the rotor. It is safe to say that in the development of such sets one of the severest handicaps to the designer is the lag which the steel manufacturer has not yet bridged—in other words, design can definitely be said to be dependent upon the resources of the metallurgist. It is only by advancing these resources that larger designs can safely be proceeded with.



A one-piece rotor in the rough machined condition as delivered to the turbine maker.

The manufacture of a large one-piece rotor forging is a difficult and, indeed, a hazardous operation. Even when every precaution which long experience of steel making, ingot casting, forging and heat-treatment can suggest has been taken, the resulting rotor is frequently not allowed by the forgemaster to go forward to his customer, and the great care and expense is found to be wasted. In such cases a second forging has to be made.

The various steps which are comprised in the manufacture of such forgings are therefore very carefully controlled. The ingot is cast from acid open-hearth steel made from selected, scrap pig-iron low in sulphur and phosphorous, with the necessary alloy (nickel and chrome) additions. It is cast in octagonal or dodecagonal ingot moulds with very liberal sinking heads. The shape of mould is chosen to minimise internal stresses in the ingot as the steel solidifies, and the very large sinking head localises segregation and piping in the upper portion of the ingot, which is afterwards discarded.

The heating of these large ingots (which weigh from two even to three times as much as the finished forging), the forging operations, and the subsequent heat treatment are all carried out with extreme care to avoid internal cracks or stresses which might lead to cracks. The rotor as delivered to the turbine maker should exhibit a high yield point, and test pieces taken from portions of the forging mutually at right angles (i.e., radially, longitudinally and tangentially) should show substantially identical results.

The photograph shows a large one-piece rotor in the rough machined condition as delivered to the turbine maker. This particular rotor was forged by Steel, Peech and Tozer, Ltd. (of The United Steel Companies, Ltd.), Sheffield, for the English Electric Co., Ltd.

It has a length of 11 ft. 5 in. and a maximum diameter of 3 ft. 3 in. The test results are as follows:—

Test Piece	Max. Tensile Stress	Elongation	Redn. of Area	Yield Point
Longitudinal ..	41·33 tons	27·5%	48·5%	24·1 tonss
Radial ..	40·26 ,,	24·0%	33·5%	23·2 ,,
Tangential ..	39·55 ,,	26·5%	37·8%	23·2 ,,

The physical properties of this large rotor forging are typical of present-day practice, and as such are noteworthy. The close agreement between the tests taken in the longitudinal, radial and tangential directions is exceptionally interesting.

MINES DEPARTMENT TESTING STATION.

The Secretary for Mines announces that, for reasons of administrative economy, and also with a view to securing closer collaboration between the staffs of the Mines Department Testing Station and the Safety in Mines Research Board, he has decided, in agreement with the Board, to transfer the testing station from the existing premises (at 42, Arundel Street, Sheffield), to a portion of the buildings occupied by the Board in Sheffield. The removal of the testing apparatus and plant will probably cause some slight delay in the official testing of safety lamps, electric bells and relays, telephones, etc., but every effort will be made to reduce such delay as much as possible.

The address of the new testing station is Mines Department Testing Station, St. Thomas Street, Sheffield.

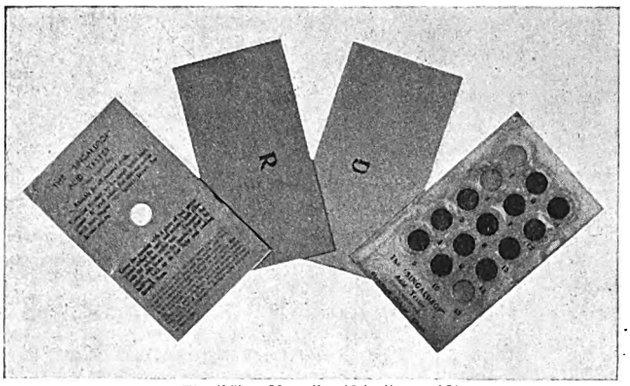
BATTERY TESTING.

WE have received from Mr. A. E. Bawtree particulars of two battery testing devices, together with samples. The first consists of a "battery blotter" which possesses the property of changing colour when brought in contact with



The "Signaldrop" acid testing outfit.

accumulator electrolyte. The blotter which in its unused condition is a greenish-grey colour, gives an indication of specific gravity by virtue of the fact that by placing on the blotter a small drop of acid by means of a match stick, the wetted surface will change its colour to orange, brown or green, according to whether the cell is fully charged, half charged or discharged, in the order given. The battery blotter is not, of course, as accurate in its indication as a hydrometer reading, but it does nevertheless serve as a useful guide with respect to the state of the battery. The only comment of a serious nature which we can make is that, in our opinion, the blotter should be supplied in a grease-proof wrapper thus protecting it to some extent from atmospheric action with consequent discolouration.

The second device is designed on the same principle but is more elaborate and gives opportunities for a greater number of "readings." Two small books of test paper are provided—one for strong acids (red) and the other (green) for dilute acids. The papers are used in conjunction with a waxed holder, pierced in the centre so that access is given to a small area of the test paper. On moistening with acid this exposed portion on both sides, the colour assumed by the paper is compared with a range of colours on a chart provided by holding both to a light source and looking through them. The chart is calibrated as to colour and specific gravity, similarity between the colour of the test paper and the standard giving, within limits, the s.g. of the solution.

The "Signaldrop" acid tester, as it is called, is intended to bridge the gulf between the rule-of-thumb worker and the laboratory-controlled process, enabling the ordinary worker who uses any form of mineral acid solution to determine whether such solution is within the limits of proper working strength. Readers desiring further information of the tester should communicate direct with Mr. Bawtree at 20, Manor Park Road, Sutton, Surrey.

LONDON CHAMBER OF COMMERCE.

Report on the Past Year's Work of the Electrical and Allied Trades' Section.

IN the annual report of the Electrical and Allied Trades Section of the London Chamber of Commerce it is stated that further consideration has been given to the suggestion that the Section should be reorganised to represent more effectively the electrical manufacturing industry. The list of members was examined and was found to comprise electrical interests of a miscellaneous character, including agents, trade associations, cable companies, engineers, electrical manufacturers, merchants and importers, supply companies and telephone services, and fulfilled a useful function in dealing with questions of a general character and of common interest, such as legislative measures. It is not considered necessary in these circumstances to pursue the proposal further. Under the Rating and Valuation (Apportionment) Act, 1928, in the case of premises used partly for purposes of storage or wholesale distributive business, the question of whether they are primarily industrial or distributive has to be settled according to the extent of the use of the premises for these different purposes, and difficulty has arisen in such cases.

POWER EQUIPMENT.

An Oscillation Limiter for Surge Protection of Transmission Lines.

TRANSMISSION engineers may be interested in the oscillation-limiter for surge protection, type B.L.R., manufactured by STANDARD SWITCHGEAR, LTD., of Albion House, 59, New Oxford Street, London, W.C.1. This surge protector is claimed to be an improvement over static condensers for use in dissipating surges of medium and low frequency such as are encountered in h.t. networks. It is not continually in operation like the condensers, but acts only at the moment when there occurs an over-voltage of sufficient magnitude. At the instant of the breakdown of an air-gap through over-voltage a damping resistance is automatically connected to the line to be protected, and it is stated the surge is dissipated within a fraction of a cycle of the normal line current. The chief component parts of this protector are therefore a suitable damping resistance and an adjustable spark gap which enables the amplitude of the critical surge (above which the device operates) to be predetermined. Though these two components determine the efficiency of the apparatus as far as its protective effect is concerned, the arc extinguishing device is also of interest, especially as it influences the design of other parts of the apparatus, such as damping resistance. The dimensions of the damping resistance are governed rather by the heat generated by the line current than by the energy to be dissipated. Thus a slow-acting arc extinguisher requires a large resistance, whereas a smaller resistance can be used with a rapid-acting extinguisher. The principle of the arc extinguisher here employed is patented, and consists of a multiple spark gap. The complete apparatus consequently consists of (*a*) an adjustable starting gap, (*b*) the damping resistance, and (*c*) the multiple spark gap.

The adjustable starting gap consists of a spark gap between two spherical electrodes contained in a glass tube and placed inside a glass bulb. It is normally set for a starting voltage of 1·5 times the composed line voltage. The damping resistance is formed of one or more quartzilite rods, which, by their quality of varying in ohmic value according to the voltage, provide a self-acting regulation of the discharge resistance and favourably influences the arc extinction. Automatic accommodation to the conditions of different networks is thus afforded. The minimum ohmic value of the resistance is approximately equal to the wave resistance of the overhead line; the resistance rods possess sufficient thermal capacity to avoid undue heating even after repeated operations in succession. The multiple spark gap consists of a large number of aluminium discs with ring-shaped concentric webs. The discs are insulated from one another and kept equidistant, while the passage of current takes place between the inner webs.

These oscillation limiters are built into porcelain cylinders and are suitable for either indoor or outdoor mounting; the joints between the individual porcelain sections are protected by rain shields for outdoor service. They are built for all voltages from 10 000 upwards.

The firm also specialises in the equipment of complete pole-mounted transformer stations for rural distribution. A typical terminal station is equipped with the following control apparatus:—Surge-protection by spark gaps with damping resistance and choke coils. Isolating link for disconnecting control cabin from line. Sheet steel cabin with lock and key to receive oil-immersed circuit breaker with direct acting overload time limit trips. Provision for manual operation by operating mechanism fixed to the pole at a convenient height. Secondary cabin for l.t. fuses for distribution circuits.

Those concerned with line connectors may be glad to learn that the "Maxim" junction clamps are being marketed by The ELECTRICAL EQUIPMENT AND CARBON CO., LTD., of Bank Buildings, 107/111, New Oxford Street, London, W.C.1. These clamps are capable of connecting two conductors of the same or different diameters; efficient contact is claimed, even when the conductors vary considerably. The lower jaw is threaded. Another speciality of the company is the cone tube and nut binder. These binders are supplied for all usual sizes of wires and cables, and by their use two conductors of either the same or different sizes may be connected; the overall diameter of the conductors should be stated when ordering. It is stated that the breaking strain of the binder is 50% greater than that of the wire or cable. The whole strain is taken up by the tube and conical liners and not by the locking nuts.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

GOLBORN URBAN DISTRICT COUNCIL, May 3.—Electric light installation in 54 houses on Edge Green Lane site. Tender forms from the clerk, Mr. H. Eckersley.

LANARK COUNTY COUNCIL, MIDDLE WARD COMMITTEE, May 3.—Electric light installation work in connection with erection of 72 houses at Netherton, near Wishaw. Applications for schedules, etc., must be sent to Mr. P. C. Smith, District Offices, Hamilton, by May 3.

WALTHAMSTOW CORPORATION, May 3.—Supply and erection of 2 500 kW motor-convertor. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, London, E.17; deposit £1.

CENTRAL ELECTRICITY BOARD, May 5.—Supply and erection of 33 kV transmission line crossing of the river Witham, Boston, under Mid-East England scheme. Specification (No. M.E.E.-S.L. 3) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

MANCHESTER CORPORATION, May 5.—Twelve months' supply of 125, 250, 500, 750 and 1 000 kVA static transformers. Specification (No. 278) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

ST. MARYLEBONE (LONDON) BOROUGH COUNCIL, May 5.—Supplies of l.t. and e.h.t. underground cables for 12 months. Tender form, etc., from the Chief Electrical Engineer, Town Hall, St. Marylebone, London, W.1.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, May 6.—Supply and erection of induction voltage regulator. Specification from Mr. R. W. Willis, 35, High Street, Cheadle; deposit £2 2s.

LOUGHBOROUGH CORPORATION, May 6.—Electric wiring of new fire station, and four firemen's cottages, etc. Specifications from Mr. W. Grainger, borough surveyor; deposit £1 1s.

TYNE IMPROVEMENT COMMISSION, May 6.—Supply of five 3-ton electric, hand travelling, semi-portal, level luffing cranes, for Prince Edward Dock. Specifications, etc., from Mr. Albert Blacklock, secretary, Bewick Street, Newcastle-on-Tyne; deposit £3 3s.

GLASGOW CORPORATION, May 7.—Work in connection with electric light installation at Carnwadrie housing scheme. Specifications and forms of tender from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

DUNDEE CORPORATION, May 10.—Supply and erection of two electrically driven, vertical spindle, main circulating water pumps, in pump room, in connection with Carolina Port generating station. Specification, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

BILSTON URBAN DISTRICT COUNCIL, May 12.—Electric light installation in Market Hall and Yard. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s. Only firms on the National Register are invited to tender.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.-G.S. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2: deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.-S.L. 2) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply of 33 kV and other cables, in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-G.C.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EPSOM URBAN DISTRICT COUNCIL, May 12.—Kiosks and converting plant (section I); e.h.t. and l.t. cables and laying (section II); and supply only of l.t. cables (section III). Specification and form of tender from Mr. H. W. Watts. Electricity Works, Depot Road, Epsom; deposit £2 2s.

GAINSBOROUGH URBAN DISTRICT COUNCIL, May 16th.—Twelve months' supply of paper insulated, lead covered, double steel tape armoured l.t. cables; and single-phase and three-phase meters. Further particulars from the Engineer and Manager, Electricity Department, Lord Street, Gainsborough.

CENTRAL ELECTRICITY BOARD, May 19.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme (London Area). Specification (No. S.E.E.-L.F.4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

STAFFORDSHIRE EDUCATION COMMITTEE, May 24.—Electric light installation in existing Infants' Council School, Pelsall, near Walsall, which is to be enlarged and converted into a Senior Mixed Council School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4th.—Supply and erection at Ironbridge generating station of storage battery equipment, comprising emergency stand-by lighting storage battery, 15 kW motor-generator set, battery-trickle charger, milking booster, and spare parts. Specification (No. 10) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phoenix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4th.—Supply and erection at Ironbridge generating station of works supply sub-station 3 300 V and 400 V metal clad switchgear. Specification (No. 9) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phoenix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1

Note.—An asterisk denotes that local representation is, in practice, essential.

BELGIAN GOVERNMENT TELEGRAPH AND TELEPHONE DEPARTMENT.—Ateliers de Constructions Electriques de Charleroi (A.C.E.C.), supply, laying and jointing of underground trunk telephone cables connecting (*a*) Brussels with Malines, Lierre and Antwerp, (*b*) Brussels with Hal and Mons, (*c*) Brussels with Termonde and Ghent. Total value of order over £450 000.

GHENT PORT AUTHORITIES, May 3.—Eight electric portal cranes. Cahier des Charges (No. W.4). (Reference A.X. 9 444).

VICTORIAN ELECTRICITY COMMISSION, May 5.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19.) (Reference B.X. 6 226.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

CAPE TOWN MUNICIPALITY, May 7.—Supply of l.t. ironclad switchgear. (Specification No. 492/1930.) Reference B.X. 6 293.)

CAPE TOWN MUNICIPALITY, May 7.—Supply of g.i. cross arms, stay rods, straps for insulators, bolts and nuts and porcelain reflectors, for street lamps. (Reference A.X. 9 424.)

DUBLIN BOROUGH COMMISSIONERS, May 8.—Automatic time-switches for public electric lamps. Specifications, etc. (5s.), from the Superintendent of Public Lighting, Tara Street, Dublin.

SOUTH INDIAN RAILWAY CO., LTD., May 9.—Supply of track bands, in connection with electrification of Madras suburban services. Specifications, etc. (10s., not returnable) from the Company's Offices, 91, Petty France, Westminster, S.W.1.

COPENHAGEN MUNICIPALITY, May 10.—Supply of switchgear and rectifier plant for Eskildsgade sub-station (Reference B.X. 6 271.)

COPENHAGEN MUNICIPALITY, May 12.—Supply and erection of two turbo-generators. (Reference B.X. 6 297.)

Digitized by Google

VICTORIAN ELECTRICITY COMMISSION, May 12.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13.—Supply of 110 kV, single-phase, oil immersed, self-cooled, transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13.—Supply of terminal strips (P. and T. 151/2 000). (Reference B.X. 6 209.)

CHILEAN MINISTRY OF MARINE, May 15.—Supply of three-metric ton travelling electric crane and four-metric ton stationary electric revolving crane. (Reference A.X. 9 186.)

POWER SECURITIES CORPORATION, May 15th.—Works and materials in connection with Pykara hydro-electric scheme, including transmission line towers (specification E2; price 22s. 6d.); (insulators E5; 7s. 6d.); steel-cored aluminium conductors (E6; 4s. 6d.); steel earth wire (E7; 4s. 6d.); guying materials (E13; 4s. 6d.); generating plant (E14; 37s. 6d.); crane (E16; 7s. 6d.); and transformers (E18; 7s. 6d.). General conditions, 3s. 6d. Specifications, etc., from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

CAIRO MAIN DRAINAGE DEPARTMENT, May 17.—Supply of electric lamps, etc., for one year. Particulars from the Department, 2, Sharia Maleka, Nazli.

VICTORIAN ELECTRICITY COMMISSION, May 19.—Twelve months' supply of triple braided, h.d. copper aerial cable. (Reference B.X. 6 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 20.—Supply and erection of one 25 kVA, three-phase, 400/230 V 50 cycle generator. (Reference B.X. 6 307.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of telegraph instruments (schedule C. 579). (Reference B.X. 6 248.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc.—(Reference A.X. 9 212.)

INDIAN STORES DEPARTMENT, May 26.—Two vertical and two horizontal centrifugal pumps, switchgear, etc. (Reference A.X. 9 416.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators, for Mangahao power scheme, section 215B. Reference B.X. 6 300.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of cable clamps for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

CAPE TOWN MUNICIPALITY, June 4.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 12.—Supply of 2 000 V switch units and l.t. switchboards (tender No. 1 649). (Reference B.X. 6 365.)

BULAWAYO MUNICIPALITY, June 13.—One 5 000 kW turbo-alternator, condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of indicators (schedule No. C.588). (Reference B.X. 6 333.)

Cable for Australian Government.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of multiple twin cable. (Reference B.X. 6 349.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of loading coil pots. (Reference B.X. 6 350.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24.—Supply of 110 kV outdoor steelwork and switchgear, for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of condensers (P. and T. 151/2 240). (Reference B.X. 6 308.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 8.—Supply of telephonists' telephones. (Reference B.X. 6 352.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 29.—Supply of auxiliary turbines and generating sets, for Arapuni power scheme—section 305. (Reference B.X. 6 356.)

VICTORIAN RAILWAY COMMISSIONERS, July 30.—Supply and erection of turbo-alternators, condensing plant and control gear. (Reference B.X. 6 355.)

Tenders Accepted.

BARNES URBAN DISTRICT COUNCIL.—Derby Cables, Ltd., cables, £1 660.

PITLOCHRY PUBLIC HALL.—J. Scott and Co., electric light wiring and fitting, £181.

AYR CORPORATION.—Darroch and Espie, electric light installation in 80 houses, £339.

HALKYN RURAL DISTRICT COUNCIL.—F. Lloyd, electric light wiring of 24 houses, £144.

ALLOA CORPORATION.—Ormiston Bros., electric light installation for housing scheme, £354.

KINGHORN CORPORATION.—Fife Electric Power Co., laying 93 yds. of excess electric cable, £11 12s. 6d.

PORTSMOUTH CORPORATION.—Barnes, Portsmouth, re-wiring Pier bandstand, £63 17s. (Recommended.)

WHITSTABLE URBAN DISTRICT COUNCIL.—Whitstable Electric Co., Ltd., public lighting, £855 per annum.

DUNFERMLINE CORPORATION.—J. W. Melville, electric light installation for housing scheme, £137 os. 6d.

EAST MALLING PARISH COUNCIL.—Maidstone Corporation, street lighting by electricity from October 1 next.

SWANSEA EDUCATION COMMITTEE.—General Electric Co., Ltd., provision of electric oven at Technical College, £70.

BRADFORD CORPORATION.—Thomas Bolton and Son, Ltd., supply of 20 drums of copper trolley wire, £1 403 1s. 1d.

HULL CORPORATION.—Siemens Bros. and Co., Ltd., supply of feeder cable for tramways department, £5 279 6s. 3d.

GLASGOW CORPORATION.—T. B. and J. A. Mathieson, electric lighting installations at various fire stations. (Recommended).

LEEDS CORPORATION.—Measurement, Ltd., and Meter Manufacturers Association, supply of electricity meters for 12 months.

HONLEY URBAN DISTRICT COUNCIL.—F. Platt, electrician's work in connection with the erection of 12 houses, in two blocks.

LONDON COUNTY COUNCIL.—Barlow Bros. and Co., Ltd., electric light installation at Broxholme House, Fulham, £462.

AIR MINISTRY.—Siemens Electric Lamps and Supplies, Ltd., supply of Siemens carbon filament, vacuum and gasfilled lamps.

ORSETT RURAL DISTRICT COUNCIL.—Wallwin Co., installation of electrical automatic pumping plant for sewerage scheme. £1 650.

WESTMINSTER CITY COUNCIL.—Barlow and Young, electric wiring of St. James' dwellings, Silver Street, £187. (Recommended.)

DEWSBURY CORPORATION.—Derby Cables, Ltd., l.t. cables for about six months; and Hackbridge Cable Co., Ltd., e.h.t. cables, £245.

HERNE BAY URBAN DISTRICT COUNCIL.—E. C. Spray, strip and flambeaux lighting, for central windscreen, £134 3s. 2d.

COULSDON URBAN DISTRICT COUNCIL.—Reliance Telephone Co., installation of internal telephone system at municipal offices, £200.

SOUTHEND CORPORATION.—Pirelli-General Cable Works, Ltd., h.t. cables, £23 219 14s. 9d.; Union Cable Co., Ltd., l.t. cables, £38 114 2s.

NANTWICH RURAL DISTRICT COUNCIL.—T. Brereton and Son, wiring and providing lamps for houses in Alpraham, Haslington, Shavington and Walgherton. £233.

Digitized by Google

WEST LANCASHIRE RURAL DISTRICT COUNCIL.—W. T. Henley's Telegraph Works Co., Ltd., works in connection with Tarleton and Hesketh electricity scheme, £16 753.

STOKE-ON-TRENT CORPORATION.—Barnett and Soans, wireless installation at isolation hospital, £67 7s. 6d.; English Electric Co., Ltd., supply of five electric motors, £116 1s.

SHOREDITCH (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., supply of sub-station switchgear, £9 871 5s.; Switchgear and Cowans, Ltd., supply of feeder panels, £1 701.

WALSALL CORPORATION.—Automatic Telephone Manufacturing Co., Ltd., provision of Strowger telephone system at new electricity offices and showrooms, £334 12s. 11d. (Recommended.)

HULL CORPORATION.—Supply of electricians' material for 12 months: B. Danby and Co., Ltd., General Electric Co., Ltd., Clark and Graham, Edison Swan Electric Co., Ltd., and T. B. Morley, Ltd.

BEXHILL CORPORATION.—W. T. Glover and Co., Ltd., supply of 1 600 yds. of e.h.t. cable in connection with Northern sub-station, £1 457 10s.; W. T. Henley's Telegraph Co., Ltd., two feeder pillars, £141 15s. (Both recommended.)

BATTERSEA (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., switch for new feeder at Nine Elms sub-station, £773 10s.; two switches for existing feeders, £1 547; and switches for 10 000 kW set and two switches for reactors, £6 563 15s.

BRADFORD CORPORATION.—Aiton and Co., Ltd., high pressure steam piping and John Spencer, Ltd., feed pump delivery piping, for Valley Road power station; Peter Brotherhood, Ltd., supply of air compressor for Valley Road power station; Scholey Construction Co., Ltd., supply of Lacy Hulbert automobile air compressor.

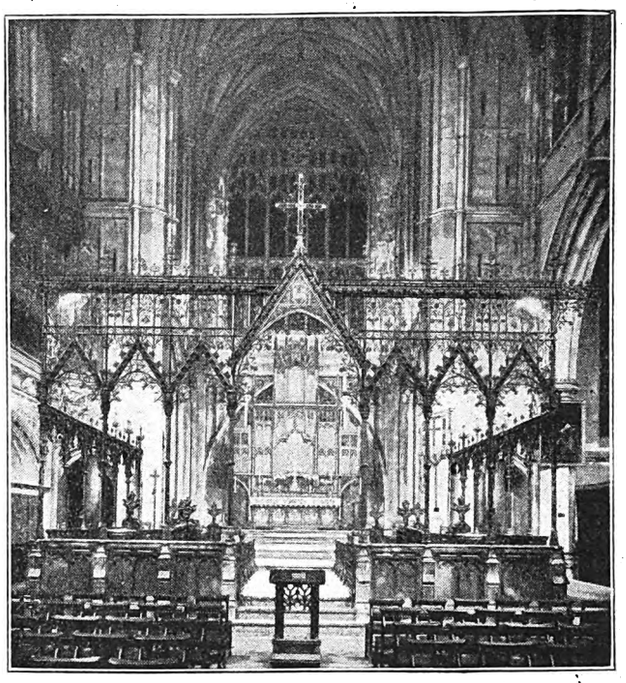
GENERAL POST OFFICE.—Cable manufacture, supply, drawing-in and jointing, Liverpool-Colwyn Bay, British Insulated Cables, Ltd.; London-Liverpool (London-Fenny Stratford section and Fenny Stratford-Birmingham section), Standard Telephones and Cables, Ltd.; Reading-Newbury, Siemens Bros. and Co., Ltd.; telephone exchange equipment, Temple Bar, London, Bishopsgate, London, E.C., and Walthamstow, Automatic Telephone Manufacturing Co., Ltd.; Electric lift, Cardiff Head Post Office, J. Bennie, Ltd.

LIVERPOOL CORPORATION.—Twelve months' supplies: cables. compounds and tapes for street mains, Callender's Cable and Construction Co., Ltd., British Insulated Cables, Ltd., and Berry, Wiggins and Co., Ltd. Alternating current electric motors and starting gear, Crompton, Parkinson, Ltd., English Electric Co., Ltd., Brooks Motors, Ltd., and Erskine Heap and Co. Electric cookers and kettles, Automatic Telephone Manufacturing Co., Ltd. Incandescent lamps, Commercial Electric Co., Ltd., Tungstalite, Ltd., and L. Andrew and Co. Meters, Ferranti, Ltd. Insulated cables, Mersey Cable Works, Ltd., and Liverpool Electric Cable Co., Ltd. (All recommended.)

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Extra high-tension and low-tension switchgear for Arlington Road sub-station. Tenders received: low-tension switchgear: Adamson, Green and Co., Ltd., manual operated, £3 650; Aeonic Radio, Ltd., £4 500; Crompton, Parkinson, Ltd., £3 760; Electric Construction Co., Ltd., £2 900; English Electric Co., Ltd., £3 628; Erskine, Heap and Co., Ltd., £3 820; Ferguson, Pailin, Ltd., £3 575; Harland Engineering Co., Ltd., £3 057; Lucy and Co., Ltd., £2 875; Walsall Electrical Co., Ltd., £3 350; B. Thomas, manual operated, £2 675; remote control, £2 831; British Thomson-Houston Co., Ltd., £4 482 and £8 923; General Electric Co., Ltd., £5 795 and £11 131*; Johnson and Phillips, Ltd., £4 910 and £9 900; Metropolitan-Vickers Electrical Co., Ltd., £4 157 and £4 757; New Switchgear Construction Co., Ltd., £5 028 and £9 978; Park Royal Engineering Co., Ltd., £3 490 and £3 850; A. Reyrolle and Co., Ltd., £2 675 and £2 831; J. G. Statter and Co., £2 641 and £3 195; Switchgear and Cowans, Ltd., £2 675 and £2 831; Whipp and Bourne, Ltd., £3 126 and £3 690. High-tension switchgear: English Electric Co., Ltd., manual operated, £4 371; B. Thomas, manual operated, £3 023; remote control, £5 816; British Thomson-Houston Co., Ltd., £4 407 and £5 174; Ferguson, Pailin, Ltd., £4 347 and £4 907; General Electric Co., Ltd., £4 313 and £5 292*; Johnson and Phillips, Ltd., £5 300 and £6 226; Metropolitan-Vickers Electrical Co., Ltd., £4 798 and £6 979; New Switchgear Construction Co., Ltd., £5 187 and £6 329; Park Royal Engineering Co., Ltd., £5 065 and £6 153; A. Reyrolle and Co., Ltd., £3 023 and £5 816; Switchgear and Cowans, Ltd., £4 236 and £7 321. *Recommended at reduced estimate of £14 798.

CHURCH LIGHTING.

IT is not to be expected that the designers of ecclesiastical edifices, built in the days when electric light was practically unknown, should have looked forward to the possibility of electrical illumination from concealed sources, or, for that



A general view of the lighting at St. Mary's Church, Portsea.

matter, any system of electrical illumination whatsoever. The lack of this foresight, though pardonable, does, however, present difficulties to those illuminating engineers who specialise in church lighting. Quite apart from the distribution of light for illumination purposes, there is the all-important question of the designing and placing of the apparatus, and where it is impossible to conceal the lighting units, a presentable and sympathetic system must be employed.

An example of the efficient solution of such a problem is St. Mary's Church, Portsea. The lighting of this large church, seating 2 000 people, presented some unusual aspects. Although the church is in many ways of cathedral proportions, it did not readily lend itself to any systems hitherto employed by the engineers for cathedral lighting. With a roof height of 70 ft. and nave 120 ft. long, and with a general lack of adequate concealment for lighting equipment, there was some difficulty in determining the best way of handling the situation. Decorative pendant fittings were not only unsuitable for the building, but prohibitive on the score of cost. Eventually it was decided to employ B.T.H. Type 1 018 wall lanterns, placed just below the clerestory windows on the north and south walls of the nave. Each lantern is equipped with a 500 W regular gasfilled lamp in a modified form of rectangular angle reflector, and the front of the lantern is glazed with suitable glass, the density of which is graded so that, while adequate protection is afforded to the eye from direct vision of the lamp filament, the absorption is kept within a reasonable limit.

The lanterns are of a design which is in keeping with the surroundings, and the artificial lighting is not only abundant in quantity but of a satisfactory quality, and comes from a position very similar to that of the daylight, thus preserving the natural shadow effects. The aisles, choir and sanctuary are lighted with B.T.H. Type 455 projectors, employing 300 W regular gasfilled lamps.

The lighting scheme was designed by the Illuminating Engineering Department of the Edison Swan Electric Co., Ltd., of 155, Charing Cross Road, London, W.C.2, and the contractors were Messrs. Barnes and Co., of 85A, Palmerston Road, Southsea.

Wigan T.C. has applied for a loan of £25 000 to cover expenditure on mains, switchgear and transformers for three years.

WORK IN PROSPECT.

ABERDEEN.—Houses (200), at Torry, for T.C. Particulars from Council's Architect.

ASKRIGG.—Grammar school, 100 places. Particulars from Mr. J C. Wrigley, Education Offices, Northallerton.

BARNSLEY.—Council school, 640 places. Particulars from Cawthorne and Coles, Regent Street, Barnsley.

BARNSLEY.—Welfare centre. Particulars from Mr. H. Taylor, Church Street, Barnsley.

BEDFORD.—Conversion of 12, Rothsay Place into boarding house, for Bedford School. Particulars from Mr. O. P. Milne.

BILLERICAY.—Additional accommodation at Isolation Hospital. Particulars from Mr. Hugo R. Bird, architect, Brentwood.

BLACKPOOL.—New club premises in St. Anne's Road, South Shore. Particulars from Slater and Parkinson, architects, 20, Birley Street, Blackpool.

CHESTERFIELD.—Additions to various schools. Particulars from Wilcockson and Cutts, 12, Saltergate, Chesterfield.

CHESTERFIELD.—Extensions to hospital. Particulars from Jackson and Fryer, 6, Stephenson Place, Chesterfield.

CHESTERFIELD.—Central Baths. Particulars from the Borough Surveyor, Municipal Offices, Chesterfield.

CHESTERFIELD.—Public abattoir. Particulars from the Borough Surveyor, Municipal Offices, Chesterfield.

COLWYN BAY.—Houses (20), on Minydon Estate. Particulars from Mr. T. B. Gorst.—Bungalows (18), in Penrhyn Avenue. Particulars from Wooller and Sons.

CROYDON.—Firemen's quarters, etc., for the B.C. Particulars from Borough Engineer.—Houses (50), at West Way. Particulars from M. Brown and Sons (Croydon), Ltd.—Houses (84), for T.C. on Mitcham Road Estate. Particulars from Borough Engineer.

DEWSBURY.—Extensions to Technical College. Particulars from Mr. T. Blakeley, Town Hall, Dewsbury.

DONCASTER.—Houses (24), for R.D.C. Particulars from W. B. Crabtree, surveyor.

ELY, CAMBS.—Public hall and offices at 26, Market Street, for Loyal Order of Ancient Shepherds. Particulars from Mr. J. W. Merrywest.

FINCHLEY.—School, on Woodhouse Estate. Particulars from Surveyor.

GOLCAR.—Alterations to co-operative premises. Particulars from Lunn and Kaye, Milnsbridge, Huddersfield.

GORTON.—New store premises in High Street. Particulars from Thorne and Collier, architects, 66, Deansgate, Manchester.

HOUNSLOW.—Houses (138), Worton Estate. Particulars from G. Wimpey and Co.—Houses (124), Crossways Estate. Particulars from Perrys (Ealing), Ltd.

HUDDERSFIELD.—Proposed public washhouses. Particulars, Mr. L. Smith, 26, Ramsden Street, Huddersfield.

KING'S LYNN.—Alterations to "Volunteer Stores" public-house. Particulars from Steward and Patteson.

KIRKHEATON.—Extensions to co-operative shop premises. Particulars from the Architect's Department, C.W.S., 1, Balloon Street, Manchester.

LIVERPOOL.—Houses (1 400), for Corporation. Particulars from Borough Engineer.

MANCHESTER.—Alterations and additions to Constitutional Club in St. Ann Street. Particulars from Mr. P. E. Barker, 32, King Street, Manchester, architect.

MELKSHAM.—Extensions, Avon India Rubber Co., Ltd., to cost £30 000. Particulars from the contractors, Blackford and Son, Calne.

NEWCASTLE-UPON-TYNE.—Houses (547), on St. Anthony's Estate. Particulars from Housing Architect, 18, Cloth Market, Newcastle.

PONTEFRACT.—School premises. Particulars from the Education Officer, County Hall, Wakefield.

PONTLLIW.—School, for Glamorgan C.C. Particulars from County Hall, Cardiff.

PORTSMOUTH.—Erection of two new blocks at Mental Hospital, Milton. Particulars from Mr. E. H. Harvey, architect, The Square, Portsmouth.

ROCHESTER.—Houses (40) and flats (five blocks), for T.C. Particulars from Mr. W. Law, city surveyor.

SALFORD.—Houses (36), at Gerald Road, Pendleton, for T.C. Particulars from City Engineer, Town Hall.

ST. ALBANS.—School to accommodate 400, together with handicraft centre, etc. Particulars from Mr. A. E. Prescott, county surveyor, Hatfield, Herts.

TRADE PUBLICATIONS.

THE "Bastian" water heater is dealt with in a new issue by the BASTIAN METER CO., LTD., Farnham Road, Trading Estate, Slough.

"How Eighty Million Operations were Saved in 1929" is the title of a leaflet issued by KENRICK AND JEFFERSON, LTD., West Bromwich.

New price lists and descriptive leaflets relative to their products have been prepared by A. C. COSSOR, LTD., Highbury Grove, London, N.5.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.1, has published a folder relative to a new photo-electric cell just put into manufacture.

The SAXONIA ELECTRICAL WIRE CO., LTD., Roan Works, Greenwich, London, S.E.10, has issued list No. 11 029, concerning the subject of mercury switch tubes.

Specification No. A-200, describing and illustrating "Tonk a.c. motors, two and three-phase, has been published by CROMPTON PARKINSON, LTD., Guiseley, Leeds.

A coloured list of "Electa" table lamps of Royal Stanley Jacobean ware has been sent to us by the ELECTRIC ART SHADES (1928), LTD., Feering Factory, Kelvedon.

The METROPOLITAN - VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, has issued publication 7 452/1, dealing with the self-contained turbo-generating unit developed in 1927.

The technical details concerning the flood-lighting of a football match played at Mansfield recently are the subject of a new leaflet by PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs, have issued publication P.253, dealing with copper sheet, sections; aluminium sheet, sections and matting. The new brochure replaces P.242.

A new leaflet describing "Saia" automatic time switches has been issued by the sole British agent, The SIFAM ELECTRICAL INSTRUMENT CO., LTD., Bush House, Aldwych, London, W.C.2.

The "Pavilion of Light" at the Ideal Home Exhibition, London, is described and illustrated in booklet form, issued by the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2.

The LIVERPOOL ELECTRIC CABLE CO., LTD., Linacre Lane, Bootle, has published a new illustrated price list, reference L.O.S., dealing with cables and accessories suitable for overhead distribution and service systems.

List No. 135, dealing with indicating and recording liquid level gauges, and list P.24, relative to air compressor sets, have been issued by the DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex.

A well-produced brochure devoted to combustion steam generator units has been prepared by the COMBUSTION STEAM GENERATOR, LTD., Derby. It is well illustrated, and gives details of a number of the more recent power station installations.

KORTING AND MATHIESON ELECTRICAL, LTD., 711–715, Fulham Road, London, S.W.6, have issued list No. D 17130 relative to dust and moisture proof Karden domestic fittings and list No. F1928a dealing with reflector fittings for industrial lighting.

The latest publications of MARCONI'S WIRELESS TELEGRAPH CO., LTD., Marconi House, Strand, London, W.C.2, include leaflet No. 1 113, dealing with type S.100 short-wave transmitters, and leaflet No. 1 111, describing type AD 6m "Universal" aircraft telegraph-telephone sets.

The first publication of the NATIONAL ACCUMULATOR CO., LTD., which gives details of the amalgamation of Peto and Radford, Ltd., and the Hart Accumulator Co., Ltd., has been sent to us. The issue outlines future advertising policy of the merger company and copies of the publication may be obtained from the Publicity Department, 50 Grosvenor Gardens, London, S.W.1.

DONOVAN AND CO., 47, Cornwall Street, Birmingham, have issued a comprehensive catalogue containing 160 pages descriptive of electric control apparatus for circuits up to 660 V. This catalogue is fully illustrated and contains technical descriptions of all Home Office "Safuse" switch and fuse gear, industrial switchboards, open type switchboards, combined switch wall sockets and plugs for factory and dockyard use, isolating links to comply with Home Office regulations and startors and control gear for a.c. and d.c. circuits. Every article in the catalogue is priced and the publication contains a large amount of information which should be of interest to every electrical engineer and architect.

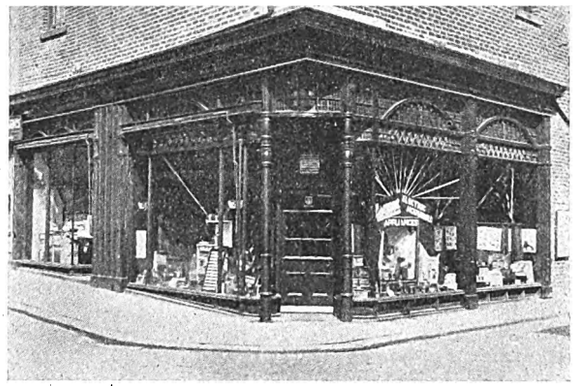
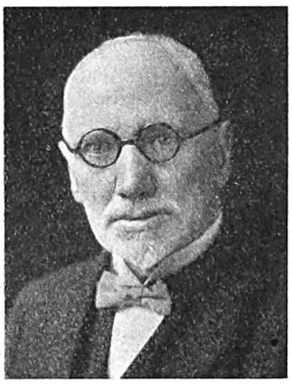
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Among those attending at the opening of the Central Scotland Electricity Scheme on Wednesday were the ex-Minister of Transport, Lt.-Col. Rt. Hon. Wilfred Ashley (left), Sir John Snell, chairman of the Electricity Commission (centre), and Mr. Herbert S. Morrison, Minister of Transport (right): See page 543.

Mr. Edwin Seddon, engineer and manager, Edinburgh, who is responsible for the new extensions at Portobello. See page 543.



The new showrooms of the Morecambe and Heysham Electricity Department which were opened on April 25. The corner shop has been fitted as a general showroom, while the adjoining shop has been converted into a domestic showroom.



A recent portrait of Councillor John Couston, convener of the Electricity Committee of the Edinburgh Corporation. See page 543.

Sir Andrew Duncan, chairman of the Central Electricity Board, was also at Edinburgh on Wednesday.

Mr. John A. Sumner, who has been appointed distribution engineer to the West Midlands Joint Authority.

Sir Archibald Page, chief engineer to the Central Board, also attended the opening of the Scottish Grid.

ELECTRICITY SUPPLY.

Inauguration of Supply at Dunoon—Islington Extensions—Electric Power in Ontario—New Plant for Dorchester—Italian Enterprise in Turkey—Commissioners do not Approve Procedure by Licence.

CROYDON electricity department is to extend mains at a cost of £3 966.

Wick T.C. has borrowed £11 000 for extensions of its electricity scheme.

Glasgow Corporation Electricity Committee has authorised mains extensions at a cost of £14 500.

Dunoon's new electricity undertaking, which has cost £40 000, will be officially inaugurated on June 14.

Whitehaven T.C. has applied for a loan of £900 for relaying mains in a portion of the borough, as an unemployment scheme.

Islington (London) Finance Committee recommends the B.C. to borrow £36 000 for e.h.t. transmission mains and distributions.

Poplar Electricity Committee has obtained sanction for loans of £23 710 for services, £10 391 for meters and £5 899 for wiring installations.

An application by the Scottish Midlands Electricity Supply Co. to Alva T.C. for permission to erect a number of overhead lines in the town has been refused.

A public meeting of residents in the Strone, Kilmun and Blairmore districts of Argyll has been called to consider a proposed electricity scheme for the district.

Taunton Corporation has applied for a loan of £9 500 for additional boiler and economiser, forced and induced draught fans, pipework, etc., for the electricity works.

Dartford Electricity Committee is to erect a sub-station in Shepherd's Lane, at a cost of £3 248, in connection with supplies to the Heath Close, Heath Farm and Whitehill estates.

It is stated that a definite announcement regarding the possible erection of a power station in the Swansea district may be made by the Central Electricity Board about the end of May.

The assets of the Dominion Power Co., including several tramways and power transmission plants in South-Western Ontario, are to be sold to the Ontario Government for $21 250 000.

The Wallingford and District Electric Supply Co. is now in a position to supply electricity to the parish of Cholsey, and the P.C. has submitted a scheme of street lighting for the consideration of the R.D.C.

Stoke-on-Trent Corporation Finance Committee has received from the North Midlands Joint Electricity Authority the money for the purchase of the Corporation's power house, etc., amounting to £560 504 7s. 7d.

The approval of the Electricity Commissioners is being sought by Irlam U.D.C. of its proposal to enter into an agreement with the Stretford and District Electricity Board for a supply of electricity for Irlam and Cadishead.

Marylebone (London) Electricity Committee has entered into an agreement with Holloway's Properties, Ltd., for the installation of rising mains at Hanover House, High Street, and Wellington House, Barrow Hill Road, at a cost of £784.

Walsall Electricity Committee is to extend mains in Well Lane to supply 30 council houses, at an estimated cost of £210. The Corporation Works Committee is to erect additional lamps along the main road from Bloxwich to Walsall, at a cost of £216.

Swindon T.C. is about to extend its supply of electricity to the parish of Stratton St. Margaret. A supply is to be given to Upper Stratton by October and to Lower Stratton later. The charge for energy will be 25% above that in force at Swindon. The Corporation is prepared to spend £25 000 on laying cables.

Bedford Corporation has obtained sanction to borrow £15 000 for the development of the assisted wiring scheme.—The Electricity Committee reports that the average coal consumption per kWh for the years ended March 31, 1930, 1929 and 1928 was: 1930, 2·008 lb. (0·212d.); 1929, 2·386 lb. (0·2375d.); 1928, 2·44 lb. (0·273d.).

The Steyning Electric Light Co. has informed Henfield P.C. that, on the Special Order being granted, a high-pressure overhead cable will be carried from Hurstpierpoint, through Henfield, to Steyning, and will enable a supply of electricity to be given in Henfield this autumn. The Council has sanctioned the erection of the cable in the parish.

The North Wales Power Co. has applied for a grant to enable the company to complete the scheme for a supply of electricity to Newtown, Montgomeryshire. If a grant is not forthcoming the company does not propose to complete its scheme as far as Newtown, and in that case would not object to the Council undertaking its own scheme.

The Electricity Commissioners have informed the Dorchester T.C. that there appears to be no alternative to the installation of additional plant in the generating station, and that they will be prepared to give favourable consideration to an application for consent to the provision of plant of sufficient capacity to meet requirements for the next three years.

Southend Corporation has had under consideration suggested rules with regard to the wiring of premises, which have been prepared by the Borough Electrical Engineer, who has now been requested to report on the question of establishing a showroom. The chairman of the committee, Coun. Le Masurier, states that there is no intention of entering into competition with private traders.

It is reported that the company formed last year by the Credito Italiano, the Banca Nazionale and the Credito Banco Roma, Milan, for fostering Italian enterprises abroad has obtained a concession for the construction of works and the supply of electricity to several towns in Turkey. A company under the title of the Societe Turque d'Electricite is to be formed with a capital of £T1 000 000.

Arrangements have been completed for the development of water power for mining and other industries in the Sudbury district of Northern Ontario. These sites are capable of producing 100 000 H.P. The Legislature has voted $1 300 000 to be expended by the Hydro-Electric Power Commission. Of this total, $1 000 000 will be spent on actual development, and the balance on transformer stations and power lines.

Fulham (London) Electricity Committee has had under consideration the question of flood-lighting the electricity showrooms. The Borough Electrical Engineer has prepared a scheme, in conjunction with the makers of the necessary apparatus, which, in the opinion of the committee, will give satisfactory results.—Sub-stations are to be established at North End House, West Kensington, and Rivermead Court, Hurlingham, at the cost of £5 313.

Col. F. Gordon Tucker held an inquiry last week, on behalf of the Ministry of Transport, into the objections of the Alvaston and Boulton Urban Council to the proposal of the Central Electricity Board to erect an overhead cable in the Council's area. Col. N. H. Firmin, for the Board, said that it would not be possible to divert the line without great expense, amounting to about £10 000. All the other local authorities concerned had raised no objection.

Swansea Corporation's electricity mains are to be extended at an estimated cost of £1 090.—A reduction of 25% in the rental of the motors is to be made.—The Borough Electrical Engineer has reported regarding the risks involved through the unauthorised connecting up of wireless eliminators and other apparatus. A notice is to be published in the local Press calling attention to the necessity for giving notice to the Corporation of any additional apparatus connected.

It was suggested at a recent conference of North Wales local electricity authorities that the North Wales and South Cheshire Joint Electricity Authority should try to secure a simplified form of licence for the supply of electricity by local authorities, instead of putting them to the expense of obtaining a Special Order. The Electricity Commissioners have intimated to the Authority that they do not feel that a sufficiently useful purpose would be likely to be served by pursuing the question of initiating procedure by licence.

The Grampian Electricity Co. has drawn up for submission to the Electricity Commissioners a new scheme for the supply of electricity in an area which includes the counties of Aberdeen, Banff, Kincardine, Moray, Nairn, and parts of Inverness and Ross and Cromarty. The area is 5 500 square miles in extent, and the population is 280 000. It comprises 160 parishes and 26 burghs. The maximum price proposed is 8d. for burghs and 1s. for all other places. The energy required for the new area will be generated at the company's hydro-electric works nearing completion at Loch Rannoch.

FINANCIAL INTELLIGENCE.

Accounts of Electrical Manufacturing and Equipment Companies, with Dividends, Quotations and Yields.

By "AUDITOR."

BANK RATE (1929–30).

1929.			1930.	
Feb. 7 ..	5½%	Nov. 21 ..	5½%	Feb. 6 .. 4½%
Sept. 26 ..	6½%	Dec. 12 ..	5 %	Mar. 6 .. 4 %
Oct. 31 ..	6 %			Mar. 20 .. 3½%

CO-OPERATION in certain directions calculated to more successfully meet foreign competition is reflected in the profits realised by many of the companies concerned, and this movement is likely to be carried further in the current year. An example of electrification in its latest form is the formation by Sir W. G. Armstrong Whitworth (Engineers), Ltd., of a Diesel electric traction department composed of experts who will investigate, on behalf of railway executives and engineers, the application of the Diesel electric form of traction to specific systems.

The following table shows the profits made by certain electrical manufacturing and equipment concerns during the past financial year, the dividends paid on the different issues, and some recent quotations and yields :—

ANALYSIS OF RESULTS OF CERTAIN ELECTRICAL MANUFACTURING AND EQUIPMENT COMPANIES WHOSE 1929 ACCOUNTS HAVE BEEN SUBMITTED.

Reyrolle (A.)	78 892	98 021	176 913	75 680	12½	60/3	1	4⅛	Same dividend for past ten years.

The credit balance of £66 539 shown by accounts of CRYSTALATE GRAMOPHONE RECORD MANUFACTURING CO., LTD., for year ended January 31, 1930, compares with net profi, £88 883, during previous 16 months. Features of 1928–29 and 1929–30 accounts are compared below :—

	Jan. 31, 1930.	Jan. 31, 1929.
Preference Dividend	£8 000	£7 463
Ordinary Dividend	45 000	62 500
General Reserve	10 000	5 000
Investments in Associated Companies, at Cost ..	166 241	143 109
Cash	56 972	125 946
Debtors	38 155	35 938
Stocks and Stores	49 375	46 156
Trade Creditors	53 254	32 945
Carried forward	12 582	13 920
Dividend	33⅓%	41⅔%

At 3s. 6d. the 1s. ordinary shares yield 9½%, while the 10s. 8% preference shares at 9s. return nearly 9%.

The output of the big electrical combine known as ASSOCIATED ELECTRICAL INDUSTRIES, LTD., was satisfactorily maintained during 1929, and the dividend of 6% is maintained on a much larger capital. Some of the principal final figures are compared below :—

	Dec. 31, 1929	Dec. 31, 1928.
Profit	£365 961	£258 772
Debenture Interest	41 454	41 454
Written off Works, Plant, etc.	62 659	56 655
Preference Dividend	76 449	78 915
Ordinary Dividend	162 698	54 573
To General Reserve	15 273	25 000
Ordinary Share Capital	3 498 900	2 314 034
Dividend	6%	6%

At 27s. 3d. the ordinary shares yield 4⅓%, while the 4% mortgage debenture stock at 75 returns 5⅓% At recent quotations the 8% preference shares yield about 6%.

COMPANY NEWS.

Decline of American Stock Quotations—Ever Ready Profits Still Improving—Progress of British Power and Light Corporation—Reports and Dividends.

A FEATURE of the past week's changes in electrical share prices is the weakness of the transatlantic favourites. Hydro Electric Securities have fallen below 50 again, and International Holdings to nearly 6½. General Electric sellers have predominated over buyers and American Telephone and Telegraph stock is 5 points lower at 255. Radio Corporation of America shares are also easier at about 65½. Cables and Wireless stocks have again been unloaded, and the 7½ per cent. "A" ordinary has dropped four points to 52½, and the "B" ordinary 1½ points to 27½, and the 5½ per cent. cumulative preference stock a couple of points from 96½ to 94½. Anglo-American Telegraph ordinary stock has eased a point to below 60. Marconi International Marine shares remain unchanged at 41/s. 3d.

Associated Electrical Industries shares have shed 6d., and are quoted 28s. The 7 per cent. debentures of the British Thomson-Houston company have been marked down 3 points to 102½. Crompton Parkinson 8% preferences are nearly 2s. lower at 22s. 6d., and Henley's ordinary have lost last week's fractional improvement. Callender's Cable "B" preference are under 27s., with a fall of 7½d. Exceptions to the weak tendency in the manufacturing group are the 10s. shares of the National Electric Construction Company, which have changed hands at over 24s.

A number of supply shares show improvement, Chelsea and County of London in spite of deduction of the dividends. Both the Midland issues are up, and Whitehall preference have put on threepence. South Metropolitans and London Electricity Supply show small declines. Victoria Falls shares have touched 62s. 6d.

Calcutta Tramways shares have reacted sharply to the Indian disturbances; the ordinary shares have dropped during the week from nearly 14s. 6d. to under 11s., and the 5 per cent. preference shares from 12s. 6d. to 10s. A rise of a point has occurred in British Columbia Electric Railway preferred stock and Rio de Janeiro Tramways bonds. London Electric Railway preference and debenture issues are easier.

Directors' Reports, etc.

HERBERT MORRIS, LTD.—Intm. div. at rate of 10% p.a. is announced.

• HASLAM AND NEWTON, LTD.—Paymt. of half yearly div. on cum. pref. shs., due May 1, is postponed.

BRUSH ELECTRICAL ENGINEERING CO., LTD.—Directors recommend paymt. of div. of 10% for past year. Surplus under co-partnership scheme is £2 787.

GATESHEAD AND DISTRICT TRAMWAYS CO.—Rev. for 1929, £123 999, increase £2 594; net pft., £25 516, agst. £18 288. Ord. div., 8%, agst. 6%. Fwd. £20 308, agst. £18 895.

WAYGOOD OTIS, LTD.—Pft. for 1929, £71 061, agst. £77 254, Fin. div. 7½%, makg. 10% (same) for year. To contingencies res., £25 000; to pensions res., £6 000. Fwd. £17 631, agst. £15 570.

IMPERIAL TRAMWAYS CO., LTD.—Directors announce that the assets of the company have been realised, and mtg. has been called for May 12 to consider resolutn. to wind up company voluntarily.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD.—Fin. divs. recommended for year ended Dec. 31, 1929, 3½% on pref. shs., less tax, makg. 7% for year, and 8% on ord. shs., tax free, makg. 12% for year.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST, LTD.—Directors have decided to recommend bonus of one £1 6% cum. red. pref. sh. for every ord. sh. held, and fin. div. of 6% in respect of year ended Dec. 31, 1929, payable on May 27.

SOUTH WALES ELECTRICAL POWER DISTRIBUTION CO.—Accts. for 1929 show credit blce., £93 666, agst. £89 060. Deb. int., £64 069, leavg. £29 597, agst. £24 990. To depreciatn. res., £15 000; to South Wales Power Co., £8 331, agst. £3 724.

TYNEMOUTH AND DISTRICT ELECTRIC TRACTION CO., LTD.—Rev. for 1929, £63 484, increase £1 209; net pft., £1 545, agst. £1 421. Div. on pref. to Sept. 15 last has been paid, but directors are unable to recommend div. on pref. from that date. Fwd. £795, against £330.

WESTERN UNION TELEGRAPH CO.—Gross revs., includg. divs. and int., for 3 months ended March 31, 1930, $33 578 027, agst. $35 642 794 in correspondg. period of 1929; total exes., $31 062 663, agst. $31 025 918; int. on bonded debt, $102 856, agst. $902 516; net income $1 486 803, agst. $2 714 360.

SOUTH WALES POWER CO., LTD.—Income for 1929, £60 731, agst. £58 205. Int. pref. div. and fees absorbed, £57 560, agst. £57 728; fwd., £24 354, agst. £21 182. A fwd. policy in regard to prices has been adopted, and resulted in increased power supplies, but some time must elapse before full advantage of this is secured.

PYE RADIO, LTD.—Pft. for year ended March 31, 1929, £71 510. After providg. for directors' fees and salaries, etc., and £5 830 for depreciatn., net blce. is £62 686, plus £2 788 brt. in. Pfd. cap. of £150 000 receives participatn. paymt. of 2%, makg. 10%, less tax, while dfd. cap. of £30 000 receives 100% less tax. Fwd. £12 022.

CORK ELECTRIC SUPPLY CO., LTD.—Rev. for 1929, £149 100, agst. £136 328; pft. £24 164. Fin. div. on ord., 5%, makg. 10% for year. Fwd. £17 220, agst. £14 170. Irish Free State Electricity Supply Board acquired company's electric lightg. undertakgs. on April 3, price to be paid being £496 500. Company still operates tramways.

CABLE, TELEPHONE AND GENERAL TRUST.—The directors have submitted to the shhldrs. proposals to increase the authorised cap. from £710 000 to £1 100 000, by the creatn. of 250 000 pref., 5 000 "A" pref. and 135 000 ord. £1 shs., to increase rate of annual div. on pref. shs. from 6% to 7% cumulative, and to rename the "A" pref. shs. "pfd. ord. shs."

URBAN ELECTRIC SUPPLY CO., LTD.—Net pft. for 1929, £102 224, agst. £100 832, plus £22 953, agst. £22 219 brt. in. To res. for depreciation, £30 000; to gen. res., £15 000. Fin. div. on ord., 4%, makg. 7%; to staff fund, £2 000. Fwd. £26 029. Pfts. of subsidiary companies, to extent to which divs. have been declared, have been brt. into accts. of hldg. company.

BABCOCK AND WILCOX, LTD.—Net pft. for 1929, £674 316, agst. £734 902, plus £118 363 brought in. To staff pensn. fund, £8 786; to res. £48 000. Fin. div. recommended on ord. shs., 8%, less tax, makg. 15% for year. Fwd. £75 992. Reductn. of pfts. is in large measure accounted for by exceptnl. accumulatn. of uncompleted orders. Very satisfactory volume of orders in hand.

AKTIEBOLAGET ELEKTROLUX.—Total income for 1929, Kr. 10 294 801, decrease Kr. 639 002; net pft. Kr. 8 539 983 (£47 443), decrease Kr. 583 768 (£32 431), plus Kr. 700 968 brt in. To res., Kr. 1 000 000. Div. 9%. Fwd. Kr. 1 565 952. Towards close of year, company brt. out a vacuum cleaner of a new type, and there are good prospects of increased turnover in this branch.

EVER READY CO. (GREAT BRITAIN), LTD.—Directors recommend paymt. of following fin. divs. for year ended March 31, 1930: On pref. shs., 5%, makg. maximum of 10% for year; on ord. shs., 25%, makg. 35% for year (same on increased cap.); payable June 2. Accts. show, subject to completion of audit, net pft. £244 754, agst. £210 167. Reserves and carry fwd. £534 198, agst. £500 696.

PIEDMONT HYDRO-ELECTRIC CO.—The Bancamerica-Blair Corporation and the Chase Securities Corporation offered for sale in New York on Monday $10 000 000 (£2 000 000) 30-year 6½% bonds of the Piedmont Hydro-Electric Co. An issue of Swiss francs 25 000 000 bonds of the company was made simultaneously in Switzerland by the Credit Suisse, and in Holland by Mendelssohn and Co. and the Nederlandsche Handels-Maatschappij.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Total rev. for 1929, £267 553, agst. £258 367; blce. to net rev. acct., £124 380, agst. £115 385, plus £95 397 brt. in. After provisn. for contributns. to contingency fund, res. for taxatn. (£15 000), sinkg. funds, and change of system acct. (£35 000), blce. is £142 651. Pref. divs. and intm. ord. div. have been paid, and fin. div. of 5½% on ord. shs., makg. 8½% for year, is recommended. Fwd. £98 861.

EINSTEIN'S ELECTRO-CHEMICAL PROCESS, LTD.—Net deficit on period from formatn. of company on Dec. 15, 1928, to Dec. 31, 1929, £21 554. Factory at Slough was only in partial operatn. at date of closing accts. Factory is now fully equipped, and work is in active progress, while factory at Acton has been punctually completed. Fully paid ord. cap., £324 000. Total called up on 8% pref. shs., £187 500. Prelim. exes., £42 251, plus exes. of additnl. issue, £1 207.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—Income for 1929, £81 534, agst. £75 065. Blce. carried to res. acct., £45 421, agst. £46 486, plus £4 281 brt. in. After provisn. for sinkg. fund instalmt. and contributns. to change-over expenditure acct., £1 500; res. for depreciatn., etc., £10 000; and gen. res., £10 000, blce. available for distributn. was £26 795, out of which int. ord. div. of 4% has been paid. Fin. div. of 7% on ord. shs. is recommended, makg. 11% for year. Fwd. £4 795.

SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD.—Rev. acct. for 1929 shows credit blce., £209 441, plus £152 076 brt. in. Int. on deb. stk., contributn. to change of system acct. (£50 000) provisn. for diffce. betwn. issue and redemptn. price of deb. stk., amts. placed to contingency fund, res. for taxatn. (£20 000), res. for depreciatn., and investmt. res. (£54 722) amtd. to £143 505. After provisn. for divs. on 7% and 6% pref. shs., fin. div. of 6% on ord. shs. is recommended, makg. 9% for year; fwd. £147 612.

INDUSTRIAL AND GENERAL TRUST.—At the mtg. on May 22, a resolutn. will be submitted for adoptg. new articles of associatn. to conform with the Companies Act, 1929. The alteratns. proposed are the inclusion of powers with reference to giving financial assistance for purchase of the company's shs. by or for the benefit of employees, and the issue of redeemable pref. shs.; increase of amt. which may be invested in any one security from 3 to 5% of combined sh. and deb. cap. (this restriction is not to apply to obligatns. of British Government); prohibiting distributn. as div. of pfts. arising from changes of investmts. or other dealings with cap. assets; authorising capitalisatn. of pfts. and issue of bonus shs. or debs.

JOHNSON AND PHILLIPS, LTD.—Pft. on tradg. acct. for 1929, after provisn. for bad debts, and charging to rev. upwards of £16 000 for maintenance of buildings, plant, etc., £155 191; deductg. directors' remuneratn. £1 150; auditors' and trustees' fees, £718, and deb. stk. int., £14 608, placing to res. re 6% deb. sinkg. fund, £15 217; and providg. for depreciatn., £20 984, leaves pft. £102 514, plus £80 903 brt. in. Intm. div. paid Nov. 22, 1929, absorbed £30 000. Fin. div. of 5%, less tax, recommended on ord. shs., makg. total of 10% for year; fwd. £123 418. Directors consider result of year's tradg. quite satisfactory. Pfts. earned show increase of nearly £50 000 over previous year. This improvemt. is due partially to increase in turnover, but principally to great economies effected in cost of productn. Important contracts have been secured during last few months, and prospects for current year are favourable.

BRITISH POWER AND LIGHT CORPORATION.—Accts. covering period from date of incorporatn., May 7, 1929, to March 31, 1930, show rev. £29 924. After charging exes. and income tax, blce. fwd. is £20 536. Corporation was formed to operate, either directly or through subsidiary companies, electrical generatg. and distributg. undertakgs., and made arrangemts. for purpose of acquiring controlling int. in North Wales Power Co., Electricity Distribution of North Wales and District and whole issued sh. cap. of East Suffolk Electricity Distribution Co., South Somerset and District Electricity Co. and other concerns. Gross revenue of constituent companies for 1929 was £278 232. After deduct. expenses and transferring £30 690 to res. for depreciatn. and renewals, blce. is £150 752. Deductg. int., etc., on Treasury debs., there remains £40 730. Proportion of this attributable to corporation, with sundry earnings of the latter, amts. to £34 444.

Company Meetings.

KOLSTER-BRANDES, LTD.—Mr. W. A. Bartlett, presiding at the first annual general meeting last week, said the extensions to the company's factory were not completed until four months after the estimated date. This had the effect of considerably restricting output and profits. Replying to a shareholder, he denied that the company was heading for insolvency and liquidation. He thought they had done fairly well, not as well as expected, but better than a number of their competitors.

ENGLISH ELECTRIC CO., LTD.—Mr. W. L. Hichens, presiding at the recent meeting, pointed out that the report and balance sheet dealt with the period prior to the reconstruction scheme already approved by the shareholders and debenture holders, and said it was proposed, after the scheme had been sanctioned by the Court, to circulate a reconstructed balance sheet setting out the effect of the changes. The rather less favourable result of the year's trading was due to a slightly lower output and to a further fall in prices, but there had been a definite improvement in efficiency, which had gone far to counteract the drop in prices. It had been found possible to make considerable further reductions in stocks, thus releasing working capital. There had been a reduction of debenture commitments of the company and its subsidiary of £69 514. The report and accounts were adopted.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Mr. Harry Kahn, presiding at the meeting last Friday, said the amount shown in the report as appropriated for payment of a final dividend of 5½%, less tax, on the ordinary stock (in view of a notice issued by the Inland Revenue that the new income tax of 4s. 6d. has to be deducted from dividends paid from April 6), would now read £8 440, and the carry forward would now read £6 038. Gross receipts for the year amounted to £2 748, a sum slightly less than last year's revenue, and net revenue carried to balance sheet was £25 099, or £107 less than last year. The policy of spreading risks was still being pursued; 57·79% of the value of securities was in debentures or charges, 16·31% in preference and 25·90% in ordinary and deferred shares and stocks. The report and accounts were adopted.

SIMMS MOTOR UNITS, LTD.—At the meeting on Monday, Mr. F. R. Simms, chairman, said he thought shareholders would agree that the net profit for the year had proved satisfactory at £44 651, against £42 946 last year. The directors, in spite of this satisfactory result, only recommended a final dividend of 5%, less tax, on the ordinary shares, which, with the interim dividend paid on November 1, 1929, of 5%, made 10% for the year, less tax, with no further distribution on the 6% cumulative participating preference shares. The directors were of the opinion that, bearing in mind the unsettled state of the country, as well as the industries generally, it would be advisable to exercise, for the past year, a cautious and conservative policy. With a view to further consolidating the company's position, the directors felt that this could best be achieved by placing the preference shares on a fixed dividend basis of 7½%. By the end of June their works at Percy Buildings would have been entirely removed to their new works at East Finchley. Percy Buildings would be kept for a very necessary enlargement of their administration, as for the development and manufacture of a number of new and important motor units. They had also extended the works of the Standard Insulator Co. at East Finchley. The results of the Standard Insulator Co. promised to become a record this year. With regard to branches, they opened a new one at Belfast last autumn, and this year they were prepared to open one in Calcutta and Buenos Aires. They would then have 23 fully-equipped and stocked branches at home and abroad. The report was adopted.

NEW COMPANIES.

E. S. COMPANY (IRELAND), LTD.—Cap., £500. To acquire electrical engineering business of W. Hall at 92, Great Patrick Street, Belfast.

ALTREE HULLCOCK AND CO., LTD.—Cap., £1 000. Electrical engineers, radio manufacturers and distributors, etc. Reg. Office: 61, Neal Street, London, W.C.2.

ALLIED ENGINEERING INDUSTRIES, LTD.—Cap., £3 000. Electrical, radio, and general engineers, etc. Solicitors: Amery Parkes and Co., 1, Arundel Street, London, W.C.2.

SOLVOLITE, LTD.—Cap., £100. Electricians, manufacturers and workers of and dealers in electricity, motive power and light, etc. Reg. Office: 256, Dickson Road, Blackpool.

ARNALS, LTD.—Cap., £2 000. To acquire business of wholesale dealer in radio and electrical sundries now carried on by B. Barker at 44, Curzon Street, Derby, as "Curzon Street Radio Stores."

PRIESTLEY PATENTS, LTD.—Cap., £1 000. Manufacturers and repairers of and dealers in household or domestic mechanical and electrical appliances, etc. Reg. Office: 28, East Parade, Leeds.

HUGHES ENGINEERING CO. (BIRMINGHAM), LTD.—Cap., £100. Manufacturers of and dealers in electrical materials, wireless and radio appliances, etc. Reg. Office:—3, Cherry Street, Birmingham.

AIR DUCTS, LTD.—Cap., £10 000. Manufacturers of and dealers in heating, ventilating and electrical plant and apparatus, etc. Reg. Office: 195, Stamford Brook Arches, Hammersmith, London, W.6.

J. AND C. FOR WIRELESS, LTD.—Cap., £2 000. Radio, wireless, electrical, mechanical, wiring, heating, light and power engineers, etc. Solicitor: E. M. Crowther, 23, Abingdon Street, London, S.W.1.

JOWETT AND CO., LTD.—Cap., £500. To construct, manage or control works and conveniences, including tramways, electric light and power supply works, etc. Reg. Office:—15, Brook Lane, Chester.

DODDS AND ATKINSON, LTD.—Cap., £500. Electrical lighting, wireless, mechanical and general engineers, etc. A permanent director: R. J. Atkinson, 34, Leeds Road, Harrogate, electrical engineer.

ELECTRO INSULATORS, LTD.—Cap., £1 000. Manufacturers of and dealers in insulating materials, insulated goods, electrical instruments, etc. A director:—S. Shirt, 9, Broomgrove Crescent, Sheffield.

R. MOORE AND SON (ELECTRICIANS), LTD.—Cap., £1 000. To acquire business of electrician and electrical engineer and contractor heretofore carried on by R. Moore at 35, Beresford Road, Longsight, Manchester.

RADIO CUSHIONS, LTD.—Cap., £2 625. Electricians, workers and dealers in electricity, sound conveyed by electricity and/or radio, etc. Solicitors: Courtenay Croome and Finch, 3, Lombard Court, London, E.C.3.

LUTON BROADCAST RELAY SERVICE, LTD.—Capt., £5 000. To construct and maintain wireless signal and other stations, to carry on the business of consulting wireless experts, etc. Reg. Office: 8, Queen Square, Luton.

ELECTRA CO., LTD.—Cap., £1 500. Manufacturers, exporters, repairers of and dealers in electric cables, wires, lines, accumulators, lamps, fittings, accessories, etc. A subscriber:—E. J. C. Deckers, 57, Rutland Square, Dublin.

ELSMORE HOLFORD, LTD.—Cap., £500. To adopt agreement between H. J. Holford and E. C. Elsmore, and to act as electrical engineers, etc. Solicitors: Wynne, Baxter and Keeble, 9, Laurence Pountney Hill, London, E.C.4.

BEACONECTRIC, LTD.—Cap., £5 000. To acquire business of electrical engineers and factors now carried on by C. Field, H. E. Field, J. A. Miles and W. J. Miles at 158, Stonhouse Street, High Street, Clapham, London, as "The Beacon Electrical Co."

BOLD ELECTRIC CLOCK CO., LTD.—Cap., £2 000. To acquire from J. Waxman and L. Marder full sole and exclusive licence of Patent No. 305 327 granted to H. Bold for improvements in electrically driven timepieces, etc. Reg. Office:—12A, Withy Grove, Manchester.

YUGO-SLAVIAN CONCESSIONS, LTD.—Cap., £5 000. To adopt an agreement with Michael Vinogradoff, to acquire lands, to produce, generate and distribute electrical energy or power; to carry on the business of a light and power company, etc. Reg. Office: Imperial House, 80, Regent Street, London, W.1.

THE LEAD MARKET.

According to Messrs. James Forster and Co. the market has had a weak tone throughout the last fortnight through lack of support either from producing or consuming interests. No change is apparent in the general position. Demand remains as dull as ever both here and on the Continent. The price is now down to a level which has not been seen since 1921, but the position is very much worse now than it was then, inasmuch as stocks were light at that period, the market being a free one, while at the present time they must be very heavy and will always militate against any sustained advance. Closing prices on April 25 were £18 for April, and £17 17s. 6d. for May, June and July, a fall of 12s. 6d. to 17s. 6d. per ton since our last report, a fortnight ago.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ARMATURE REPAIR CO., 28, Cross Street, E.C., electrical engineers. £19 4s. 9d. March 4.

AYLING, Mr. W. J., 3, Elm Park Road, Church End, N., electrical installation contractor. £13 14s. 9d. February 20.

BROWN, John, c/o Jenkins, motor and wireless engineers, Peach Street, Wokingham, electrician. £21 7s. 10d. March 18.

DOUTHWAITE (J. R.) AND CO., 15, Pilgrim Street, Newcastle-on-Tyne, electrical engineers. £15 12s. 8d. March 8.

MODEL REPAIRING CO., 8, Grosvenor Gardens Mews North, S.W., radio dealers. £14 12s. 4d. February 24.

NATHAN, James (trading as JAMES DAVIS), 92, Wood Lane, Becontree, wireless dealer. £18 10s. March 7.

ROCKALL AND CO., 7, Ham Yard, Great Windmill Street, W., electrical engineers. £36 15s. 9d. February 12.

RODERICK (L. J.) AND CO., Gorseinon, electrical engineers. £18 5s. 6d. March 17.

SIGNARTS, 30, Barden Road, Tonbridge, electricians. £17 8s. 1d. February 17.

STANSBURY, Alf. Leonard, 2, Empire Parade, Beckenham, electrical engineer. £91 8s. 10d. March 11.

TIMMINS, Mr. W. T., Cwmavon Road, Blaenavon, wireless dealer. £11 1s. 6d. February 6.

TROMBA ELECTRICAL CO., 51, Chalk Farm Road, N.W. £20 4s. 2d. March 5.

Deed of Arrangement.

BARBER, John Marsden, and BRIDGEWOOD, Leonard, trading at 21, York Place, Leeds, as CLIMAX ELECTRICS, electricians and electrical factors. Dated April 23, filed April 28. Trustee, T. A. Stoker, 71, Albion Street, Leeds. Liabilities unsecured, £1 956; assets, less secured claims, £666.

Receivership.

CLEARTRON (1927), LTD.—S. W. Tubbs, of 24, Basinghall Street, E.C.2, was appointed receiver on April 14, 1930, under powers contained in debentures dated March 28, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

BARNETT (C.), LTD., London, W.C., wireless accessory dealers. Registered April 17, £150 third debentures, balance of £2 000; general charge. *£1 940. December 31, 1929.

BOOTH AND BOMFORD, LTD., Cardiff, electrical engineers. Registered April 14, mortgage to bank; charged on 99, Port Street, Evesham, etc. *Nil. February 8, 1930.

Satisfactions.

ELECTRIC CONSTRUCTION CO., LTD., London, W.C. Satisfaction registered April 15, £2 150, part of amount outstanding July 1, 1908.

EXE VALLEY ELECTRICITY CO., LTD., Exeter. Satisfaction registered April 14, £1 000 registered September 2, 1927.

LYMINGTON ELECTRIC LIGHT AND POWER CO., LTD. Satisfaction registered April 9, £10 000, total issued of amount registered October 7, 1902.

PULVERMACHER (I. L.) AND CO., LTD., London, E.C., medical electricians.—Satisfaction registered April 12, £500, registered October 9, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BORDER ELECTRICAL FACTORING CO., LTD. This Carlisle company, which has gone into voluntary liquidation, was only formed at the beginning of last year. It has an authorised capital of £5 000 in £1 shares, its directors, according to the Somerset House file, being William Hamilton Gardiner, John Ridley and Thomas Harris Little, the secretary of the company. In March, 1929, a charge was given by the company to its bankers, and in February, 1930, a debenture for £1 000 to T. B. Harris.

ODDIE AND CULSHAW, LTD., Southport. wireless dealers, etc. The statutory meeting of the creditors of the above was held on April 24 at the offices of Messrs. Goffey and Wheeldon, solicitors, 1, London Street, Southport. Mr. C. M. Oddie occupied the chair, and submitted a statement of affairs which showed liabilities of £1 653. The assets totalled £1 300, and were estimated to realise £822. After allowing for preferential claims the net assets were £764, or a deficiency of £889. It was reported that the company was registered in March, 1919, with a nominal capital of £1 000. The issued capital was £303, of which £153 was allotted for cash, and the balance was fully paid. During the year to March, 1925, there was a profit earned of £40, and in the following year, a profit of £50. For the year to March, 1927, the profit was £258, but in the following 12 months it fell to £78, and in the two succeeding accounting periods losses of £97 and £783 were sustained. After some discussion a resolution was passed by the creditors confirming the voluntary liquidation of the company with Mr. H. C. Binns, accountant, of 81, Dale Street, Liverpool, as liquidator, and a committee consisting of the representatives of Smith and Cookson, B.N.B. Wireless, Ltd., and Brown Bros., Ltd. The following are creditors: Smith and Cookson, Liverpool, £237; B.N.B. Wireless, Ltd., Liverpool, £236; Brown Bros., Ltd., London, £103; Fuller Accumulator Co., Ltd., Chadwell Heath, £37; Kolster-Brandes, Ltd., Sidcup, £33; Dutton, A., Southport, £237; Oddie, C. M., Southport, £275; Bankers, Southport, £245.

London Gazette, etc.

Company Winding-up Voluntarily.

BATTERY SUPPLIES, LTD.—Meeting of creditors at 4, King Street, Hammersmith, W.6, on Saturday, May 3, at 11 a.m.

Bankruptcy Information.

COX, Bernard Luther, Holmes Yard, Shirland Street, Chesterfield, electrical engineer. Receiving order, April 17. Debtor's petition. First meeting, May 2, 12 noon. Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. Public examination, May 16, 12.15 p.m., County Court, Market Hall, Chesterfield.

DOUDNEY, Edward, 93, East Street, Chichester, and 40, South Street, Chichester, wireless wholesale and retail salesman. First meeting, May 8, 12.15 p.m., Official Receiver's Offices, 12A, Marlborough Place, Brighton. Public examination, May 21, 11 a.m., Court House, Church Street, Brighton.

Notice of Intended Dividend.

MARSH, Basil, 6, Victoria Road, Brighton, Sussex, electrician. Last day for receiving proofs, May 9. Trustee: A. E. Orbell, 6 and 7, Old Steine, Brighton.

Application for Discharge.

MORPHY, Donal William, lately 4 and 5, Dorset Mews North, Upper Gloucester Place, London, N.W.1, manufacturer of wireless apparatus. Hearing, May 23, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Order Made on Application for Discharge.

MCLEOD, John Stuart (trading as MCLEOD BROS.), 189, Blackburn Road, Bolton, and also with a partner as MCLEOD BROS., at 55, Chorley New Road, Horwich, radio and electrical engineer. Discharge suspended for three months until July 15, 1930.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

323 952 J. H. Runbaken and G. W. Melland. Means for indicating when electric current is flowing in a circuit. (19/2/29.)
323 953 A. Schwarz and Dr. B. Lange. Electric tachometer. (20/2/29.)
323 966 General Electric Co., Ltd., H. C. Turner and W. Hamilton. Induction-type electrical instruments or relays. (7/3/29.)
323 974 Trevelyans (Birmingham), Ltd., and T. Gladdy. Electric tumbler switches. (20/3/29.)
323 981 Standard Telephones and Cables, Ltd. (R. Schenk). Automatic battery-charging device for telephone exchanges. (27/3/29.)
310 031 Allmanna Svenska Elektriska Aktiebolaget. Electric induction furnaces. (21/4/28.)
310 003 Bing Werke Vorm. Geb. Bing Akt.-Ges. Electromagnetic device for imparting an intermittent pendular movement to a swinging member. (19/4/28.)
318 195 Ateliers de Constructions Electriques de Charleroi. Starting of polyphase electric motors by means of auto-transformers. (30/8/28.)
316 659 E. F. Northrup. Inductor furnaces. (2/8/28.)
323 994 G. Fischer. Current-collectors for electric vehicles. (19/3/29.)
312 081 British Thomson-Houston Co., Ltd. Oil-filled lead-covered electric cables. (18/5/28.)
316 148 Siemens and Halske Akt.-Ges. System for transmitting alarm signals. (20/12/27.)
323 817 J. L. Baird and Television, Ltd. Television and like apparatus. (10/10/28.)
323 818 J. L. Baird and Television, Ltd. Television and like apparatus. (12/10/28.)
323 763 British Thomson-Houston Co., Ltd., and G. O. Watson. Electric ship-propulsion systems. (7/9/28.)
323 730 British Thomson-Houston Co., Ltd., and G. O. Watson. Electric power supply systems. (7/9/28.)
323 746 British Thomson-Houston Co., Ltd., and G. O. Watson. Speed measuring and indicating apparatus. (7/9/28.)
323 764 British Thomson-Houston Co., Ltd., and G. O. Watson. Protective-systems for alternating-current electric generators. (7/9/28.)
324 082 British Thomson-Houston Co., Ltd., F. J. Lane, and R. D. Parry. Electric protective apparatus. (11/7/28.)
324 065 Dr. E. Treibmann. Combination electrode for unipolar high-frequency curative treatment. (17/7/28.)
324 027 H. J. Round. Apparatus for recording and/or reproducing sound. (7/9/28.)
324 066 Edison Swan Electric Co., Ltd., and S. Rogers. Bonding or fixing devices for electric conductors. (12/9/28.)
297 360 G. Somajni. Electric remote control apparatus. (19/9/27.)
324 029 J. L. Baird and Television, Ltd. Television and like apparatus. (3/10/29.)
324 032 British Electrical Reproduction Co., Ltd., and C. Berrage-Moulton. Supporting devices for use in connection with sound reproducing apparatus. (8/10/28.)
324 049 J. L. Baird and Television, Ltd. Television and like apparatus. (10/10/28.)
324 007 A. Reyrolle and Co., Ltd., and H. W. Clothier. Plug and socket connectors for electrical circuits. (11/10/28.)
324 008 Standard Telephones and Cables, Ltd. (L. J. J. Schreiber). Anti-vibration mountings for switches such as are used in automatic telephone systems. (11/10/28.)
324 022 E. T. Williams. Construction of grids, plates, frames, and the like for use in electric accumulators. (13/10/28.)
324 094 Automatic Telephone Manufacturing Co., Ltd., C. Gillings, and T. G. Rice. Telephone systems. (15/10/28.)
324 040 A. E. C. Snell and F. S. Clifford. Electrical transmission or reproduction of sound. (15/10/28.)
298 917 British Thomson-Houston Co., Ltd. Automatic electric circuit breakers. (14/10/27.)
324 055 G. A. Atkins. Electric level luffing grab cranes. (16/10/28.)
324 056 Nalder Bros. and Thompson, Ltd., and C. L. Lipman. Electric time selective relays and time selective control devices. (16/10/28.)
324 097 R. A. Salaman. Control of theatre and like lighting systems. (16/10/28.)
324 059 Automatic Telephone Manufacturing Co., Ltd., and H. S. Woodhead. Electromagnetic relays. (16/10/28.)
324 099 T. McClelland. Magnetic sound records. (17/10/28.)

COMING EVENTS.

Friday, May 2 (To-day).

Iron and Steel Institute.—Institution of Civil Engineers, Great George Street, Westminster, London, S.W. Annual meeting. 10 *a.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Lecture by Mr. C. W. Marshall on "The Metering Arrangements for the 'Grid' Transmission System in Great Britain." (To be followed by a discussion.) 7 *p.m.*

Tuesday, May 6.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting.

Institution of Civil Engineers.—Great George Street, London, S.W. James Forrest lecture by Prof. R. V. Southwell, F.R.S., on "Aeronautical Progress, 1914-1930." 6 *p.m.*

Illuminating Engineering Society.—Royal Society of Arts, John Street, Adelphi, London. Paper by Mr. T. Austin on "Luminous Traffic Signals." 7 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section).—Birmingham University, Edmund Street. Paper by Mr. A. H. Slade on "Routine Testing of D.C. Machinery." 7.30 *p.m.*

Wednesday, May 7.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting.

Electrical Contractors' Association (Dublin Branch).—Ordinary meeting.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Sheffield Illumination Society.—Visit to English Steel Corporation—Messrs. Vickers' Works.

Institution of Electrical Engineers (Wireless Section).—Savoy Place, Victoria Embankment, London. Paper by Messrs. P. P. Eckersley and N. Ashbridge on "A Wireless Broadcasting Transmitting Station for Dual Programme Service." 6 *p.m.*

Polytechnic (Electrical Engineering Department).—Lecture I (course of six lectures), by Mr. W. H. Date, on "Thermionic Valves." 6.30 *p.m.*

Thursday, May 8.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Southampton Branch).—Ordinary meeting.

Electrical Contractors' Association (E. Yorks Branch).—Builders' Exchange Room, Metropole Hall, Hull. Ordinary meeting. 3.30 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section).—Visit to Messrs. "Birmingham Gazette," Corporation Street. 4 *p.m.*

Friday, May 9.

Institution of Electrical Engineers (London Students' Section).—Savoy Place, Victoria Embankment, London. Annual general meeting. Paper by Messrs. J. W. Moffatt and J. C. Emerson on "The Rotary Automatic Telephone System." 6.15 *p.m.*

Saturday, May 10.

Institution of Electrical Engineers (London Students' Section).—Visit to the Brookman's Park Regional Station of the British Broadcasting Corporation. 2.30 *p.m.*

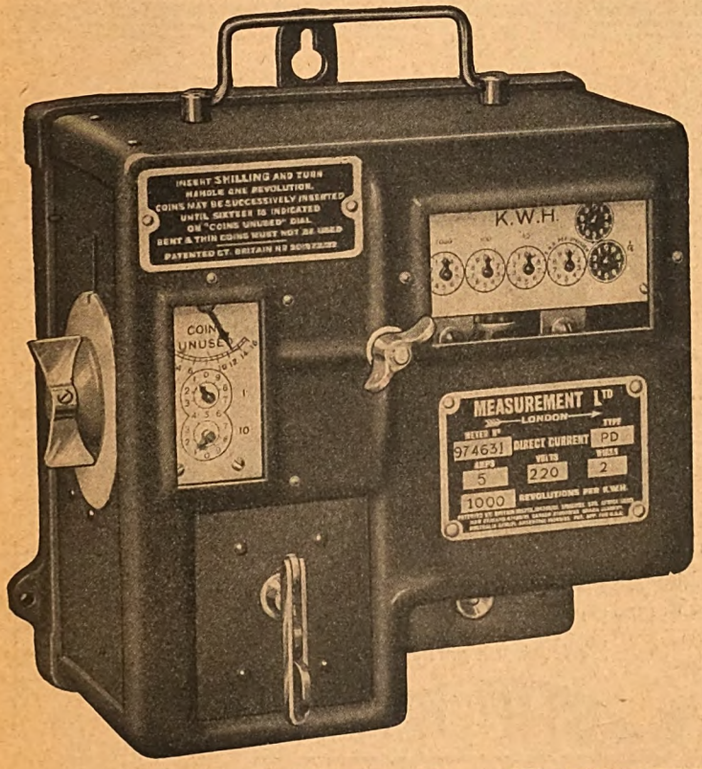
THE ELECTRICIAN

Vol. CIV.—No. 2710. Friday, May 9, 1930. [Registered at the General Post Office.] Sixpence

Your Guardian against Bad Debts, Inaccuracies and Irregularities

PREPAYMENT METERS (A.C. & D.C.)
1d. and 1s. coin.



THE outstanding advantages and sound British Construction of "Measurement" Meters are an insurance against unreliability and inaccuracy: special attention has been paid to immunity against fraud.

Write for particulars of our A.C. and D.C. prepayment Meters.

OUTSTANDING FEATURES.

i. The coin box is independent of the meter cover.

ii. Price change wheels can be fitted in situ in one minute.

iii. The operation of the mechanism is independent of gravity.

iv. The meters are small in bulk and light in weight, the A.C. prepayment meter weighing only 14½ lbs. and the D.C. prepayment meter 19 lbs.

PRICES ARE COMPETITIVE.

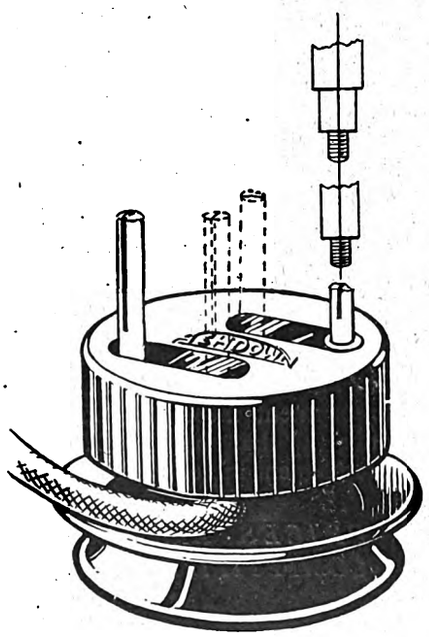
The

ASHDOWN

"ADJUSTABLE 2 PIN PLUG"

A Boon to the Trade!



Why stock innumerable sizes and patterns of plugs when the "Ashdown" embodies the qualifications of all?

This plug—made of Bakelite—is of substantial construction, entirely shockproof throughout and is extremely simple in operation. Pins are automatically adjusted to hole-spacing of socket merely by turning the knurled outside ring, thus obviating the dangerous practice of finger adjustment with its risk of touch contact.

The pins, which are instantly removable and interchangeable, are of 3, 5 and 15 amp. capacity and any intermediate sizes.

Write for full particulars.

International Electrification.

ONE of the most interesting documents relating to electrical development that has been issued for some time is the first annual report of the Board of Directors of the Société Financière de Transports et d'Entreprises Industrielles (commonly abbreviated to "Sofina"). This international financial undertaking with headquarters in Brussels took over the assets of the former Sofina company, which had long been engaged in studying the problem of the systematic organisation of the production and distribution of electricity, and is actively interested in a long list of progressive electrical and industrial companies in Europe, North Africa, and North and South America. Through its various finanial subsidiaries it has secured the technical, financial and administrative control of many operating companies in addition to holding large interests in others, the credit balance of the profit and loss account for the year ended December 31, 1929, being 116 217 174 Belgian francs (£666 956).

There is a great deal of information contained in the report, which is of general interest. The section entitled "A World Survey" gives a remarkable picture of the rapid growth of electric power production. Between 1923 and 1928 the energy produced in Belgium increased by 125%; in the Paris region of France the output rose from 534 600 000 kWh in 1920 to 1 740 000 000 kWh in 1928. In Italy public service power stations generated 4 550 000 000 kWh in 1920 and 10 580 000 000 kWh in 1929, all but 380 000 000 kWh being produced by hydro-electric plants. Private Italian plants produced an additional 1 500 000 000 kWh and 340 000 000 kWh were imported from Switzerland. Total exports of electric energy from Switzerland in 1928-29 amounted to 1 094 000 000 kWh out of a total Swiss production of 4 782 000 000 kWh. Japan's installed plant has quadrupled in power in ten years; it had reached 3 878 000 kW at the end of 1928 and of this amount 2 315 000 kW was generated by water power. Well conceived interconnections take advantage of the climatic differences between the basin of the Pacific and that of the Sea of Japan and minimise the importance of seasonal variations. By making greater use of thermo-electric stations for peak consumption in winter the hydro-electric plants in Japan have been able to avoid costly enlargements. In Great Britain and Germany the tendency is for the production of private stations (including those of traction undertakings) to increase less rapidly than that of distributing concerns. In Germany the share of private producers declined from over 52% in 1926 to less than 42% in 1929. On the basis of progress in recent years the development of the electrical industry in Germany—the installed power of plants is at present over 12 000 000 kW and is increasing at the rate of about 1 000 000 kW per annum—will require an annual expenditure of £50 000 000.

Concerning the electrical future of the European continent, the view is expressed that the day is coming when the national networks of electricity will be interconnected throughout the whole of industrial Europe. Powerful steam-driven plants will then have the support of the great water strongholds of Sweden and Finland in the north and the Pyrenees, the Central Plateau, the Alps with the Tauern and the Carpathians in the south, the electrification of the continent being thus assured with a minimum of waste. Already there is a good deal of interchange of power. Mention has been made of Swiss exports to Italy. Germany is also a large importer and exporter of energy. In 1928 she bought 293 000 000 kWh, mainly from Switzerland and Austria, but partly from France, and sold 181 000 000 kWh to France, Poland, Switzerland and Czecho-Slovakia. Switzerland exchanges over 1 000 000 000 kWh per annum with her neighbours. At present consideration is being given to a vast scheme for the transmission of hydro-electric energy from Norway to Germany via Sweden and the Baltic. "The domain of electrification is being extended. The meshes of the networks are being contracted and a

Digitized by Google

single network no longer serves only a single city or a province, but an entire country." Main line railway electrification is proceeding at a rapid pace in Switzerland, France, Austria, and Italy. There are now 1 589 km. electrically worked in Switzerland and 85% of the traffic in ton-kilometres is now carried over electrified lines. In France, 1 400 km. have been converted and the electrification programme embraces 9 000 km., or about a fifth of the total extent of the French railways. This survey is a short but inspiring picture of steady progress towards a complete revolution in transport, industrial and domestic conditions on the European Continent. Are we in this country advancing with sufficient speed to ensure that we shall not be left further behind than we already are?

Current Topics.

"Grid Alive at 132 000 Volts."

LAST week THE ELECTRICIAN was alone among the electrical journals in publishing not only a description of the Central Scotland grid and the extensions to Portobello power station but a report of the proceedings at the opening ceremonies and luncheon at Edinburgh on April 30. This important event in the history of the British national electrification programme was very well staged by the Edinburgh Corporation and the Central Electricity Board. The occasion was favoured with a day which improved greatly in quality after Mr. MORRISON, who performed the task of throwing the switch with a look of the grimmest determination, had energised the grid. The early morning was grey and cold, but the afternoon was warm and sunny. As the large disc above the platform rotated, the black legend "grid switch open," changing to "grid alive at 132 000 volts" in red letters, the Lord Provost of Edinburgh said: "I take the hand of Glasgow," and shook hands with the Lord Provost of the western city whose power stations were now linked with Portobello by means of the large grey towers that stretch from Forth to Clyde and northwards towards Dundee and the Grampians. Those who subsequently stood beneath the conductors stretching upward from the sub-station insulators to the first tower did not require any printed notice to warn them that the grid was "alive," the continuous crackling being a sufficient indication.

Portobello's New Generators.

THE generator hall at Portobello, with the machinery all newly painted to a cheerful green and representing a total capacity of 117 500 kW, is an impressive spectacle, and Mr. EDWIN SEDDON is to be congratulated on having almost completed a very big task in a thoroughly efficient way. The last set of boilers is not fully erected, and there is still a little tidying up to be done in the yard between the power house and the river, but before the end of the year all the extension work should have been completed. When the new boilers are in service the thermal efficiency of the station is expected to reach 22·8 per cent., and if this figure is attained Mr. SEDDON and the makers of the plant installed at Portobello will have good cause to be proud of their work. At present the two new 31 250 kW British Brown Boveri turbo-alternators are being run without their full complement of boilers. On the acceptance tests the average steam consumption for one of these turbo sets was 9·115 lb. per kWh, the average for both being approximately 1 per cent. better than the guaranteed figure without allowing for the margin. It is an indication of the development in turbo-alternator design that has taken place within the past six or seven years that it is more economical to run the new 31 250 kW sets at 10 000 kW than to operate the 12 500 kW sets installed in 1922 at 10 000 kW.

Good Work.

IT is the fashion to throw stones at the telegraph service, and it is only fair to hand that much abused institution a bouquet when such an offering appears to be deserved. The last sheet of our telegraph message of about 1 200 words, giving the report of the proceedings at the opening of the Central Scotland grid, was delivered at our offices in Fleet Street about an hour and a quarter after the time at which the entire telegram was handed over the counter at Edinburgh. As THE ELECTRICIAN is not a daily, and there was heavy special traffic for the dailies to be handled, the telegraph service is entitled to credit for rising to the occasion in a very satisfactory way.

Price Fixing by Order.

NEW markets and more trade are the chief needs of the trading community, and neither is likely to result from the Consumers' Council Bill, which the President of the Board of Trade has introduced on behalf of the Government. This extraordinary measure is designed to enable the Board of Trade to appoint a Council to hold such inquests as they please on production, distribution, supply or price of articles of food, articles of wearing apparel, clothing materials, fuels and "any other article of common use" referred to them by the Board with the assent of Parliament; and to submit such recommendations as they think fit. The Board of Trade are even to step in with orders fixing maximum prices of scheduled commodities. This is an extension of the growing interference of the Government with the liberty of the individual as shown by the exceptional penalties which are prescribed in certain circumstances for members of the Consumer' Council. If a member neglects or refuses to make a declaration of secrecy, he or she may be fined £50 or imprisoned for three months, or suffer both penalties. Further, if any member discloses information about any individual business acquired during these investigations, he will be faced with a raising of the fine to £100, and of the term of imprisonment to two years. There is also a scale of pains and penalties for traders who contravene price-fixing orders made by the Board of Trade; but a great deal of water must flow under London Bridge before the harassed trader reaches that stage.

A Dangerous Path.

THIS, of course, is not the first experiment which Governments have made in price-fixing in the last fifteen years. Experience of former incursions into this dangerous field suggests that the maximum price tends to become the minimum price as well, or, in the alternative, that the article arbitrarily priced disappears altogether from the market. There is the further difficulty that cheaper articles may be increased in price, and that unless the quality of the scheduled article is strictly defined, there may be serious interference with the production of goods of a better quality. It is possible that the Bill may not get through Parliament, and if it does, that it will become a dead letter. All the same, its appearance at this time throws a lurid light on the attitude of a large section of political opinion towards the trading community.

EAST ENGLAND ELECTRICITY SCHEME.

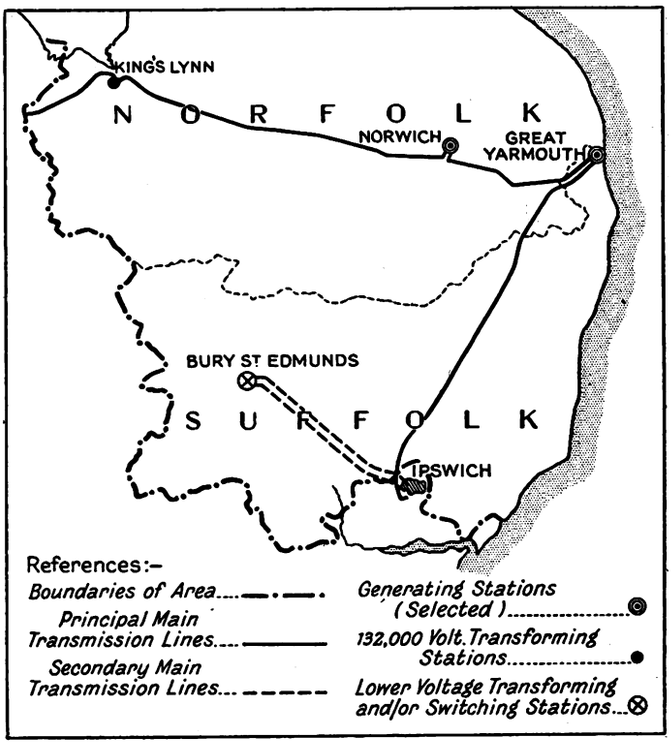
Eighth of the Grid Schemes Issued by the Electricity Commissioners—Arrangement for Meeting Requirements of Norfolk and Suffolk.

BY the publication on Wednesday of the East England Electricity Scheme, the Electricity Commissioners have now provided for the whole of England and Wales and part of Scotland, leaving only the sparser areas of South and North Scotland to be dealt with. The work of the Commissioners, so far as electricity schemes are concerned, is coming to an end, 72% of the geographical area of Great Britain having been catered for, representing 94·7% of the population and 99·4% of the units supplied from public supply sources. The East England Scheme is the eighth to be published, while the Central Board has already adopted six, the seventh being under consideration.

The aggregate maximum load on the undertakings in the East England area during the winter of 1928–29 was 26 059 kW, and is estimated to reach a total of 61 225 kW in 1937–38, an increase of about 135%. By the winter of 1943–44 the aggregate maximum load is estimated to amount to 82 500 kW. The sales of electricity in this area during the year 1928–29 amounted to 48·2 million units, or an average of 61 units per head of population, and are estimated to reach a total of 162·7 million units in the year 1937–38. By 1943–44, sales are estimated to reach a total of 221 million units, or 280 units per head of population.

The extent of the area is about 3 438 square miles, and the population at the last Census was approximately 788 880, representing an average density of about 230 persons per square mile. It embraces the whole or part of the areas of supply of 18 authorised undertakers operating between them 11 public generating stations, including the extension area recently granted to the Corporation of Ipswich, the supply for which is provided for by the present scheme. The cost of generation in this area in 1936–37, when the full capital charges under the scheme fall to be met, will form approximately 77% of the total cost of the units delivered by the Central Board to authorised undertakers for distribution in turn to their bulk and other consumers. The remaining 23% represents the expenses incurred by the Central Board, and includes the capital and other charges upon the Board's transmission system and their general administration expenses. The stations determined to be selected stations are the South Denes station of Great Yarmouth Corporation and the Thorpe station of Norwich Corporation. The scheme also permits of the operation, if necessary, of the station of King's Lynn Corporation under temporary arrangements between the Central Board and that Corporation. On the data at present available to them, the Commissioners have concluded that additional generating plant in the selected stations will be required as follows: (i) South Denes (Great Yarmouth Corporation). An addition of 15 000 kW of 3-phase 50-cycle generating plant and equivalent boiler plant (for operation by the winter of 1932–33); a further addition of 15 000 kW of 3-phase 50-cycle plant and equivalent boiler plant (for operation by the winter of 1935–36); and a further addition of 15 000 kW of 3-phase 50-cycle plant and equivalent boiler plant (for operation by the winter of 1939–40). (ii) Thorpe (Norwich Corporation). An addition of 15 000 kW of 3-phase 50-cycle generating plant and equivalent boiler plant (for operation by the winter of 1941–42).

The scheme provides for about 131 circuit miles of overhead primary transmission lines to be operated at 132 000 V between phases, the carrying capacity of each primary line covered by the estimates being not less than 50 000 kW. The primary transmission lines will be joined up to the selected stations at Peterborough and Ipswich in the area of the South East England Scheme; and will thus constitute an essential supplement to the main transmission system between the two generating stations in question by completing a ring main. For interconnection of selected stations with one another and with the systems of authorised undertakers or of the Board, these extra high pressure overhead lines and/or underground mains will be erected by the most convenient route in each case, from: (1) Norwich to Great Yarmouth; (2) Norwich to King's Lynn; (3) King's Lynn to Peterborough as far as the boundary of the area; and (4) Great Yarmouth to Ipswich. In connection with these principal main transmission lines, transforming stations will be provided at such points convenient for the purposes of supply to or from Great Yarmouth (60 000 kVA), King's Lynn (10 000 kVA), and Norwich (30 000 kVA). Overhead lines designed for operation at 33 000 V or other approved voltage between phases will be erected over the most convenient route from Ipswich to Bury St. Edmund's, while transforming stations will be provided at such points convenient for the purposes of supply to or from Bury St. Edmund's (5 000 kVA), and Ipswich (5 000 kVA).



Illustrating the East England Scheme. It is proposed that the base load output be allocated to Great Yarmouth station.

It is estimated that by the end of the financial year 1937–38 the capital expended under the scheme will have been as follows:—

By Central Board—	
Transmission lines and transforming stations, including capitalised interest	£594 328
By Owners of Selected Stations—	
On extensions of existing stations (30 000 kW of generating plant and equivalent boilers, etc.), together with additional boiler plant equivalent to 18 000 kW	306 074
Total expenditure	£900 402

On the basis of individual development by the various authorised undertakers in the absence of the scheme, it is estimated that provision would have to be made by 1937–38 for further generating plant amounting to 58 500 kW (inclusive of the above-mentioned figure of 30 000 kW) to meet the load in the area and to allow for further immediate growth, representing an estimated net capital expenditure of £527 537. By the year 1937–38 a proportion of the existing spare plant in the generating stations at Great Yarmouth and Norwich will have been released for revenue earning purposes under the scheme, such released plant amounting in all to about 22 580 kW and representing an actual expenditure of about £383 860. Allowing for the non-release of spare plant in the absence of the scheme, it appears that the system of inter-connection for the East England area can be effected by a capital expenditure up to 1937–38 of £594 328, as compared with an investment of £605 323 under the existing system (i.e., the preceding items of £527 537, less £306 074, plus £383 860). It is of interest to note that the Commissioners' estimate that in the five years 1933–38 there will be a saving to the undertakers in the area of about £218 578.

VARIETIES AND USES OF MICA—I.

Value as an Electrical Insulator—Few Sources of Large Sheets—Possibility of Utilising More Finely Divided Mica.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

MICA shares with asbestos the distinction of possessing as a natural substance and in its natural state, remarkable properties which render it of extremely great value in the manufacture of electrical apparatus. It is, perhaps, the most important of solid insulating materials, being used very extensively, especially where great electric strength is required. The methods of its use are already many and varied and, as will be indicated later, there are possibilities of still further important developments of its use. For these reasons it demands an important place in a review of the raw materials of the electrical industry.

Historically the earliest use of mica seems to have been for window lights. The name of one of its principal varieties, moscovite, is said to have been given after the material had been observed in this use in Russia (Muscovy). The general use of mica in the electrical industry has only been developed within the last quarter of a century, Some twenty years ago, probably the majority of electrical machines depended almost entirely on the use of varnished cloth for the insulation of their highly stressed parts. The use of such fabrics, however, rapidly decreased as the art of applying mica advanced. In its earliest applications to windings, mica was applied principally in the form of tapes formed of overlapped mica splittings bonded to a paper, cambric or silk, and this use still continues.

An outstanding advance was made by the development of the Haefely cell for high voltage wingings. The Haefely process, named after its inventor, consists in wrapping the slot conductors with sheets of micafolium, which are pulled tight by the ironing action of the hot bars of a special machine rotating slowly round the slot portion of the winding. In parallel with this advance great improvement was made in the methods of bonding mica both for tapes and for sheet used either flat or moulded to simple shapes, and further important developments in this direction are now being made by the successful use of a new variety of synthetic bonder known as "Glyptal." Another interesting recent development is introducing the use of mica in very finely divided form bonded with lead borate to form a high voltage insulation with remarkably low losses at high frequencies.

By nature, mica is a crystalline mineral consisting mainly of a double silicate of aluminium and potassium, often with magnesia and iron oxides, the constituents varying in the varieties mined in different localities. It occurs extensively in the earth's crust, first as a constituent of primary igneous rocks such as granite, and also in metamorphosed rocks known as schists, in which the mica is segrated in layers and pockets. It is thus not by any means a rare material. Rocks consisting apparently almost entirely of mica particles form great masses of the hills of Macedonia and the mica dust lay thick and slippery on the roads cut and climbed by our troops there during the war. Unfortunately, however, the occurrence of mica in large crystals is limited to comparatively few sources and since, up to the present time, its methods of use have demanded pieces of medium to large sizes, it remains one of the most costly insulative materials used. Should success attend attempts which are being made to use mica in more finely divided form, some change in the problem of supply may possibly result.

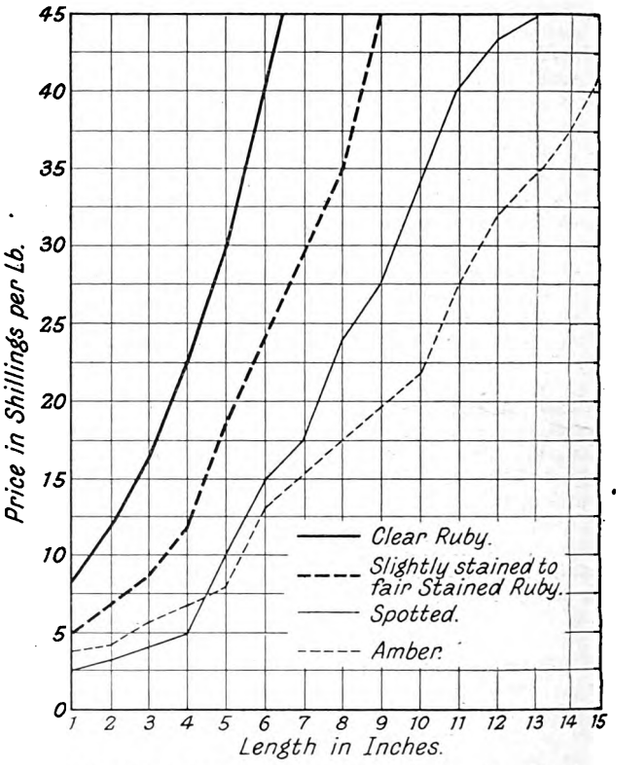

Fig. 2.—Comparative prices of various qualities of block mica. The prices are approximately proportionate for cut mica sheets having a width up to 50 per cent. of the length.

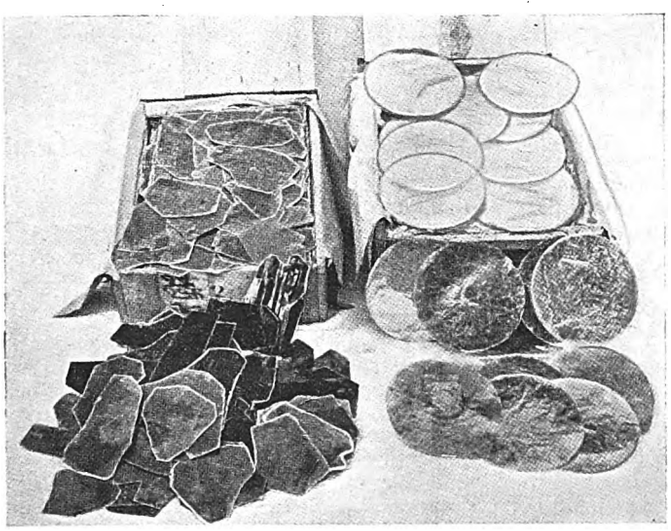

Fig. 1.—Block mica and mica splittings (pan-packed) as received from the mines.

It may be noted here that while there are a considerable number of firms catering for the mica demand of the electrical industry, practically all the mica received in this country passes through the agency of three or four leading brokers.

The principal varieties of mica commercially exploited are as follows:—

Muscovite or *Ruby* or *Potash Mica* is the most common form. It may be colourless to ruby, green or brown, and clear or spotted. It has vitreous lustre and is more or less transparent. It is obtained mainly from India, but Rhodesia, East Africa, Argentine and the United States contribute important quantities and supplies exist also in Russia, Switzerland, Sweden and other countries. Fig. 1 shows some fine specimens of India mica as handled at the mines, and Fig. 2 shows mica, white and ruby, as received in this country.

Phlogopite or *Amber* or *Magnesia Mica* varies in colour from pale yellow to dark amber and green. It has a pearly lustre, and even in thin sheets is merely translucent. Canada and Madagascar are the most important producers of this variety.

Biotite or *Black Amber Mica* contains a high percentage of iron oxide, which renders it useless for electrical purposes. It is very dark green or brown to black in colour and is more brittle than phlogopite.

Lepidolite or *Lithia Mica* varies in colour from light mauve to yellow, greyish white or white. It is very hard and brittle and will not withstand heat but fuses at ordinary temperature. This variety is scarce and is not used in the electrical industry.

For purposes of electrical insulation only, muscovite and phlogopite need be considered. Their approximate compositions are shown in Table I. It will be noticed that phlogopite contains relatively small quantities of alumina

Digitized by Google

and potash but a comparatively large amount of magnesia, and that it has less water of constitution.

TABLE I.—Typical Percentage Compositions of the Principal Kinds of Mica

Kind of Mica.	Silica.	Alumina.	Magnesia.	Potash	Fluorine.	Water.
Muscovite* ..	45·1	36·6	—	11·8	traces	4·5
Phlogopite† ..	39·6	17·0	26·5	9·9	2·2‡	2·99
Biotite‡ ..	39·0	15·5	11·3	8·6	1·3	3
Lepidolite§ ..	51·5	25·9	—	11·0	5·8	0·95

* Also contains traces of iron oxide. † Also contains 0·5 to 0·9% of iron oxide.
‡ Also contains 22·8% of iron oxide. § Also contains 0·3% of iron oxide and 4·9% of lithia.

Table II shows a simple sub-division of the two varieties with an indication of some of their properties and uses. Both the varieties in block form come under the B.E.S.A. Class C insulation materials; when converted into the various grades of micanite by the use of a suitable bonder they are recognised as B.E.S.A. Class B materials. In these materials it is stipulated that the mica content must not be less than 30% by volume.

TABLE II.—Varieties of Mica for Electrical Insulation.

Muscovite Varieties			Phlogopite Varieties.		
Ruby or white Indian splittings.	Green spotted	Ruby Block	Amber Splittings	Silver Amber	Amber block
Characteristics			**Characteristics**		
Best electrical and mechanical properties. Hard; Good splitting	Splittings rather irregular.	Rather hard; easily split.	Uneven and soft.	Very soft; splits badly.	Soft; excellent heat resistance.
Applications			**Applications**		
Undercut commutator micanite. Micafolium for Haefely wrap. Slot cells. Tapes. Hard micanite. Moulding micanite.	Punched washers.	High voltage washers.	Special armature segments. Armature band insulation.	Moulded micanite.	Heating elements.

Between the two varieties of mica there are important differences, which greatly affect their suitability for particular conditions of service. Muscovite mica is more flexible and splits more readily than phlogopite. The former can be divided into laminæ ·001 in. in thickness without cracking, and with very little waste, whereas the latter is more difficult to cleave and tends to form "heels," i.e., differences in thickness between the edges of the same splitting. On the other hand the phlogopite splittings usually have a finely crinkled surface which for some built up mica work forms an advantage, as it anchors the bond and tends to prevent the splittings from slipping under pressure. Phlogopite is softer than muscovite, and is, therefore, more suitable for commutator segment separators which are not undercut. Phlogopite has another advantage over muscovite in that it will withstand higher temperatures. Muscovite begins to lose its water of composition at about 450 deg. C. and nearly all its water is given off at about 800 deg. C. It is thus unsuitable for such work as heating element construction for domestic appliances. Phlogopite, on the other hand, contains less water to lose and does not begin to lose it below about 900 deg. C. Some phlogopite can safely be used for temperatures up to 1 000 deg. C.

In electrical strength muscovite is much better than phlogopite. When tested in sheets of about ·002 in thickness, phlogopite breaks down at about 2 000 V per mil, whereas muscovite goes to about 3 000 or 4 000 V per mil, or even higher. With regard to both heat resistivity and electric strength it should be remembered that these properties of almost any kind of mica are so good in comparison with those of other insulating materials that for most applications except high temperature and high voltage or high frequency work any variety of mica can be used which is rendered suitable by its other characteristics.

The use of block mica in plain sheets is limited by the scarcity and cost of the material in large pieces. Fig 2 shows the comparative prices of the various quantities of block mica as given in a chart issued by the Micanite and Insulators Company, Ltd., the largest mica specialists in this country and the originators of the name Micanite, which was introduced as a trade name in 1893, but has since passed into general use as a designation for any material consisting of mica splittings held together by an adhesive. Fig. 3 shows a group of materials and products of this firm. It is interesting to note than the lamp shades in this illustration are of the newly developed "Glyptal" micanite, to which reference has already been made. Most of the splittings used by this firm in the manufacture of micanite are prepared from Indian Ruby mica.

The maximum commercial sizes in which Ruby mica can be obtained are about 8 in. by 8 in., 6 in. by 12 in., etc., sheets of more than 80 sq. in. being uncommon, and consequently very expensive. Spotted mica (muscovite) can be obtained in sheets up to but rarely exceeding 12 in. by 12 in. Amber

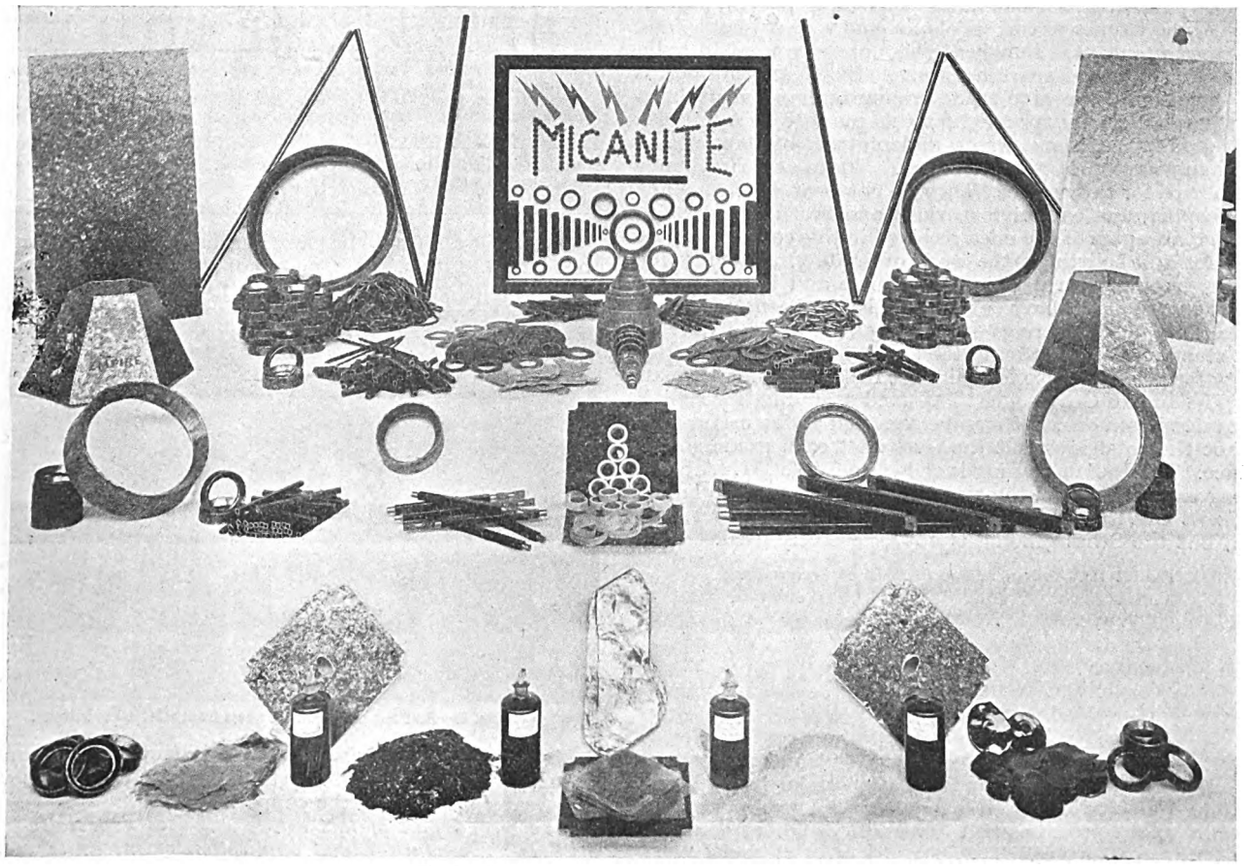

Fig. 3.—Group of raw materials and micanite products.

Digitized by Google

(Phlogopite) mica is found in slightly larger sheets than the Muscovite varieties, the largest commercial sizes being about 12 in. by 12 in., 9 in. by 18 in., etc.

In view of the cost of clear mica, either in sheet form or splittings, free from stain, streaks or spots, every consideration should be given to the actual service considerations when specifying mica for particular purposes.

For many purposes great electrical strength, low power factor and very good heat-resisting properties are not essential,

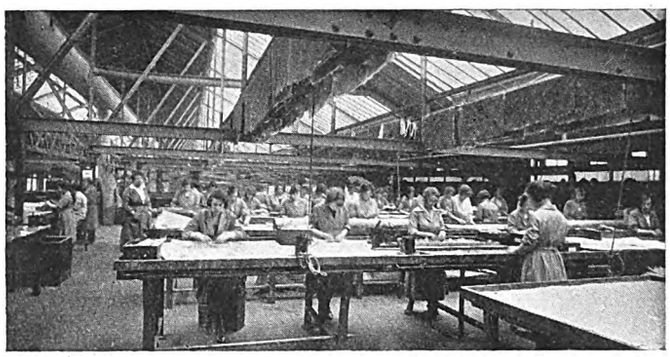

Fig. 4.—Sorting mica in the Metropolitan-Vickers Works.

and in these cases economies can be effected safely by using stained or even spotted or streaked mica. Spots and streaks often consist of iron in one form or another, and mica in which they occur is not suitable for high voltage or high frequency work. The existence of spots, however, does not reduce the electrical strength very much and spotted mica is used extensively and safely for low voltage work, including commutator segment separators, the element insulation of electrical heating and cooking apparatus, switchgear insulation, and for the manufacture of insulating washers. The existence of streaks should be viewed with caution, since some of these represent conducting paths between the laminæ. Where the insulation involves only low voltage stresses through the thickness of the sheet, even these impurities are often not dangerous, but in order to avoid any risk to reliability most manufacturers of high-grade electrical apparatus absolutely prohibit the use of mica marked with dark lines.

The principal uses of plain sheets are for electrical condensers, and for punching washers and separating pieces, as, for instance, the flanges of coil spools for fine wire solenoids, and in X-ray equipment. Punched pieces are also used to build up the insulation of sparking plugs. Block amber mica is used extensively for high-grade commutator segment insulation, and is usually specified for this purpose in Admiralty contracts and in general where undercutting of commutator segment insulation is not permitted. White and ruby mica are too hard for this service. They do not wear down as much as the copper, and excessive sparking and brush wear result.

The greater part of the mica received in this country arrives in the form of splittings, the work of grading, trimming and splitting having been performed by male and female native labour in India. Many attempts have been made to standardise the splittings according to areas available. Such standardisation is important as a means of comparing quality for price and also for guidance in selection for ultimate use. The Indian Government has fixed a grading for slab or block mica based on what may be regarded as the useful area, i.e., not the total area but the sizes that each grade should produce. The Indian grading is shown in Table III. A Swiss grading exists, in which the sizes are about one grade larger, i.e., Swiss Grade 2 corresponding with Indian Grade 1, and so on, but the Swiss grading is not extensively used.

TABLE III.—Indian Standard Sizes of Splittings.

Grade.	Useful Area. (sq. in.)
Extra special	60 and upwards.
Special	48—59½
A1	36—47½
1	24—25½
2	15—23½
3	10—14¾
4	6—9½
5	3—5½
6	1—2¾

Even with the Indian standardisation there is often considerable difficulty in obtaining uniformity of supplies, due no doubt to the processes and low grade of labour employed for splitting and sorting. The splittings are sometimes mixed, so that what may appear to be a box of high-grade size is in reality an inferior grade due to the large percentage of smaller splittings included.

It is usual when obtaining splittings to ascertain how they are packed, whether loose or pan-packed, in the latter case the splittings being packed in round, or sometimes square cakes. Round pan-packed cakes are seen on the right in Fig. 1. Pan packing is usually adopted for the better varieties, as it ensures more careful selection, due to the fact that the splittings are arranged by hand, and small fragments and dust are more or less eliminated. Loose packed splittings do not receive so much attention. For general manufacturing purposes small splittings are used wherever possible, to reduce cost. In any case special selection of splittings is necessary according to the uses required.

The smallest grades of mica splittings, costing about 5d. per lb. can be used for making micanite for commutator segments by the new tower-building method in which the splittings are scurried down a tall tower in blasts interspersed with powdered bond. When hand-making is necessary in the absence of tower-building equipment larger sizes of splittings must be used to obtain an equal quality of product. The ruling sizes and prices for splittings used for some typical purposes are shown in Table IV. The apparent discrepancy in price for the first two items in this table is explained by the fact that there is a larger percentage of small splittings in the first item, and in the second a predominance of larger splittings in order to permit later bending and moulding.

TABLE IV.—Ruling Prices of Splittings for Typical Applications.

Application.	Approx. area. (sq. in.)	Approx. price. (per lb.)
Tower built segment micanite	1—3	5d.
Tower built moulding micanite	1—3	10d.
Segment or V ring micanite (hand-built)	2—6	2s. 3d.
Admiralty cell mica	10—5	4s. 3d.

Recommended grades and characteristics of mica splittings for typical applications are shown more fully in Table V.

TABLE V.—Recommended Sizes and Varieties of Mica for Various Purposes.

Application.	Quantity.	Thickness (inch)	Characteristics.
Commutator segments from tower built micanite. Hard mica plate	60% with 1 sq. in. area. 30% „ 2 „ „ „ 10% „ 3 „ „ „	0·0005 to 0·0015	Fairly hard, unstained, clear ruby or white splittings.
Moulding micanite from tower-built sheets.	40% with 1 sq. in. area. 50% „ 2 „ „ „ 10% „ 3 „ „ „	0·0005 to 0·0015	Soft, flexible, unstained clear white splittings.
Slot cell insulation made of built-up mica backed with flexible materials.	5% with 1 sq. in. area. 50% „ 2 „ „ „ 30% „ 3 „ „ „ 15% „ 4 „ „ „	0·0005 to 0·0015	Very soft, flexible, unstained, clear white splittings.
Micanite for V ring mouldings and high voltage slot cell insulation.	5% with 2 sq. in. area. 25% „ 3 „ „ „ 40% „ 4 „ „ „ 25% „ 5 „ „ „ 5% „ 6 „ „ „	0·0005 to 0·0015	Very soft, flexible, selected large size, unstained, clear ruby or white.
Slot cells for Admiralty Specification and for traction motors.	30% with 10 sq. in. area. 35% „ 12 „ „ „ 35% „ 14 „ „ „	0·0005 to 0·001	Very soft, large flexible, unstained, ruby or white.

Even this does not by any means exhaust the field of application. For example, no use of amber splittings is shown,

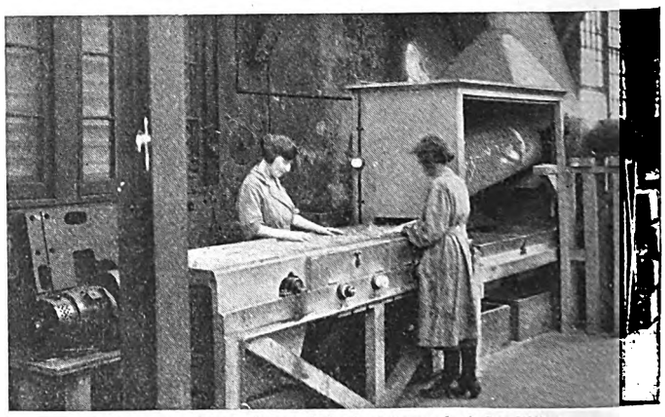

Fig. 5.—Building mica cambric sheet from selected splittings.

these being chiefly reserved for the manufacture of commutator segment micanite, which has to be of such softness that it will wear equally with the copper.

[*The second part of this article will deal especially with the methods of production and application of micanite and other forms of mica bonded with adhesives.*]

TELEPHONE INSULATION.

Impregnating Mediums—Difficulties in Coil Work—Open Tank Impregnation—Use of Paraffin and Beeswax.

(FROM A CORRESPONDENT.)

IMPREGNATION is applied in telephone work with the object of rendering material impervious to water. There are a number of substances which, while perfectly good insulators in themselves, readily take up moisture within their pores and thus present a comb-like maze of conducting passages throughout their mass. In some instances waterproofing is not the primary reason for impregnation, but these are decidedly in the minority. Sometimes fine textile covered wire is impregnated previous to winding in coil form so that the whole shall be adherent. Impregnation is also used to render surfaces adhesive for purposes of assembly of terminals and the like.

It is not sufficient for an impregnating medium simply to be waterproof. Obviously it must of itself have insulating properties. Sometimes it must be transparent so as not to obscure colouring of wires, etc., and often there is a limit on the flowing temperature especially for use on apparatus in tropical climates.

Generally speaking, for the actual process of impregnation the substance has to be rendered fluid by the application of heat. The other method, that of employing a solvent, while satisfactory for the preparation of waxed papers, fabrics, etc., is not suitable for treatment of completed apparatus, parts, coils, switch insulators, and so forth, because great difficulty is experienced in driving off the solvent from the internal portions.

Open tank impregnation is carried out for smaller parts, but naturally cannot be applied to the larger coils. The usual method in such cases is to dry the parts under vacuum (about 28 inches) and then treat with the fluid compound without breaking the seal.

Perhaps wax impregnation is the most common and it includes the use of paraffin, beeswax and such materials. These have the advantage that they do not become brittle on solidifying nor do they affect the colour visibility of parts to which they are applied. In telephony probably the largest use of paraffin wax lies in the treatment of condensers and paper insulated cables.

Beeswax by itself has very little application—it has decidedly acid tendencies. For the treatment of onion skin paper for coil interleaving a mixture of beeswax and paraffin wax in the proportions of one to one is popular. The addition of resin and carnauba wax makes the compound both harder and of better insulation value. Resin oil also is often added. With additions as mentioned the paraffin-beeswax compound is used to a large extent for the impregnation of switchboard wiring, coils, etc.

Temperatures for treatment with the different mixtures naturally vary and more than a little skill is required for getting the best results. Round about the boiling point of water (212 deg. F.) has been found suitable for most of the wax mixtures. If the temperature be allowed to run too high there will be every chance of the proportions changing—the resin is the first to be thrown out.

Resins, Asphalte and Oils.

Resins are used largely in combination with resin oils in the proportion of four to one. Impregnation takes place at about 250 deg. F. in vacuo. Repeating and retardation coils are treated in this manner.

Asphalte impregnation is used to some extent but not for coil work. For sealing condensers it finds one of its chief applications. The great advantage of asphaltic mixtures is that they may be so blended as to be quite flexible.

Oils, although used for impregnation of papers, silks, and such materials, do not find application in telephone manufacture itself—impregnated materials are bought from manufacturers.

At the present moment there is a difference of opinion amongst telephone manufacturers in regard to the advisability of impregnating certain types of coils, especially those subjected more or less to constant current as in automatic work. Any traces of water present in a coil form a path of low resistance for leaks, but there is another and more serious reason why all water should be kept out. It has been found quite impossible to produce enamelled wire absolutely free from pinholes. These are kept to a minimum by suitable tests applied to a percentage of the wire deliveries, but still wire with small holes has to be accepted. Again the materials of which the wire and coil are made are liable to be corrosive; for instance, the impregnated onion skin paper previously mentioned is distinctly so—and as such may act on the unprotected parts of the wire directly beneath one of the minute holes. It only requires the presence of water to initiate the chemico-electrical action which may result finally in severance of the wire. Impregnation with a suitable wax removes this trouble. On the other hand, waxes are liable to flow under certain conditions at temperatures which laboratory tests have indicated to be quite compatible with stability. There are a number of reasons for this, one of the chief being the additional rise due to rapid working for a limited period of time. Flow of impregnant is a serious matter for it easily covers up contacts and jams the delicate armatures. Thus it is that there is a divergence of opinion on the question of impregnating. It was once tried to split the difference by draining the coils in vacuo after the initial impregnation. This prevented flow but did not seem to improve the resistance to possible corrosion; furthermore, it was expensive, and so was finally abandoned.

WORLD POWER CONFERENCE.

Special Arrangements for Visits to German Power and Industrial Plants.

SOME 400 papers have been submitted in connection with the second plenary meeting of the World Power Conference, to be held in Berlin from June 16 to 25. The most important statements will be dealt with by the General Reporter of each section at the meeting. The discussions that will then take place will constitute the most valuable part of the Conference, and result in important decisions being reached. Apparatus specially installed for the purpose will transmit the speeches, simultaneously, in English, French, and German, the three official languages of the Conference.

On the conclusion of the Conference, special facilities are being granted for visiting the most important power and industrial plants in Germany, the number of such plants that can be visited numbering over 200. These include in Berlin, the chief electrical manufacturing works, power stations, gas works, scientific institutions, and the largest steam-accumulator plant as well as the largest rectifier traction station in the world; in its environs, lignite mines and important lignite power stations; in the Rhineland, coal and lignite mines, coking plants, iron and steel works, electric power stations, long-distance gas supply plants, a 220/380 kV plant and the largest pumped storage hydro-electric plant in Europe; in Central and Southern Germany, several large pumped storage hydro-electric plants now under construction, chemical works, a large steam-power plant operating with steam at extra high pressure at Baden, and the 220/380 kV transmission line from Rhenish-Westphalia to Switzerland. Provision has also been made for visiting the large hydro-electric stations of Bavaria and the Deutsches Museum at Munich, as well as important chemical works. Visits will be paid to the generating stations for supplying current to electrically operated railways in Silesia as well as to well-known coal mines and foundries. Tours are also being arranged to the shipyards of Northern Germany, as well as to the various technical universities.

FARADAY MEDAL AND KELVIN LECTURE.

At the Institution of Electrical Engineers, on May 1, the President, Col. Sir Thomas F. Purves, presented the Faraday Medal to Sir Ernest Rutherford, F.R.S., saying that no one would ever ask why this award had been made.

The presentation was followed by the twenty-first Kelvin Lecture, on "Some Recent Advances in the Electron Theory of Metals," by Mr. R. H. Fowler, F.R.S., who expressed the belief that quantum mechanics would proved adequate to deal with the problems presented by electrical conductivity and magnetism, though there was still much work to be done.

The Council dinner was afterwards held at the Waldorf Hotel, Aldwych, London.

LARGE TRANSFORMER DESIGN.

Our Recent Progress in Great Britain—Units of 80 000 kVA under Construction—Some of the Difficulties—Mechanical and Thermal Stresses.

By E. T. NORRIS, M.I.E.E., Member A.I.E.E., Chief Designer, Ferranti, Ltd.

AN outstanding feature of engineering progress in this country during the last few years has been the rapid increase in size or rating of the largest transformers. Two years ago the largest transformers built in this country were not more than 25 000 kVA at 33 000 V, whereas at the present time transformers of 60 000 kVA at 132 000 V have been built, and even larger units of 75 000 kVA and 80 000 kVA are under construction.

Although actual manufacture of such large transformers has only recently taken place, their design has been evolved

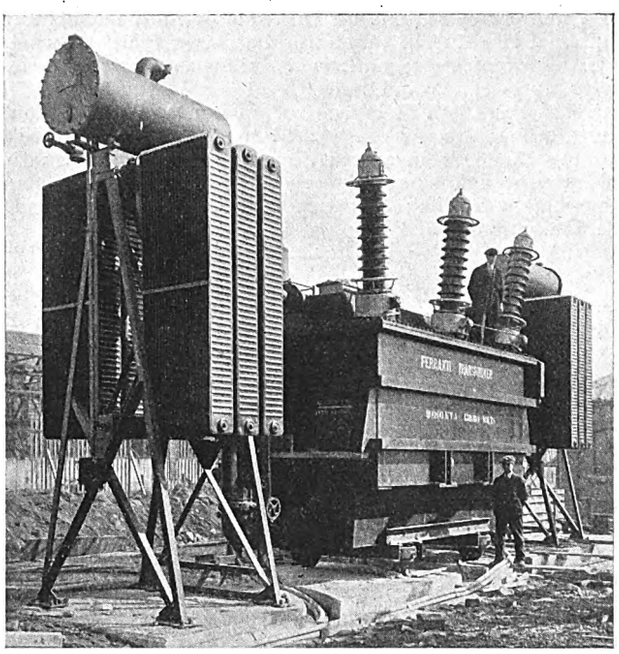

Fig. 1.—20 000 kVA transformer in course of erection.

through long periods of accumulating experience. Indeed, many years of continuous design work have been spent entirely on these large transformers. Innumerable trial designs must be made with all manner of proportions, before the final design is reached in which conflicting characteristics are reconciled into harmony with well-balanced proportions and safe reliable performance. As the size of a transformer increases, its design becomes more difficult and complicated. Electrical, mechanical and thermal stresses grow more acute and demand more accurate and complete technical knowledge for their satisfactory control. Many firms to-day are successfully building transformers on methods developed by experience and from designs based on trial and error, rule of thumb and empirical formulæ. Such firms run serious risk in attempting considerably larger sizes—a risk often not appreciated until too late.

In designing a transformer larger than any he has done before, the designer is extrapolating from his curve connecting Size of Transformer with Design Experience. It is necessary that this curve be accurate and fundamentally sound. The extrapolation in any case requires skill and judgment with a certain amount of imagination. Unfortunately, imagination tends to run riot. Its branches must, therefore, be ruthlessly pruned and its roots firmly embedded in solid fact. Imagination as a substitute for technical knowledge and without a sufficient foundation of fact inevitably results in failure.

During normal operation a transformer of any size is subjected to electrical, mechanical and thermal forces, or stresses. Electrical stresses, i.e., insulation stresses, are dependent mainly on the voltage and not on size; in fact, the difficult and relative cost of providing for these stresses lessen as the size of transformer increases for a given voltage. The necessary thicknesses of insulation are approximately constant, and hence for the larger transformers the space taken up by nsulation is relatively less. So far, then, as electrical stresses are concerned, a 30 000 V transformer of 30 000 kVA is easier to design than one of 300 kVA for the same voltage.

Mechanical and thermal stresses, however, whilst being affected by other characteristics, become rapidly more severe as the size of transformer increases. Since there are danger limits to these stresses, there comes a time when the stresses are as large as is safe. Alterations must then be made in the design so that either the stresses are reduced or better provision is made for resisting them.

For example, in very small low voltage transformers, the primary and second windings may each be wound as a single solid coil, and its temperature rise will be small, i.e., the thermal stresses will not be appreciable. As the size is increased the temperature increases until a point is reached when the coils would become excessively hot. At this stage the thermal stresses must be reduced either by reducing the current density, or, alternatively, by improving the cooling of the coils, each coil being split into two or more sections with cooling spaces between them. In a similar manner, if the size is increased still further, this improvement in cooling will no longer be sufficient and additional means must be adopted.

The ability to design really excellently and economically transformers of a given range of sizes is not, in itself, by any means a guarantee of success in the design of considerably larger transformers. In the case of the very small transformers just referred to, a designer who did not realise that thermal stresses existed at all would be under no handicap and might well be producing transformers of efficient design and excellent quality with a deservedly good reputation. His attempt at the larger size design would, however, result in immediate or ultimate failure.

To qualify for the ability to design satisfactorily the larger sizes, it is not enough for the designer to know that thermal stresses will be serious and to make a guess at suitable provision for them. It will nearly always be extremely expensive both in time, money and reputation, if alterations have to be made after the transformer has been constructed. The designer must have sufficient technical knowledge to be able to predetermine quantitatively the actual values of the temperatures concerned. He must check this knowledge

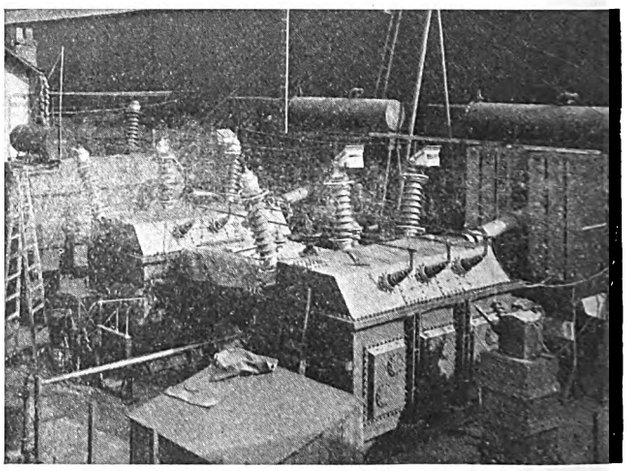

Fig. 2.—Temperature test on large transformer.

against measurements of the negligible stresses on the small transformers he has been building, and, if necessary, obtain thermal constants and other data by experiments. Then, when thermal design formulæ have been developed which are theoretically sound; which are sufficiently complete to deal with any proposed new construction, and which have been quantitatively checked, the larger size of transformer may be designed with confidence.

Load and no-load losses, since they cause thermal stresses, may be included under that heading, although frequently

Digitized by Google

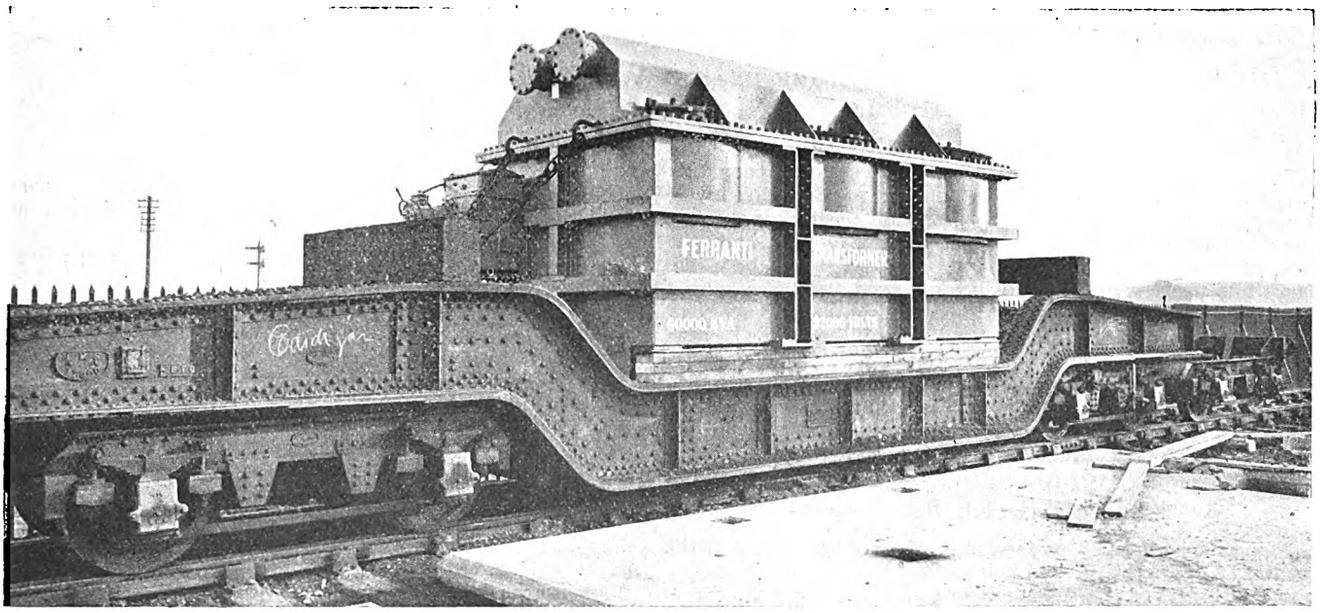

Fig. 3.—60 000 kVA transformer on railway well wagon.

they have other and more urgent limitations due to efficiency guarantees.

Copper losses resulting from load currents in the windings are easily calculable, but the extra losses due to eddy currents in the conductors are more difficult to determine, and, moreover, increase rapidly with the size of transformer. Winding arrangements which would give an insignificent eddy current loss in a 300 kVA transformer would, if used in a 60 000 kVA transformer, give a quite prohibitive loss of two or three times the load copper loss. There are many other components of the load loss which, in transformers of 5 000 kVA or so are negligible, and indeed often unsuspected, but which may easily reach alarming proportions in transformers of ten and twenty times that size.

Study of tank losses.

Some years ago a number of transformers of comparatively large size, for those days, were built to a certain order. On test, it was found that the load loss was increased 40 per cent. by putting the transformers into their tanks. It was known that, due to the leakage flux setting up eddy currents in the tank walls, the tank increased the load loss somewhat, but such an enormous increase was entirely unexpected. Since the transformers were, of course, completely built before the test was made, the only solution was the extremely costly one of making new and much larger tanks. So far as transformers hitherto built were concerned, it had been sufficient to know that the tank loss was not serious, but the satisfactory building of these transformers did not prevent serious trouble when the larger ones were attempted. Somewhat belatedly the characteristics of tank loss were studied and methods developed for its accurate predetermination and control.

Complete technical knowledge is equally necessary for the calculation and control of mechanical stresses and no-load losses. In particular, core iron losses are sure to give trouble in large transformers unless the characteristics accentuated by size are properly appreciated and provided for. In certain cases of neglect, the iron losses will come out high on test, and, at least so far as the purchaser is concerned, give timely warning, but most frequently the trouble is more insidious, there being no evidence of it for several years until complete breakdown either wrecks the transformer or destroys part of the core.

The subject has been considered hitherto on the assumption that a firm has had to rely entirely on its own resources and provide and develop its own technical ability in increasing its range of manufacture.

There is, however, an alternative to this procedure which has, at first sight, attractive features. If the experience desired has been obtained elsewhere, and this source of information can be tapped, not only will duplication of technical and experimental work be avoided, but a possible element of risk will be removed, and mental stress in the firm's own design office greatly reduced. In the past this method has been frequently adopted. Some firms in this country who were in a position to do so looked to American friends for advice and assistance whenever new technical or constructional problems arose.

The practice, while giving temporary relief in special cases is thought to be bad as a habit. It is, moreover, doubtful, if the shifting of responsibility is good for the health of the firm's own technical staff. In any event, so far as this country is concerned, the method is now of no avail. British manufacturers of transformers have made tremendous progress in recent years, and America no longer holds the position of technical supremacy which was hers for several years after the War. Her manufacturers have sheltered from the chilly, if healthy blast of competition, largely by substituting financial operations. Standard American practice still includes features such as single-phase units, water cooling coils and convective oil circulation—features long since abandoned by most European manufacturers.

There are, then, no new problems in the design and construction of large transformers; no phenomena or characteristics peculiar to size; merely problems which are present in the smallest transformers, but more or less accentuated and intensified. Factors which are negligible in small design—so negligible that the designer need not, and often does not, know they exist—become important and vital in large designs. In short, for a firm to be in a position to build large transformers successfully, complete technical knowledge of the design of smaller transformers is essential.

It is not enough to be able to build transformers well. Manufacturers must know just how well and why so well. Transformer designing, often regarded as an art, is also a science.

LOW TEMPERATURE CARBONISATION.

THE Department of Scientific and Industrial Research has issued a report of a test carried out last June by the Director of Fuel Research on the "Babcock" Low Temperature Carbonisation Plant at the Dunston Power Station of the Newcastle-upon-Tyne Electric Supply Co., Ltd. (Stationery Office, 9d. net). The plant, which is fully described, is designed for the production of power, the solid smokeless fuel being crushed at the outlet of the retort and discharged direct on to the chain grate stoker of a B. and W. boiler. The crushers are designed to produce a suitably sized coke.

The yields of products per ton of coal, as charged to the retort and per ton of dry coal, were :—

	As Charged.	Dry.
Coke (cwt.)	14·65	15·04
Tar (gals.)	16·4	16·8
Spirit scrubbed from gas (gals) ..	2·5	2·6
Gas (cu. ft.)	37·690	38·700
Gas (therms)	26·38	27·09

No practical difficulties were encountered in the operation of the retort. The carbon balance, which includes all the loss of the carbon in the volatile products during the cleaning periods, shows a loss of 4·5 per cent., which indicates that the test was satisfactory.

UNEMPLOYMENT AND WORK—II.

Making the Worst of It.

By SIR ERNEST J. P. BENN.

IF our politics were healthy, we should hear both sides of the unemployment question. As it is we only get different views of one side of the matter. Three political parties, all playing the same game, all offering bribes and all promising the impossible tend not unnaturally to drive the common sense out of popular discussion. How much better we should be if one party told us we were going to the dogs, and the other, taking the natural line of opposition, argued that we were on the road to prosperity! In that case the public would perhaps be able to discern the truth and would understand that we are really in a fairly natural position, and that there is not as much to worry about as interested politicians would have us believe. As it is we are doing ourselves no good at home and infinite harm abroad by encouraging the notion that we are all out of work.

Success Breeds Success.

Trade depends upon buyers, and a little more study of the mentality of the buyer and a little less emphasis on the supposed interests of the seller might make a striking alteration in the state of affairs. As we are all buyers at some time or another, it is not difficult for any of us to understand how buying may be discouraged. We do not, for instance, rush to a theatre when we hear that the seats are mostly empty. On the contrary, we queue up in the rain to crush ourselves in when we are told that everybody is going to see some particular play. A cynic might say that we are sheep and must have a lead to follow. I prefer to think that in the matter of buying we like to feel the moral support of association with others. After all, a very great deal of our buying is only done because others do it also—women's fashions make this point quite clear. Then the average person dearly loves to be associated with success. He will buy a newspaper because he hears of its big circulation and avoid another journal which is probably far superior because it is understood to have difficulty in finding readers. When, therefore, we shout to the world that we are unemployed, the world pities us, but looks elsewhere for its purchases. Just as success breeds success, so failure breeds failure.

If the worst that is said about unemployment is true, it is nevertheless extremely foolish from a business point of view to emphasise the trouble. But the worst that is said is happily very far from true. Our position is infinitely better than we make it out to be; we have more employment than ever; we pay more wages than at any previous time. The income of the working classes taken as a whole is larger, the general standard of living higher. Considering our post-war difficulties, mostly created by political folly, we are in an economic position which reflects the highest credit upon those of us who still do real work. When two years ago I put this point of view to the annual meeting of the Charity Organisation Society, I was widely criticised and held up to scorn as a heartless creature. I find, therefore, no little satisfaction in listening to Mr. J. H. Thomas and applauding his efforts to get even the Socialists into a frame of mind when reason can be applied to this troublesome problem.

There is complete unemployment of the old-fashioned kind—total absence of any chance of work—to be found in one or two specialised industries and in several special districts. The industries are those which, like coal, have been ruined by politics, and the districts are those where an unnaturally large industrial population was introduced to make munitions of war. The rest of our vaunted unemployment, so far from being an old trouble, is in reality a new social benefit. No doubt it is making an ever-increasing quantity of trouble, which must in fairness be charged not to the failure of industry but to the success of the political agitator.

The point will perhaps be made more clear if the reader will imagine that instead of being English with our love of self-depreciation we were Americans with a genius for boost. What a different story we should tell! Our newspapers would be full of our wonders and our triumphs. The psychological skill which has had the world madly jazzing for the last few years would put the dole dope over one hundred per cent. The illustrated papers would display the smiling photograph of Sam the sea-side Chauffeur, who a few years ago had to earn a living in five months of the year and do odd jobs in the off season. Now, thanks to the wonders of Prosperity George and his People's-Budget-Every-time-Payment-Plan, Smiling Sam charges rather more for his five months' work and draws his "Loving Lloydy" for the other seven months. "Sam don't have to worry over odd jobs, and the cinema returns are up so many million dollars. Sam's health is better, his wife sees more of him and the country is a better place to live in."

But, fortunately, we are not American, and we cannot amuse ourselves in this fashion, although it would be the proper and logical thing to do, if we believed all we said to ourselves when we first voted for the People's Budget and all the alluring delights of ninepence for fourpence. We go to the other extreme, and now that we have secured to the full and more all the "benefits" which we ourselves planned, we set up a wail to the world that we are down and out and unemployed.

There is, of course, a vast, tragic difference between Smiling Sam and the coal-miner who has had no work for years, and in between the two are many grades of trouble, but we lump them all together in our lazy way, treat them all as if they were alike, and degrade our own intelligence by refusing to face up to facts.

When we discuss the causes of unemployment we take the line of least resistance and blame the foreigner, the war, the money market or some other remote and nebulous bogey which has no chance of answering back. Thus, for example, we seldom mention women. But, surely, if industry has put two men out of work and absorbed three women (for that is roughly what has happened) the numbers of employed are increased by 50 per cent. and a big step forward is made by the feminist movement. This from the industrial or the feminist point of view is triumph rather than disaster, except to that shallow, safety-first type of thinker who forgets that nothing can be done without cost. We may differ as to the wisdom of making wholesale payments to juveniles, but we can all agree as to the absurdity of using such payments as evidence of industrial depression.

The Ministry of Labour is but thirteen years old and was established to arrange and facilitate employment. So great is our common respect for Government institutions, that to suggest that the Ministry itself is one of the causes of unemployment sounds like a species of gross sacrilege. But surely the question is worth examination. If the Ministry, instead of enjoying a blank cheque on the public purse, had been floated as a company, it would have gone into liquidation years ago. A study of its prospectus, of the speeches and promises of its authors and advocates, shows that every hope on which it was founded has been falsified. This conclusion is inescapable whether we examine the matter in principle or in detail. When the State first said to the worker: "We will find you employment," it drove a fatal crack into our economic foundations, comparable to the effect of one of those noisy pneumatic drills on the concrete foundations of our roads. A totally new and altogether false thought was put into the minds of millions of people. The nature of industry, the true character of work, and the sense of personal responsibility which is inherent in them, were all smothered up in political falsehood. Economic salvation, depending as it does upon value for value, was cast aside and discarded for the tempting but devastating lie—ninepence for fourpence.

Trusting the Government.

We are a simple, docile people, which fact in itself is perhaps a point in our favour, but when those qualities lead us, as they have done in recent years, to accept as sacred and perfect everything labelled with the authority of Government, it is time that we developed a few of the balancing qualities of cynicism and pugnacity. As it is, if a government uses a word, say, "Peace" or "Coal" or "Housing" or "Employment," we all seem to take it for granted that the actions of governments in these matters must be good. It does not seem to dawn upon us that in some circumstances and in some mouths talk of peace may lead to war, or talk of coal may drive us to oil, or that official fussing about employment may put us all out of work.

The subject becomes the more worth enquiry when we remember that the Ministry of Labour, set up to facilitate employment, has in the course of a very short career simply

Digitized by Google

established legions of bureaucrats whose living absolutely depends upon the absence of the very employment which they were appointed to provide.

Not only do we tempt our people to develop the spirit of idleness, but in doing so we make it much more difficult for the great majority who are happily immune from any such temptation to exercise their natural right to work. We multiply rules and regulations which are supposed to help and often only hinder. For example, we raise the school leaving age with the silly idea that by withdrawing boys and girls from industry we are making jobs for men and women. There are, of course, a few cases where this notion is more or less well founded, but in other cases the absence of a boy will throw the man out of work as well. By removing the soprano from a church choir you do not make more employment for the bass, and so it is with an industrial unit ; there is a proper proportion of skilled and unskilled men and boys and women and girls which gives the requisite efficiency and enables the produce to be marketed. If that proportion is disturbed the whole trade may be dislocated. Yet we go on merrily with this sort of folly, a little more each day.

We need a new outlook, a change of heart, an alteration of our philosophic viewpoint. We must give up the Safety First mentality and write upon our banners a more inspiring thought. Success and happiness are personal achievements and cannot be conferred upon us by order.

In talking in this way I am running risks, but I face them gladly. I have too often been called a heartless wretch, in those and other more decorative words, for doubting the sense of the " benefit " idea. But when I stand on the pavement outside a Labour Exchange and look into the faces of my fellow citizens as they drag themselves up to receive their doles and allowances, I become more convinced than ever that if there is any heartlessness in this discussion at all, it is to be found heavily coated and hidden by the sloppy sentimentality of a social policy which ignores most of the truth of life. Studying the expressions of these poor victims, I see qualities which are denied by the popular philosophy of social rights. I believe that if the doctrine of personal responsibility were preached to them. and if we framed our policy in such a way as to give it a chance, they would not only be much better off but would have a chance to enjoy the delights, now denied to them, of personal pride and healthy self-respect.

There is real happiness to be won by facing difficulties, and if we were honest with ourselves we would give up the notion either that life can be so arranged as to be free from difficulty, or that it would be worth living if that could be done. Ignoring truth, we seek a snobbish satisfaction in pretending to shoulder the difficulties of others. Needless to say we do not really shoulder them, we merely vote rates and taxes for the purpose.

A straightforward appeal to the manhood of the nation would flatter and delight millions who are now encouraged to regard themselves as hopeless automata in a machine of which they can know nothing and should care less.

BOOK REVIEWS.

Principles of Electrical Engineering. By W. H. Timbie and V. Bush. 2nd Ed. (London : Chapman and Hall.) Pp.vii+595. 22s. 6d. net.

A more appropriate name for this volume would, I think, be " The Physical Basis of Electrical Engineering." As stated in the preface, it does not attempt to give an exhaustive treatment, but to illustrate and explain the fundamental physical conceptions on which the applied science of electrical engineering is founded. The subjects treated are well selected and cover, roughly, Resistance and Kirchoff's Laws, Electrolytic Action, Magnetism and Magnetic Materials, the Magnetic Field, Induced and Generated E.M.F., and Forces on Conductors, Thermionic Conduction and, finally, Dielectrics. That a second edition should be required proves that it has been successful, at least in America, but its place in an English technical syllabus is difficult to find. Though described as a first course, the mathematical parts are too advanced for a true beginner and much of the text is too elementary for an advanced student.

The treatment is unequal—parts are very good indeed. The authors boldly tackle the problem of magnetic action from the basis of the line integral (and slyly introduce the elements of vector notation—i.e., Gibb's " dot " product, which corresponds with Heaviside's scalar product). This is excellent and the sooner the study of magnetic fields in terms of work and forces on an isolated N pole drops into disuse the better. The treatment of dielectrics is interesting but not so satisfactory. In particular the authors seem (to me) to dodge the issue in the treatment of displacement current. These two parts have been selected as exhibiting the strength and the weakness of the whole book. On several points I have found a clear explanation of matters on which it is very easy to become confused and the limits of accuracy of engineering theory have been clearly set out. No doubt many engineers will be surprised to find that some formulæ which they have become accustomed to treat as exact are only close approximations. The book is rather long for the subject matter but it is, therefore, easy reading. It is valuable for those appeals to first principles which we all at times have to make (and has a most valuable summary of important formulæ in heavy type at the end of each chapter), but does not give a sufficiently rigorous examination for a research worker or physicist. There are a large number of examples and exercises.

W. F. C.

Design of Electrical Apparatus. By John H. Kuhlmann. (London : Chapman and Hall). Pp. xii+455. 30s. net.

The author of this work is not only a designer, but a teacher of design. The object is to present a practical method of design in a clear and simple form, with explanations of the theory, procedure, and limits of design. The author has succeeded in his task. The work is divided into four main sections : d.c. machines, synchronous machines, induction motors and transformers. In the first section the construction of machines is followed by voltage formulæ and output equations. Armature winding, the magnetic circuit and losses, efficiency and temperature rise are dealt with later. An important feature is the discussion of commutation and commutating pole design. The second section follows the same treatment of subjects, and each contains the working out of a sample design. The third section deals very fully with the principles of the design of the stator and rotor of an induction motor. Sample designs are worked out and general characteristics are discussed. In the last section, transformers are fully dealt with and many sample designs are given. The constructional details are very clear, a large proportion of the illustrations being reproduced from photographs taken during manufacture. The book should appeal to those associated with the testing of the apparatus referred to, and to students in technical colleges.

Cyril Sylvester.

Starkstromtechnik. Seventh Edition. Vol. 1. Edited by E. v. Rziha and J. Seidener. (Berlin : W. Ernest und Sohn). Pp. xx+1 039. Price, in linen covers, 34 marks ; in leather covers, 37 marks.

This is one of the best pocket books covering electrical engineering on the market. The publication was always good, and successive editions have enhanced its value by adding to its practical nature, much of the earlier somewhat academic treatment being discarded. Apparently the present (7th) edition has been largely rewritten and much enlarged. Volume 1, now under review, opens with a section of 52 pages devoted to those parts of higher mathematics needed by electrical engineers. The second lengthy section deals with fundamental principles underlying electrotechnology. The new material here includes electric strength of materials, the electron theory and theoretical electrochemistry. The second on measurements deals with the various types of instruments, transformers, meters and methods of measurements. Transformers and machines are treated by numerous experts, and examples of the several types are given in the following section. Much of the information here will be of particular use to designers. Rectifiers form a new section of the book.

Batteries, starters, controllers, switchgear and accessories are fully dealt with. Illumination is one of the sections which have been completely re-written and includes information on train lighting, and on car systems for starting and lighting. Under electric heating, the various types of furnace are discussed in conjunction with their respective applications. The concluding section is devoted to cooking and heating appliances, and from the English reader's point of view must be regarded as one of the poorest in the book. Taken as a whole the book is well written, well illustrated and well made.

The following sections have been left over for the second volume now in preparation : power stations, networks, industrial, railway and ship installations, and agricultural applications.

MAGNETOSTRICTION CONSTANT FOR ALTERNATING MAGNETIC FIELDS.

Application to the Production of Mechanical Oscillations—Stress Unaccompanied by Strain—Flexural Forces.

MR. F. D. Smith, M.Sc., A.M.I.E.E., in a paper on "The Magnetostriction Constant for Alternating Magnetic Fields," read before the Physical Society, defined a magnetostriction constant K for the Joule effect by the equation $p = KH$ where p is the alternating mechanical stress produced by a small alternating magnetic field H superposed on a steady magnetic field H_0. It was shown that the alternating intensity of magnetisation I, produced by an alternating strain $\delta l/l$ is given by the equation $I = K\frac{\delta l}{l}$, K being the same constant in both equations. These equations were used to calculate the motional impedance of a laminated ring toroidally wound and vibrating in its fundamental radial mode. K has been measured for various values of H_0 with a ring of the alloy Fe 60 per cent., Ni 40 per cent. It was shown that the magnetostriction effect for steady magnetising fields could be inferred from the measurements with alternating magnetic fields, if the reversible permeability and the differential permeability of the alloy are known.

Ring Oscillation Period.

Dr. J. H. Vincent: I think that the Physical Society is to be congratulated on the presentation of this paper, which marks a distinct advance in the application of magnetostriction to the production of mechanical oscillations. I suppose that the formula given for the period of oscillation of an anchor ring in its fundamental radial mode is only approximate. The period of oscillation for an infinitely thin ring is the circumference divided by the velocity of sound in the material. If the anchor ring is supposed to have its orifice filled up with the same material, we approach the case of a wire vibrating radially. Whenever a current flows in a wire of magnetostrictive material the radius of the cross-section must change in consequence of the magnetic field which the current produces. This should entail a number of interesting consequences, some of which might be capable of experimental demonstration.

Dr. D. W. Dye: I have read the present paper with much interest and wish to congratulate the author upon a difficult piece of work in a field not hitherto explored. I admire the author's courage in obtaining the results he has worked out, in spite of the admixture of paper, paraffin wax and nickel-iron alloy investigated. These must form a specimen of rather poor vibratory properties. There are three points to which I would like to draw attention: (1) In discussing the Young's modulus of the alloy the author states that Pierce should not have used the term aSB' as a term to be subtracted from Young's modulus. Pierce is quite consistent in what he has done; the difference between him and the author is simply one of definition of Young's modulus, which is different in the two cases. One is free to choose either. (2) The dimensions of the built-up ring, as shown in the diagram, indicate a ratio of 1 : 3 between outer and inner diameters of the ring. This will result in a corresponding ratio of magnetising fields between inner and outer edges. The results obtained are, therefore, those referring to an average magnetisation corresponding to this range of H. (3) The values obtained from the circle diagram and by the theory given pre-suppose a pure mode of radial vibration in which the stresses are purely compressional and tensile in the direction of magnetisation. From my experience of quartz specimens of all shapes and sizes I should not be at all surprised to find that a ring of the shape shown had overtone flexural modes such that the vibratory energy was divided up between two or more modes of vibration. This would profoundly affect the magnetostriction constant as here determined. In the analogous case of the quartz plate, the effective piezo-electric constant nearly always comes out at about one-third only of its theoretic value when the motion is complex, simply because energy is divided up between various modes, only one of which reacts piezo-electrically upon the maintaining circuit. I would suggest that a ring of greater thickness should be tried to see if the same result is obtained.

Mr. A. W. Benton: I consider the paper of quite outstanding interest and importance. There was one remark, however, made by the author in presenting his paper to which I felt exception might be taken. Mr. Smith spoke of the "alternating current producing stresses unaccompanied by changes of dimensions in the magnetic material." It is difficult, if not impossible, to conceive of any stress not accompanied by strain, and, as a matter of fact, the mathematical reasoning would appear to hold good if small dimensional changes accompany the alterations in stress. It may interest Fellows to know that over 50 years ago Dr. Du Moncel, and I believe others, described telephones based on magnetostriction effects. A rod of magnetic material attached to the centre of a diaphragm reproduced music and speech without acoustically modified currents circulating round the rod. It would not appear, however, that anyone has used the reverse, or Villari effect, as a telephonic transmitter. The very considerable changes of stress which could be produced by acoustic vibrations in a rod or wire made of a magnetic material especially susceptible to the Villari effect could be used to modify the strength of a current and thus form a transmitter.

Mr. Smith said, in reply: The simple formula given in the paper for the fundamental mode of radial vibration of a ring is, as Dr. Vincent points out, only approximate. An exact calculation which takes into account the finite radial width of the ring shows that the error involved in this approximation is negligibly small for the comparatively thin ring used in the experimental work.

I agree with Dr. Dye that the theory given by Pierce for the vibrating rod is accurate provided that Young's modulus for the material is suitably defined. Pierce does not, however, define this modulus in his paper, and the usual simple definition is therefore implied, whereas another rather complicated definition is required if his theory is to be consistent. There is no doubt in my mind that the predominant mode of vibration of the laminated ring is radial. The sound in air emitted by the vibrating ring is audible and it is possible to explore its surface with a small stethoscope. The sound intensity appears to be uniform over the whole of the outside and inside cylindrical edges. The flexural forces in the vibrating quartz disc arise from the fact that the diameter of the disc is usually large in comparison with the wave-length of sound in quartz at the frequency of the vibration. The expansions and contractions of the quartz in the plane of the disc, depending upon Poisson's ratio, are partially prevented by a lateral constraint from the inertia of the disc, and radial stresses are produced. These stresses are not quite symmetrical with respect to the quartz disc because the piezo-electric properties are not, in general, quite uniform throughout the disc, and stresses are therefore provided which can excite flexural modes of vibration. In contrast to the quartz disc, which is usually large in two directions in comparison with the wavelength, the laminated ring is small in two directions in comparison with the wavelength. Expansions and contractions in the directions of the thickness and the radius of the ring, depending upon Poisson's ratio for the material, are practically unconstrained. Moreover, the ring is built up from a large number of their stampings assembled at random, and any appreciable variation of the magnetostriction constant along the circumference is improbable. It is difficult to imagine how any stresses can arise which might excite a flexural mode of vibration.

Forces in Equilibrium.

The conception of a material in a state of stress without strain, which Mr. W. A. Benton finds difficult to accept, can perhaps be most clearly realised in the following case. Let a long thin rod of a material, having the property of magnetostriction, be magnetised so that its length and cross-section change. The rod can be restored to exactly the original dimensions by forces applied to its ends and surface so that it is completely freed from strain. These forces are in equilibrium with the forces arising from stresses in the material so that a state of stress without any strain whatever is produced.

Proposals for the establishment of telephonic communication between the Channel Islands and England have been brought before the Channel Islands States of Deliberation. It is proposed to land the cable at Saint's Bay. The total expenditure is estimated at £4 140. The maintenance costs of £210 per annum would be borne by the Post Office, which would also pay 5% on the capital outlay.

SALFORD RELAYS.

Redesigned Types for a Variety of Purposes—Protection of Generators, Transformers, Parallel Feeders and Transmission Lines—Reverse Power and Moving Coil Types.

THE Salford instrument works of the G.E.C. have recently redesigned a number of their well-known relays, including overload induction relays (with inverse time element), super-sensitive leakage relays, reverse power relays and d.c. moving-coil relays. It will be seen from the particulars given below that they embody many ingenious features of considerable interest to engineers concerned with the distribution and transmission of power.

On a.c. systems the ever-growing size of power stations and distribution networks means that more and more time and money is lost if there should be any failure in the system, and the problem of automatic protection has become one of the utmost importance. Modern distribution developments have made it essential that, if a fault arises in any part of the system, the trouble be confined to as small an area as possible, and that no part of the system should be closed down unnecessarily. The object throughout must be to promote continuity of supply by isolating the faulty section, and it was with this aim in view that the latest Salford designs were produced. Various combinations of these are also manufactured in self-contained forms. This series of relays provides for the full and complete protection of generators, transformers, parallel feeders, ring mains and transmission lines.

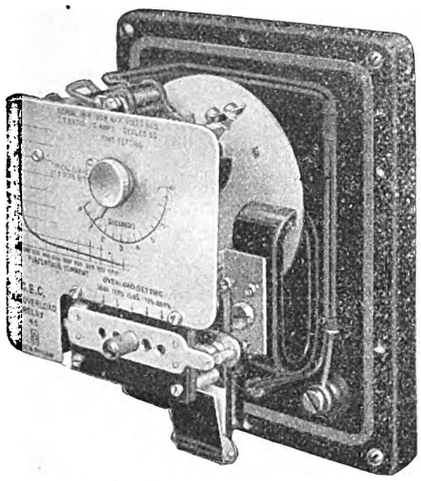

Fig. 1.—Overload induction relay.

The specialised and localised form of protection given by these relays is well illustrated by the Salford overload induction relay (Figs. 1 and 2), to which is fitted an inverse definite minimum time element. This feature allows the mains

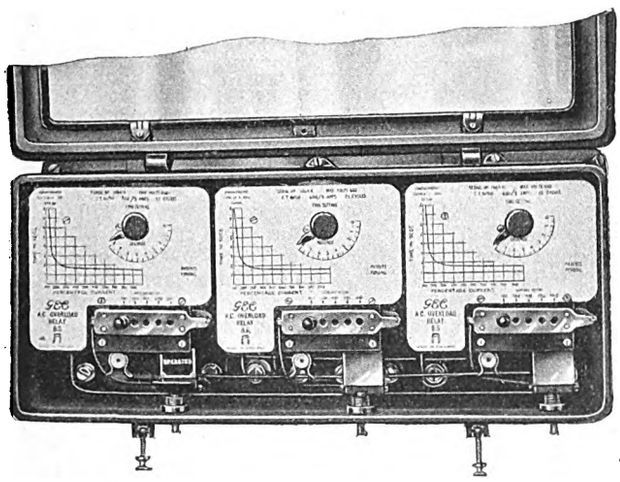

Fig. 2.—Three-pole form of overload induction relay.

superintendent to regulate the operation so that either the relay (or relays in the case of a ring main system) next to the fault is the only one tripped, the remainder of the system being unaffected, or the relays trip in their correct sequence, irrespective of the severity of the fault. This may mean hundreds of pounds saving to a large undertaking. For currents greater than 1 000 per cent. full load current the time of operation is approximately constant. The relay works on the induction principle, and will withstand overloads of 1¼ times full-load current continuously and 10 times full load current for a short time without damage or loss of accuracy; full-load current is 5 A. The settings can be varied independently, the time setting from ½ to 8 seconds and the current setting up to twice full load. A patented safety device is fitted, to allow the tapping to be changed while the relay is on load without risk of open-circuiting and damaging the current transformer or endangering the life of the operator; in addition, if an overload or fault occurs on the system while the current setting is being altered, the relay will still carry out its protective functions. The relay is not operated by momentary surges such as may be caused by switching operations, and, if the load falls during the operation, it will automatically re-set, even at the point of making contact. The power consumed on 50-cycle circuits with normal full-load current is not more than 3·2 VA. The relay is made in single- and three-pole forms.

For use on high-voltage circuits of small current capacity where bushing transformers are used, the G.E.C. manufactures a specially sensitive form of overload induction relay, which imposes a minimum load on the transformer. This relay has

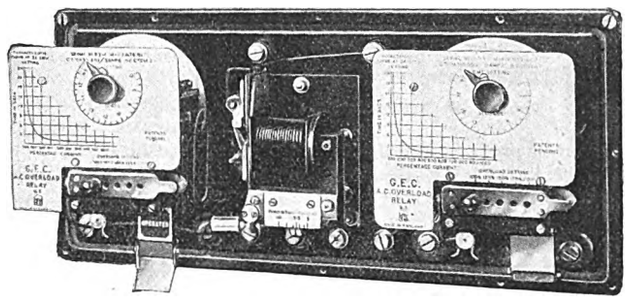

Fig. 3.—Relays for leakage protection.

all the advantages of the standard form already described, with the addition of reduced power consumption (not more than 1·6 VA on 50-cycle circuits with normal full-load current.)

For leakage protection, a special super-sensitive relay is manufactured, and can be supplied combined in one case with two overload inverse time-element relays (as illustrated in Fig. 3), the combination thus giving complete overload and leakage protection to a three-phase circuit, generator or transformer. Used with shunt-tripping circuit breakers, this relay is able to isolate any faulty circuit and warn the operator of abnormal conditions; as its name implies, it operates with extreme sensitivity, thus minimising interruptions to the service and damage to machines. The principle of operation is the attraction of a sensitively-balanced armature to an electromagnet, when the voltage or current exceeds that for which the relay is set. When operated from a standard current transformer with a 5-A secondary, it will indicate leakages of 5-10 per cent. In view of the robust construction of the relay, the power consumption is particularly low (0·03 VA at minimum setting), and every part is liberally designed to be suitable for general power station use.

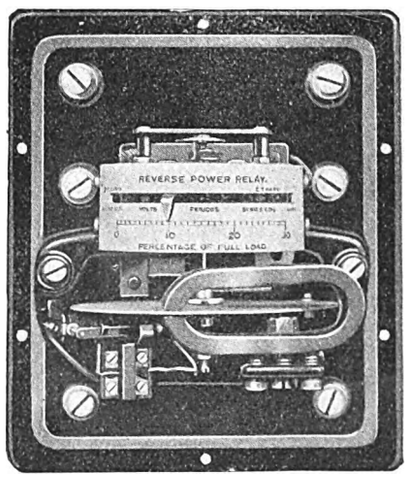

Fig. 4.—Reverse power relay.

Besides being used for leakage protection, Salford supersensitive relays in single-pole form have a wide variety of other applications, including a.c. or d.c. over-voltage or overload protection. They can also be arranged for use as out-of-balance relays for a.c. earthed systems, balanced-core protection relays (a.c.) or tell-tale relays for industrial purposes.

An improved form of the Salford reverse power relay has lately been introduced. This relay (Fig. 4) is constructed

Digitized by Google

on the induction wattmeter principle, and can also be arranged as a differential reverse power relay (for reverse power and leakage protection on the McColl system), and as a biased differential relay (for parallel feeder protection). The movement consists of a disc rotating between a pressure electro-magnet and a current electromagnet. The value of reverse power at which the relay operates can be varied by an adjustable pointer from zero to 30 per cent. of the normal forward load. The loss in the pressure coil is 0·6–1·5 W, and the voltage drop in the current coil (at full load) is 0·36 V. The relay operates instantaneously. In addition to the projecting pattern as illustrated a flush pattern in a round case is also available.

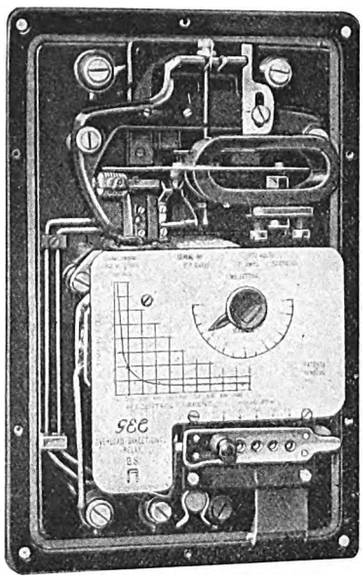

Fig. 5.—Overload and directional relay.

For cases where combined overload and reverse power protection is desired, a specially-designed overload and directional relay (illustrated in Fig. 5) is available. This relay incorporates an inverse time-limit overload element with a directional element, mounted in a common case and with their ci cuits suitably connected.

The latest pattern of the Salford moving-coil relay developed by the G.E.C. fulfils a variety of functions in a reliable and economical manner. It can be arranged either as a current relay (to give protection against overload and/or reverse current), or as a voltage relay (for over and/or under-voltage protection). The relay (Fig. 6) is operated with shunts in series with the load, and is generally similar to most permanent-magnet, moving-coil instruments, except for certain modifications that give important advantages to the present design. For instance, the much higher working forces greatly increase the contact pressure and the torque of the movement; this ensures very reliable operation and prevents the possibility of trouble from adhesion of contacts. A further advantage is due to a very low resistance movement allowing the use of shunts with a low millivolt drop (e.g., 150 millivolts at full load), which allows power to be economised without the reliability being impaired. The overload capacity complies with the appropriate British Specification, and the relay is guaranteed within 4% of the adjustable current setting. If required, the d.c. over-load relay can be fitted with an indicating pointer, so as to serve also as an ammeter.

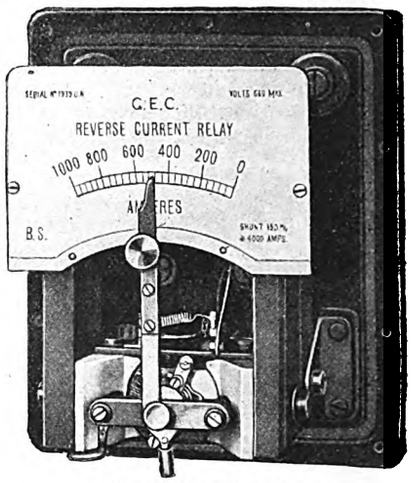

Fig. 6.—Moving coil relay.

SOFT SOLDERS AND JOINTS.

Advantages of Pure Tin and Tin-Antimony Alloys for Electrical Purposes—Avoidance of Lead in Preliminary Tinning.

PART 1 of a Report of the British Non-ferrous Metals Research Association on the Jointing of Metals, dealing with soft solders and soldered joints, has been issued to members. It extends to 96 pp. and is illustrated with micro-photographs and diagrams. The chapter headings are (1) Soft Solder Alloys; (2) Physical Properties of the Solder Alloys; (3) Strength (Shear) of Soldered Joints; (4) Metallurgy of a Soldered Joint; (5) Corrosion Resistance of the Solder Alloys; (6) Some Practical Considerations.

With respect to electrical resistivity and conductivity it is stated that within the limits of the compositions dealt with, the presence of antimony causes an increase in electrical resistivity which is most marked in the absence of lead. In this case the resistivity continues to rise with antimony concentrations beyond those plotted; but in the Pb-Sn-Sb alloys the maximum resistivity occurs when the limit of solid solubility of antimony (in tin) is reached. Tin shows the minimum resistivity of all the specimens examined; the maximum value being attributable to pure lead. The addition of lead to tin and to tin-antimony alloys has little effect until the proportion of lead exceeds that required for the alloy to be wholly eutectic in constitution; this characteristic being most marked in alloys saturated with antimony. Additions of lead beyond the eutectic point accelerate the increase in resistivity. Of the graded solders, grade "A" shows the lowest resistivity and grade "D" the highest.

Measurements of temperature coefficients of resistivity were made only in Sn-Sb alloys and those constituting grade "C" solders. This question is more fully discussed in relation to the temperature coefficient with respect to joints. Within the temperature limits of the experiment (0—100 deg. C.) the resistivity of pure tin is lower than Sn-Sb alloys, the presence of antimony causes a reduction in the temperature coefficient which continues up to (and beyond) an Sb-Sn ratio of 0·065. With the Pb-Sn-Sb alloys the reverse is true; the temperature coefficient increases with increasing antimony content until the limit of solid solubility of antimony in tin is passed. The presence of lead, in addition, would appear to lend uniformity to the values. The effect of antimony is probably negligible in practice.

Attention is drawn to the performance as a solder of pure tin and its alloys with antimony. Tin has the highest electrical conductivity of the soft solder system, being 16% higher than grade "A" solder. Additions of antimony reduce the conductivity somewhat, but an antimony content of 6% may be added and still maintain a conductivity sensibly the same as the best tin-lead solder. It has been found from tests on a number of joints typical of the kind used by electrical engineers for the stator and rotor end connectors in induction motors that the presence of antimony in solders would not increase the resistance of a stator or a rotor by more than 0·8%. The presence of antimony does not cause the increase in resistance of a joint with temperature to be appreciably greater than would be the case in its absence. This is of importance because the desirable electrical properties of pure tin are unfortunately accompanied by relatively low shear strength which can be fully compensated by additions of antimony. Antimonial-tin holding 6% antimony gives a joint shear strength on copper of three tons per square inch, practically equal to the maximum joint strength obtainable with any solder. In addition it has an elongation of 35% and (Izod) impact strength of 22 foot lb., the latter figure being nearly 60% greater than grade "A" solder. In conjunction, the fact that it retains its strength to a point of 40-50 deg. C. higher in the temperature scale than any lead-containing solder will perhaps point its eminent suitability for certain electrical purposes, notably the jointing of armature conductors to commutator necks. For the maximum effect it is, of course, essential that all preliminary tinning be done with either pure tin or antimonial-tin; otherwise, if a lead-tin solder be used for tinning the advantageous strength at elevated temperatures will be lost; the presence of even small quantities of lead introducing the lower melting point lead-tin eutectic, liquid at 183 deg. C., in the absence of which, melting does not occur below 243 deg. C.

ELECTRIC DOOR CONTROL.

We should be glad if manufacturers of electrically operated systems of door control would communicate with us. A correspondent who is interested in the matter sepecially desires to obtain particulars of switch or push button controls suitable for a 200 V 50 cycle supply, whereby a communicating door can be opened or closed without the necessity of rising from one's chair.

POWER STATIONS IN RUSSIA.

Revised Programme of New Work and Extensions for 1929-30.

IN the April number of the "Bank for Russian Trade Review," a list is given of "regional and republican electric stations under construction or in process of extension during 1929-30." It is stated that the growing demand for electrical energy in connection with the industrial development of the U.S.S.R. necessitated an extension of the original programme elaborated for the electrical industry in the current financial year. The revised programme provides for large capital investments for the speeding up of the construction of electric stations in all parts of the country.

The first group in the list relates to "regional stations in course of erection and extension during 1929–30," and includes 27 items with a total capacity of 2 017 000 kW, the cost being given as 436 940 000 roubles. The largest stations in this list are Dnepr (372 000 kW), Moscow Electric Trust (224 500 kW), Elektrotok (139 500 kW), Shterov (115 000 kW) and Nizhni-Novgorod (110 000 kW).

Group 2 embraces "new regional stations to be started this year." There are twelve of these with a total capacity of 757 000 kW, the estimated cost being 57 340 000 roubles. The Bobrikov and Southern stations in this group are each to be of 150 000 kW, New Leningrad of 100 000 kW, and Zuev of 88 000 kW capacity.

Group 3 consists of "Republican electric stations for the People's Commissariat for Transport," and includes only two stations of a capacity of 42 500 kW, to cost 5 800 000 roubles.

Groups 1, 2 and 3 combined represent 2 816 700 kW and 500 080 000 roubles. In addition, local and rural stations with a total capacity of 75 400 kW are planned for erection in 1929-30 at a cost of 18 229 000 roubles.

It is pointed out that the principle underlying practically all the new stations at present under construction is the utilisation of local fuel or water power. Of the large stations now being built only the Moscow and Leningrad thermo-electric power stations will work on imported fuel. The central thermo-electric power stations are to produce electricity and steam for technical and heating purposes. A number of such stations are to be erected in Moscow and Leningrad.

"The total investments, including those in the reconstruction and extension of local, factory and village electric stations, will amount this year to 760 million roubles. Half of this sum will be provided by the State budget, and the rest by the banks, consumers of electric power, local budgets, and so on."

[*We give the foregoing information for what it is worth, being unable to separate reality from hot air in the case of statements relating to Russia.*—ED.]

BROOKMANS PARK B.B.C. STATION.

AT the Institution of Electrical Engineers, on Wednesday, a paper read by Capt. P. P. Eckersley, M.I.E.E., and Mr. N. Ashbridge, B.Sc., on "A Wireless Broadcasting Transmitting Station for Dual Programme Service," describe the first of the twin 50 kW transmitters (Brookmans Park) erected in connection with the B.B.C. Regional Scheme.

The paper deals with the considerations underlying the choice of sites for such broadcasting stations, the type of power supply adopted, and the factors contributing to reliability in operation, as well as with the wireless transmitters themselves.

The paper deals, further, with the general station layout, the building and the auxiliary services, as well as with low-frequency apparatus for supplying modulation to the transmitter and apparatus for testing and monitoring purposes.

Of particular interest is the use of high-tension direct-current machines at this station for the production of high-tension voltage for anode supply to the main power valves. The type of generator developed especially for this work is considered in some detail.

DIOLITE'S VICTORY AT NEWMARKET.

Sir Hugo Hirst has received numerous congratulations from his many friends on the victory of his colt Diolite in the race for the Two Thousand Guineas at Newmarket on Wednesday, when, with F. Fox in the saddle, it won by two lengths. We hope this will be followed by a win for Sir Hugo Hirst's colours at Epsom next month.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Hertz" as a Unit Name.

[TO THE EDITOR.]

SIR,—In order to commemorate the first demonstrator of the reality of Maxwell's theoretically suggested free electro-magnetic waves, the Germans originated the idea of naming the unit of frequency (one vibration per second) a "Hertz." This idea was obviously not very fortunate, and the Washington Conference in 1927 rejected its universal adoption in radio-telegraphy. In fact, the name was inappropriate as vibrations of the order 1 c/s had been studied for centuries before Hertz, who never worked with slow-order vibrations. Had "a megacycle per second" or "a kilomegacycle per second" been termed a Hertz, perhaps the christening had met with wider approval.

This is not the suggestion I wish to make, however, but to point out another unit, more and more important, and still without a name, though its twin brother has had one for a long time. The unit, which has distinctive claims to bear Hertz's name, is that of electric fieldstrength now called "volt/cm" or "millivolt/m" or by other cumbersome names. Everyone concerned with broadcasting knows that in connection with radio consideration of electric fieldstrength have been the hobby of many. Consequently, there is now a real need for a name for this unit.

Hertz was the first to compute, and in a crude manner to measure, the field around an antenna. Now, the unit for the magnetic twin brother is called a *Gauss* (Γ); *let us call the practical unit for electric fieldstrength a Hertz*, and let us abbreviate it to E, as there is no Greek h.

The choice of a suitable submultiple or multiple of the C.G.S., E.M.U. must be governed by the following two considerations:

1. Easiest mode of expressing all kinds of fieldstrengths in practical problems, ranging from 1 EMU (or 1 μV/m) to 10^6 EMU in Radiotechnics, or from 10^8 to 10^{12} or 10^{13} in electrical power engineering and in the science of atmospheric electricity.

2. Least confusion with actual German practice of using "Hertz" for cycles per second, where radiotechnics is concerned with the range 10^4 to 10^8 or 10^9, and electrical power engineering with the range 10^1 to 10^2.

Both considerations are best complied with by making:

1 Hertz = 1 $E = 10^6$ *e.g.s.e.m.u.* of Electric Fieldstrength.

Then *e.g.* 1 $E = 1$ V/m; 1 $mE = $ m V/m; 1 $\mu E = 1$ μ V/m; normal Field of the Earth = 150 $V/m = 15$ k E; disrupting field for air 6 000 $V/cm = 0{\cdot}6$ ME, and so on.

Thus radio engineers generally would have to use submultiples of the Hertz and electrical engineers multiples; little confusion would ensue from the change of sense.—Yours faithfully,

BRUNO ROLF, Ph.D.

Alsten-Stockholm.
April 22.

Surges on Overhead Lines.

[TO THE EDITOR.]

SIR,—In the paper by Messrs. Melsom, Arman and Bibby, of which an abstract appeared in THE ELECTRICIAN of April 25, mention was made of a number of shut-downs, due to salt being deposited on insulators by winds from seaward, and the difficulty in re-starting caused by the salt adhering firmly. This trouble was also mentioned in greater detail by several correspondents in your Overhead Lines issue of January 31 last.

We have the consent of the Lothians Power Co. to state that during a salt storm one of the Lothians Co.'s 11 000 kW lines, which runs along the coast for some twelve miles, and was fitted with "Pernax" patent birdguards, gave no trouble whatever. A similar line without these guards, situated ten miles from the coast, flashed over several times, although similar insulators were fitted on both lines. The Lothians Co. considers that these guards were entirely responsible for this difference in results.

We understand that similar comparative results have been experienced on other lines.—Yours faithfully,

The Croydon Cable Works, Ltd.,
J. H. C. BROOKING,
Managing Director.

Mitcham Road, Croydon.
April 29.

CONTRACTS IN ELECTRICAL PRACTICE.

Legal Aspect of Breaches—Case of Unexpected Obstacles—Stoppages on the Ground of Improper Performance.

By BASIL BARHAM.

IN electrical practice a contract is generally an arrangement whereby one of the parties agrees to supply certain plant or machinery, or to carry out certain work with certain specified material and in a specified manner, and the other agrees to pay so much, either during or within some specified period after the carrying-out of the work.

The completion of such an agreement is not compulsory on either party; it may be set aside by mutual consent, or steps can be taken, in the event of either party failing to fulfil his obligation, to arrive at a decision as to the amount of damage, if any, either party has suffered through the other's breach of covenant and to see that such damage is made good. At one time, it was a custom, when drawing up the terms of a contract, to insert certain "penalty" clauses which, however high sounding and formidable, could not be legally enforced; penalty clauses are still included as a general thing, but their wording is usually such as to render them enforceable. No contractor should enter into any contract whatsoever without knowing exactly what he is doing, what he is undertaking to do, and what will happen if he fails to carry out his undertaking partially or wholly, or takes longer over the work than he has agreed.

The time may arrive, during the carrying out of some electrical contract in which work has to be done as well as material supplied, as, for example, during the wiring of a house or factory for electric light or power, when the contractor may have to call a halt and ask himself the question: Can I continue to carry on the work with any chance of making a profit? If he sees no profit in the future, it will be necessary for him to consider whether immediate stoppage will not help him to cut his loss. Should he arrive at that decision he may have to face a serious loss; one even greater than that which he would incur were he to complete the work, for by shutting down, he not only becomes exposed to an action for breach of contract, but may, and probably will, have to forfeit the value of all materials brought upon the job and the value of work already done.

Judicial Decisions.

It has sometimes been argued by contractors that they were not fully aware of the difficulties likely to be met with in carrying out the work at the time they signed the contract, and that, consequently, the terms of the agreement can be set aside or extra payment claimed. In a case that came under the notice of the writer only a short time ago, a contractor had agreed to get out certain foundations and to erect a building. The ground was "cleared ground," i.e., ground which had been occupied by buildings which had been razed. The contractor put down two or three trial soundings with iron rods and the result of these, in conjunction with a study of a local geological map, showed that the subsoil was good clay. He quoted a price, obtained the order, set to work and found almost immediately a huge mass of reinforced concrete, with all sorts of ramifications and complications and he sought to be relieved of the contract or, alternatively, to be paid a higher price for the work. Of course, his position was hopeless.

To quote another case, it will be remembered that in "MacDonald *v.* the Mayor of Wokington," a case which was tried in 1892 and has formed the base of many subsequent judgments, a builder contracted with a corporation to execute certain sewerage work according to plan, specification, and working drawings. In the course of the work it was found that a good deal of the tunnelling which had been specified was impracticable, owing to the quantity of water in the soil; and the builder suggested certain modifications of the scheme. These proposals were rejected, whereupon he threw up the contract on the ground that the presence of water in such quantities had not been disclosed to him and that his alternative proposals should have been accepted. In an action to recover the balance due to him on the contract, so far as it had been performed, Baron Pollock found for the defendants, and held that the builder could not refuse to finish the work, nor claim to be relieved of his undertaking because the nature of the difficulties met with, whether expected or unexpected, made performance according to the plans and specification difficult or impossible.

It is the custom, in connection with big work, to agree that some person shall be present to supervise or superintend the work to see that materials and performances are as specified. The fact that the contractor or his representative may not see eye to eye with such a superintendent does not entitle a contractor to abandon the job. It has been pointed out that in a certain case a contractor agreed with a second party, which was the local authority, to execute certain works according to plans and specifications, under the superintendence of the defendants' engineer, within a period of 18 months. During the progress of the works some deviation from the plans was made which, unfortunately for the contractor, caused difficulties to arise with certain land owners affected, as a result of which the builder stopped work. Later, he sued to recover for work and labour done and money paid to the use of the defendants. It was held that a contractor to execute certain sewerage works for a sanitary authority under the Public Health Acts is not entitled to abandon the contract because of difficulties created by the landowners affected. This case may be cited as that of Dickinson *v.* the Richmond Sewage Board, 1893.

There is another way in which a contract is sometimes broken and that is when the work is stopped by the party or parties for which it is being carried out, such stoppage being usually on the grounds that the work is being improperly done, or done with materials other than those specified or is being carried out by inexpert, careless or ignorant workmen or under imperfect supervision. In that case the builder or contractor is entitled to recover, as damages, all the expenses to which he has been put, and the profit which he would have made. He will, however, find it necessary to justify the course he was pursuing in the work and where the use of materials other than those specified is alleged, he may find it difficult to explain why he was using, let us say, 600Ω grade of cable instead of 1 200 Ω as specified.

It must be clear, in such a case as that imagined, that the other party to the contract has definitely given instructions for the work to stop. A case may be imagined in which certain work, let us say the wiring of a factory for electric light, is specified and the party for whom the work is to be done agrees, as part of his contract, to pay the sum of, say, £100, after the work has been in progress for a certain time and the balance on completion. The mere fact that the employer did not pay or refused to pay the £100 by the time specified would not be held by the courts to be evidence that he had broken or abandoned his contract. In Rees *v.* Lines, 1837, the plaintiff contracted to build a house for the defendant, according to a certain plan, for an agreed sum. After proceeding with the work and making a payment of £15 on account of the contract, the defendant, it was alleged, had broken the contract by refusing to pay a further sum. In an action by the builder to recover the balance of the contract it was held that the fact that the defendant, when asked for money, had stated that he would not pay a farthing, was not proof that he had abandoned the contract, as up to that time he had not done anything to justify the work being stopped, seeing that he was not, in law, liable to pay any further sum until after the work was finished.

BY-PRODUCT STEAM FOR CENTRAL HEATING.

The City of Winnipeg, Manitoba, is the proud possessor of one of the Empire's cheapest electricity supply installations. The domestic consumer in the City enjoys the lowest rates on the American Continent, and in 1928 the average number of units employed by the domestic user was 3 384. An interesting fact in connection with the City "hydro" plant is the utilisation of offpeak load electricity from the hydro-electric stations, together with steam from the standby steam electric plant, for heating blocks of buildings in the neighbourhood of the plant. Two hundred large buildings in the centre of the city are now heated from this single plant, and in residential areas on the outskirts private companies are setting up plant for the heating of blocks of homes. The general experience seems to be that people are willing to pay as much as 15% more than it would cost them for coal in order to secure the compensating advantages of thermostat control of heat with relief from dirt and worry.

Another important factor is the estimated reduction in fire losses in the city by $2 000 000 during the past five years.

NEWS IN BRIEF.

Royal Society Address By Wireless—Canada and Machinery Imports—Oldham and Domestic Electrical Appliances—Pulverised Fuel in 1905—A Long-distance Telephony Conference.

SOUTHPORT Lighting Committee has received from the local Chamber of Trade a suggestion for flood-lighting the public buildings.

The summer meeting of the North Midland Centre of the I.E.E. will be held on June 5 and 6, when a visit will be made to Buxton.

A junior scientific officer, with honours degree in physics or electrical engineering, or its equivalent, is wanted for an Admiralty establishment at Portsmouth.

Sir Ernest Rutherford, president of the Royal Society, is to deliver a wireless address from London to the members of the Royal Society of Canada at the annual meeting of the Canadian Institution on May 21 at Toronto.

Glasgow Tramways cycle sports meeting will be held at Parkhead on May 13.

Ayrshire Electricity Board held a domestic efficiency exhibition at Fairlie last week.

Leeds Electricity Committee has authorised the purchase of a further 10 000 prepayment meters.

An electric cookery demonstrator and showroom assistant is required by Darlington Corporation.

Eastbourne Electricity Committee has decided to make the minimum period for the hire of electrical domestic apparatus three years instead of one year.

Ilford Corporation has been recommended to accept a tender amounting to £21 290 for the erection of electricity offices and showrooms at Clarks Road.

Hungerford U.D.C. is to apply for powers enabling them to meet the expense of lighting the Hungerford town clock, the Government auditor having intimated that expenditure incurred in the matter was not legal.

Manchester Electricity Department issued during last year a quarterly "Power Service Bulletin." The series is being continued this year, and the March issue contains articles on "Applications of Electricity," "Electric Heat" and "Good Factory Lighting."

The Borough Electrical Engineer has reported to Oldham Electricity Committee that the electricity showroom is doing well. Cookers supplied number 454, and wash boilers 198. During one week in April four washing machines and 21 vacuum cleaners were supplied.

The International Consultative Committee for Long-Distance Telephony began on May 1 a fortnight's conference in Stockholm. Among the countries represented are Germany, Belgium, Denmark, United States, France, Great Britain, the Netherlands, Sweden and Switzerland.

The Liége International Exhibition of Industry, Art and Science was officially opened last Saturday, the King and Queen of Belgium and other members of the royal family being present. The exhibition includes halls devoted to electricity, metallurgy and applied science.

A party of students taking the Electrical Housecraft Course at Battersea (London) Polytechnic visited the model electric kitchen of the Electrical Association for Women on April 29. Miss C. Haslett gave an address, which was followed by a short talk by Miss Norvick on "Electrical Methods in the Kitchen."

The Automobile Association is of opinion that flood-lighting of main roads is the only perfect means of abolishing the menace of glaring headlights and minimising the number of road accidents, and it is suggested that the Central Electricity Board's cables running along the trunk roads should supply the energy for providing the necessary light.

On Wednesday and Saturday of last week, the public were admitted to view Birmingham Corporation's Hams Hall and Prince's power stations.

The next meeting of the Institute of Fuel will be held on May 14, at Burlington House, London, W., when Mr. C. M. Walter will give an address.

The annual dinner of the Bradford Engineering Society was held at the Great Northern Victoria Hotel, Bradford, on May 2, when the guest of honour was Mr. Thomas Roles.

Swansea and Merthyr Joint Hospital Board has decided that the new mental institution be lighted and heated electrically. A scheme has been prepared by Mr. T. J. R. Kiernan and the borough electrical engineer of Swansea, Mr. J. W. Burr.

Irvine Housing Committee recommends that the Council's next housing scheme be all-electric.

Birmingham Health Committee is to provide a lift and goods hoist in the nurses' home and laundry, respectively, at Dudley Road hospital, at a cost of £1 560.

Members of the North West Midlands Students' Section of the Institution of Electrical Engineers will visit the Hope Cement Works, Hull, on Wednesday, May 21.

Plans for extensions and alterations to the Chester Electricity showrooms, Northgate Street, have been prepared by Mr. F. C. Saxon. Tenders for alterations are to be invited.

The 35th general meeting of the German Bunsen Society will be held at Heidelberg, from May 28 to June 1. Names of persons desirous of participating should be sent to "Ortsausschub der Deutschen Bunsen - Gesellschaft, Heidelberg, Ploeck 55," the local committee which will also find accommodation.

The Crown Agents for the Colonies invite applications for appointments as: (1) engineer and manager; (2) electrical engineer; (3) electrician; and (4) station engineers in connection with the Kano (Nigeria) water and electric light schemes. Reference numbers: M.2 155, M.2 162, M.2 163, and M.2 158, for Nos. 1, 2, 3 and 4 respectively.

The Duke of Northumberlnad has been elected president of the Royal Institution for the ensuing year. Amongst the managers elected are Dr. W. H. Eccles, Sir Charles Parsons Mr. C. C. Paterson, Mr. R. W. Paul and Lord Rayleigh, while the visitors include Mr. F. H. Berryman, Mr. C. V., Drysdale, Dr. A. O. Rankine; Mr. E. H. Rayner and Mr. R. S. Whipple.

In the "Queen's Engineering Works Magazine" for April, 1930, published by W. H. Allen, Sons and Co., Ltd., attention is called to the fact that this year is the jubilee year of the business, which was founded by the late Mr. W. H. Allen in 1880, and that a celebration of the event will take place during the summer months, when a suitable memento will be published.

In his budget speech on May 1, Mr. C. A. Dunning, Canadian Minister of Finance, dealt with Customs Tariff changes. Amongst the provisions are free entry under the British preferential tariff and reductions under other tariffs for all non-specified machinery such as boilers, electrical equipment, etc., which is of a class not made in Canada, and an increase of the duty on same under the general tariff; free entry under the British preferential tariff for heating and cooking appliances, with an increased general tariff rate on gas stoves and ranges; and extension of the existing margin of preference on lighting fixtures and appliances.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of May 8, 1880, stated that makers of electric lighting apparatus anticipated a large amount of business in the coming winter. The permanent lighting of the new Victoria Docks by 30 Siemens lamps was to be the most important contract to be undertaken in this country.*

A small electric furnace designed by Dr. C. W. Siemens for melting highly refractory metals was exhibited to the Royal Society. In a test 2 lb. of broken files were melted in 20 minutes.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of May 12, 1905, described a visit to the General Electric Company's works at Salford, of which the latest productions in the form of relays are described in this week's issue. At that time the works' average annual output of these included 32 500 sets of telephone apparatus, 91 000 electric bells, 17 800 indicators, 15 000 switches, 11 250 sets of telegraph apparatus, 510 telephone annunciators and small switchboards and 115 large switchboards.*

A paper read by Mr. Eustace Carey before the Liverpool Section of the Society of Chemical Industry referred to a number of experiments proving that more water could be evaporated per pound of fuel in boilers constructed for coal dust firing than in boilers burning lump coal.

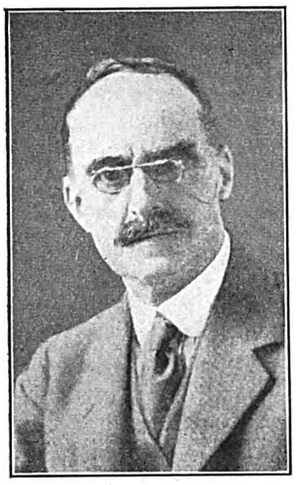
PERSONAL.

MR. W. Marsh, engineer and manager, has completed 25 years' service with the Brighton Corporation tramways undertaking.

The Electricity Committee and staff of the Electricity Department of the Coventry Corporation and representatives of the Coventry branch of the E.C.A. entertained Mr. George Tough on April 30, at the Queen's Hotel, on the occasion of his retirement as engineer and manager of the Coventry Electricity Department. The Mayor (Alderman Fred Lee) presided, and during the evening Mr. Tough was the recipient of several handsome presents. Coun. C. Payne, on behalf of the Electricity Committee, presented a fruit bowl and claret jug; Mr. W. J. Marston (who is succeeding Mr. Tough), on behalf of the staff, presented an oriental tea service; and Mr. H. Beesley, on behalf of the local contractors, presented a silver cake basket. See page 597.



Mr. G. Tough, engineer and manager, Coventry, who is retiring.

Mr. Douglas Hays, of the Falkirk and District Tramways Co., was, last week, presented with a canteen of solid silver monogrammed cutlery to mark his 25 years' service and retirement.

Mr. Stanley A. Young, who for the past seven years has been contracts manager of Post Office telephones for the Reading district, and who left Reading last week to take up a position as district manager at Aberdeen, was presented with a fountain pen, with marble stand and swivel holder, by a number of personal friends; and also with a gold watch and gold pencil, and a case of bottles of scent for his wife, from the department at Reading.

Maidstone Town Council has appointed Miss Wheeler as lady demonstrator at the electricity showrooms.

Mr. Arthur Charles Watts, partner in the firm of the Premier Electrical Co., of Tunbridge Wells and Paddock Wood, has been re-elected chairman of the Sussex branch of the Electrical Contractors' Association.

Obituary.

ALDERMAN F. E. READ, aged 65 years. He was for many years welfare master at the works of the English Electric Co., Ltd., and at one time served in the "Faraday." He was a member of Staffordshire County Council, and had served on the Town Council continuously for 21 years.

Sir BENJAMIN LONGBOTTOM, on May 1, aged 53 years. He was a member of the I.E.E. Council, joint managing director of Laurence, Scott and Electromotors, Ltd., vice president of the British Electrical and Allied Manufacturers' Association, director of Richard Johnson, Clapham and Morris, Ltd., honorary treasurer of the Manchester Chamber of Commerce, and chairman of the Chamber's engineering section. In 1924 he was chairman of the British National Committee of the first World Power Conference, and was created a knight in the following year. He was president of the Manchester Association of Engineers, 1926–7, and of the Manchester Engineers' Club. A recent portrait of Sir Benjamin appears on page 597.

MR. DANE SINCLAIR, on May 6, aged 78 years. Mr. Sinclair had been associated with British Insulated Cables, Ltd., first as general manager, then as managing director, and latterly as chairman. His early years were spent on the staff of the telegraph department of the North British Railway and subsequently in the service of the Japanese Government as inspector of telegraphs. In 1882 he was appointed engineer to the National Telephone Co. in the Glasgow district, shortly after becoming London manager, and in 1892 engineer-in-chief. This position he held until 1902, when he became associated as general manager of the British Insulated and Helsby Cables, Ltd. Mr. Sinclair was a pioneer in the development of automatic telephones, and he was largely responsible for the formation of the Automatic Telephone Manufacturing Co., of which he was a director, and for the acquisition of the Strowger patents. See page 597.

THE E.T.B.I.

Report of the Annual General Meeting—Mr. Marryat's Successful Presidency.

THE annual general meeting of the Electrical Trades Benevolent Institution was held at the Institution of Electrical Engineers, Victoria Embankment, London, on April 29, at 2.30 p.m. The chair was taken by Col. Sir T. F. Purves, the President of the Institution of Electrical Engineers. The minutes of the last annual general meeting were read and confirmed, and the report of the committee was read. The chairman then proposed that the report of the committee and accounts and balance sheet for the year ended December 31, 1929, as submitted, be approved and adopted. In moving the resolution, the chairman voiced the satisfaction, which he felt must be general amongst all the members of the Institution, at the magnificent collection which had been achieved by Mr. Howard Marryat, and the consequent increase in the invested funds of the Institution; the total actually collected by Mr. Marryat being £9 800, which was far in a way the largest collection that had been experienced in the history of the Institution. Col. Sir T. F. Purves then pointed out that the continued increase in the number of grants which were made annually demonstrated very clearly the necessity for this Institution. The running costs of the Institution came to only 5½% of the actual income, whilst the actual expense incurred in dealing with this tremendous number of grants and pensions was only 3½% of the amount actually expended. One item which he noticed appeared to be a legacy, and he thought it was not out of place to remind the industry as a whole that this Institution should not be forgotten when dealing with their wills.

The other point which Col. Sir T. F. Purves thought worthy of comment was that this Institution and the Benevolent Fund of the Institution of Electrical Engineers acted in the closest co-operation in all of their activities.

Mr. Eck proposed, and Mr. Gatehouse seconded, that the following be elected as Members of the Council: Messrs. A. G. Beaver, C. H. Cox, J. Y. Fletcher, E. A. Gatehouse, W. E. Hobbs, L. C. Penwill, R. Robson, S. D. White.

ELECTRICAL WOMEN.

Details of the Fifth Annual Conference of the Electrical Association for Women.

THE fifth annual conference of the Electrical Association for Women is to be held in London on May 15 and 16. The conference will open with the annual general meeting, at the Park Lane Hotel, at 11.15 a.m., and this will be followed by a luncheon at the hotel at 1 p.m. The speakers will include Mrs. Wilfred Ashley (President), Mr. Herbert S. Morrison, Minister of Transport, the Rt. Hon. Margaret Bondfield, Minister of Labour, and Sir Felix Pole, chairman, Associated Electrical Industries, Ltd.

A visit to the H.O. Industrial Museum will be made at 3.30 p.m., and a reception by the London Executive Committee will be held at the Institution of Electrical Engineers from 8 to 10.30 p.m.

On May 16, a visit will be made at 10.30 a.m. to the works of J. Lyons and Co., Greenford, while the afternoon will be left free, though informal visits can be arranged if desired.

A ball will be held at the Park Lane Hotel, and Mrs. Wilfred Ashley will receive guests at 9 p.m. The Eric Ross "Dazzle" cabaret has been engaged.

THE NATIONAL REGISTER.

The annual meeting of the National Register of Electrical Installation Contractors was held at the Institution of Electrical Engineers, on April 25th, when the chairman, Mr. P. V. Hunter, presided. The accounts were presented by Mr. W. R. Rawlings, hon. treasurer, who stated that the expenses were being met by renewal fees, interest on investments and by appropriating £2 of each £5 entrance fee. Mr. H. Willoughby Ellis, President of the E.C.A., moved that the Executive Committee should raise the annual renewal fee from one to two guineas, and this was adopted. The following were elected to the Registration Board: Messrs. J. A. Lee, F. W. Purse, E. E. Hoadley and Dr. W. T. Walsh. Messrs. P. V. Hunter and A. H. Dykes were re-elected chairman and vice-chairman respectively. Messrs. W. A. Walker, E. Calvert and D. S. Munro were re-elected to the Executive Committee.

ELECTRICAL GOLFERS.

I.E.E. Northern Centres Benevolent Fund Golf Competitions.

THE third annual golf competition in aid of the I.E.E. Benevolent Fund, for the trophy presented by Messrs. W. L. Winning and Andrew Hutcheson, will be held at Gleneagles on May 22. This competition is open to members of all classes and played against "bogey." Each entrant for the competition is required to pay a fee of 2s. 6d. towards the Benevolent Fund. It is recognised, however, that many members would possibly wish to contribute, although it may be impossible for them to attend, and in such cases it is hoped that they will give their support by sending a non-player's contribution of 2s. 6d. The cost of the outing, including transit from Gleneagles Station to the course and back, green fee and lunch, but excluding railway ticket and entrance fee of 2s. 6d., will be 9s. Members should purchase their own railway tickets in the ordinary way. Arrangements will be made for a saloon carriage to be attached to the 9.15 a.m train from Buchanan Street station, Glasgow, due at Gleneagles at 10.30 a.m., and the competition will start immediately after the arrival of that train. Members taking part from other districts should endeavour to arrive at Gleneagles as near 10.30 a.m. as possible. A saloon carriage will also be attached to the 8.15 p.m. train for the return journey from Gleneagles to Glasgow. Entrance forms, obtainable from Mr. J. Miller, 53, Pitt Street, Glasgow, C.2, should be returned not later than May 15.

The Mersey and North Wales (Liverpool) Centre of the I.E.E. announce that the competition and play for the G. P. Dennis Trophy will be held on May 22, on the Links of the Prenton Golf Club, Birkenhead. The tournament will be a bogey competition under handicap, and will be open to members and their friends. The player, being a member of the I.E.E., returning the best net score against bogey will receive the G. P. Dennis Trophy and Replica, the Trophy to be held by the winner for one year. A two-ball foursome competition will be played for four prizes under medal play rules. Members of the Home Club will be penalised two strokes off their full handicap for local knowledge. A putting competition will be arranged, and competitors may take out as many cards (18 holes) as they wish upon payment of one shilling for each card. The competitor handing in the best score on any card will receive the prize. One half of the entrance fees to go to the Benevolent Fund, the balance to take the form of a sweepstake to be divided between the competitors returning the second and third best scores in the proportion of two-thirds and one-third. In the event of a tie the competitors will play it off over 9 holes. Competitors must arrange their own partners and may start from 10 a.m. onwards, all cards to be returned by 6 p.m. The net proceeds will be handed over to the I.E.E. Benevolent Fund. The prizes have been presented by British Insulated Cables, Ltd., the British Thomson-Houston Co., Ltd., the Callender's Cable and Construction Co., Ltd., the Edison Swan Electric Co., Ltd., the English Electric Co., Ltd., the General Electric Co., Ltd., Metropolitan-Vickers Electrical Co., Ltd., and other friends.

RAILWAY SIGNALLING SYMBOLS.

New B.E.S.A. Specification Relative to Electrical Equipment to be Issued Shortly.

THE British Standard Railway Signalling Symbols (Part I), dealing with schematic symbols, has just been issued by the B.E.S.A. The symbols are intended for use on general plane showing signalling requirements, and therefore none of them attempts to show the component parts of the apparatus to be used. They have been so designed that they may be combined with each other where one does not adequately represent the complete device. For convenience of reference the symbols have been divided into the following seven sections: (1) signals, semaphore and light; (2) points; (3) track details; (4) apparatus; (5) controls; (6) level crossings and (7) buildings. Part 2, which it is hoped will be completed in a few months' time, will cover the wiring symbols, *i.e.*, the symbols for the actual apparatus used with their electrical connections, and written circuits or simplified wiring diagrams.

Copies of this new British standard may be obtained from the B.E.S.A., 28, Victoria Street, London, S.W.1., price 2s. 2d., post free.

THEATRE LIGHTING.

Details of the Illumination Arrangements at the New Richmond Cinema.

IN connection with the lighting of the stage and the atmospheric portion of the auditorium of the Richmond Cinema carried out under the direction of Messrs. Wingfield Bowles and R. C. Clay, with Messrs. Locke and Soares as electrical contractors, it is interesting to note that Holophane, Ltd., have supplied a 36 ft. 4-colour footlight claimed to be remarkable for its distribution and light intensity, particularly with the colour circuits. The same firm also supplied two No. 4 type top battens, each with four colours. Besides the distribution and intensity of light, these battens are sufficiently strong to be suspended from three points only, without the use of shackles. The colour circuits are arranged for the usual Holophane colours—white, red, green and blue, and a rich chrome yellow can be obtained on the stage, from the use of red and green circuits. Holophane also provided an up-to-date back of board type stage switchboard, with back of board contact stud dimmers (each having over 60 contact studs). The dimmers are arranged in four sets, each of four dimmers and each set has individual or master control. The individual dimmers can be set on the master controls at various positions as they trip off when they have reached the limit of their travel. The four colours are also each controlled by a colour master switch and there are coloured pilot lamps to indicate which circuits are on, and whether or not the dimmers are in check. The atmospheric portion of the auditorium is provided with a white plaster dome sky. This has been lighted all round by means of special 3-colour reflector equipment, and the lighting is so arranged that scores of different colour lighting effects can be produced on the sky alone, ranging from a sunrise to a storm setting. Imaginative and colour hues of every colour can also be obtained, these changing and blending as desired. The proscenium arch and side walls of the atmospheric portion of the auditorium are illuminated by batteries of concealed spot lights and flood lights. The outstanding feature of the installation, however, is perhaps the new Holophane automatic control. This provides: (*a*) 672 sequences of colour lighting effects each lasting over five minutes, by setting the indicators of the sequence meter and operating the master switch (this represents one different sequence every week for thirteen years); (*b*) a special lighting effect may be pre-set on a control panel while the automatic dimmer gear is working and by the operation of the master control wheel; the lighting will immediately merge into the pre-set effect; (*c*) if desired, the house may be lighted in any desirable manner by hand operation of the switches which control the automatic dimmer gear; (*d*) under ordinary circumstances, the operator needs simply to dial to any particular sequence and to operate the master control wheel whereupon the lighting will gradually come up and continue to go on changing until such time as the operator wishes to take the lights down again, ready for the films; (*e*) it is intended that the lighting shall be worked in this manner so that the control equipment shall provide colour effects which are artistically and properly blended, instead of leaving the choice of the effects to the operator, who, in the ordinary way will also have to work the dimmers; (*f*) at no time does one actually touch a dimmer when working the lighting effects, as all the dimmers are electrically operated either from the automatic control or from the hand switches on the control panel; (*g*) a number of indicator dials on the control panel which are illuminated by coloured lamps in reflectors show the approximate position of any dimmer at any time; (*h*) the footlight colour circuits and also the colour circuits in No. 1 batten may also be controlled by the automatic control gear and may be worked either at the same time as the auditorium colour lighting or by themselves.

DEVELOPMENTS AT BRIGHTON.

Sanction is sought by Brighton Lighting Committee to borrow £6 500 of the £10 000 required to defray the cost of the necessary cable extensions in connection with the extension of buildings and plant at Southwick works, and £3 382 for the provision of mains and sub-station equipment. The T.C. has received sanction to borrow £1 275 for public lighting on the Grand Junction Road and Madeira Drive.—The Central Board has informed the Corporation that the Board has made arrangements for the interconnection of the Brighton station with other generating stations before the winter of 1930-31.

POWER PLANT.

New Equipment and Apparatus of Interest to Manufacturers.

ALTHOUGH descriptions of the recently introduced products of a great number of electrical manufacturers were included in our review of exhibits at the British Industries Fair, we are able to give below particulars of further apparatus.

MAVOR AND COULSON, LTD. (of Castle Chambers, Castle Street, Sheffield, and 47, Broad Street, Mile End, Glasgow, S.E.), have sent us details of their new driving gear for electric shaker conveyors for coal. Though the height of this driving gear is only 16 in., it is claimed that nothing is sacrificed to the essentials of an ideal gear. For starting, the B.E.S.A. plug is standard, while an alternative plug can be supplied whenever desired.

Switching Convenience.

The switch handle is conveniently placed, but well protected; the starter can break the standstill current, and its heavy barrel contacts and finger tips are renewable, the barriers being removable. The motor is stated to be as powerful as that on the 22 in. gear; it is supported from the gearcase in such a way as to prevent distortion and misalignment. Starter and motor are contained in a flameproof enclosure. The gearbox is heavily cross-ribbed, and the use of solid bushes eliminates loose bearing cups with the chance of nuts slacking back. The bushes are of the firm's special phosphor bronze which is claimed to be superior in quality even to that called for under Admiralty specifications. The gearbox is bolted to an angle iron frame which carries steel pockets. The gearing is case-hardened; the motor pinion drives a countershaft carrying a level pinion which meshes with a bevel wheel mounted on a sleeve running on a fixed shaft; the sleeve also carries a pinion which drives a spur wheel on the crank shaft. The connecting rod is turned out of a solid billet; the character of the conveying stroke may be adjusted to individual requirements by selecting the appropriate length of connecting rod. Crank shaft, spur wheel and crank pin are machined out of one forging, heat treated, and ground. The spur wheel is hollowed to bring the main bearing to one inch from the crank pin, thus reducing the overhang of the crank pin to a negligible value. As the main journal is 11 in. long by 6 in. in diameter, the large bearing area is hard wearing.

Turning to the fulcrum shaft, each lever is forced up its locking taper on the shaft by a fine thread nut, a key being provided only as an extra precaution. A sleeve which fits tightly in the right-hand end of the shaft forms one journal, and acts as a distance piece between nut and driving lever. For the M. and C. trunnion block a patent has been applied for. The block prevents backlash from developing and subjecting the gear to the strain of repeated hammer blows. The pin on the driving lever passes through a bush in a case hardened block on which trunnions are formed to receive eyes drilled in the end of the coupling rod. The semi-universal joint thus formed is stated to give sufficient sideways freedom to the coupling rod to enable the gear to work when out of exact line with the troughing—without the resultant side thrust causing undue heating. As regards lubrication the motor and first reduction shaft run on ball and roller bearings which require practically no attention. The first reduction gearing runs in its own oil bath, the level of which is maintained from the main gearbox.

Electric Drive.

Those interested in small motors may be glad to learn that the NORMAND ELECTRICAL CO., LTD., of 3, North Side, Clapham Common, London, S.W.4, has put on the market the "Neco," universal motor which develops $\frac{1}{6}$ H.P. at 2 800 r.p.m. It is built throughout from steel pressings, and is claimed to be lighter, stronger and cheaper than any other motor of its size. The frame consists of two steel pressings which butt together on the centre line of the motor, enclosing the fields and forming the end covers. The complete motor weighs 12 lbs. 14 ozs. Since no castings are used in the motor, no machining is required, and it can be sold at a low price. The motor is mounted on a detachable pressed steel base; for users who wish to mount the motor by one end, or vertically, a flat ($\frac{1}{2}$-in. wide and $4\frac{1}{4}$-in. diameter) is provided on the end covers, forming a spigot concentric with the shaft. Separate windings are provided for a.c. and d.c. The armatures are hand-wound, with double-covered wire. The field coils are former wound, insulated with three layers of tape, stoved, and impregnated. The $\frac{1}{2}$-in. diameter shaft runs on double row self-aligning ball bearings. The bearings are $1\frac{5}{16}$ in. in diameter and allow the motor to be mounted on floor, wall, ceiling, or vertically without alteration.

The commutator is $1\frac{1}{2}$ in. in diameter, with 32 segments, and a radial wearing depth of $\frac{1}{8}$ in. The brushgear consists of two extruded brass brush boxes bolted to a bakelite slab mounted inside the end cover. Except for the actual brush boxes, the whole brushgear is made of insulating material, and it is claimed that all possibility of shorts and earths is eliminated. As in all "Neco" motors, the only openings are underneath, and the motor is claimed to be proof against falling water and dirt. Ventilating air is drawn through the windings by a large pressed steel centrifugal fan, and two large cover plates give access to the brushgear.

The speed of the motor can be varied by means of the "Neco" control unit, consisting of a suitable adjustable resistance mounted in a cover together with a starting switch. It is tested in accordance with British Standard Specification 170/1926. Temperature rise will not exceed 50 deg. C. after six hours on full load. The standard finish is black crystalline stove enamel, with all outside nuts, etc., heavily nickel plated.

TELEPHONE REFORM.

Scheme for the Control of Telephone Service by New Statutory Control Board.

A SCHEME for the control of the telephone service by a new statutory Telephone Control Board, on the lines of the British Broadcasting Corporation or the Port of London Authority, was launched on Monday, the details being embodied in a booklet entitled "The Stranglehold on Our Telephones: A Practicable Remedy." The pamphlet deals fully with the difficulties inherent in the present system, and makes the following recommendations:—

1. The telephone system, at present the property of the Post Office, should be transferred to a statutory body—the Telephone Control Board. This would be a perpetual corporation, similar in legal status to the Port of London Authority and the B.B.C.

2. The entire present personnel of the telephone service would (subject to mutually acceptable conditions) be transferred to the T.C.B.

3. The T.C.B. would exercise complete financial responsibility in regard to telephones, and would run them as a commercial undertaking with reference not to the principle of maximum profit, but of maximum service.

4. The telephone system (worth to-day £100 000 000) would be taken over, with liabilities and assets, from the State by the T.C.B. on terms to be arrived at after valuation on some agreed basis.

5. Provision should be made for an appropriate annual payment to Parliament as compensation for loss of annual revenue (for the last four years an average of about £350 000).

6. Provision would also be made for the apportionment between Parliament and the T.C.B. of the costs of common service.

7. The T.C.B. would be a body, consisting of a chairman and, say, six other members. The chairman's would be a whole-time appointment, carrying with it a salary commensurate with his responsibilities. The other members would serve, and would be remunerated on a part-time basis.

8. The T.C.B. would meet at frequent intervals, and would run their business much on the lines ordinarily pursued by the executive of any large concern.

9. The members of the T.C.B. would be appointed, in the first instance, by the Crown, on the recommendation of the Postmaster-General. The appointment of the chairman would be for a period of five years, and would be renewable. Of the other members, four would be appointed by the Crown and two would be annually elected by a Telephone Advisory Council.

10. For the subsequent appointments of the chairman and all but the two elected members, the Crown would continue to be responsible.

11. The Telephone Advisory Council, to which reference has just been made, would be a statutory body representative of every interest concerned in the effective administration of the telephones.

Copies of the booklet are available, free of charge, on application to the office of the Telephone Development Association, at 10, Bedford Street, W.C.2. (Tel.: Temple Bar 6824.)

OVERHEAD LINE EQUIPMENT.

Overhead line equipment materials for power, traction and telephones form the subject of a new issue by BRITISH INSULATED CABLES, LTD., of Preston, Lancs. The catalogue consists of 200 pages of well-described and illustrated matter. At the end of the book is published a collection of data and formulæ useful in overhead work.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

FIFE COUNTY COUNCIL.—Electric lighting work in new police stations at Newburgh and East Wemyss. Specifications from Messrs. Walker and Pride, architects, Church Square, St. Andrews; deposit £2 2s.

WREXHAM CORPORATION.—Electric wiring of 57 houses on Huntroyde estate. Specification, etc., from Mr. J. W. Williams, borough electrical engineer.

Electrically-Driven Pumps.

DUNDEE CORPORATION, May 10.—Supply and erection of two electrically-driven, vertical spindle, main circulating water pumps, in pump room, in connection with Carolina Port generating station. Specification, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

GLASGOW CORPORATION, May 10.—Twelve months' supply of electrical fittings to the public health department. Specifications, etc., from the Superintendent of Stores, 20, Cochrane Street, Glasgow.

BILSTON URBAN DISTRICT COUNCIL, May 12.—Electric light installation in Market Hall and Yard. Specification from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £3 3s. Only firms on the National Register are invited to tender.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.-G.S. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.-S.L. 2) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12.—Supply of 33 kV and other cables, in connection with North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-G.C.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CLEETHORPES URBAN DISTRICT COUNCIL, May 12.—Supply of l.t. and e.h.t. underground cables. Forms of tender, etc., from the Clerk, Council Offices, Cleethorpes.

DUNDEE CORPORATION, May 12.—Electric lighting work in connection with the erection of 84 houses on Tullideph Road site. Particulars from Mr. G. Baxter, 91, Commercial Street, Dundee.

EBBW VALE URBAN DISTRICT COUNCIL, May 12.—Supply and erection of automatic rectifier plant of 300 kW capacity, with switchgear cables, etc. Specifications from the Electrical Engineer, Council Offices, Ebbw Vale, Mon.

EPSOM URBAN DISTRICT COUNCIL, May 12.—Kiosks and converting plant (section I); e.h.t. and l.t. cables and laying (section II); and supply only of l.t. cables (section III). Specification and form of tender from Mr. H. W. Watts, Electricity Works, Depot Road, Epsom; deposit £2 2s.

GLASGOW EDUCATION AUTHORITY, May 12.—Electric lighting installation in Drumoyne School, Shieldhall Road, Govan. Specifications, etc., from the Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s.

MANCHESTER CORPORATION, May 13.—Supply and erection of electric passenger lift at town hall. Specification from the City Architect, Town Hall, Manchester; deposit 10s. 6d.

MIDDLESBROUGH CORPORATION, May 13.—Twelve months' supply of cables and meters. Specifications from Mr. R. H. Scotson, borough electrical engineer, Snowdon Road, Middlesbrough.

PLYMOUTH MENTAL HOSPITAL, BLACKADON, May 15.—Supply of 750 Ah, 200 V battery of 110 cells, in lead-lined wood cases. Further information from the Medical Superintendent.

GLASGOW CORPORATION, May 16.—Six months' supply of electrical fittings, to the public assistance department. Specifications, etc., from the Contracts Department, 266, George Street, Glasgow.

TOTNES CORPORATION, May 16.—Electric motor and centrifugal pump. Particulars from the Borough Engineer.

WARWICKSHIRE AND COVENTRY JOINT COMMITTEE FOR TUBERCULOSIS, May 16.—Supply of a.c. motors, switchgear, wiring, etc., at the King Edward VII Memorial Sanatorium, Hertford Hill, near Warwick. Specifications, etc., can be seen at the offices of Mr. A. B. Mallinson, consulting engineer, 44, Brazennose Street, Manchester, and will be supplied to contractors furnishing references of similar work carried out; deposit £2 2s.

CHERTSEY RURAL AND CHERTSEY, WALTON, WEYBRIDGE AND WINDLESHAM URBAN COUNCILS' HOSPITAL COMMITTEE, May 17.—Electric light installation at Ottershaw Isolation Hospital. Specifications from Mr. F. J. Wareham, clerk, Council Offices, West Byfleet, Surrey.

ECCLES CORPORATION, May 17.—Twelve months' supply of single phase house service integrating watt hour meters. Specification, etc., from the Borough Electrical Engineer Electricity Works, Cawdor Street, Patricroft; deposit £1 1s.

SALFORD CORPORATION, May 17.—Transfer of existing X-ray apparatus and installation of new apparatus. Specifications from the Medical Officer of Health, 143, Regent Road, Salford.

CENTRAL ELECTRICITY BOARD, May 19.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme (London Area). Specification (No. S.E.E.-L.F.4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

NORTH WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 20.—Outdoor type static transformers (contract A.105); and outdoor 33 kV switching station (A.106). Specifications from Chairman of Engineers' Committee; deposit £2 for each.

SLOUGH URBAN DISTRICT COUNCIL, May 21.—Electrically-driven vertical-spindle pumps, etc. Particulars from Messrs. Allan Bromley and Arthur Gladwell, Denmark House, Windsor Road, Slough.

STAFFORDSHIRE EDUCATION COMMITTEE, May 24.—Electric light installation in existing Infants' Council School, Pelsall, near Walsall, which is to be enlarged and converted into a Senior Mixed Council School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

BELFAST WATER COMMISSIONERS, June 4.—Electrically-operated pumping plant. Specification, etc., from the Secretary, Water Office, Belfast, deposit £1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of storage battery equipment, comprising emergency stand-by lighting storage battery, 15 kW motor-generator set, battery-trickle charger, milking booster, and spare parts. Specification (No. 10) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of works supply sub-station 3 300 V and 400 V metal clad switchgear. Specification (No. 9) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., May 9.—Supply of track bands, in connection with electrification of Madras suburban services. Specifications, etc. (10s., not returnable), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

COPENHAGEN MUNICIPALITY, May 10.—Supply of switchgear and rectifier plant for Eskildsgade sub-station (Reference B.X. 6 271.)

COPENHAGEN MUNICIPALITY, May 12.—Supply and erection of two turbo generators. (Reference B.X. 6 297.)

D

Digitized by Google

VICTORIAN ELECTRICITY COMMISSION, May 12.—Supply of 22 000 V pin type supporting insulators for the year 1930-31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13.—Supply of 110 kV, single-phase, oil immersed, self-cooled, transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13.—Supply of terminal strips (P. and T. 151/2 000). (Reference B.X. 6 209.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13.—Supply of dials. (No. P and T. 151/2 280). (Reference B.X. 6 379.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 13. Galvanised line, binding and jointing and stranded wire. (schedule No. C. 594). Reference A.X. 9 461.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 14.—Supply of 100 000 lead alloy clips, 3¼ in. in length, for cleating four or five 0·25 in. lead-covered cables on poles; 30 000 ditto 2¼ in. in length for cleating one or two similar cables; and 400 lb. of fixing nails. (Reference B.X. 6 375.)

CHILEAN MINISTRY OF MARINE, May 15.—Supply of three-metric ton travelling electric crane and four-metric ton tationary electric revolving crane. (Reference A.X. 9 186.)

s POWER SECURITIES CORPORATION, May 15.—Works and materials in connection with Pykara hydro-electric scheme, including transmission line towers (specification E2; price 22s. 6d.); (insulators E5; 7s. 6d.); steel-cored aluminium conductors (E6; 4s. 6d.); steel earth wire (E.7; 4s. 6d.); guying materials (E13; 4s. 6d.); generating plant (E14; 37s. 6d.); crane (E16; 7s. 6d.); and transformers (E18; 7s. 6d.). General conditions, 3s. 6d. Specifications, etc., from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

SOUTH INDIAN RAILWAY CO., LTD., May 16.—Supply of electrical fittings and materials. Specifications, etc., from the Company's Offices, 91, Petty France, Westminster, S.W.1, upon payment of 5s. (not returnable).

CAIRO MAIN DRAINAGE DEPARTMENT, May 17.—Supply of electric lamps, etc., for one year. Particulars from the Department, 2, Sharia Maleka, Nazli.

VICTORIAN ELECTRICITY COMMISSION, May 19.—Twelve months' supply of triple braided, h.d. copper aerial cable. (Reference B.X. 6 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 20.—Supply and erection of one 25 kVA, three-phase, 400/230 V, 50 cycle generator. (Reference B.X. 6 307.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of telegraph instruments (Schedule C. 579). (Reference B.X. 6 248.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO, May 21.—Electric overhead travelling cranes. Specifications (10s., not returnable) from the company's offices, 91, Petty France, Westminster, S.W.1.

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

INDIAN STORES DEPARTMENT, May 26.—Two vertical and two horizontal centrifugal pumps, switchgear, etc. (Reference A.X. 9 416.)

CAPE TOWN MUNICIPALITY, June 4.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

AUCKLAND HARBOUR BOARD, June 10.—Supply of submarine cable (contract No. 902). (Reference B.X. 6 354.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 12.—Supply of 2 000 V switch units and l.t. switchboards (tender No. 1 649). (Reference B.X. 6 365.)

Sub-Station Equipment.

MADRAS GOVERNMENT, June 15.—Complete electrical equipment of three 66/110 kV outdoor sub-stations, in connection with Pykara hydro-electric scheme. Specification (No. E.26) (price 30s.) and general conditions of contract (price 3s. 6d.) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4, on payment of the respective fees (not returnable).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of indicators (schedule No. C.588.) (Reference B.X. 6 333.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of multiple twin cable. (Reference B.X. 6 349.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of loading coil pots. (Reference B.X. 6 350.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24.—Supply of 110 kV outdoor steelwork and switchgear for, Waitaki power scheme—section 71. (Reference B.X. 6 238.)

CAPE TOWN MUNICIPALITY, June 25.—Supply of single phase transformers (specification No. 495/1930). (Reference B.X. 6 378).

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of condensers (P. and T. 151/2 240.) (Reference B.X. 6 308.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 17.—Supply and erection of 15 electric pumping stations, with pumps, motors, switchgears, etc., in the Isolated Basins, Oswin Province. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1. (£10 5s. per set, not returnable.)

Tenders Accepted.

MILTON NEW CHURCH.—E. A. Kitchen, electric light installation.

PLYMOUTH CORPORATION.—Albion Clay Co., Ltd., the supply of conduits, £222 4s.

BURY ST. EDMUNDS CORPORATION.—Mather and Platt, rotary convertor, £1 236 4s.

BASINGSTOKE CORPORATION.—British Thomson-Houston Co., Ltd., motor generator, £3 715.

ILFORD CORPORATION.—Crompton Parkinson, Ltd., supply of kiosk, £492. (Recommended).

AYRSHIRE COUNTY COUNCIL.—Campbell Banks, electrical work in connection with new County offices, Ayr.

WOKINGHAM CORPORATION.—Wallwin Co., electrical pumping machinery at proposed pumping station, Toutley, £1 370.

PRIMITIVE METHODIST TRUSTEES, MIRFIELD.—H. Senior, electrical work in new Sunday schools, Greenside, Mirfield.

ABERDEEN CORPORATION.—Forbes Gordon, electric lighting work of new shelter and public conveniences at Sea Beach, £42.

BERWICK-ON-TWEED CORPORATION.—Urban Electric Supply Co., Ltd., electrical work in 16 houses at Prince Edward Road, Tweedmouth.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—A. C. Woodrow and Co., supply of 100 cast-iron fluted lamp columns, £2 18s. each.

SHROPSHIRE EDUCATION COMMITTEE.—G. H. Smallwood and Co., generating plant, electrical installation and pump, at Council School, Harlescott, £373. (Recommended).

LONDON COUNTY COUNCIL.—Dyer and Young, Ltd., Player and Mitchell, E. Showell and Sons, Ltd. and Yorkshire Switchgear and Engineering Co., Ltd., tramcar controller segments, fingers, lips, etc.

WILTSHIRE COUNTY COUNCIL.—Western Electricity Supply Co., electric light installation at Chippenham Police Station, £50 10s.; James Bros., electric light installation at Malmesbury police station, £39 10s.

CONGLETON CORPORATION.—A. Reyrolle and Co., Ltd., and C. Ellison, switchgear; Metropolitan-Vickers Electrical Co., Ltd., and Ferranti, Ltd., transformers; Electric Cables, Ltd., kiosk; Macintosh Cable Co., Ltd., cables.

METROPOLITAN WATER BOARD.—J. White and Co., electric light installation, etc. at 80, Tubbs Road, Harlesden, £128. (Recommended). Also tendered: Sims and Sims, £164; J. Myring and Co., £190; Collins and Co., £220.

FAVERSHAM CORPORATION.—Philpott and Son, wiring houses under assisted wiring scheme, £1 2s. 6d. per point for four lights; £1 1s. 6d. per point for five lights; £1 1s. per point for six or more lights; and £1 4s. 6d. extra for a power point.

BOURNEMOUTH EDUCATION COMMITTEE.—Brook Motors, Ltd., three-phase induction motor, £10; British Electric Transformer Co., Ltd., three small transformers, £18 15s.; and Crompton Parkinson, Ltd., potentiometer, £18, for Municipal College.

DUMFRIES CORPORATION.—Worthington-Simpson (sub-contractors for British Thomson-Houston Co., Ltd.), piping, jointing materials, bolts and supports, in connection with new water cooler tower, £500; Glenfield and Kennedy, five cast-iron valves, £57 12s. 6d.

WESTMINSTER CITY COUNCIL.—Barlow and Young, electric light installation in tenements, £187 (Recommended.) Also tendered: Gaillard, Robinson and Co., £205; Edmundson's Electricity Corporation, Ltd., £205; Coleby and Co., £225; Rashleigh, Phipps and Co., Ltd., £230.

Digitized by Google

BIRMINGHAM EDUCATION COMMITTEE.—Electric lighting installations—Thornton Road junior school and Sparkhill junior commercial school, Lea Son and Co., Ltd.; Bleakhills school and Erdington secondary school, Harrison and Searle, Ltd.; Severne Road School, Walker Bros.

CAPE TOWN CORPORATION.—Siemens Bros. and Co. (British), Ltd., supply of service cut-outs, £517 10s.; British Insulated Cables (S.A.), Ltd., supply of copper and galvanised iron wire, £5 132; Dowson, Dodson and Behr, Ltd., supply of 30 miles of insulated wire, £568 10s. (All recommended).

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—A. Woodrow and Co., supply of 100 c.i. fluted lamp columns, £2 18s. each. (Recommended). Also tendered: F. D. Bird, £3 4s. 6d.; F. Bird and Co., £3 18s. 6d.; Mackenzie and Moncur, Ltd., £3 10s.; W. Lucy and Co., Ltd., £3 3s., and subsequent quantities, £2 18s. each.

LEEDS CORPORATION.—Igranic Electric Co., Ltd., supply of switch starter for asphalt plant motor, £30 5s.; W. T. Glover and Co., Ltd., telephone cable, £124 16s. and 0.6 sq. in. single cable, 10s. 10.8d. per yard, subject to rise or fall in cost of copper or lead; W. T. Henley's Telegraph Works Co., Ltd. (£4 436 10s.); Macintosh Cable Co., Ltd. (£3 127); Enfield Cable Works, Ltd. (£800); and Derby Cables, Ltd. (£1 999 17s), cables.

CAPE TOWN CORPORATION.—Associated Engineers, Ltd., automatic sprinkler apparatus, at power station, £1 235 12s.; South African General Electric Co., Ltd., fittings, etc., in connection with second instalment of street lighting improvement scheme, £1 733 12s.; Cape Battery Co., Ltd., constant potential charging set, £123, and motor-generator set, £97.

"HOW TO SEND AND SAVE."

As announced in our issue of April 11, the Great Western Railway now publishes a useful guide to the best ways and means of despatching goods over its system. This book, the title of which is as above, is issued free of charge on application to Mr. E. Ford, Chief Goods Manager's Office, Development Department, Great Western Railway, Paddington, London, W.

BUSINESS ITEMS.

MR. GEORGE S. GARTON, electrician, has opened premises in the Bull's Head Yard, Beast Market, Huddersfield.

The telephone number of the Maidstone branch of SUPER-LAMP, LTD., 11-13, Union Street, Maidstone, is now Maidstone 3033.

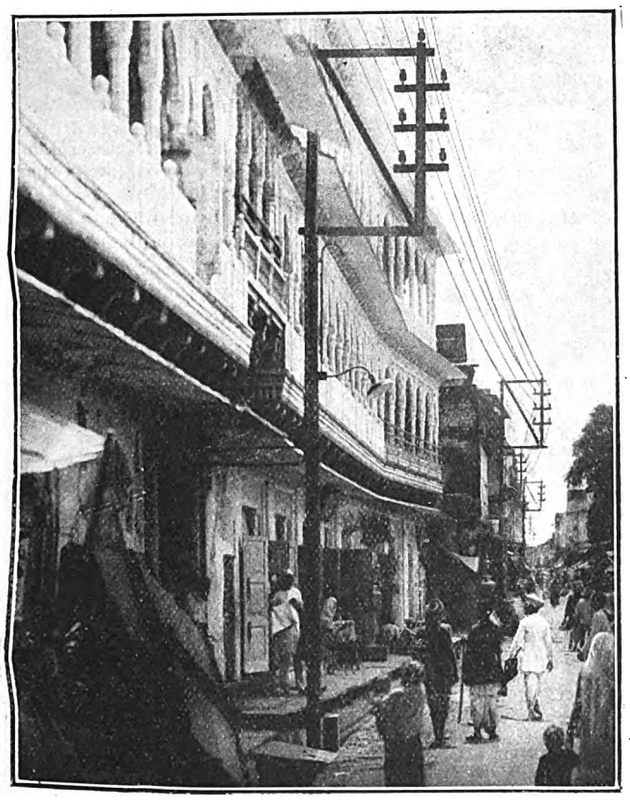
MR. RAY FURSE, electrical engineer, of Holland Street, Barnstaple, has taken into partnership MR. H. CORK, and the business will be carried on under the style of FURSE AND CORK.

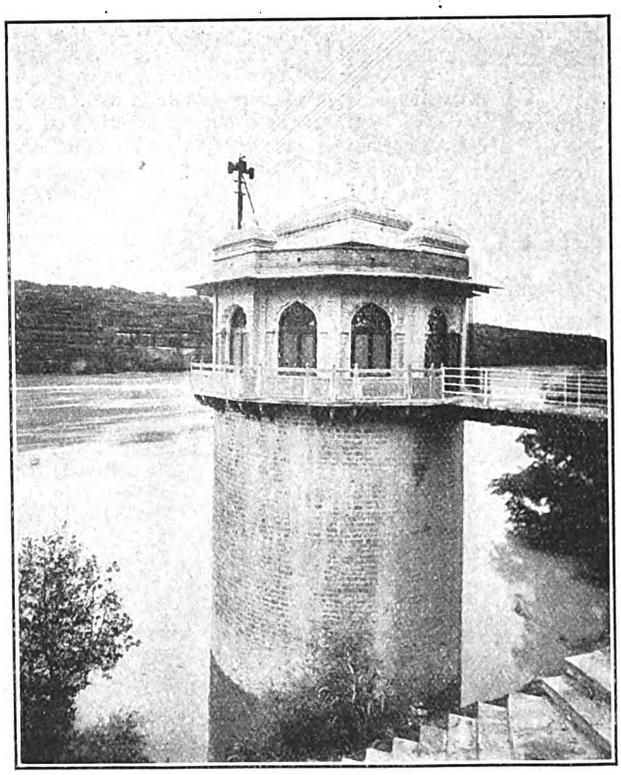
We are informed that the CHLORIDE ELECTRICAL STORAGE CO., LTD., of Clifton Junction, has now established 13 000 "Exide Service Stations" throughout the world, of which 600 are in the British Isles.

BULPITT AND SONS, LTD., of Birmingham, have appointed Mr. W. T. Rawcliffe, of Craven Bank, Osborne Road, Levenshulme, Manchester, as their representative for electrical cooking and heating appliances, in Lancashire, Cheshire and North Wales.

A confidential report on the market for secondary and primary batteries in New Zealand has been prepared by the Department of Overseas Trade (London) from information furnished by H.M. Trade Commissioner at Wellington, and issued to firms on the Department's special register. Copies of the report, with particulars of the special register, can be obtained from the Department. (Reference B.X. 6 334.)

In connection with the arrangements made by IMPERIAL AND INTERNATIONAL COMMUNICATIONS, LTD., for the handling of news, the following letter from Mr. T. Dunbabin, manager and editor of the Australian Newspapers Cable Service, to Sir Basil Blackett, chairman of Imperial and International Communications, Ltd., is of interest: "I should like to express my thanks to Imperial and International Communications, Ltd." wrote Mr. Dunbabin, "for the most excellent arrangements for handling traffic at St. James's Palace. I cannot speak highly enough of the work of your staff generally. The messages were handled expeditiously, and our staff have nothing but the pleasantest recollections of their association with your officers at St. James's Palace."





ELECTRICAL development in India is proceeding apace, and we have received from W. T. Henley's Telegraph Works Co., Ltd., details of the contract which they have just completed in Kotah State. It comprised the supply and complete installation of h.t. and l.t. underground feeder-cables and overhead feeders, l.t. distributors and street lighting fittings. The system is 3 300/400 V three-phase, 50 cycles. High tensile weldless tubular steel poles manufactured by the British Mannesman Tube Co. were used exclusively. The type of overhead construction adopted is illustrated in the picture of the Kotah main bazaar on the left; the l.t. house service and street lighting mains are also shown. The second illustration depicts the filtered water pumping station in Kotah, and shows the Henley terminal pole with 3 300 V three-phase overhead main.

ELECTRICITY SUPPLY.

Expansion of Colchester System—Stoke-on-Trent Mains Extensions—Assisted Wiring at Edinburgh—Unemployment Grant for Hull Extensions—Bulk Supply at Reigate.

POPLAR (London) Electricity Committee seeks sanction to borrow £10 000 for minor network extensions.

West Ham Electricity Committee has instructed the Borough Engineer to submit an estimate for the erection of the Plashet sub-station.

Hackney (London) Electricity Committee seeks sanction to borrow £20 000 in connection with free-wired prepayment installations.

Dronfield U.D.C. has consented to the granting of a Special Order to Sheffield Corporation for the supply of electricity within its area.

Heston and Isleworth U.D.C. is to extend mains in Sutton Lane, Woodlands Road, in a new road to Duke's River, and in Cecil Road, at a cost of £1 328.

Glasgow Dean of Guild Court has passed plans for the erection of an electricity sub-station at Calder Street, and a transformer house at Chancelot Mills, Dalmeny Street.

The Borough Engineer of Southwark (London), has been authorised by the Highways Committee to experiment with a centrally suspended 1 500 W lamp in Walworth Road near the Town Hall.

Bridlington R.D.C. has consented to the supply by Scarborough T.C. of electricity to Hunmanby Hall school and the parish of Hunmanby. The supply is expected to commence by the end of September.

Burton-on-Trent Electricity Committee has obtained the sanction of the Ministry of Transport to the placing of overhead 11 000 V lines between Hartshorne and Repton, and 400/230 V lines at Hartshorne.

Grimsby Electricity Committee seeks sanction to borrow £12 300 for high-pressure feeders, transforming equipments and low-pressure cables, required for the supply of electricity to North Thoresby, Waltham and Humberstone.

Hastings Electricity Committee has obtained sanction to borrow £2 440 for a transformer, cable connections, etc.; £1 981 for sub-station plan, building work and sites and £22 571 for steam raising plant and building work.

Bradford Electricity Committee is to provide a district transformer station at Nelson Street, at a cost, including mains, of £7 850.—A compressed air supply is to be provided at the Valley Road power station at a cost of £1 050.

Erchfont (Wiltshire) P.C. recently held a meeting of ratepayers to discuss a proposal for electric street lighting by the Western Electric Supply Co. Voting on the question was equally divided, so that the proposition was not carried.

The Minister of Transport proposes to confirm an Order made by the Electricity Commissioners to be granted to the Central Electricity Board increasing their borrowing powers. Any objections must be sent to the Ministry of Transport by May 12.

Guildford Electricity Committee seeks sanction to borrow £10 000 for extension of mains and £2 000 for meters.—The electricity department is to extend mains, at an estimated cost of £169, to supply electricity to the Portsmouth Estate, Rydes Hill.

Colchester Electricity Committee is arranging for the erection of transmission lines to St. Osyth and Kirby, at a cost of £3 270.—The Committee is to provide screens to prevent dust from the bunkers and coal conveyors spreading to the boiler house, at a cost of £230.

It is proposed by Maidstone Electricity Committee to extend the mains to Linton at an estimated cost of £1 350, a guarantee of sufficient revenue having been obtained. The Housing Committee recommends that the houses being erected on the Mote Park Estate be wired for electricity.

Bexhill Electricity Committee has approved the plan for a sub-station in the northern district, to cost £480, and has decided to invite tenders for its erection. The Committee recommends extension of cable to supply proposed new houses in a new road off Haddocks Hill, at a cost of £136.

Lord St. David's Committee for unemployment grants has made a grant of £88 489 to the Sheffield City Council for electricity supply works. Schemes to be carried out consist of work which would not yet have been undertaken without the grant, but which would have been necessary in the future.

The Electricity Commissioners have been consulted regarding a proposal to install an additional oil driven generating set at Llandrindod Council's electricity works, and a reply had been received directing the Council to ascertain whether the Shropshire, Worcestershire and Staffordshire Co. would supply electricity in bulk and on what terms.

Darlington Electricity Committee has received from the Borough Electrical Engineer an estimate of the cost of laying mains in all streets which have been built up. There are about 12¼ miles of streets in which mains can be laid, and approximately 4 000 houses which can be supplied. The Committee will apply to the Unemployment Grants Committee for approval of the scheme.

The new electricity supply for Tain was formally switched on by Mrs. Ewen, the wife of Coun. Ewen, convener of the Electricity Committee, on May 1. The capital cost has been about £5 000. Energy is supplied from the hydro-electric station of the Ross-shire Supply Co. at Lochluichart, 40 miles distant, and a consumption of 60 000 kWh is expected, to cost the burgh £700 per annum.

Reigate T.C. has decided to take a bulk supply of electricity from the Home Counties Electricity Authority, at a charge of £6 2s. 1d. per kW, plus 2·487d. per kWh, for at least seven years. From the time the bulk supply is available the Authority will repay to the Council the cost involved in running the station and managing the machinery and the annual loan charges outstanding on the plant.

Kensington (London) Street Lighting and Street Safety Sub-Committee expresses the opinion that the new system of lighting in Redcliffe Road is satisfactory and should be adopted for residential streets in the borough in which conditions are similar. The lamps in this street have been fitted with asymmetric refractors supplied by the General Electric Co., and the cost is 11s. 6d. per lamp. The Works Committee concurs in the sub-committee's views.

Stoke-on-Trent electricity department is to extend mains at a cost of £600 to afford a supply to the L.M.S. Railway at Chatterley. Mains are to be laid to give an alternative supply to the Tunstall and Burslem areas, at a cost of £3 500, to supply 23 houses to be erected on the Vivian Road estate, Fenton (£220), and to the Chatterley-Whitfield Collieries housing estate at Chell (£2 000). Mains are to be extended in Wolstanton at a cost of £2 600, and in the Basford district (£1 700).

Members of the committee in charge of the scheme for Liverpool Corporation's Clarence Dock power station inspected the works last week. Mr. F. C. Wilson, chairman of the committee, said the station would contain, in the first instance, one 50 000 kW turbo alternator, and a second turbo alternator would probably be commenced within two or three months. The ultimate capacity of the station would be 400 000 kW. There was every prospect of the station being in operation at the end of this year or early in 1931.

Edinburgh Electricity Committee has received a report from Mr. E. Seddon, engineer and manager of the electricity undertaking, on a proposal by Coun. Crawford that a scheme of assisted wiring be adopted in the poorer districts. Mr. Seddon is of opinion that such a scheme should apply to houses with an assessed rental not exceeding £50, and that three lights should be the minimum installation, that the work should be done at agreed rates by local contractors, and that the consumer should pay the net cost, plus 10 per cent., by instalments. Representatives of the Electrical Contractors' Association Edinburgh Branch have quoted 36s., 33s. 9d. and 31s. 6d. for installations of three points, four to six points and over six points, respectively, and Mr. Seddon considers these figures fair and reasonable.

The City Electrical Engineer of Hull has been authorised to obtain tenders for two make-up circulating water pumps of 100 000 gallons per hour each. Sanction has been received from the Unemployment Grants Committee to the application for a grant in respect of an estimated expenditure of £120 000 for the laying of supply mains in various streets in the city.—The Electricity Commissioners have informed the Corporation that, while they would not be in a position to sanction the borrowing of money in respect of those works required solely for the bulk suppy purposes in the Hornsea area, until the arrangements for the bulk supply have been formally approved, they would be prepared to consider forthwith the issue of a loan sanction in respect of works in connection with the supply of electricity to the villages of Swine and Skirlaugh.

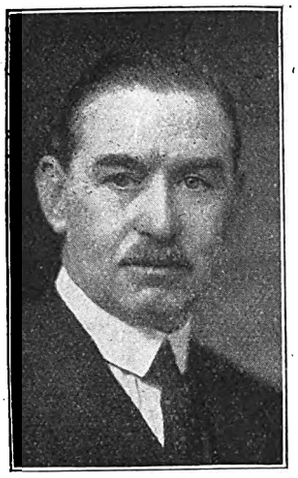
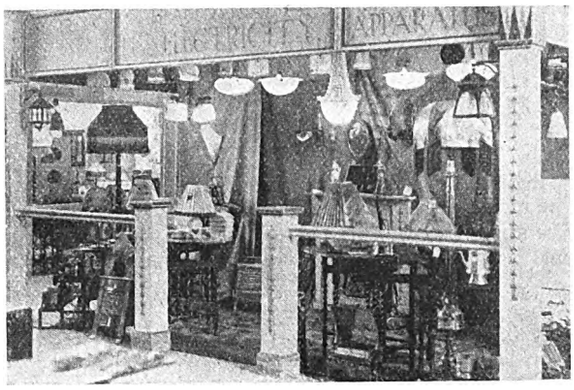
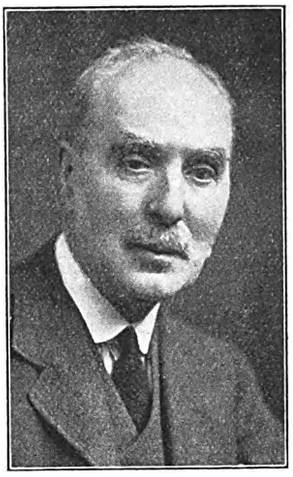
ELECTRICAL PICTURES.



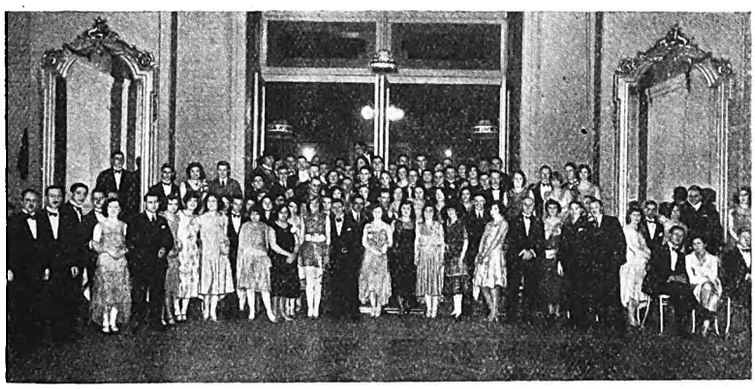
Sir Benjamin Longbottom, member of the Council of the I.E.E., joint managing director of Laurence, Scott and Electromotors, Ltd., whose death on May 1 is referred to on page 590.



The first of a series of electrical exhibitions to be held throughout Herefordshire by the Shropshire, Worcester and Staffordshire Electric Power Co. was opened on Monday at Hereford. The company had a large block of stands in the centre of the Shirehall, one of which is seen above, and washing, cooking and ironing demonstrations were given.

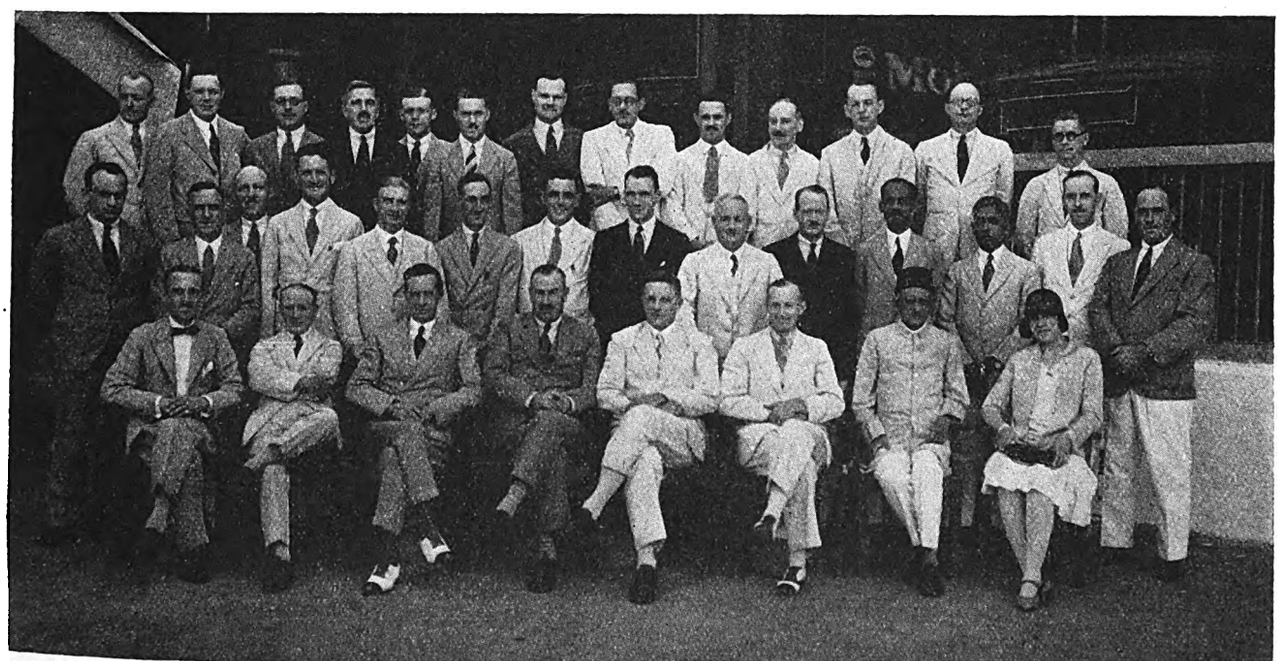


Mr. Dane Sinclair, chairman of British Insulated Cables, Ltd., whose death on Tuesday is reported on page 590. Mr. Sinclair was also a director of the Automatic Telephone Co., Ltd.



One of the most successful electrical dances held recently was that organised by the Social and Sports Club of Philips Lamps, Ltd. The dance was held at the Portman Rooms, London, and many of those attending wore fancy dress. The guests numbered well over 200 and some of the revellers are here seen assembled before the camera.

Lord Provosts Whitson, of Edinburgh (left) and Kelly, of Glasgow, joined hands last week, while Mr. H. Morrison closed the switch which energised the Scottish grid. A full report was given in our last issue.



A conference of the representatives of a number of electricity supply and transport undertakings throughout India and Burma was held recently at Bombay. This group, taken outside the works of the Bombay Electric Supply and Tramways Co., includes Mr. C. W. Moberly, the company's general manager. [Photo: "The Tramway and Railway World."

COMPANY NEWS.

Weakness in Transatlantic Securities—Johnson and Phillips' Satisfactory Year—Associated Electrical Industries' Increased Profit—Reports and Dividends.

THE break in the American market has led to further pronounced weakness in the transatlantic favourites. American Telephone and Telegraph capital stock has lost a further 6 points, to under 250, International Telephone and Telegraph Stock is 9 points down at 65½, and Radio Corporation of America shares have also dropped sharply from over 65 to nearly 50. Hydro-Electrics at a couple of points down are comparatively firm, and International Holdings are only fractionally below last week's quotation. Cables and Wireless stocks have been irregular and finish up much about the same as a week ago. Marconi International Marine are 1s. 3d. down at £2.

In the manufacturing department, General Electrics at just under 47s. have lost 1s. 3d.; Ever Readies at 18s. 9d. are 1s. 9d. lower; and Associated Electrical Industries shares are 1s. down at 27s. Enfield Cables have fallen 2s. 6d. to 87s. 6d., but Henley's have recovered the 1s. 3d. lost a week ago. Electric Construction 7% preference shares are 7½d. to the good, at nearly 19s. 6d.

Midland Counties Electric Supply shares have more than lost their recent gain, and are down to 28s. 6d. Bournemouth and Poole are 1s. 3d. down and Newcastle shares are also lower. Victoria Falls shares have further advanced 1s. 3d. to 63s. 9d. Calcutta Electric Supply shares have shed 1s. 3d., but Calcutta Tramways shares have recovered somewhat. British Electric Traction 6% preference stock is a point up, as also is Central London Railway 4½% preferred. London Electric Railway 4% preferred and debenture issues are lower, and Underground Electric Railways ordinary shares at 23s. have shed 6d. Metropolitan Electric Tramways debentures have been bought recently, and the official quotations have been marked up, the 5% stock 6½ points to 79½ and the 4½% 2½ points to 75½. London and Suburban Traction "A" debentures are up a point, and Metropolitan Railway ordinary stock is slightly harder at 67.

The present pref. shs. are to be converted so as to become 200 000 7% cum. 1st pref. shs., and with 300 000 7% cum. pref. shs. now to be created will form one class of 500 000 7% cum £1 1st pref. shs., and ord. shs. will be divided into two of 10s. each, forming, with 600 000 10s. ord. shs. to be created, one class of 800 000 10s. ord. shs.

ANGLO-AMERICAN TELEGRAPH CO., LTD.—Rpt. for year to March 31, 1930, states that three qrtly. intm. divs. of 15s.% on ord. and £1 10s.% on pfd. and fin. div. for year amtg. to £1 10s.% on ord., £1 10s.% on pfd. and £1 10s.% on dfd. stks. have been paid. These, with £52 500 for income-tax, absorbed £262 500, being rent paid by Western Union Telegraph Co. for year, equal to 3¾% on ord., 6% on pfd. and 1½% on dfd. Blce. at credit of rev. acct. (£65 625) is available for paymt. of divs. for qtr. to March 31, 1930.

NORTH WALES POWER CO., LTD.—Rev. from sales of energy in 1929, £208 464, agst. £180 416; tradg. pft. £147 115, agst. £76 635, int. £5 628 agst. £15 160, makg. total pft. £152 743, agst. £91 792. After placing £5 000 to renewals fund, and paymt. of int. charges, trustees' fees, etc., blce. was £30 262. To depreciatn. £14 992. Fwd. £15 270. By means of reorganisatn. scheme, new money was provided to extent of £729 588 for redemptn. of "B" debs., and for working cap., and also for purchase from Aluminium Corporation of their hydro-electric generatg. plant at Dolgarrog, which was effected as at July 1, 1929.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Gross rev. for 1929 £1 058 629, agst. £955 129. Pft., after provisn. for depreciatn., £461 121, agst. £401 803, plus £41 130 brt. in. After paying deb. int., pref. div., intm. ord. div. and stamp duty on additional cap., and makg. contributns. to sinkg. fund on 2nd mtge. debs. and res. for taxation, res. fund £75 000, premises acct. £25 000, insurance fund £3 000, and retiring gratuity fund £10 000, it is proposed to pay div. on ord. shs. for second half-year of 7% actual, less tax, making 12% for year, plus bonus of 5d. p. sh. To res. for distributn. to domestic consumers, £28 188; fwd., £41 621.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Total rev. for 1929, £277 066, agst. £272 477. After provisn. for generatn. and distributn. costs, rents, rates, taxes, etc., blce. to net rev. acct. was £158 361, agst. £170 382, makg., w. £6 267 brt. in. ,a total of £164 628. After deductg. deb. int., allocatns. to leasehold and special redemptn. funds and int. to res. for depreciatn. (£35 000) res. for taxatn. (£3 000), and gen. res. (£15 000), blce. is £103 678. Intm. and fin. divs. on 4½% and 6% pref. shs. and intm. div. on ord. shs. have been paid. Fin. div. of 9% on ord. shs., less tax, recommended, makg., w. intm. div., 15% for year. Fwd. £7 798.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD.—Net rev for 1929, £99 521, after charging £27 142 for depreciatn. and renewals, plus £34 425 brt. in. Fin. div. of 3½% on pref. shs., less tax, and fin. div. of 8%, tax free, on ord. shs. recommended. To res. for depreciatn., £12 500, increasing fund to £78 685. The Bombay and Madras Telephone companies are still makg. progress. The Hongkong Telephone Co. has paid divs. amtg. to 8%, which has enabled the China and Japan Telephone and Electric Co. to declare div. of 15%, tax free. The Bengal Telephone Corporation paid a div. of 8% last year, agst. 7½% for previous year. The automatic system hs. bn. put into operatn. at Singapore.

Company Meetings.

CABLE, TELEPHONE AND GENERAL TRUST, LTD.—At an extraordinary general meeting on April 30, resolutions were passed increasing the capital to £1 100 000 by the creation of 390 000 £1 shares, of which 250 000 are to be preference shares, 5 000 "A" preference and 135 000 ordinary shares; raising the rate of annual dividend on the preference shares from 6% cumulative to 7% cumulative; changing the title of the "A" preference shares to "preferred ordinary shares"; and adopting new articles of association.

BABCOCK AND WILCOX, LTD.—At the meeting on Monday, Sir John Dewrance, chairman, said that once again the company was able to show a satisfactory year's working. The reserve accounts, carry-forward and dividend equalisation fund represented 30% of the total capital. There was a reduction in the net profit for 1929, but it was a matter for congratulation that their earnings had been so well maintained during the last four or five years. There was an exceptional accumulation of uncompleted orders, and in this connection he should explain that the character of the business was changing. Previously the great bulk of the business was in standard boilers and their equipment. This now represented a small proportion of the turnover, and the bulk of their orders was for boilers built to special design. As a result, the volume of orders secured was in excess of the normal, and certain delays occured which prevented the work being executed. The report was adopted.

EINSTEIN'S ELECTRO CHEMICAL PROCESS, LTD.—Major G. M. Kindersley, M.P., presiding at the meeting last week, said the profit and loss account showed a debit of £21 554. The period up to December 31, 1929, covered by these accounts, was one of construction and development, and the company was not trading. Over half this sum was in respect of development charges which would be largely non-recurring now that the factories were completed. In regard to the patent situation, the strength of the position had, in their opinion, been substantially improved since the inception of the company as a result of further applications which had been lodged during these past months. They were now treating thousands of articles weekly for motor manufacturers, locksmiths, makers of gramophones and optical apparatus, and others. This treatment lay chiefly in rendering the articles corrosion proof by suitable preparation and finishing with a coating of chromium of a special nature and excellent appearance. It was hoped that the Slough works would arrive at a profit-making stage before the end of 1930.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION, LTD.—At the meeting on April 30, Sir Frederick Hall, who presided in the unavoidable absence of Sir Harry Renwick, said the

Digitized by Google

total receipts were £267 552 compared with £258 367 in 1928. The units sold showed an increase of 3 237 821, an increase of over 16 %. The balance carried to net revenue account was £124 380, compared with £115 385. Adding the balance brought from revenue account and the amount brought forward from 1928, there was a total on the credit side of this account amounting to £219 777. The dividend on the ordinary shares was the same as last year—namely, 8½%. This represented the standard dividend under the No. 1 Act. Progress was not only well maintained, but a satisfactory advance had been made in the increase in kilowatts applied for and the units sold. The progress indicated by the business done in the first three months of the current year showed an increase on the corresponding period of last year. Their shareholders were able to look forward to the future with confidence. The report and accounts were adopted.

JOHNSON AND PHILLIPS, LTD.—Mr. John Macgregor, presiding at the meeting on Monday, said the profits for the year amounted to £155 191, compared with £106 416 for the previous year. He had no doubt that the shareholders would regard the result as being highly satisfactory. The net profit was £102 514. The reason they were not recommending a higher dividend for the year than 10% was that they had in hand a record volume of business, and to carry out those contracts a substantial liquid capital was required. They had decided to increase the carry forward to £123 417. The substantial increase in profits was due partially to an increased turnover, but principally to the great economies effected in the cost of production. Competition had remained very acute throughout 1929, and productive capacity had kept well ahead of demand, so that efficiency in manufacture, and active and enterprising salesmanship had been necessary to secure a reasonable share of business at an adequate profit. They were at present commencing work on an important contract for the Central Electricity Board, the erection of " grid " lines in mid-east England. During the year they had again carried out a large amount of railway electrification work, and the directors looked forward to considerable expansion in that direction. They were also busily engaged in telephone work. The report and accounts were adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.—Sir Felix J. C. Pole, residing at the meeting on April 30, said the issued capital consisted of 3 498 900 £1 ordinary shares and 616 525 £1 preference shares, all fully paid. The general reserve fund had been increased from £575 000 to £800 000 by a transfer to that account of the premium on share account, £209 726, and a transfer from profit and loss account of £15 273. Profit for the year, including dividends from subsidiary companies and after deducting all expenses and charges other than debenture interest and depreciation, amounted to £365 961, against £258 772 last year, plus £101 851 brought forward. After providing for interest on debenture stock, depreciation and the amount transferred to special reserve, profits available for distribution amounted to £348 389. The board recommended dividends of 8% on the preference shares and 6% on the ordinary shares, both less tax, leaving £109 241 to carry forward. Notwithstanding the large orders placed by the Central Electricity Board, there was still an excess of manufacturing capacity, and there was a wide field for co-operative effort within the industry. The steps taken to co-ordinate the activities of the companies embraced in Associated Electrical Industries had already been fruitful of some results, and they looked hopefully to the future. An important development during the year was the decision to utilise the Edison Swan Electric Co. as the merchandising section of the group, and the business in wiring supplies, fittings, and radio apparatus formerly handled by the merchandising sales department of the British Thomson-Houston Co. had been taken over by the Edison Swan Electric Co. This would be followed in the course of the next few weeks by the transfer to the Edison Swan Electric Co. of the Metropolitan-Vickers merchandising business. The chairman then referred to large units completed or under construction by the Metropolitan-Vickers Co., including turbo-generators for Sydney Council, the Victorian Government, Liverpool Corporation, the Uruguayan Government, the London Power Co., Manchester Corporation and the Ellerman steamships and electric locomotives supplied for numerous railways. They had recently completed negotiations with the International General Electric Co. for an exchange of patent rights and manufacturing information between all the companies of the Associated Electrical Industries and the General Electric Co. of America. The report and accounts were adopted.

NEW COMPANIES.

FITZPATRICKS, LTD.—Cap., £1 000. Merchants, dealers in metals, machinery, plant, electrical goods, etc. Reg. Office: Junction Mill, Burnley.

WESTERN ENAMELLED IRONWORKS, LTD.—Cap., £100. Manufacturers of refrigerators, electric and gas cookers, etc. Reg. Office: Eastgate House, Eastgate Street, Gloucester.

LONG EATON CABLE CO., LTD.—Cap., £3 000. Manufacturers of, and dealers in, electric and other cables, bell and fuse wire, flexible cords, insulating materisls, etc. Solicitors: Flint, Marsden and Bishop, Derby.

VERART, LTD.—Cap., £1 000. Manufacturers of, and dealers in, glass, porcelain, glassware, lampshades, glass and metal fittings, electricians, etc. Solicitor: J. E. M. Crowther, 23, Abingdon Street, Westminster, S.W.1.

H. FITZPATRICK, LTD.—Cap., £25 000. To acquire business carried on at Junction Mill, Burnley, as H. Fitzpatrick, and to carry on the business of merchants and dealers in metals, machinery, plant, electrical goods, wireless instruments, etc.

MAMCO, LTD.—Cap., £100. Agents for the purchase or sale of British, Colonial or foreign goods; manufacturers of, and dealers in, electrical goods, wireless apparatus, etc. A director: W. B. Heskins, 26, Carlton Road, Walthamstow, London, E.17.

PECONA, LTD.—Cap., £500. To acquire business of manufacturer and merchant now carried on by B. Nodin, of 8, Camp Street, Manchester, as " The Decone Co.," and to carry on business of novelty manufacturers, radio engineers, electrical suppliers, etc.

BRITISH SANAFONE SYNDICATE, LTD.—Cap., £67 500. To adopt an agreement with D. S. S. Steuart, to acquire the trade mark " Sanafone " No. 480 981, of August 13, 1928, to acquire licences of any patents relating to telephonic, telegraphic or wireless apparatus, etc. Solicitors: Ashurst Morris, Crisp and Co., 17, Throgmorton Avenue, London, E.C. (Public co.)

SIR W. G. ARMSTRONG WHITWORTH AND CO. (IRONFOUNDERS), LTD.—Cap., £130 000. To acquire from Armstrong Whitworth Securities Co., Ltd., business of ironfounders carried on at the Close Works, Gateshead, and to carry on said business and that of engineers, manufacturers of, and dealers in, railway carriages, tramcars, etc., electricians, electrical engineers, suppliers of electricity, etc. Solicitors: Roney and Co., 42, New Broad Street, London, E.C.2.

COMING EVENTS.

Friday, May 9 (To-day).

INSTITUTION OF ELECTRICAL ENGINEERS (LONDON STUDENTS' SECTION).—Savoy Place, Victoria Embankment, London. Annual general meeting. Paper by Messrs. J. W. Moffatt and J. C. Emerson on " The Rotary Automatic Telephone System." 6.15 *p.m.*

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington, London, S.W. Ordinary meeting. 5 *p.m.*

Saturday, May 10.

INSTITUTION OF ELECTRICAL ENGINEERS (LONDON STUDENTS' SECTION).—Visit to the Brookman's Park Regional Station of the British Broadcasting Corporation. 2.30 *p.m.*

Monday, May 12.

ELECTRICAL CONTRACTORS' ASSOCIATION (LIVERPOOL BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (HASTINGS BRANCH).—Lewcock's Restaurant. Ordinary meeting.

Tuesday, May 13.

ELECTRICAL CONTRACTORS' ASSOCIATION (BOURNEMOUTH BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (LEICESTER BRANCH).—Corridor Chambers. Ordinary meeting. 2.30 *p.m.*

INSTITUTION OF CIVIL ENGINEERS.—Great George Street, London, S.W.1. Annual general meeting. 6 *p.m.*

Wednesday, May 14.

ELECTRICAL CONTRACTORS' ASSOCIATION (SHEFFIELD BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (EASTBOURNE BRANCH).—Ordinary meeting.

POLYTECHNIC ELECTRICAL ENGINEERING DEPARTMENT.—307-311, Regent Street, London. Lecture II (course of six lectures) by Mr. W. H. Date on " Thermionic Valves." 6.30 *p.m.*

ROYAL SOCIETY.—Conversazione, Burlington House, London. 8.30 *p.m.*

Thursday, May 15.

INSTITUTION OF ELECTRICAL ENGINEERS (HAMPSHIRE SUB-CENTRE).—Southampton. Summer meeting.

INSTITUTION OF ELECTRICAL ENGINEERS.—Institution, Savoy Place, Victoria Embankment, London. Annual general meeting. 6 *p.m.*

Company Winding-up Voluntarily.

ELECTRODRIVES, LTD. By reason of its liabilities, April 29. D. R. Evans, 29-30, King Street, Cheapside, London, E.C.2, chartered accountant, appointed as liquidator.

Bankruptcy Information.

BAINTON, Joseph, 86, Wheelock Street, Middlewich, Cheshire, electrician and radio engineer. Receiving order, May 1. Debtor's petition. First meeting, May 15, 11.30 a.m., Official Receiver's Office, 12, Lonsdale Street, Stoke-upon-Trent. Public examination, June 5, 11 a.m., Petty Sessional Court House, Edleston Road, Crewe.

WILEMAN, Norman Arthur, trading as A. WILEMAN AND CO., 141, Commercial Street, Maesteg, Glamorgan, electrical engineer and contractor. Receiving order, April 29. Debtor's petition.

Notice of Dividend.

DEAN, Joseph Holcombe, electrician, 4, Gogerddan Place, Aberystwyth. Supplemental dividend, 2s. per £, payable May 9, 4, Queen Street, Carmarthen.

Partnerships Dissolved.

ANDERSON ANGELL AND CO. (Frank ANGELL and Henry Baron ANGELL), electrical engineers, 8 and 8a, Paul Street, E.C.2, by mutual consent as from April 11, 1930. Debts received and paid by H. B. Angel, who continues the business.

"CHESTERS," (Albert Ernest CHESTERS and Thomas Henry CHESTERS), electrical engineers, 139, Victoria Road, New Brighton Cheshire, by mutual consent as from April 30, 1930. Debts received and paid by T. H. Chesters, who continues the business.

POWERPLUS ELECTRIC PLANT COMPANY (Frank ANGELL, Henry Baron ANGELL and Edgar DUVAL), electrical engineers, 8, Paul Street, Finsbury, London, by mutual consent as from April 11, 1930. Debts received and paid by H. B. Angell and E. Duval, who continue the business.

Bankruptcy Proceedings.

COX, Bernard Luther, Holmes Yard, Shirland Street, Chesterfield, electrical engineer. The first meeting of the creditors herein was held on May 2 at the Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. According to the statement of affairs submitted by the debtor there were liabilities amounting to £1 227 and a deficiency of £857. Debtor attributed his failure to an unprofitable agency in batteries, bad trade, and heavy trade expenses. It appeared that the debtor commenced business in February, 1927, as an electrician at the above address with a capital of £50. Debtor obtained contracts for the wiring of Council houses and other local buildings. The debtor stated that about July, 1928, he was appointed agent for a firm of battery manufacturers. Owing to this agency, the debtor neglected his own business. Books of account showed that for the year ending March 31, 1928, there was a net profit of £403, but for the following year a net loss of £108 had been incurred. A resolution was passed for the appointment of Mr. Lewis Barnes, chartered accountant, of Chesterfield as trustee, with a committee of inspection.

HOEY, Frank Walter Charles, wireless and electrical dealer, late of 29, Sicilian Avenue, London, W.C. This debtor attended in the London Bankruptcy Court, on May 1, for his public examination. His statement of affairs shows liabilities £5 063, of which £5 049 is returned as due to 135 unsecured creditors, and his assets are valued at a net sum of £40. It appeared that in 1912 the debtor joined the Army, in which he served until October 1919. In March, 1926, he bought for £1 150 the goodwill stock, etc., of the business of a dealer in wireless and electrical accessories carried on at the above address. He also acquired the lease of seven years of the premises. Of the purchase price he borrowed £200. He afterwards traded in partnership with another person who brought in £50 capital, and they conducted the business under the style of Scientific Appliances. In April, 1927, however, his partner retired receiving £280 in respect of his interest in the business. The debtor continued the trading alone until last December, when he found that he was unable to obtain payment of a debt of £2 369 in respect of goods supplied during November and December. He then sold his business for £400 which he paid into his banking accounts in reduction of overdrafts. The debtor attributed his insolvency to his inability to obtain payment of the book debt mentioned, to ill-health, and to other causes. The examination was adjourned until June 19.

MELVILLE, Ernest James, lately trading as JAMES MELVILLE AND CO., Sutherland House, Forest Road, lately Dudley Chambers, Angel Row, Nottingham, electrical contractor. The public examination of this debtor was held on May 1 at Nottingham. According to the statement of affairs filed there was a deficiency of £1 576, and the debtor attributed his position to lack of capital, heavy extraneous trade expenses, and bad debts. It seemed that at the end of 1923 a balance sheet prepared showed the debtor to be in financial difficulties. He continued trading, and in May, 1929, took into his employment a person who contributed £200 capital. The business, however, was unsuccessful, and at a meeting of creditors held in February last an offer of 4s. in the £ was not accepted. The debtor, it was stated, commenced trading with a capital of £20 in 1920. The hearing was concluded.

SHEPHERD, Cyril, 69, Micklegate, previously 73, Acomb Road, formerly Coffee Yard, Stonegate, York, radio engineer and dealer in wireless accessories. The statutory first meeting of creditors was held on May 1 at the Official Receiver's Offices, Duncombe Place, York. According to the statement of affairs submitted there were liabilities amounting to £821 against assets estimated to produce £280, a deficiency of £541. Debtor attributed his failure to bad trade, during the past two years, to keen competition, and to lack of capital. The case, being a summary one, was left in the hands of the Official Receiver as trustee of the estate.

THE LEAD MARKET.

According to James Forster and Co., the lead market continues to show weakness, prices declining daily and closing at the lowest. The small backwardation at the end of April has disappeared and given place to a contango, which is certainly a more natural position in view of the excess of supplies. The American price remains unchanged at 5.50 cents, but conditions are dull, and any further weakness in London would force a price recession in New York. Closing prices on May 2 were £17 5s. for May and June, £17 6s. 3d. for July, and £17 7s. 6d. for August, a fall of 12s. 6d. per ton on the week.

Electrical Manufacturing Progress.

IT was not to be expected, in view of the intensity of the economic crisis in our best overseas markets that exports of electrical manufactures could continue to show a contrary trend to the general run of British exports as they have done in recent months. The Board of Trade returns for April indicate that electrical exports have begun to suffer from the same adverse influences which have been affecting other industries for some time. For the first four months of the year exports of electrical manufactures are still ahead of the figures for the corresponding period of 1929, but unless there is a speedy recovery from the prevailing conditions, manufacturers will have to depend much more on the home market for orders than has been the case during the past fifteen months. Meanwhile imports of electrical goods are still steadily rising.

It is pleasing to turn from contemplation of the intra-Empire and international trade situation to two very important developments in the British electrical manufacturing industry to which we devote a good deal of space this week. First let us mention the opening by Lord Melchett yesterday of the research laboratory which has been established at the new Stourport works of Steatite and Porcelain Products, Ltd. This high tension and mechanical research department is provided with equipment which, it is claimed, can produce voltages in excess of 1 800 000—greater than any other laboratory in the British Empire, though still some way behind what has been achieved in this direction in Germany and the United States. The laboratory has been established with the intention that it shall exchange results with associated undertakings in this country and in Germany; it is also to be at the disposal of the entire electrical industry. The undertaking of which it forms an essential part is a notable enterprise. It is a serious and successful effort to make up the leeway lost by this country in the technical development of electrical insulators. With the friendly co-operation of two German companies which had carried out extensive work in this field, a thoroughly modern and efficient factory is now at work in Great Britain, turning out large quantities of the high tension insulators and bushings required for the grid and a wide variety of low tension porcelain and steatite products. Having an exclusive licence for the British Empire to manufacture under the important patents owned by the German Hermsdorf-Schomburg and Steatit Magnesia Companies, the British undertaking, in association with Imperial Chemical Industries, has secured such a volume of business that works extensions have become necessary, and its future appears assured. British industry has been enriched by a valuable accession to its list of up-to-date factories, and Mr. CHARLES GARLAND and his fellow directors and their associates are entitled to all credit for their enterprise.

The other development to which reference has been made, also relates to high tension transmission of power. On another page we give a description of the complete new range of oil circuit breakers of high rupturing capacity, which has been produced by Ferguson, Pailin, Ltd. In this field also German and American engineers had advanced further than our own. In this country we are just reaching the critical stage which was attained in the United States some time ago, and the need for a more robust type of circuit breakers is becoming increasingly felt. Ferguson, Pailin, having noted the solution of the problem abroad by the installation of exceptionally robust circuit breakers incorporating the three phases in a common cylindrical tank, have adopted a design of this type which has now been proved satisfactory by an extensive series of rupturing tests. The breaking capacity ratings range from 100 000 kVA upwards. Breakers of this type made at Manchester have stood up successfully to exacting short circuit tests under service conditions in America, and there is no room for doubt that a thoroughly efficient British made circuit breaker of high rupturing capacity is now at the disposal of supply engineers in this country and elsewhere.

Current Topics.

A Lesson from Lewisham.

THERE is ample excuse for the raising of the pæan by the gas industry on its success in securing the verdict of the Lewisham Borough Council's Works Committee as the result of a competition between gas and electricity undertakings in which each had a free hand to carry out experimental installations over two successive miles of roadway. The electricity undertaking favoured standards on the footway. The gas company, on the other hand, profiting by the admitted success of the lighting carried out by the G.E.C. on the Thames Embankment, suspended its lamps centrally above the roadway and by doing so secured a victory which would probably have gone to its rival had the latter been more alive to the definite trend of opinion among road users in favour of central lighting. We may depend upon the wideawake gas industry to take full advantage of this success. Much too little attention is paid to the subject of adequate street lighting and there is no doubt that bad lighting is a frequent cause of accidents.

Jubilee Supplement.

NEXT week's issue of THE ELECTRICIAN, in common with those of the other weekly journals belonging to the Bouverie House group, will include a special illustrated Jubilee Section of 40 pages descriptive of the founding and development during half a century of steady progress of the firm of Benn Brothers, Ltd. This round dozen of trade and technical newspapers has become a powerful force in the development of British industry and trade, and we feel certain that the story of fifty years of achievement from the humblest beginnings to the substantial success of the present day—an advance which is still far from having lost its impetus—will be read with more than ordinary interest. Among the contributors to the ordinary issue of THE ELECTRICIAN next week will be Colonel Sir THOMAS F. PURVES and Colonel CROMPTON.

Rating Burden on Power Stations.

AN instance of the very burdens placed on power stations by the new rating assessments levied under the Rating and Valuation Act of 1925 was given by Lord ERSKINE, who deputised for Sir HARRY RENWICK at the ordinary general meeting of the Bournemouth and Poole Electric Supply Company last week. This Company's liability for local rates has been raised from £19 174 to £46 797, an increase of 144 per cent. The chairman's speech rightly pointed out that this very heavy increase really amounts to payment by the company of a surtax on all units sold to consumers. There are extraordinary and quite incomprehensible variations in the fixing of assessments by different local authorities some of the increases being as high as 700 per cent. Concurrently pressure is brought to bear on supply undertakings to reduce their charges. We agree that the subject calls for thorough overhauling.

Mr. Beauchamp's New Post.

As the South West England and South Wales Grid Scheme has not yet been finally adopted by the Central Electricity Board—probably this will happen very shortly—it would be premature for the Board to announce appointments to posts which as yet have no official existence. It is, however, no longer a secret that Mr. J. W. BEAUCHAMP, the engineer and general manager of the South Wales Power Company, has accepted an important position under the Central Electricity Board in connection with the above-mentioned scheme. May we add our congratulations to those of Mr. W. NORTH LEWIS, the chairman of the South Wales Power Company, who referred to the matter in his speech at the ordinary general meeting of the company last week.

Muscle Shoals.

EVER since the Armistice there has been heated discussion as to what should be done with the great Muscle Shoals development on the Tennessee river which was undertaken during the war by the American Government in connection with the manufacture of nitrates for munitions. Seven years ago Mr. HENRY FORD offered to lease Muscle Shoals but personal attacks on Mr. FORD in the Senate after the House of Representatives had ratified the proposed base caused him to withdraw his offer. Now a Bill for Government operations has been passed by the Senate but disapproved by the Military Affairs Committee of the House of Representatives which is to draft an alternative measure directing the President to lease Muscle Shoals for private operation on properly safeguarded terms. In view of the prejudice which has been aroused and the strength of the two opposing groups which favour government operation and private operation, respectively, it does not seem likely that anything definite will be done. Meanwhile improvement of the Tennessee Valley, which is of vital importance to a large area of the South, is held up while politicians continue their wrangling. Muscle Shoals is in fact an American counterpart of the Charing Cross bridge.

Telephone Contrasts.

THE two chief topics in the telephone world during the last week show a remarkable divergence. One has been the continual expansion of the Post Office's wireless telephone service. Australians can now ring up the mainland of Europe, and the purser of an Atlantic liner can talk to a friend in Buenos Aires. The other has been the question of supervision in telephone exchanges. According to complaints at the Belfast conference of the Union of Post Office Workers, exchange supervisors are often excessively active—sometimes almost to the extent of reducing operators to tears. If this occurs it is certainly very unfortunate for all concerned, yet we hesitate to say that telephone supervision is overdone. At all events it seems a serious pity that, with a telephone service which engineering skill has made world-wide, the Englishman cannot enjoy a certain reliability at home. It is not unusual for a private subscriber in the London area to have one call out of every three a " wrong number." This is bad enough, but when wrong numbers are obtained from the modern public telephone matters are even worse. Button "A" has been obediently pressed, and the twopence is beyond recall—unless, indeed, one waits patiently for a chat with the " exacting " supervisor. One has heard of fortunate individuals who, on pressing Button " B " more in curiosity than in expectation have been rewarded with a shower of coppers, but these are rare if not legendary incidents. The call box whale does not relish giving imitations of the sea beast which disgorged Jonah.

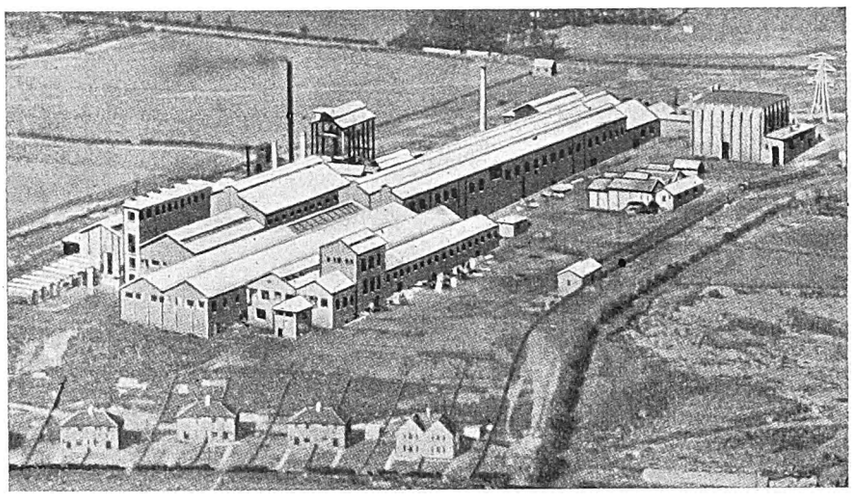
STEATITE AND PORCELAIN INSULATORS.

New British Industry Established at Stourport—Works Already Employing 650 Hands—Official Opening of Research Laboratory Yesterday.

YESTERDAY the new research laboratory of Steatite and Porcelain Products, Ltd., at the firm's works, Stourport, was officially opened by Lord Melchett, in the presence of more than 300 guests. The factory at Stourport has been established by the company, in association with Imperial Chemical Industries, Ltd., for the manufacture of electrical, porcelain and steatite goods, particularly the high tension insulators and bushings required in connection with the national electricity scheme.

On Monday, representatives of the Press were given an opportunity of inspecting the works and laboratory which stand on an island site of 70 acres, bounded by roads on the bank of the Severn at the head of navigation by large barges. It has its own railway station and sidings and a housing estate has been arranged for 300 dwellings, of which 142 are already occupied. The laboratory, which is to be at the disposal of the entire electrical industry, is claimed to be capable of producing higher voltages than any in the British Empire.



Aerial view of the new Stourport factory of Steatite and Porcelain Products, Ltd. The research laboratory can be seen at the top right hand corner.

Speaking at a luncheon in the works on Monday, Mr. Charles Garland, managing director of Steatite and Porcelain Products, Ltd., said that this was an attempt to establish an entirely new industry in Great Britain. The making of porcelain in this country had previously been mainly in the hands of people manufacturing tea cups, baths, cooking vessels and so on. His firm were tackling the matter from the electrical and engineering ends, which were much more important. They had embarked upon this venture with the aid of the knowledge that had been acquired by the Hermsdorf-Schomburg and Steatit-Magnesia Companies, with whom, in association with Imperial Chemical Industries and Falk, Stadelmann and Co., Ltd., it had been arranged to establish an up-to-date factory in Great Britain for the manufacture of electrical, porcelain and steatite insulators. The company held an exclusive licence for the British Empire covering the many valuable patents owned by the companies named, in addition to a reciprocal arrangement for exchange of the results of research work.

In America it was the practice to go round transmission lines every two or three years, test the insulators and replace those broken or defective. In Great Britain we looked for greater dependability.

There was no other factory of the same kind in the Empire, and a notable feature was the smooth flow of products from one end of the factory to the other.

In this country we had lagged very seriously behind in electrical development, as any traveller who looked out of the windows of a train could notice. The grid schemes were an effort to make up leeway. The company had business on hand for every one of the Central Electricity Board's schemes that had been promulgated since the company was formed. They had provided a new type of electrical insulator in steatite which was stronger and better than anything made before. The works which were now employing nearly 700 people would ultimately give work to 1 200 or 1 500. A number of the employees were miners from Wales and Durham, with an average of about seven children apiece.

* * *

The site selected at Stourport has a number of advantages. It is close to the fireclay deposits at Stourbridge and to coal pits supplying coal of the required quality. It is in easy communication by waterway and rail with Birmingham, Manchester, Gloucester and Avonmouth, and the clear atmosphere is well suited to the manufacture of high grade porcelain. The Shropshire, Worcestershire and Staffordshire Power Co. showed commendable enterprise in earmarking the best industrial sites in the area when their new power station was established at Stourport, and it was one of these sites that was acquired for the new works. The first unit of the factory covers a floor area of more than four acres, and it has been designed with a view to eventual duplication of its output. There is room for a second factory on the other side of the railway siding.

The company was originally formed in 1907 to manufacture magnesia rings and nozzles for incandescent gas mantles, and subsequently added the production of refractory insulating materials of the kind required for electrical heaters and cookers. Extensions to the works at Earlsfield were made in 1914 and 1920, and the Nottingham business of W. A. Ward and Co. was acquired in 1917. In 1928 the decision was made to extend the scope of the business to cover the whole range of ceramic electrical insulating materials.

The raw materials used include china clay, plastic kaolin (ball clay), quartz and felspar, of which the chief supplies come from Cornwall and Dorset. Steatite of the composition required for electrical insulators is only obtainable in Bavaria.

Analysis are made of the china clay at several stages as it passes from the trucks to the storage bins, from the bins to the breaking machines and thence to the 22 concrete silos each holding 30 to 40 tons. Effective precautions are incorporated in the layout to prevent any raw materials other than those which have been carefully weighed to become accidentally mixed with the body. The automatic weighing machines weigh up to 2 tons of mixture at a time with an accuracy of 0·01 per cent. There is an absolute mechanical control of the body composition, each charge being thoroughly tested; standard test pieces are also made from each batch of raw material and their electrical and mechanical properties determined.

Passing through the porcelain lined grinding mills and mixing vats and the filter presses, the material, now in the form of cakes of uniform mixture and known water content goes to the storage cellars, where it is kept for some time under conditions of constant humidity to increase its plasticity. It then passes through kneading machines before being moulded into the final insulator shapes. The exactness of the shape is of the greatest importance in the case of suspension insulators. The insulators are afterwards placed in drying stoves, glazed with a highly refractory felspathic glaze and then fired, enclosed in fireclay saggars, made in the factory, in a producer gas-fired tunnel kiln 320 ft. long. There are also two round kilns for large pieces up to 8 ft. high and 3 ft. 6 in. diameter.

When removed from the kilns the h.t. insulators are carefully examined for mechanical or glazing faults. They are then listed for 15 minutes at their flashover voltage by the routine testing plant. There are four testing tables at which tests with normal frequency current up to 150 kV against earth or 300 kV between insulated poles can be carried out. One of these is of special construction for testing exceptionally large pieces such as bushings for voltages up to 220 kV. There is also equipment for continuous h.f. and impulse tests and a special machine for routine mechanical tests. The impulse and h.f. tests, although not usually specified as routine tests in this country are generally used on the Continent and in

Digitized by Google

America and are specified in the testing regulations of the A.I.E.E. The maximum peak voltage obtainable from these two equipments is approximately 300 kV in each case. For higher voltages plant is available in the h.t. laboratory. By the use of a rotating table continuous tests can be carried out so that several thousand pieces a day can be passed. The testing transformers (of 300 kV) are fed normally from a single-phase generator, the driving motor being connected to the factory mains. The primary voltage of the transformers was chosen so that they could be connected directly to the mains in case of a breakdown of the motor generator. Each testing field is closed by doors which cannot be opened while an electrical connection exists between a testing transformer and that particular field.

In the impulse plant two high-voltage condensers are charged by an unsmoothed unidirectional current which is obtained from a mechanical rectifier fed from the high-tension side of one of the transformers. For the high frequency plant a special bank of oil-filled glass condensers is used which is charged directly with alternating current. The discharge in this case takes place through a quenched spark gap and the primary of a Tesla transformer both of which are connected in series across the condenser bank. The quenched spark gap is so built that the voltage can be easily regulated, and so designed that it can be used for continuous tests. A very simple switching operation is required to change immediately from impulse tests to high-frequency tests.

The 50-ton tensile testing machine is placed in such a manner that should it be necessary to carry out simultaneous electrical and mechanical tests on this machine a connection can quickly be made to one of the high-tension busbars. However, to avoid the complicated safety devices which would be required no permanent connection is made to this machine.

Testing High Voltage Bushings.

For temperature cycle tests two immersion tanks (see picture on page 607) are available in which a large number of insulators can be simultaneously put through the temperature cycle test and in which exceptionally large porcelains such as high-voltage bushings, etc., can easily be dealt with.

Each piece of steel and malleable iron used to make up the assembled insulator or insulator string-caps, pins, etc.—is tested to 50 per cent. above its working load. The porcelain is mounted—in the case of suspension insulators with a patent spring ring fixing—with a pin and malleable iron cap.

With the old type of cemented insulator it was found that the unavoidable tendency of the cement to expand produced after a shorter or longer period stresses in the porcelain resulting in fine cracks and ultimate puncture and failure of the line. Most of the difficulties of the early high-tension lines have been traced to this cause. In the spring-ring insulator a spiral spring ring of steel wire of high tensile strength carried on the stem of the pin is forced through the neck of the hollow cylindrical space in the head of the insulator and allowed to expand into the wider cavity, the shape of which is specially designed to conform in curvature with that of the spring itself. The spring is retained in position by means of a serrated collar and clip. In order to protect it from the weather, to prevent any possibility of relative movement of the two parts, and to secure a better distribution of the mechanical and electrical stresses over the insulator, the inter-space is filled with a lead alloy. The tension on the pin is converted into uniform compression stress over the whole of the inside of the insulator, and even without the lead filling the insulator has a much higher mechanical strength than is attainable with cement. Moreover, it is impossible without actually breaking away the whole of the porcelain for the pin to come out of the insulator and allow the conductor to fall.

Every insulator is, after assembly, tested mechanically to 25 per cent. above its working load, and is subjected to an impulse voltage of up to 200 000 V and a high-frequency test of 150 000 V at 120 000 to 150 000 cycles. After these tests, in which any failures are rejected, the insulators are again tested as a matter of routine on the testing tables for fifteen minutes at their flashover voltage.

In addition, a definite proportion of each batch of insulators is sent to the Research Laboratory for flashover, ultimate electro-mechanical strength, ultimate mechanical strength, and porosity tests. They are finally punctured under oil.

After inspection by the consulting engineers the insulators are packed in crates which have been designed to admit of the easy assembly of the insulators by the contractors and are dispatched either by railway truck or by road lorries.

In the case of steatite, advantage is taken of the fact that when finely powdered it can be pressed in a dry state to give an article sufficiently strong to be dropped on a travelling band. Automatic presses are used in the case of sufficiently large orders to warrant the making of the accurate and costly stamping tools for these machines; steatite contracts much less than porcelain on firing at 1 450° C., the difference being 8% against 18%. Steatite articles can be supplied commercially with a tolerance of only 2%, compared with 5% and upwards in the case of porcelain.

A feature of the factory is the continuous chain conveyors over half a mile long which travels at a speed of two miles an hour through all departments. It is brought down to table level at all points where goods are taken from it or delivered to trays.

The H.T. Laboratory.

The h.t. laboratory has a floor area of 4 300 sq. ft. and a height of 45 ft., with side buildings having an additional area of 3 200 sq. ft. A single-phase 500 kVA generator feeds a transformer set consisting of two cascade-connected transformers. From these voltages up to 1 000 000 can be obtained. Open air isolating switches are mounted on the roofs of the side buildings.

Normal frequency a.c. voltage up to 1 000 000 V is attained from two 450 kVA cascade connected Ferranti transformers fed by a 500 kVA 6 000 V generator.

For the generation of h.f. voltage there is a Tesla transformer, the h.f. circuit being set in oscillation either by a.c. or d.c. excitation. Up to 1 500 000 V peak against earth is obtainable, with provision for doubling this voltage between poles at a later date. For such high voltages the secondary winding of the transformer must be oil-immersed. The primary is entirely air-insulated. Only the four lowest condensers of the bank illustrated on page 607 are normally used for h.f. tests.

The laboratory impulse plant, like that in the routine testing room incorporates the Marx voltage multiplication impulse circuit. The condensers are charged in parallel through high resistances and discharged on to the object under test in series on the simultaneous breakdown of the intermediate spark gaps. Voltages in excess of 1 800 000 have been obtained. To obtain the unidirectional current for charging the condensers and having regard to the high stresses applied to the rectifier when used in conjunction with such an impulse generator, it was decided not to use thermionic rectifying valves, but to employ a Delon mechanical rectifier. Such a rectifier, when caused to revolve at the correct speed, enables two condensers to be charged up against earth, so that a voltage which is double the peak voltage of the transformer supplying the current for rectification is obtained. The rectifier is direct-coupled to the generator supplying the transformers in order to avoid the necessity for synchronisation.

Some impressive displays of h.f. and impulse flashovers on strings of insulators were given on Monday, both within the laboratory and on the grid-type pylon specially erected outside the works.

The machines for carrying out vibration, torsion and tension tests are housed alongside the high tension laboratory, and outside there is an open-air endurance testing plant on which four strings of insulators can be tested simultaneously.

In the fog room any atmospheric conditions can be reproduced, and there is also a smoke or sooting chamber. A rain frame in the main h.t. laboratory allows artificial rain to play on insulators in wet flashover tests, and transportable oil tanks are available for tests under oil. Tests of insulators under power arcs of several hundred amperes can also be carried out.

NICKEL-COPPER SHEETS.

The B.S.S. for non-ferrous metals and alloys have recently been extended by the issue of two specifications relating to nickel. The first, No. 374-1930, "Nickel-copper (Cupro-Nickel) Sheets and Strips," standardises sheets and strips of four different chemical compositions. In this specification the physical properties of the material are laid down, tensile and bend tests being prescribed, whilst tolerances on thickness are specified for sheets and strips of various widths and gauges. The second specification, No. 375-1930, "Refined Nickel (Grade A,)" provides for a nickel of 99 per cent. purity.

Copies of these two specifications may be obtained from the British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d. each, post free.

NEW DEVELOPMENT IN BRITISH SWITCHGEAR.

Oil Circuit Breakers of High Rupturing Capacity—Short Circuit Tests—Tank and Top Plate—Operating Mechanism—Contacts and Bushings—Venting and Insulation.

THERE is considerable activity at the present time in experimenting with entirely new methods of breaking high power, high voltage circuits. Whilst the results of these experiments may be seen in commercial form in the course of time, it would be unwise in the interim to refrain from improving the oil circuit breaker, which has served the industry for so many years. Tests on the new devices have indicated that at present they leave much to be desired, and it may ultimately be found that the devil we know is better than the devil who is a stranger. Concurrently with the trying-out of these new ideas, every effort should be made to bring the oil circuit breaker to a high state of perfection.

The problem in this country will very shortly be how to substitute higher rupturing capacity breakers for those already installed, in view of the more onerous duties to be imposed on this class of equipment, due to rapid plant extensions, the Grid supply, and the extension of overhead transmission, with its consequent increased frequency of faults. Our problem is very similar to that which is constantly facing American supply authorities. So rapid are the developments that some American supply engineers state that every five years the system outgrows the rupturing capacity of the breakers installed, and necessitates changes. They also say that up to a certain point they experienced little or no trouble with oil circuit breakers, but after passing that point they had such constant interruptions and failures that it was necessary for them to give the matter of installing breakers of greater known rupturing capacity their closest consideration. They were driven to calculate carefully the maximum short-circuit power that could be obtained in any particular location, and to install breakers with corresponding rupturing ability.

We, in this country, are now reaching the same critical stage, and unless supply authorities install circuit breakers of ample rupturing capacity under the revised conditions, they are courting trouble. One example occurred within the last few weeks illustrating this point. A municipal power station installed circuit breakers some twenty years ago, which, according to modern ratings, would have a rupturing capacity of not more than 25 000 kVA. In spite of considerable developments in plant, the original oil breakers were not changed, with the result that when a short circuit occurred immediately outside the generating station, the switch failed to clear, and an explosion occurred, the doors of the cells being blown across the engine-room. The most serious aspect of this trouble was the liability of fire due to the oil being thrown about the station, including the cable trench. The supply was, in consequence, shut down, for some time, but luckily the fire did not get a hold.

American and German engineers have solved the problem of rupturing ability consequent upon growth by installing exceptionally robust circuit breakers incorporating the three phases in a common cylindrical tank. After some tens of thousands of rupturing tests, this form of construction was found to be the most suitable for moderate rupturing capacities, and was found to occupy the minimum of space. Ferguson, Pailin, Ltd., of Higher Openshaw, Manchester, decided that circuit breakers of this class would have an application in this country, and have, therefore, adopted a design which has been proved by these extensive rupturing tests. A complete range has been developed comprising 16-in., 20-in., 24-in., 28-in., 32-in. and 36-in. diameter tank breakers, and further developments are in progress for increasing the range, both in an upward and downward direction. The breakers now described are of proved rupturing ability, each type of breaker having been tested. Because of this, it is believed that they will appeal to British engineers who are keen on installing a product which has withstood the most onerous conditions of tests within its range. The design was evolved only after a large number of tests, and though in some directions it runs counter to theories which have been advanced by many engineers in the past, yet " the proof of the pudding is in the eating."

The particular range of breakers is known as the " R " series, the breaking capacity ratings ranging from 100 000 kVA upwards .These ratings are not mere estimates, and it will be of interest to give a brief outline of the nature of the tests which led up to the final design of these breakers. The test generator is capable of delivering 500 000 kVA under three-phase short-circuit conditions for several seconds by direct generation at 14 500 V at frequencies up to 60 cycles per second. The power ruptured by the breakers is controlled by reactors capable of adjustment to suit each investigation. Oscillographs are used to record the current, line voltage, arc voltage, breaker speed, etc., and in addition several special instruments are used to record speed of break, arch energy, gas formation, pressure and so on during interruption. As many as six three-element oscillographs have been used simultaneously to record the phenomena during short-circuit tests. In addition to the exhaustive testing of the lines of breakers, from which the Ferguson Pailin breakers have been developed, many experimental sample breakers have been tested to obtain data and formulæ. Samples of each new commercial design have been tested thoroughly to determine its breaking capacity rating before it was finally approved for production, and, in addition to the factory tests referred to above, the parent line of breakers has seen considerable service in actual commercial operation, and has proved eminently satisfactory. It has always been observed that short circuits produced in the factory are more serious and impose a more drastic test than those produced under actual service conditions. This is probably because the distribution over a wider area of all items which contribute to the short circuit conditions in the case of service operations introduces something comparable to a damping action.

The purpose of the large number of tests was, first, to demonstrate with certainty that the breakers could rupture

TABLE I.

THREE-PHASE SHORT CIRCUIT TESTS AT 13 200 V ON TYPE " R " 11 kV, 600 A OIL CIRCUIT BREAKER TANK, 28-IN. DIAMETER.

Test No.	Ext. React. in Ohms.	Current Amperes. Max. Loop. Peak Value.	Current Amperes. Max. Loop. RMS Value.	Initial in Arc RMS.	Dur. of S.C. in ½-Cycles.	Arc Length in ½-Cycles.	Pressure Above Oil in lb./sq. in.	Remarks.

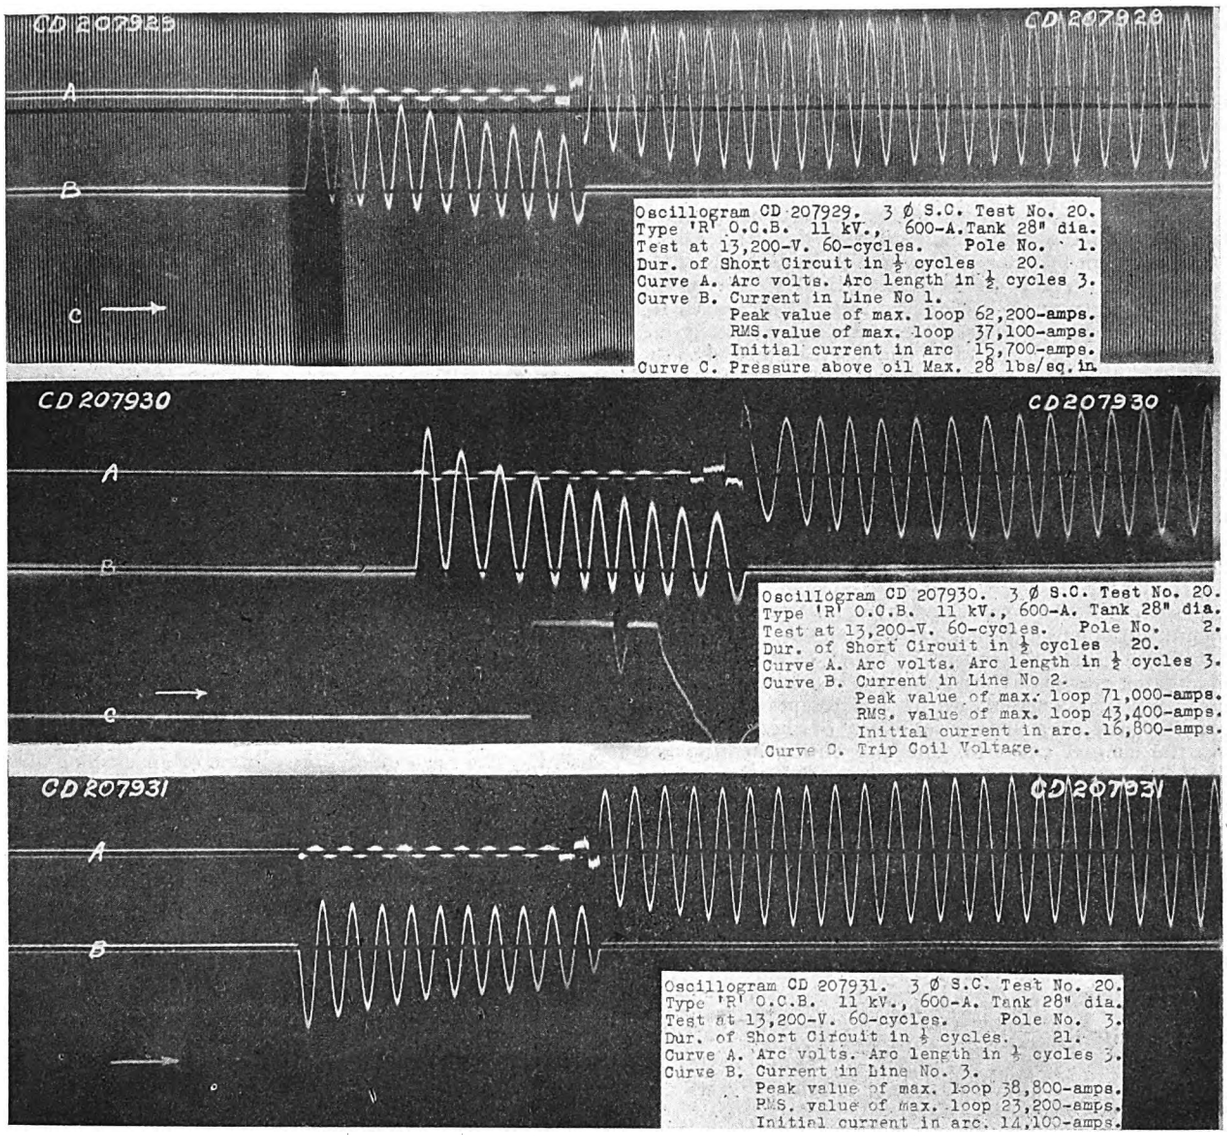

Fig. 1.—Oscillographs of test No. 20 on type "R" 11 kV oil circuit breaker.

the definite interrupting values assigned to them, and, secondly, by variation of certain physical features, to produce breakers having well balanced characteristics with small dimensions and weights, but at the same time, possessed of a liberal factor of safety. An example of the kind of information obtained under test conditions is given in Table 1 opposite. The data tabulated are abstracted from results obtained at different stages of a series of three-phase, short-circuit tests at 13 200 V 60 cycles on a 600 A breaker having a 28-in. diameter circular tank. This was a final trial after preliminary investigations had been concluded. The table gives data obtained with differing amounts of reactance in the external circuit of the test generator, and includes results obtained with the lowest to the highest arcing current broken in the series. In every case the breaker successfully cleared the short circuit. The oscillograms CO. 207 929, 207 930 and 207 931 (Fig. 1) correspond to test No. 20.

Although the tests involved the clearing of fifteen short circuits, in seven of which the ruptured kVA was between 300 000 and 422 000, the arcing surfaces were only moderately affected, and to an extent which would not have prevented continued operation in service before adjustment of the contacts. From the photograph (Fig. 2) it may be seen that the arcing had been restricted to the arcing contacts. Throughout the whole series of tests only a very small discharge of oil vapour was noticeable but no oil was thrown. This conforms with the A.I.E.E. Rules, which state that an oil breaker shall perform at or within its rupturing rating without emitting oil or flame. This is an important consideration of which account has been taken in the design.

Typical circuit breakers designed on similar lines to the parent American breaker, but manufactured by Ferguson, Pailin, Ltd., have been forwarded to America and short circuit tests applied. In all cases approximately 30 over rated and under rated short circuits were interrupted successfully. In short, the supply engineer will know that when installing this type of breaker the switch will definitely interrupt the short circuit current for which it was designed.

Figures 3a and 3b show a typical breaker of the series and each size is designed on generally similar lines so as to give a uniform appearance. It will be noted that the three phases are contained in a common cylindrical tank, this design giving the most compact arrangement.

The tank consists of a rolled steel plate with pressed steel bottom, which in all cases is dished out from the inside, a skirt ring being fitted to the outside enabling the complete breaker, when withdrawn from its fixings, to stand in an upright position. A rolled steel clamp ring, with a turned upper lip, is shrunk on to the outside of the tank rim. All the parts are heavily electro-welded, inside and out, to form a rigid tank. On sizes for heavier currents, steel pipes are welded to the tank sides in order to assist cooling of the oil. The tank is closed in by a domed shaped top plate complete with self-contained fixings. A rolled steel fixing ring is shrunk and welded to the dome. The lower surface of this fixing ring has a machined annular groove for the reception of a gasket ring. The weight of the complete breaker is carried from the fixing ring, and the tank is fastened to the top plate by means of clamp bolts which are short in order to eliminate troubles due to elongation, when the breaker is under short-circuit stress. These bolts are of solid drawn steel of uniform size but varied in number to suit particular breaking capacity ratings. A gasketed, gas and oil-tight joint is obtained between the lip on the tank clamp ring and the bottom of the groove in the dome fixing ring. In addition, the lip and groove interlock and render mutual support when internal tank

Digitized by Google

pressures occur. The construction of a cylindrical tank with dished bottom and top dome is the nearest commercial approximation to a spherical shape, a form which is ideal for a balancing of stresses with the minimum of weight. The switch dome referred to above is of pressed steel construction, fabricated in the smaller ratings, but with inserts of high strength, non-magnetic material round the terminal bushings in the larger current sizes. These inserts minimise the heating due to magnetic causes. For the higher currents in the series the entire dome is made of non-magnetic steel.

The operating mechanism of the breaker is housed in the upper portion of the top dome so that the exterior of the breaker is free from complications and easily accessible for cleaning. The mechanical parts, therefore, are protected and self-oiling. The external operating effort is transmitted to the moving contracts via a rotating shaft and simple parallel motion, powerful closure and quick opening characteristics are thus obtained. All parts of the dome are electro-welded together, inside and out, so as to obtain the maximum rigidity. Fulcrum pins and links employed in the operating mechanism are of rust-resisting material. The movement is controlled by oil dash pots and adjustable stops which bring rapidly moving parts to rest without undue shock.

The terminal bushings are of the solid bakelite variety and are fixed to the top dome by means of " shrunk on " flanges. A gasket is provided between the flange and the top dome in order to prevent oil or gas leakage at this point.

The stationary contacts consist of heavy copper fingers of the self-aligning wedge pattern arranged in multiple pairs to suit the particular current rating. With parallel fingers arranged in pairs, the magnetic effect of heavy current increases the contact pressure, thus preventing heating and welding of the contact surfaces. The arcing fingers are longer and heavier than those for contact surfaces, thus ensuring that the current is shunted from the main contacts. The large amount of metal embodied in the arcing contacts increases

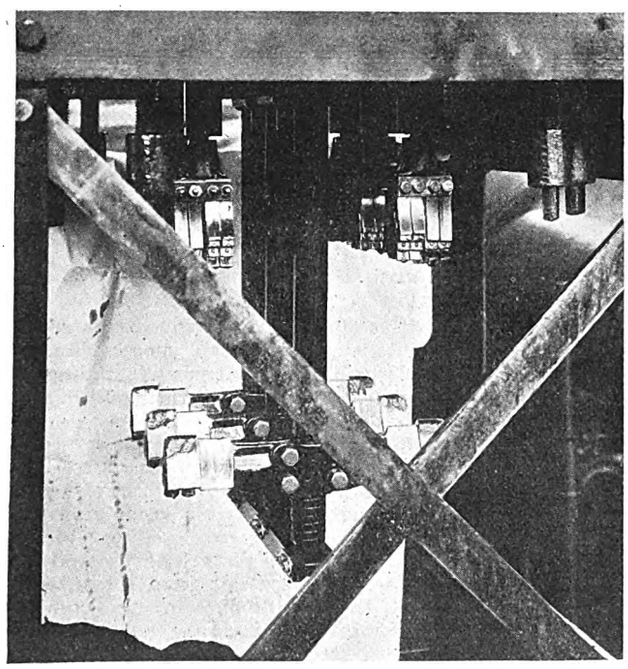

Fig. 2.—Type "R" oil circuit breaker, 11 kV, 600-amp., 28 in. diameter tank. View of contacts after test No. 20 of a series involving the clearing of 15 short circuits.

their thermal capacity and so helps to reduce the temperature at the root of the arc. The moving contacts consist of heavy copper angle bars and arc resisting metal tips, so arranged that they can be replaced when excessively burnt. The contact surfaces are arranged at such an angle that the finger pressure assists the parting of the contacts. The features ensuring a quick rupture of the circuit are gravitational opening, magnetic repulsion due to the current passing at the instant of the break, pressure of the throw-off springs and the contact finger pressure referred to above. Internal tank pressures cannot retard rupture owing to the operating mechanism being internal to the breaker, therefore, there can be no unbalanced piston effect tending to close the breaker. The terminal bushings and the impregnated wood operating rods are strongly braced with reinforced wooden clamp bars to ensure rigidity under the electro-magnetic stresses produced by the flow of short circuit current through the breaker. All wood used in the construction is specially selected, kiln dried, treated and rigidly tested and any part which shows only slight mechanical or electrical uncertainty is ruthlessly rejected.

A minimum amount of oil is used consistent with the positive rupture of the circuit, and loss through oil throw and

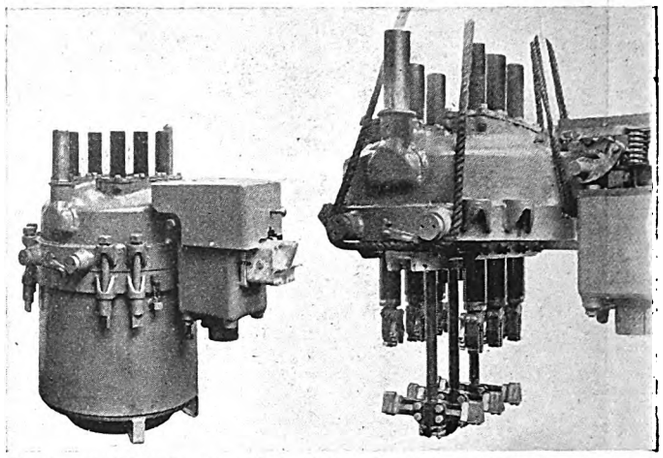

Fig 3.—*a* (left) Exterior view of round tank breaker. *b* (right) View of contacts and top-plate (on larger scale than *a*).

leakage is almost negligible, fire risk, therefore, being practically absent. The head of oil and volume of air cushion above oil level are proportioned to minimise oil surging and tank pressure, while the length of break between stationary and moving contacts is ample to ensure the arc being broken before the limit of travel has been reached. In order to relieve any pressure of arc gases that may manifest itself in the tank, a small shielded vent hole is provided in the breaker dome. This communicates with a spacious pebble-filled chamber acting as an oil separator and gas cooler. The chamber is coupled to an ample outlet pipe for the conveyance of gases to a safe distance, entrapped oil returning to the tank after circuit rupture has been effected. Auxiliary insulation between phases and from live metal to the tank, under oil, is provided in the form of a heavy arc resisting insulating lining, fitting close to the tank, together with two " U " shaped pieces of similar material which shroud the contacts of the centre phase and form effective arc barriers between phases. A protected glass oil sight gauge is fitted.

The breakers are intended to serve a number of mounting requirements into each of which a breaker is interchangeable. A number of banks of units have been exported for an installation in South America. This installation is of the vertical isolation metal-clad design, but the breakers are equally adapted for truck type units, stationary steel cubicles, masonry cubicles, self-supporting and for panel or wall mounting. Provision is afforded so that any breaker can be turned through 90 degs. in either direction to suit a particular mounting.

Due to the fact that the material in the design of the breakers is used to its highest efficiency, it will often be found that these can be installed in the space now occupied by breakers having a much lower rupturing capacity. This feature is of special importance in that existing breakers will have to be changed in accordance with the exacting conditions brought about by the grid connection. Ferguson, Pailin, Ltd., have already carried out a number of installations where the type of breaker dealt with in this article has been used in cellular gear, replacing older switches of smaller rupturing capacity. Electrical and mechanical interlocks, auxiliary contacts for indicating devices, etc., can be provided to suit the usual requirements of practice. A mechanical indicator is fitted on each breaker to show whether the breaker is closed or open. All breakers comply with the B.S.S. No. 116/1929 and will meet all the tests specified therein.

In connection with the Jubilee Achema VI which will be held at Frankfurt a/M. from June 10 to 22, the Achema Year Book, 1928–30, edited by Dr. Max Buchner, will be sent to anyone interested in chemical apparatus on receipt of two international postage coupons, so long as a supply is available. This year's Achema will have a floor space of 20 000 sq. m., and will form, according to the organisers, the largest show of chemical apparatus that has yet been held anywhere.

TRANSPORT FOR CONTRACTORS.

Running Costs of the Two-ton Van—Numerous British Models Available—Economy of Employing a Skilful Driver.

By W. A. GIBSON MARTIN.

ALTHOUGH the small delivery van and the one-ton lorry are both very useful vehicles for all-round transport purposes, many contractors require a van capable of two-ton loads and giving more body accommodation than can be provided on a one-ton chassis. Until a year or two ago, most of the two-ton vehicles on the market were of foreign origin (often inadequately supported by service depots) or of British manufacture at double and treble the price of foreign products. To-day, however, there are quite a number of British vehicles about the two-ton mark, and the table given below shows the full operating costs of a representative van in this class.

RUNNING COSTS FOR THE 35/40 CWT. DELIVERY VEHICLE.

PETROL: 13 m.p.g., 1s. 5d. per gallon.
OIL: 700 m.p.g., 5s. per gallon.
TYRES: 15 000 miles per set of five: £45 3s. per set.

List Price	£355
Painting	35
Total Cost	£390

	Number of Miles Per Annum.								
	5 000		10 000		20 000	
	Actual Cost	Cost Per Mile	Actual Cost	Cost Per Mile	Actual Cost	Cost Per Mile
	£ s. d.	d.	£ s. d.	d.	£ s. d.	d.
RUNNING EXPENSES:						
Petrol	27 4 0	1·30	54 8 0	1·30	108 16 0	1·30

TOTALS	351 2 6	16·82	400 2 6	9·58	493 2 6	5·80

The example upon which the table is based is designated a 35/40 cwt. van and is specially intended for commercial, as distinct from passenger, traffic. Many of the two-ton chassis offered at the present time are claimed to be equally suitable for a goods lorry or for charabanc coachwork. The 35/40 cwt. chassis selected, however, is not a compromise, but has been designed as a goods vehicle from the very beginning. The engine is a four-cylinder unit with cylinder-block cast integral with the crankcase, of 2½ litres capacity, developing 35 B.H.P. The crankshaft has three main bearings, lubrication is by cam-shaft driven pump and splash, and ignition is provided by magneto.

First Cost.

Cooling is by thermo-syphon, assisted by a water impeller in the cylinder head and a large three-blade fan driven by a self-tensioning belt. Four forward speeds are provided by a gear-box designed in unit with the engine, some of the trans-continental vehicles being fitted with only a three-speed gear-box. Disc wheels shod with 34 by 7 tyres are fitted to the rear, and 32 by 6 to the front wheels. The petrol tank carries fuel for 120 miles without refilling. A 12 V electrical system operates five lamps and an electric starter, while the chassis equipment includes a spare wheel with tyre and an engine-driven tyre pump. At £355, with an ash body panelled in metal-faced plywood, driver's cab with plate glass windows in rattle-proof channels, sprung seat, double doors with lock and key, and a capacious tool box, this 35/40 cwt. van is an outstanding example of good value in the British commercial vehicle world.

The question is, what does it cost to run? In view of the greater load, is it much more expensive than the one-ton van, running costs for which were given in THE ELECTRICIAN of April 18.

In order to present a fair comparison, the table reproduced with this article has been compiled in exactly the same form as the one previously published, and reference will show that the one-ton van cost 5·07d. per mile inclusive of every charge, for 20 000 miles per annum, whereas the two-ton vehicle under the same conditions, will cost 5·80d. With a lower mileage the difference is, of course, greater. On the 5 000 miles per annum basis, the one-ton van costs 14·91d.; the corresponding figure for the two-ton vehicle is 16·82d.

The New Road Bill.

The increased cost is due to the heavier tax and the greater amount set aside for depreciation. In regard to tax, the new Road Bill is being debated in the House of Commons, and at the moment of writing it is impossible to say what effect the Bill, if passed, will have upon commercial vehicles. The non-tariff insurance companies accept this particular 35/40 cwt. van as coming under the 30 cwt. unladen class, while the tariff companies place it in a higher category. For the purpose of this article, however, the rate quoted by a non-tariff insurance company has been taken.

The manufacturers of the 35/40 cwt. vehicle claim 18 m.p.g. of petrol and 900 m.p.g. of oil, these figures having been obtained in an R.A.C. test officially carried out. It is unlikely, however, that any commercial firm would attain such economy in practice, and therefore 13 m.p.g. and 700 m.p.g. respectively are allowed.

In preparing these tables of running costs, the calculations have been based upon thoroughly reliable data, and the final figures may be taken to represent the maximum cost of operating the vehicle to which each table refers. Unless there are unusual circumstances, these costs should not be exceeded. On the other hand, there are numerous ways in which transport costs can be reduced below the figures mentioned. For instance, 15 000 miles have been taken as the maximum obtainable from a set of five tyres, but many firms are experiencing much better results. In one instance, two front tyres on the 35/40 cwt. vehicle have covered 26 000 miles and are still in service. If an additional 10 000 miles can be had from a set of tyres, the cost per mile would be reduced by almost a third of a penny; or, on the 20 000 miles per annum basis, the tyre bill would be reduced by some £30. Obviously, it is worth while spending a little time in checking tyre pressures, and worth while giving a small bonus to the driver, if this amount can be saved on one item alone. It is not desirable, however, to reduce the amount spent on oil.

Consumption of petrol can be reduced by frequent inspection of all unions, by having the carburetter tuned for economy, and by fitting an extra-air valve which the driver must use when driving at 20 m.p.h. and over on top gear, or at corresponding speeds on the lower ratios, if the valve is of the usual type controlled by lever from the driving compartment. There is at least one entirely automatic extra air-valve on the market, and if cross-country journeys are the rule, this type is preferable to one depending upon manual control.

The greatest aid to economical operation, however, is a careful and skilful driver. It is often good policy to select an employee whose character is known and who has proved reliable and conscientious in some less responsible position, and to have him trained as a driver by the motor agent supplying the vehicle, or in the manufacturer's service station or training school. To hand over a vehicle costing £390 to a new employee, is to risk large maintenance costs and big repair bills, for as a rule the result is careless driving, reckless use of gearbox and brakes and neglect of lubrication.

Costing System.

Large firms operating a fleet, will have their own transport costing system, and no difficulties will arise as to how expense can be controlled, nor will there be any doubt as to whether or not the vehicles are economical. Smaller concerns owning two or three vehicles, however, often find it impossible to obtain any satisfactory information to prove that their vans are being operated on an efficient basis, nor can it be proved that it is really worth while owning vehicles when an outside contractor could provide all the necessary transport at a low rate. In a subsequent article, therefore, it is proposed to outline a suitable costing system for the electrical contractor operating two or three motor vehicles.

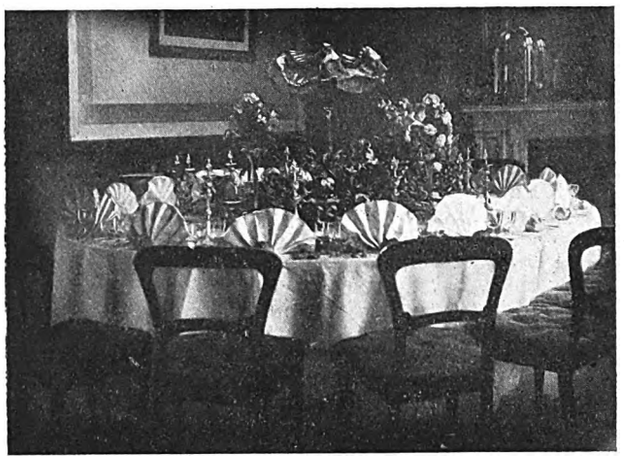
PIONEER ELECTRIC BANQUET OF 1894.

Reminiscences of a Historic Occasion—Chef Who Received a Shock—Progress in the Past 36 Years.

By CAPTAIN WILLIAM P. DURTNALL.

THE article by Mrs. Hilda L. Dover in THE ELECTRICIAN of March 21, on the "Growth of Electric Cooking," contained a slight error in regard to the date of the famous electrically cooked banquet at the Cannon Street Hotel, London, at which the then Lord Mayor enjoyed probably for the first time the advantages and delights of a delicious electrically-cooked meal. This function actually took place on Friday, June 15, 1894 (a year earlier than that mentioned by Mrs. Dover); it was practically the first demonstration of cooking by electricity on a large scale, the occasion being a banquet by the City of London Electric Lighting Company, to celebrate the linking up of their "East Side" generating station with their newly erected and then working "Bankside" station, for the supply of the City of London.

A distinguished assembly of civic and scientific gentlemen were present, who were not only judges of a good dinner but



Electrically lighted table at the Cannon Street Hotel in 1893.

appreciated the fact that it was cooked by electrical energy, which had already been revolutionising the country generally, as an illuminant. It was thought even then that it was destined to replace coal and gas, in great measure, for cooking, heating and general hotel engineering purposes.

At that period I was in the youthfully-hopeful and buoyant stage of my professional career and occupied the responsible position of Chief Electrical and Mechanical Engineer to the hotel company (having just finished fitting the hotel with a complete electric light and power installation, with Willans steam engines, generators and boilers), and was intensely interested in the possibility of recommending the use of electrical energy for cooking and water heating in the hotel. The current for the cooking of this historical banquet was, however, supplied from the mains of the City of London Company, who also supplied the necessary cooking plant, which was manufactured by the famous firm of Crompton and Co., then of 4, Queen Victoria Street, E.C.

The Lord Mayor was the guest of the evening. Sir David Salomons was in the chair, and among those present were. Professor (now Sir A.) Fleming, the late Professor S. P. Thompson, the late Sir William (then Mr. W. P.) Preece, C.B. and Mr. (now Colonel) Crompton.

Covers were laid for 112 persons and 100 sat down. Mr. J. W. Aptommas, the manager, provided an excellent menu, to which the chef, M. Bernard, tabled a very satisfying dinner.

The conditions entailed an organisation entirely new and quite different from those of the normal coal and gas cooking then in use at the hotel. The banquet was served in the Pillar Hall (on the second floor) and the arrangements gave a striking demonstration of the safety and convenience of electrical cooking appliances, for the cooking was actually carried out in the room next to the Pillar Hall, much of it being done in the presence of the guests.

Although cooking was in progress for 100 guests and the room was full of roasting and baking ovens, hot plates, fish kettles, frying pans, saucepans, hot water urns, vegetable cookers and so on, no smell or heat entered the dining hall, owing to the use of an electric fan in one of the top windows.

At that time the price of lighting current in the City of London was 8d. per unit; for cooking purposes it was to be 4d. per unit and this high price made it very difficult to put forward a commercial proposition for general application to the hotel cooking service. We did, however, go fully into the matter and a scheme for the extension of our generating plant was considered with a view to installing another 100 H.P. generator with a set of storage accumulators to meet the cooking "peak-loads" for the breakfast, lunch and dinner periods. The chef, however, was able to show that he was able to cook a similar menu (11 courses) with coal (which was very cheap at the time) for ½d. per head, so the matter was dropped as uneconomical.

We now have current available at a quarter the price per unit, and there has been a great advance in the thermal efficiency of all electric cooking apparatus, particularly in cases where a low voltage (say 100 V) can be used.

Thanks to the number of meters which Mr. Cordery had inserted in the various circuits, we were able to get an interesting record of the consumption of the various appliances used for cooking this meal. Four large electric ovens, working for four hours, used 14 units; one extra large hot-plate working six hours used 16 units. One smaller hot-plate, working four hours, used 4 units. Three fish-kettles, working for two hours, used 6 units. Six frying-pans, working for two hours, used 8 units. Six sauce-pans, working for six hours, used 18 units. The total energy consumption was 66 units, which, at 4d. per unit, amounted to £1 2s. net, or a fraction over 2½d. per head.

An amusing incident took place, which caused much merriment amongst the junior cooks. It seems that M. Bernard accidently allowed a small pricker to penetrate the insulation of one of the sauce-pan leads and received the full benefit of a 200 V a.c. shock at 100 periodicity; M. Bernard took it in very good part, muttering something in French which, I was told, was not exactly what such young and tender ears as mine should hear. This incident was one of the many things that I have witnessed, all indicating the advantages of a lower voltage. During the discussion the chef stated that he highly appreciated the use of electrical energy for cooking. Although he had received the shock (which I feared at the time would have put the lid on the matter) he was broad-minded enough to say that this was a trifling matter.

Use of Storage Accumulators.

As previously stated, electrical cooking apparatus has, during the last 36 years, been very greatly improved, not only in general design but also in appearance and insulation. I have travelled all over Europe in the pursuit of my various studies of this subject, and the most interesting types of hotel cooking plant that I have seen have been those which I inspected in Italy and Russia. Both the Russians and the Italians have, in my opinion, given the matter the most advanced attention, in fact, in thermal efficiency they have made much headway. They have reduced the consumption per unit of work done by giving the greatest possible attention to the essential value of thick insulation and the thermal storage which is so easily secured by this means, resulting in the reduction of the weekly consumption of electrical energy. Supply authorities should give every consideration to the possibilities of non-peak load demands which may be lurking around in the form of hotel cooking installations, with storage accumulators, not only enabling a lower voltage to be used in the apparatus, but the supply of say 400 V 3-phase a.c. at periods which may flatten the station load curve, etc. At say ½d. per unit for such off-peak supply, much can be done in the shape of large cooking installations. At the same time, the bogey of having the current off just as the hotel or restaurant service is about to begin, will be completely banished. In "Paragon" electric kitchens for very large hotels and public institutions, the use of an infinitely variable

Digitized by Google

voltage supply can be arranged, providing from a constant storage battery voltage that essential heat regulation which is so much desired when cooking large volumes of food.

However, be that as it may, Mrs. Dover has certainly done good service in drawing attention to the pioneer position of England in the matter of large-scale electric cooking. I have received letters from many parts of Europe and even one from America inquiring if it was a fact that as far back as 1894 this banquet was really cooked by electricity, as it was much later before anything in this line was done abroad. Let us hope that in the interest of British trade, the example so well set will be continued with even more progressive spirit.

I have kept one photo taken 37 years ago of a type of electric table decoration which was always a great favourite with many of the hotel's patrons. The standard hotel silver fittings were used, and indeed formed part of the circuit (the voltage was only 110). On this table there were no fewer than 500 miniature deeply coloured lamps hung in festoons from the standards. Coloured silk floral decoration was also incorporated, each flower containing a small lamp, which made the whole table a very charming and popular feature. In some cases we had as many as 2 000 lights so arranged down the long " T "-shaped tables then laid out in the " Great Hall," in which many of the City companies used to hold their annual banquets. The silk floral effects, and the festoons of lights hanging between the highly finished silver standards, gave the hall a very pleasing appearance, especially when the top lights were turned down.

ROUND THE JOBS.

Some Remarks on Specifications—Rating of Fuse Wires—Position of Plug Sockets—Wear of Flexibles of Electric Irons—Untidy Additions to Office Installations—Evil Due to Buried Tubing.

By "CONTRACTOR."

IN company with many other contractors I have just been asked to tender for the electrical installation of a building. With the letter there arrived a " specification " which occupied about half of one sheet of quarto paper. This " specification " informed me that the work must be carried out " in the very best manner " and that the wires were to be of " very best quality " ; beyond that nothing was specified.

Such customers, of course, would deserve to have the very worst of installations put in, and if their premises should burn down " owing to the fusing of an electric wire " it would be poetic justice. Many contractors, however, have a reputation to maintain and they therefore fill in the gaps of the " specification " according to their own view of what is required to meet the case. On the other hand there is sure to be competing someone either without the knowledge or without the conscience to instal a good job, unless it is rigidly specified, and this man's price will probably make that of the reputable contractor look absurd.

How can any architect possibly maintain that he is earning his fees when he allows electrical installation work to be undertaken on a basis of this sort ? How does a client think he is going to get value for money if he employs an architect who knows so little about the job, or cares so little, that he is prepared to take such a big risk ?

There is only one gleam of hope for a remedy for this sort of thing that I can see. It lies in the insurance companies tightening up their conditions concerning electrical installations. At the present moment they do, in most cases, have certain regulations to which electrical installations must conform. On the other hand, in my experience, they do not take very much trouble to see that such regulations are followed, except in the case of very large buildings. Now the average customer has a deep respect for insurance companies, not only because the premiums he has to pay affect his pocket very materially, but because he regards them as a weighty authority on the subject of risks. Armed with this reputation the insurance companies could, if they so wished, improve the standard of electrical installation work to a surprising degree. At the moment, of course, their contention is that they would prefer to take the extra risk rather than incur the very costly expense of an elaborate inspectorate.

* * *

It seems to me to be time that something was done about the rating of fuse-wires. At present a very great deal of confusion exists when speaking of fuse-wire. The electrician classifies it in a satisfactory manner according to its size and composition, but the layman, who is more and more coming to use it himself, prefers to refer to it in terms of amperes. And this is where the confusion arises ; for there seems to be no definite rule as to whether the rating in amperes should refer to the safe current-carrying capacity of the fuse-wire or to the current at which it will blow. This can very easily be the cause of considerable annoyance to householders.

* * *

It is a curious convention which ordains that plug-sockets, both on the lighting circuit and on the heating or power circuit, should be placed on the skirting-board in a room. That they are so placed in the vast majority of cases is a fact. That there is no valid reason for doing this in most cases is also a fact. To my mind by far the best position for any switch-plug is about three feet from the floor level. The argument that, from a plug so placed the flexible cord hangs in a catenary to the piece of apparatus to which it is connected, may be easily answered by allowing an extra yard or so of flex on that equipment, so that the flex shall hang straight down to the floor from the plug and thence travel in the manner in which it does when the plug is on the skirting. This raised position for plugs has several distinct advantages.

* * *

I think the manufacturers of electrical appliances ought to set their minds to the devising of some better method of bringing flexible cord into the ordinary domestic electric iron. By far the weakest point in an excellent piece of apparatus is this entry of the flex into the plug-socket which connects it with the iron. The ordinary helical guard which is mounted at this point of connection is quite inadequate to preserve the life of the flex. Where dressmakers use a large quantity of these irons the repairing and renewing of flex, owing to its wearing when the iron is turned up on end, is a very large and quite unnecessary item in their expenditure. It is of no use saying that care should be taken to see that the flex is not unnaturally bent back when the iron is on end. The beauty of the electric iron is that it is, or should be, foolproof, and the type of labour employed in large dressmaking establishments is not capable of taking any great pains to prevent this wearing of the flex. It ought not to be a serious matter for manufacturers to produce a type of fitting which is incapable of abuse.

* * *

What a lot of money is wasted on elaborate lay-outs for the electrical installation of large blocks of offices ! Consulting engineers, architects, builders and electrical contractors spend a great deal of time on producing a lay-out for such offices based on a symmetrical arrangement of lighting points. They then spend a good deal of money in installing these points, and when the floor is eventually let, the various tenants split their premises up by partitions in such a way that the original positions of the lights are quite useless. The result is usually a nasty confused jumble of lead-covered cable, surface tubing and flexible cord hooked back by pieces of string in order to get the lights where they are needed. The other day I was appalled to see the condition of the electrical installation in a first-class block of offices in Regent Street. The original installation had been carried out excellently and provided that each floor had been let in symmetrical portions, that installation could scarcely have been improved upon. As it was, however, very few of the conduit runs were in use, the majority of lights being served by recently run—and in many cases abominably run—lead-covered cable which hung in festoons along the corridors. It seems to me that this sort of thing is largely due to the insistence on the burying of all tubing while the building is in process of erection. As far as the landlord's services are concerned there is no reason why the tubing should not be buried, but if the actual tenants' points are left until it is known what form the division of the floor is to take, then these can be conveniently and neatly run on the surface. One tube running across a ceiling is considerably less ugly than a multitude of lead-covered cables and diagonal flexible cords.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—VII.

Recording the Purchases Transactions—Method of Classification—Analysis of Management and Working Expenses.

By S. HOWARD WITHEY, F.C.I.

IT is a good plan to stamp all invoices by means of a rubber or other suitable impression designed to cover the different operations, with spaces for the signature or initials of the clerks or assistants responsible, a good form being as under:—

INVOICE STAMP

No:..... Date..... 19....
Goods Received by .....
Number, Quantity, or Weight Checked by.....
Price and Discount Verified by.....
Calculations and Additions Checked by.....
Approved by.....
Passed for Payment by.....
Entered in Inwards Book by.....
Stock Book Folio.....
Purchases Book Folio.....

In the case of the electrical contractor in business in a small way, the operations to be covered by the stamp will be few in number, but if several departments are in existence, the staff duties should be allocated in such a way as will ensure, as far as possible, that each operation is conducted by one person in the first instance, and afterwards checked by another.

The purchases made by the contractor will probably consist of both cash purchases and credit purchases, that is to say, some electrical goods, articles, accessories, etc., will be bought and paid for at the same time, while others will be purchased subject to payment some time in the future. Both these kinds of transaction will fall under the same general heading or headings in the final accounts, but the methods for recording the original items in subsidiary books will be different.

When meters, resistances, disconnecting boxes, electric fires, etc., are bought on a cash basis, the contractor's cash or bank balance will be decreased and his stock correspondingly increased, which means that the cost price should be recorded on the credit side of the cash book and posted direct to the debit side of the purchases account. This account will be kept in the impersonal ledger, each entry giving the date of payment, the words "To Cash" or "To Cheque," and the cash book folio, the page on which the account appears in the ledger, being inserted against each cash book item to show at a glance that the amount has been properly dealt with. Upon no consideration should a ledger folio be set down against a payment transaction until the amount has been actually posted.

If the contractor's sales have been classified under specific headings for the purpose of ascertaining the gross profit in each case, the purchases will have to be analysed in the same way. Instead, however, of opening separate purchases accounts, one account ruled with a sufficient number of cash columns will suffice, each payment being inserted in its proper column.

The credit purchases should be recorded in a purchases book, or bought journal, kept for the purpose. Some contractors use a guard book into which the invoices, after being checked, folded and endorsed, are stuck, the amounts being extended into a money column and posted direct to the ledger, but the drawbacks associated with this method are the difficulties in handling the book and sub-dividing the work, and the absence of any systematic analysis of the items. The majority find it necessary to keep a purchases book of the analytical type, with columns not only for the different electrical machines, goods and accessories bought from time to time, but also for the classification of the management and working expenses as these fall due. A very useful form is shown in the adjoining column.

The number of analytical columns, and also their headings, will naturally vary in individual cases according to the size of the business and the particular class of trade in which the contractor specialises, but in every case at least one column should be provided for the capital outlay in the form of test-room products, electrical units, shop fittings, etc. When goods of various kinds are enumerated on the same invoice, the cost price of each kind or description should be inserted, first in the "Details" column, then under its most appropriate heading, the total of the details being then extended into the "Total" column. Each amount shown in the "Total" column will have to be posted to the right-hand or credit side of the particular personal account kept in the purchases or bought ledger, with the date; the words "By Goods" or "By Sundries," and the folio. At the end of each month, the total of each classification column will be transferred to a debit side of an account bearing that name in the impersonal ledger, giving the date, viz., the last day of the month, the words "To Sundries per Purchases Book," and the folio, but before posting these totals the clerical accuracy of the figures should be verified by seeing that the analytical totals, added together, tally with the amount in the "Total" column.

Providing they are not numerous, the returns outwards transactions may be entered at the end of the purchases book, where a number of pages can be reserved for this purpose. Each amount should agree with that shown on the credit note received by the contractor, and will be classified in the same manner as the purchases transactions, the figure inserted in the "Total" column being posted direct to the debit side of their respective personal accounts, and the monthly totals either transferred direct to the credit side of the different impersonal accounts or deducted from the corresponding monthly totals of the purchases before the latter are posted. Allowances made by creditors and suppliers in lieu of actual returns should be treated as returns in the books of account.

Unlike the columns headed "Switch and Fuse Gear," "Implements and Apparatus," and "Materials and Stores"; the monthly totals of which will be transferred to goods or trading accounts, the totals of the expenses columns should be debited to separate nominal accounts, the final balances of which will appear on the debit side of the periodical profit and loss account, which will be prepared for the special purpose of ascertaining the amount of net profit made or the extent of the loss sustained. To avoid the need for dissecting the amounts at the close of each month's work, the classification

PURCHASES BOOK.

Date	Invoice No	Name etc.	Details	Ledger Folio	Total	Switch & Fuse Gear	Instruments & Apparatus	Materials & Stores	Rent, Rates Taxes, Gas Water etc	Capital Outlay

provided in the purchases book should be as detailed as possible, expenses of a similar nature being grouped together. If only one "Capital Outlay" column has been provided, the monthly totals of this column will have to be analysed for the purpose of determining the correct amount to be debited to each asset account opened in the private or general ledger, the final balances of these accounts being enumerated on the assets side of the contractor's balance sheet, subject to deductions to cover wear and tear, obsolescence, etc.

The next instalment of this series will show the correct method of recording cash payments and discounts obtained, and of keeping and balancing the creditors' accounts.

(To be continued.)

The summer meeting of the Western Centre of the I.E.E. will be held on May 23-26, at Sedbury Park Hotel, Chepstow, when visits will be made, among other places, to Lydney power station and the Lydrook works of Edison Swan Cables, Ltd. The annual competition for the Western Centre Past Chairmen's Golf Cup will be held on May 25.

ELECTRICAL EQUIPMENT OF CINEMA THEATRES—III.

General Decorative Effects, Stage Equipment and Lifts—Value of Adequate Lighting—Control of Stage Equipment.

By CLEMENT D. BOND.

[Mr. C. D. Bond is the amusement engineering specialist for Messrs. W. J. Furse and Co., Ltd., Nottingham, the well-known firm of electrical engineers and lift manufacturers, who specialise in electrical equipment and lifts for theatres, cinemas, race tracks, skating rinks and dance halls. The previous articles appeared in our issues of March 21 and April 18.]

THE previous two articles dealt with the general wiring scheme and its allied equipment. To complete the installation there only remains the speciality plant; by this is meant general decorative effects, stage equipment and lifts.

The cinema for which the electrical installation has been described is to be atmospheric, but as this is only one type of

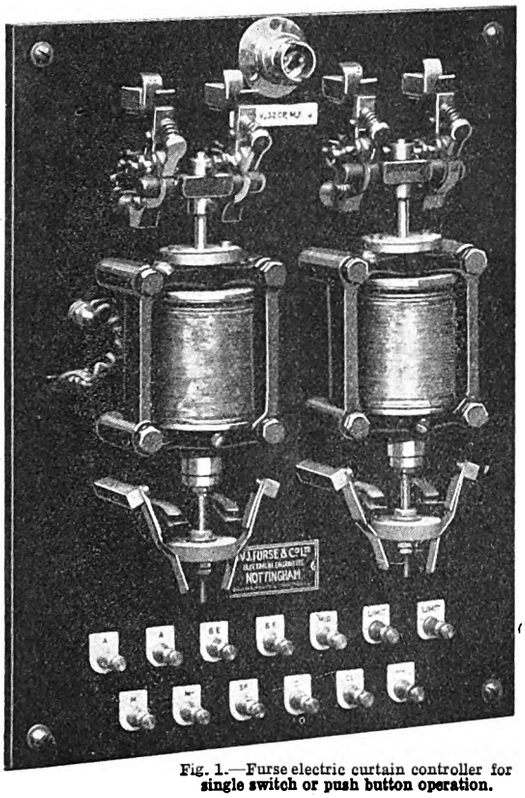

Fig. 1.—Furse electric curtain controller for single switch or push button operation.

decoration I shall try to generalise and give a few notes with regard to decorative effects irrespective of the style of decoration, be it Atmospheric, Grecian, Tudor or Futurist.

Whatever the scheme of decoration to be employed it is essential for the closest co-operation to be present between architect, artist and electrical engineer. The final lighting scheme should be decided early in the building operations. Whether the scheme adopted be single colour, multicolour, cornice lighting, lay lights, flush or hanging fitting or a combination of all, the following points should be borne in mind :—

(1) There cannot be too much light providing there is no glare—1¼ watts. per sq. ft. of floor space for white lighting, 1½ watts for red and green lighting, and 3 watts for blue lighting are good averages to aim at.

(2) Have the maximum amount of light at the stage end of the cinema and gradually reduce intensity towards the back of auditorium.

(3) If you use cornice lighting buy good and efficient troughing, it is far more economical in the end, owing to the current saved. Be sure that all such troughing is easily accessible for cleaning and re-lamping.

(4) If you use pendant or flush fittings remember a few good ones are far better than a multitude of cheap ones.

(5) Try to obtain balance throughout the hall and avoid spotty lighting.

(6) If capital expense will not allow for a good multi-colour scheme throughout, do not half-do it but be content with a single colour scheme generally with a multi-colour lighting effect round the proscenium. After all, this is the part of the hall of which the audience sees most.

(7) When showing pictures have your hall as dark as your Watch Committee will allow, as you will get a better picture, bigger contrast when lights are raised, and the British cinema-goer generally likes it.

Leaving the auditorium, we come to the stage. Here, accompanied by music, we can get " Entertainment " in itself. It must be remembered that entertainment is really just something different from everyday life. Be it legitimate stage or just pictures the audience is *shown* something different from the usual and led into a land of make-believe. The same effect can be produced by colour lighting accompanied by sympathetic music, the only difference being that the audience *takes* itself in its imagination into a fairyland of its own and is not led. Again, music and light are a further entertainment in that they are a *contrast* to the black and white of the picture. No cinema, therefore, should be without its efficient stage and a short description of an average arrangement may be useful.

Without adequate and good lighting a stage is valueless; as no matter how good the setting, how good the artistes and orchestra the effect cannot be put over without efficient illumination.

Generally speaking the cinema stage should have at least :—

One Footlight.
Two Battens.
Two Spots.
One Tab Curtain Gear.
One Screen Curtain Gear.
Two switch-plugs on stage.

The battens and footlights should be wired on four circuits and should be of the compartment all-metal type, preferably with prismatic glass reflectors, and arranged so that suitable colour media can be fitted to provide for required colours. Each circuit should be controlled by its own dimmer, preferably with colour master and cross grand master controls.

All equipment on the stage should be controlled from the stage switchboard fixed preferably on the stage. Frequently however, the stage board is now fixed in a room adjoining the operating box as this saves the expense of a stage operator. The curtain controls should be of such a design as to deal easily with the load. The weight of the curtains to be moved

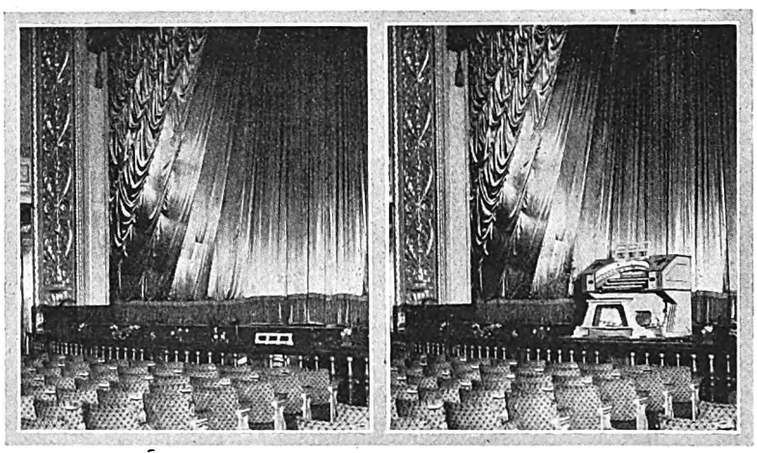

Fig. 2.—Furse organ lift at the Metropole Cinema, Victoria, S.W., in lowered and raised positions. (Architect, Mr. G. Coles, F.R.I.B.A. London.)

should be decided and given to the gear manufacturer, so that the proper installation can be put forward. Often a gear is ordered and then later on the curtains. The curtains are

Digitized by Google

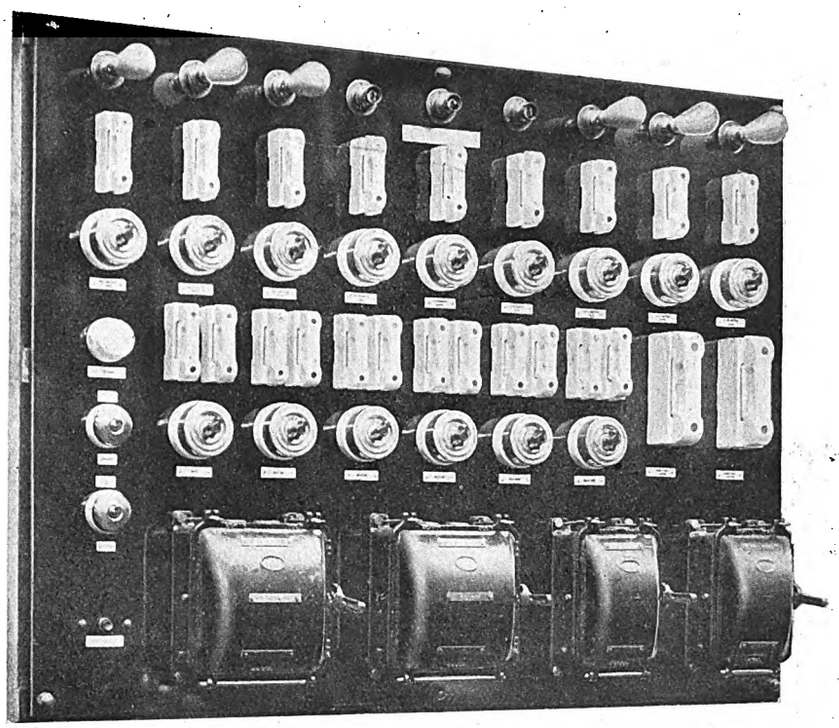

Fig. 3.—Stage switchboard for control of curtain mover, footlights, battens, etc.

then found too heavy for the gear with resultant trouble and sluggish operation.

Silent tracks should always be fitted irrespective of the travel or weight of the curtains, as it has been found by experience that strainer wires are far from satisfactory, and generally prove troublesome. The curtain controls can be either of the push button or single switch type; if the latter, they can be arranged for dual control with change-over switch, so that they can be operated either from stage or operating box.

Whenever possible the motors and gears should be fixed under the stage so as to deaden any noise there may be. The battens for the tracks should, when possible, be fixed to brackets and only slung when this method is not practicable. Where there is a considerable amount of room at the sides of the stage it is sometimes found desirable to the curtain gears to stop in two positions, this can readily be arranged on the controller with the necessary additional operating pushes.

Now that the large screen is coming to the front, proscenium openings should not be less than 45 ft. wide. The depth of stage should be not less than 10 ft. from proscenium to screen with an additional nine feet for sound reproduction horns behind the screen, unless of course a special horn box is built behind the back wall.

Few cinemas are now being built which do not incorporate an organ, and it is usual to install the console on an organ lift. This should always be of the multi-thread screw-jack type built on the cantilever principle.

In conclusion it should be remembered that the lighting of a cinema to-day is part of the "Entertainment" and a good impression of this part has a lasting effect on the audience, as it does not change from week to week according to whether the picture is thought good or bad. Begin with a good, pleasing, and efficient installation, and the first cost will be more than repaid.

SAFETY IN RURAL ELECTRIFICATION.

Fatal Voltages—Insulation the Primary Need—Other Precautions—Proper Construction of Flexible Cables—Danger of Appliances with Metal Handles.

By ALFRED EKSTROM, D.Sc., M.I.E.E.

IN a very interesting article on earthing which appeared in a recent issue of THE ELECTRICIAN, Mr. Gilbert mentioned my name in connection with some opinions about the difficulty of earthing in rural areas. In such areas, where a public water supply system is generally not available, it is very often impossible to obtain, without unreasonable expenditure, earthing connections at the different consumers' appliances which are of sufficiently low resistance to ensure protection should an earthed appliance develop a leakage fault. I propose to set out in this article the arrangements which I consider necessary for this protection.

In certain circumstances an electric installation can be the cause of fire, and can be dangerous both to persons and to cattle. Voltages of only 10 and 20 V are fatal for cattle. In the case of human beings, voltages of 230 d.c. and 50 V a.c. have proved fatal only in very exceptional circumstances. It may, therefore, be unnecessary for electric undertakings giving supplies of energy of 230 V d.c. and possibly up to 115 V a.c. to prescribe any special precautions, such as earthing and the like, for installations connected to their plant.

The case is quite different, however, for undertakings giving a supply of 230 V a.c. The consequence of a person being exposed to such a potential difference on touching two conductors with his hands, or a live conductor and earth, depends to a great extent upon the contact resistance between the person and the conductors, or between the person, the conductor and earth. If it be slight contact, i.e., a high contact resistance, the person can generally liberate himself from one or both the conductors. If, on the other hand, he should grip the conductors with damp hands a low contact resistance results and the person will be paralysed. In this case he will not be able to liberate himself from the circuit as his muscles will have contracted. This may prove fatal. Such a fatality may occur when a person touches with one hand the metal frame of an electric appliance which has a leakage fault, while touching with the other hand some other earthed metal-work. It may also occur when a person is standing on a concrete floor in contact with the soil, or in a bath in contact with earth through the water pipes, and touches the metal frame of an electric appliance which has a leakage fault. Electric undertakings supplying energy of this voltage (230 V) must, therefore, prescribe special precautionary measures in order to avoid fatal consequences due to the occurrence of faults in the connected installations.

The primary precaution in this respect is insulation. The wiring system with accessories and appliances should have all the current-carrying parts covered, as far as possible, with substantial insulating material. Rubber insulated conductors are, therefore, to be recommended:—

(*a*) for concealed wiring placed in conduits,

(*b*) for surface wiring placed in insulated beadings or channellings. C.T.S. cable is preferable in this latter case.

Accessories such as switches, outlets, joint-boxes, fuse-boxes, meter-boxes and meter-boards, should, if possible, be made of or have all current-carrying parts totally covered with bakelite or some similar insulating material.

Electric appliances for domestic use should also be covered with insulating material, wherever possible—e.g., with wood, bakelite, or rubber composition. Standard lamps and portable hand lamps for garages should be either totally covered with insulating material, or constructed entirely of insulating material.

Appliances which, for some reason, cannot be insulated should be placed in a position where anyone using such an appliance is unable to touch any apparatus or construction which is normally earthed, or which may become earthed through the occurrence of a fault. If this is impossible, special protective measures, as described below, must be taken.

When the neutral point of the a.c. three-phase distribution system is earthed, the metal frame of the consumers' appliances

Digitized by Google

can be connected to the public water supply system. This form of protection is known as *local earthing*. In rural areas where a public water supply system is not available, the metal frames of the consumers' appliances may be connected to the neutral conductor. This form of protection may be called *connecting to neutral*.

In the latter case it is necessary, however, to make arrangements so that, should a fault occur in the overhead system and cause an undesirable voltage to be transferred to the neutral conductor, the whole of the defective overhead line would be cut out. For example, if the neutral conductor of the overhead system should break, and the part of the line remote from the substation or transformer be left in service, the switching on of only one lamp in this part of the sytsem will transfer an undesirable voltage to the frames of all the appliances connected to the defective line.

The effectiveness of local earthing or of the neutral conductor as a protective device depends, moreover, on the following :—

(1) Adequate and reliable fuses or automatic circuit breakers must be inserted in the different distribution groups of the consumers' installations, so that in case of a fault, or of a defective appliance, the defective part of the consumer's installation would be cut out.

(2) A special protective conductor, independent of the current-carrying conductors (phase and neutral) should be arranged leading from the distribution board throughout all the premises of the installation where protective measures are, or are likely to be, necessary.

This protective conductor should be insulated in the same way as the current-carrying conductors and should be arranged throughout the installation in such a way as to secure an uninterrupted circuit. At the distribution board this conductor should be connected to the water pipe, when earthing is used, and to the neutral conductor of the incoming service line of the overhead system, when the neutral conductor is used as a protective device.

3. Where portable appliances with metal frames are used, the flexible cable connecting them to the wall sockets must be constructed in such a way that the *current-carrying conductors are concentrically surrounded by the protective conductor*. This is necessary, as otherwise if the flexible cable is worn out and its live conductor is touched, a dangerous voltage would occur between this conductor and the metal frame of the appliance. In this case, in fact, earthing has introduced a danger which would be non-existent if the metal cover of the appliance were *not* earthed or connected to the neutral conductor.

The diagram below shows the construction of such a flexible cable :—

Annealed thin copper wires are braided with cotton and surrounded by vulcanised rubber. Two such conductors together with jute filling the interstices between the cores, are first braided with and surrounded by compounded cotton and then concentrically surrounded by a thin layer of annealed copper wires which serve as the third protective conductor. This layer is braided with cotton and surrounded by an outer rubber sheath, and eventually by another braiding of artificial silk or glacé cotton.

The effectiveness of these precautions depends, mainly, on the protective conductor being connected to earth or to the neutral conductor in a reliable manner throughout the installation. Should an interruption occur in part of this circuit where one appliance has leakage voltage, the fuse or automatic switch will not operate, and not only the defective appliance, but the metal covers of all the non-defective appliances connected to the protective conductor, in the interrupted part of the installation, will obtain a dangerous voltage. A periodical test is therefore necessary.

There are, however, circumstances *where neither of these protective devices should be used*, i.e., for toasters or radiators, where it is possible to touch the live element at the same time as the metal framework. In such cases, earthing or the connecting of the metal frame of the appliance to neutral introduces a considerable risk which is greater than the one eliminated by earthing or connecting to neutral.

We may now summarise as follows :—

1. Use insulated installation wiring material, accessories and electric appliances *as far as possible*.

2. Where non-insulated electric appliances must be used try to place them out of reach of earthed constructions.

3. If this latter is impossible, then :—

Provide all such appliances with carefully constructed handles made of insulating material. A handle which has to be grasped firmly by the user is particularly dangerous when it is made of metal and the appliance develops a fault.

4. Where these precautions cannot be carried out satisfactorily, the frames of the metal-covered appliances should be earthed or connected to the neutral conductor.

5. The flexibles used with metal-covered portable appliances must have the current-carrying conductors surrounded by rubber-sheathed concentric protective earth wires, preventing the current-carrying conductors coming within reach on the occurrence of a fault in the flexible.

6. *Apparatus, where the outer metallic sheath does not form an effective earth shield, must not be earthed.* They must only be used in connection with wall-sockets placed in such a position that anyone using the apparatus cannot simultaneously touch the apparatus and an earthed metal construction or another non-insulated appliance which is in use.

7. Where earthing, or connection to neutral is used, the controlling supply undertaking must arrange efficient periodical tests to ascertain that the protective earth conductors in the different installations are in good working order.

This system is obviously not satisfactory—even in a case where a reliable local earthing or connecting to neutral can be carried out—for after the introduction of a number of earthed metal constructions it will be difficult to place the wall-sockets in the position described above. It may, however, be justified in that this difficulty can be overcome by using appliances covered with insulating material. If this should be a failure, or if an undertaking wishes to be ensured of no failure, it would be necessary to introduce another system which has been developed on the Continent during the last few years and which I hope to have an opportunity of describing in a subsequent article on housing.

BOOK REVIEWS.

Electrical Wiring and Contracting, Vol. IV. Edited by H. MARRYAT. (London : Sir Isaac Pitman and Sons, Pp. viii+237.) 6s. net.

Half of this series has now been published, and Vol. IV is well up to the standard of the previous volumes. This volume consists of Sections 14 to 17 inclusive, which deal with Motor Starters and Regulators by H. Cotton, M.Sc., M.B.E., A.M.I.E.E., Private Power Plant, by the same author, Electric Signs by G. A. Wedge, and Estimating by H. R. Taunton, who in a remarkably concise form, covers the all-important subject of estimating in a lucid and readable manner. This is a subject which may well mean the difference between life and death to an electrical contractor.

D. W. T.

Elektrobetrieb in der Textilindustrie. By DR.-ING. WILHELM STIEL. Pp. xiv+652. (Leipzig : S. Hirzel.) 33 marks.

Textiles are a sore subject at present in Britain, and a book on the industry from a Continental standpoint cannot fail to be of interest. It may be of significance that in 1924-25, according to the author, only 26% of the motive power in the English textile industry was electric, compared with 55% in Germany and 68% in the United States ; in the iron and steel industry the figure was 42%, compared with 74% and 72% respectively. The electrification of this country is undoubtedly backward, although the conclusion to be drawn from this fact is hardly the reviewer's business.

Dr. Stiel's book is a most exhaustive treatise, dealing with textile electrification from every standpoint, economical and technical. Electric drive compared with steam ; transmission ; group-drive ; individual drive ; machines and their speed control ; processes ; mechanical details, are among the subjects dealt with. The book has a mixed electro-textile-technological character, since for successful operation the union between machinery, electric drive and textile technology must be of the closest. The author has a substantial claim to combine a theoretical and practical knowedge of all three in his own personal experience. Besides the actual application of electricity to drives, the questions of lighting, heating, ventilation, etc., are discussed. The book is to be recommended on account of its authoritative nature and exhaustive treatment.

UNEMPLOYMENT AND WORK—III.

Thinking Upside Down.

By SIR ERNEST J. P. BENN.

IT is not easy for a casual observer to grasp all that was in the mind of the artist if a picture is hung upside down, or to appreciate the beauties of a composition from the back of the canvas. Yet we continue day by day to potter about with the unemployment problem with an almost complete disregard of its essentials and a totally inverted view of its nature. If we start at the beginning, and consider an elementary example, this becomes apparent. Suppose we ask: What is a carpenter? Why does he exist? How did he arise? What are the conditions which brought him about? How long will he last? What are his obligations to others and the obligations of others to him? Unless we can answer such questions as these in a way to satisfy ourselves, we admit in advance our incapacity to discuss the employment of a carpenter. When, however, the subject is approached in this simple way, a number of long-forgotten but very obvious truths begin to dawn upon us.

Social Contracts.

The carpenter exists, we observe, as a carpenter because his neighbours are in need of woodwork. As civilisation evolved there gradually developed a sort of social contract between the carpenter and the rest, that if he would provide woodwork as and when the others were in need of it, they, on their part, would supply him with other things in return. An implied condition of the contract, quite essential to its proper working, left it understood on both sides that when the requirements of the neighbours in the matter of carpentering were satisfied, or of the carpenter in the matter of any particular article for which he exchanged his labour were filled, either party was under an obligation to find another market or to render some other sort of service. The whole scheme was built upon the need of the neighbours for woodwork and the need of the carpenter for other things. But now, and that is why I suggest that we are thinking upside down, the needs have disappeared from our discussion and we talk only of the carpenter and his wages. We have allowed our carpenter, and every other supplier of everything, to get into a false position. He says, in effect, "I am a carpenter. I will perform woodwork in such quantities and at such prices as shall be arranged by all my fellow carpenters in union together, and if you other people will not comply with our ideas and our requirements, if at any time you do not want our services on these terms, then we will be idle at your expense. You must continue to supply us with your products, but you can only have ours on our terms. If you do not want our products, then we will offer no others; we will wait until you see the wisdom of complying with our demands." All of which is summed up in the current phrase: "Work or maintenance."

Things are, of course, by no means as simple as this. Centuries of complications have obscured our economic foundations, but the foundations remain and are more essential than ever by reason of the wonderful fabric that has been built upon them. The simple truth that we work for others, however completely we may forget it and however far modern commercial methods may remove us from the others, remains and absolutely governs the whole situation. Until we get a different attitude of mind towards the consumer or the customer, our employment difficulties will continue to increase. At the moment, we have entered a period when it would seem, to judge by our conversation, as if the consumer did not exist, and there was therefore no need to take account of his convenience or opinions. The distance we have travelled along the wrong road is amazing; our minds cease to function, except on behalf of the worker or producer or supplier. This is noticeable not only in industrial discussion but in every question we touch. The other day we had an official inquiry into infant mortality, but the report of the experts, who were supposed to be concerned with the lives of our infants, consisted of a number of recommendations for pensions for midwives.

Whenever we talk of work, we think of the worker and ignore the work; we think of the wages and ignore the price; in fact, we get the picture upside down.

It is commonly agreed that it takes two to make a quarrel, but usually forgotten that in this respect a quarrel differs from few of the rest of human activities. Two at least are necessary for almost any economic process. One man writes, but unless another man reads he writes in vain. The singer who fails to attract a listener is not an economic proposition, and so in all well-ordered affairs you must have a willing buyer and a willing seller. From which it follows that there must be two opposing views of every economic proposition. One side desires to be rid of an article and another desires to acquire it. It is right and proper for me as a publisher to think only of selling books and to strive to sell them on my own terms. But society must think of buying books and endeavour to modify my demands. When two forces are allowed free play in an open market the maximum business follows, but when one or other of them secures a favoured position, an artificial and unreliable state of affairs prevails.

Man does not want work; he wants the product of the work of others, and it is the failure to realise this simple but incontrovertible proposition which is the cause of much of our difficulty. We have hedged the problem round with false issues and lost our way in a sophisticated political maze. Talking to a politician about unemployment is something like talking to a Jew about transubstantiation. There is no basis upon which to argue. The politician's mind is full of constituents who want wages or of manufacturers in search of artificial aids. On the other hand, it is as useless to talk about work to a trade union official or an officer of a Labour Exchange as it would be to discuss the totalisator with a bookmaker.

Like so many other problems that worry us, we want for a successful solution of this one less of the experts and more of common-sense experience. Life is much easier for us than for previous generations, because we have still further developed the processes of dividing labour and of specialisation. It follows, however, that we find ourselves more and more separated as producers and consumers, and it is increasingly difficult for the producer to visualise the consumer or for the consumer to get into touch with the producer of the article he enjoys. As I delight in a cigarette, it is not easy to recognise my obligation to the miner who produced the coal which made the steam to drive the machinery which manufactured the paper to roll the tobacco in. And yet the definite obligation is there. A greater stretch of imagination is called for on the part of the miner, because his coal, for all he knows, may be wanted for baking bread or boiling soap. Nevertheless, the mutual obligation is as definite and clear and irresistible as the obligation between the village carpenter and the blacksmith with whom he exchanges service. In these days of wonderful industrial organisation, we are quite naturally apt to lose sight of the other party and sometimes of the article itself, and give all our interest to the working of the great machine of which we form only an unimportant unit.

The unemployment problem is by no means entirely a working man's affair, and our errors are not by any means confined to the working classes. We are all after Safety First, and we cannot get it. It simply does not exist. It is the fashion to sentimentalise and legislate just as much for the inefficient employer as for the superfluous worker, and both processes accentuate our difficulties. A few more healthy bankruptcies would help our traders to see that safety cannot be secured by trade arrangements; it must be obtained by the harder means of satisfaction to customers.

Recent Experience.

I am quite conscious of the lack of any satisfaction in this line of argument to the father of a family in search of next week's wages, or to the directors of a factory whose machinery is for the moment standing idle. Also I recognise the plight of a Government which in face of such circumstances is almost forced to take some measures to avert disaster. But I protest that unless those measures are taken with a full knowledge and understanding of the real nature of the problem, they are quite certain to make it worse. I can at least point to our recent experience for a justification of this protest. The more we do for the unemployed, the more numerous they become; as things are now arranged, every competent observer expects to see the two millions mark reached before Christmas, and if we go on forgetting the nature of work the numbers will mount in a sort of arithmetical progression.

The sucking of an acid drop may do something to ease the pain of a sore throat, but unless the stomachic trouble, of which the sore throat is only the symptom, is corrected, grave harm may be done. No difficulty seems to stand in the way

Digitized by Google

of a right understanding of the subjective method when the problem is concerned with science or medicine. Popular education has taught us to think rightly and to appreciate the difference between cause and effect, and we no longer mistake the symptom for the disease. Is it therefore entirely unreasonable to hope that our modern wisdom in these matters may now be capable of application to our economic troubles as well? Can we not give up this last remnant of the weakness for the quack remedy, and begin to think on scientific lines on unemployment and work? Science always starts at the beginning, with a correct analysis and a formula on which reliance can be placed. Politics, by way of contrast, concerns itself with the froth or fringe and discusses the visible, more often than not without regard to what is underneath.

The whole matter can be summed up in this very simple way: If we turn our attention from the unemployed to the employed, and asked them the question: "Are you giving value? Are you doing your best to satisfy the customer and develop the market in a sound and healthy way?" the whole problem might assume another and more pleasant aspect.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Unemployment and Work."

[To the Editor.]

Sir,—I have read with considerable interest Sir Ernest Benn's second article in last week's issue of The Electrician on "Unemployment and Work," and, although I think it is a little provocative, I agree with much that he says. Personally I regard the unemployment problem very seriously, for, in my small business here, I find very great difficulty indeed in getting sufficient good men. My experience is quite common in this trade, both in the London district and in Coventry and Birmingham. This means, I am afraid, that a very large proportion of the unemployed are below the line of economic employability, and that, as the trend of prices for our goods is slowly downwards, this economic employability line must tend to rise. The sooner this problem is tackled in the proper way the less likely is it to bring us to financial disaster. First, I would divide the unemployed generally into three categories. The first would contain those who are economically employable but, owing to their trade and situation, cannot get work. This type is likely to be found in a mining village, where local pits have closed down altogether. The second would contain the type of man, of whom I have seen a good deal, who is anxious to get employment but is not economically employable, and the third would consist of those who do not desire employment and may be seen in deputations to Boards of Guardians or public assistance committees. Whenever I have mentioned the matter to practical thinkers they have agreed with me, which confirms your condemnation of our lazy way of lumping all the unemployed together.

Although I am a supporter of the Conservative Party, I do not know the definition of a Conservative, but I am quite certain that I am an Individualist and I maintain that there are only two classes of people in this world—Individualists and Collectivists or Socialists. I am not opposed to Collectivism. I simply do not think that it is a practical proposition, for it means the possession of all things by everybody, and I have never yet met a Socialist practising Socialism. If an individual has no right to hold property by himself, a collection of individuals can obviously have no more right either. Were Collectivism a practical proposition, I think I should have no hesitation in overlooking the moral side of the question and in whole-heartedly embracing the Collectivist's creed for, although my undivided share in my collar stud would only amount to a several hundred millionth part, I should, at any rate, enjoy an exactly similar share in everything else with every other inhabitant of this globe. I am a member of a Rotary Club, whose motto is "Service above self," and I do honestly believe that I could work whole-heartedly for the good of humanity without hope of any extra reward, provided everybody else did the same. What makes me an Individualist is my grave doubt about the practicability of Collectivism with human nature as it is and is likely to be for a long time to come. Therefore I feel I have a divine right to hold the property I possess for the time being and that when I am called upon to give an account of my doings it will be from the point of view of what I have done for others. So it must be with this idea in our minds that we, as Individualists, must try to deal with every question.

In my small business I engage and discharge all labour, and, dealing as I do very largely with boys who are just leaving school, I am appalled at the apparent lack of individual responsibility shown by so many parents. I maintain that unemployment is very largely caused in the home, and is quite beyond the handling of teacher, employer or State. Probably the Church can do more than anything else to inculcate the sense of individual responsibility, divinely laid upon us, and all that employer and teacher can do is to work up in its later stages the human material that is provided. If politicians would only grasp the nettle and state clearly and emphatically that they can do far less than the head of the home, I believe that we should, at any rate, start from the right end to prevent this terrible problem of unemployment from getting any worse.—Yours faithfully,

D. G. Ryder.

New Cross, S.E.14,
May 12.

Kaplan Turbines at Passau.

[To the Editor.]

Sir,—In your issue of May 2 I read the account of the interesting installation at the Back River in Canada of the Montreal Island Power Co., consisting of turbines with movable blade propeller runners. An installation of this type, the Kaplan turbine, was erected in 1926 at the Austro-German frontier town of Passau, on the Danube, in connection with the Bavarian electrification scheme. There are eight of these propeller turbines, each rated at 7 350 h.p. normal output and 9 200 h.p. maximum output, the head being 9 m.—i.e., 29 ft. The electrical rating of each generator is 8 500 kVA at 6 300 V a.c. of 50 cycles.

As a result of this installation the navigability of the Danube has greatly benefited, because the water level has been raised by about 6·5 m., over a length of about 25 km., and the strong current of the river reduced.—Yours faithfully,

J. J. C. Berkeley,
Dipl.-Ing.

INQUIRIES AT THE B.I.F.

South Midland Area Committee of the E.D.A. Issues Report.

According to the E.D.A. officer of the South Midland Area, whose report on the British Industries Fair has just been issued, inquiries emanated from Canada, Australia, India and many foreign countries. It is estimated that 2 000 odd inquiries were made at the E.D.A. Kiosk, typical examples being:—(1) From Vancouver B.C.—wanted the name of a British firm making bulb lamps for sun-ray apparatus; (2) a Belgian engineer wanted a certain type of motor; (3) a representative of Hall Engineering works, Sydney, inquired *re* electric welding; (4) an inquiry for an electric dish washer; (5) an inquiry for an electric bird-scarer; (6) flood lighting; (7) procedure when supply authority changed over from d.c. to a.c.; (8) information *re* assisted wiring schemes; (9) electric water-heating; (10) advice *re* an all-electric house. It was difficult to estimate the number of visitors (apart from inquirers) during the Fair, but it is believed that over 5 000 people visited the Kiosk. Three German visitors who signed the visitors' book expressed surprise at the Fair, and especially the electrical section, one remarking that "we have had the surprise of our life; had no idea you had such a Fair in England." The most popular leaflets among the public were "Electricity in the Home"; "Chats on Electricity"; "Electric Helps"; "Is your Larder Safe"; and "The House You Want."

BOOKS RECEIVED.

"Die Elektromagnete." By Erich Jassez. (Berlin: Julius Springer.) Pp. vi+198. 21 marks.

NEWS IN BRIEF.

Rockefeller Donation for Royal Institution—Memorial to Sir Joseph Swan—The Electrical Women of Bradford—An Historical Pageant—America's Radio Merger.

It is stated that the Duke of York will visit the Lochaber hydro-electric works at Fort William on July 30.

The telephone service between England and the city of Luxemburg was extended last week to all parts of the Grand Duchy.

The Engineers Club, London, is to be wound up under an Order made by Mr. Justice Eve in the Chancery Division, on the petition of a creditor.

London County Council requires an instructor in the electrical engineering and physics department of the Poplar School of Engineering and Navigation.

The National Guild of Telephonists has passed a resolution protesting against the proposal of the Postmaster-General to employ women telephonists on late night duties.

Barking U.D.C. requires an electricity showroom assistant.

Applications are invited for the position of sales assistant in the Scarborough electricity department.

A chief lecturer is required in the electrical engineering section of the engineering department at Halifax Municipal Technical College.

Ilford Corporation has accepted an invitation from the Metropolitan Cable and Construction Co., Ltd., of Chadwell Heath, to visit the company's works.

The Royal Institution has accepted a conditional offer from the Rockefeller Foundation of £20 000 for the endowment of research in the Davy Faraday Laboratory.

Southwark (London) Libraries Committee has received from the Athenæum Club, a framed bas-relief in copper electro-type of the head of Faraday, for the Michael Faraday Memorial Library.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of May 15, 1880, the gas interests were already showing signs of alarm at the development of electricity as an illuminant, and anti-electric propaganda was beginning. A statement by "Gas and Water Engineering" was quoted to the effect that doctors were prophesying that the electric light would eventually destroy the eyesight, one medical man claiming to have been blind for three days in consequence of having attended a concert in San Francisco in a hall supplied with the electric light. (As this was before the days of Prohibition, it was probably a smoking concert).*

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of May 19, 1905, recorded the issue of a revised code of the Board of Trade Regulations applicable to electric light and power undertakings. The new regulations sanctioned the delivery of extra high pressure to factories, mines or electric traction installations and clarified the rule as to permissible leakage on high pressure cables. It was provided that overhead lines could only be erected in accordance with plans approved by the Board of Trade.*

The L.M. and S. Railway Co. has arranged for the installation at the Prince of Wales Dock, Swansea, of an electric belt conveyor, capable of shipping about 700 tons of coal an hour.

A forthcoming examination of candidates for appointment as probationary assistant engineers in the engineering department of the Post Office is announced. Application forms from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1.

The first edition of "Westelco," the Westminster Electric Supply Corporation's new staff magazine, has now been issued. It contains a number of instructive and amusing articles and information relating to the staff's sports club, pension fund, co-partnership scheme, etc.

It is stated in the monthly report of the Lancashire Federation of Utility Poultry Societies that much success has attended the introduction of electric brooders in the district. It is stated that on one farm an electric bell rings in the house when a fuse on the poultry rearing circuit blows.

The charges for telephone communication from Great Britain or Northern Ireland to any place in North America have been reduced by £1 per minute. The charges now vary from £6 to £9 for 3 minutes, with *pro rata* charge per additional minute. The report charge is 12s. instead of £1.

In reply to an inquiry by Dr. G. de Gelder, of Amsterdam, Mr. R. Borlase Matthews has written a letter in which he describes his experiments to determine the effect of electric light and heat on bees. To get the blossom in the apple orchards better fertilised and to obtain an increased yield of honey, he says, the hives were placed in a house which was lighted and warmed, the bees were attracted out, flew around, fed on the syrup and water provided, and picked up some of the artificial pollen set out for them. Then the queen bee laid her eggs early, with the result that a strong breed of young bees was ready to attack the apple blossom harvest. This meant an increase of eight kilos of honey per hive per annum.

Weymouth Beach Committee has decided that the shelters on the esplanade be electrically illuminated, at a cost of £190.

Salford Watch Committee has found the police boxes in the Broughton and Pendleton districts so satisfactory that the system is to be extended to the Salford or "A" division.

A technical officer, with university degree in engineering or its equivalent, and with experience in design of telephones bells, etc., used in low power signalling systems, is required for an Admiralty establishment in London.

At the new Oxo factory at Blackfriars, London, there is an electric "OXO" sign, the letters of which are over 10 ft. in height. The nine floors of the building are electrically lighted and heated, and the equipment of the works includes 16 cranes and six overhead runways, all electrically controlled.

An electric organ blower has been installed at St. Mary's Church, Brecknock.

Two engineering and distribution assistants are wanted in the Hampstead electricity supply department.

Members of the Bradford Branch of the Electrical Association for Women had their first outing on May 3, when they visited the all-electric dairy farm of P. Hudson and Son, Carleton, near Skipton.

The National Committee of the Amalgamated Engineering Union, at its meeting last week, rejected a resolution to instruct the Executive Council to withdraw from the engineering joint trades wages movement.

Telephone communication is now available between all parts of Great Britain and the principal towns in the provinces of Buenos Ayres, Cordoba and Santa Fé, Montevideo and Santiago, Valparaiso and Vinadelmar.

It is expected that when the Prince of Wales visits Sunderland on July 3 he will unveil a bronze tablet which is to be erected in the hall of the Central Public Library to the memory of Sir Joseph Wilson Swan, the inventor of the electric incandescent lamp. The committee which has the memorial in hand hopes to raise sufficient funds to establish a local scholarship and a national lectureship as well as to erect the tablet.

It is reported that the United States Department of Justice has filed a suit to test the legality of the merger of the Radio Corporation with the radio interests of the Westinghouse Electric and Manufacturing Co. and the General Electric Co. of New York, and the legality of the arrangements existing between these companies and the American Telephone and Telegraph Co., Western Electric Co. and other companies.

An historical pageant will take place in connection with the Josiah Wedgwood Bi-centenary celebrations at Stoke-on-Trent next week. On the opening day, Mrs. C. H. Yeaman, wife of the City Electrical Engineer and herself an ex-member of the Borough Electrical Engineer's office staff, will enact the part of Queen Erminilda on Monday (when Princess Mary will be present), and on Tuesday and Thursday. An electrical exhibition will be held in the Fenton town hall during the week, and the town halls of Burslem, Hanley and Tunstall, and the offices of the electricity department and the North West Midlands J.E.A. will be illuminated electrically.

A National Safety Congress to be held at Liverpool from May 21 and 22, will be opened by the Duke of York (president of the Association). Sir Henry P. Maybury will speak on "The Development of Roads and Road Transport with Special Reference to the Prevention of Accidents," and Mr. Robert Beveridge, inspector of lighting and cleansing, Edinburgh, and member of the council of the Association of Public Lighting Engineers, will read a paper on "Street Lighting and Illuminated Traffic Signals."

Digitized by Google

PERSONAL.

MR. Roy, electrical engineer at Wick, has been granted an increase of £52 per annum by the Town Council.

The late Mr. Arthur Greenhow Lupton, chairman of the Yorkshire Electric Power Co., left £83 010; net personalty £81 906.

Mr. A. W. Makovski, of Tamplin and Makovski, Ltd., has been re-elected president of the Reigate and Redhill Chamber of Commerce.

Mr. John Barnard, general manager of Bolton Tramways, has been appointed secretary of Lancashire and Cheshire Transport Authorities' Council.

Mr. Thomas Mensforth, works manager with the Darlington Rolling Mills Co., Ltd., has been appointed electrical engineer with Dorman Long and Co., Ltd.

The General Electric Co., Ltd., announces that owing to ill health Mr. P. Howard has resigned his position as general manager of their Singapore branch, and that Mr. R. C. Giggins, of their Kuala Lumpur branch, has been appointed to fill the vacancy.

Owing to pressure of work in connection with extensions at the generating station, Mr. A. J. Fuller, borough electrical engineer, will be unable to attend the conference of the Association of Public Lighting Engineers in September, and Mr. J. F. White, mains superintendent, will attend in his stead.

The Lord President of the Council has appointed Sir Ernest Rutherford, F.R.S., to be Chairman of the Advisory Council of the Department of Scientific and Industrial Research, in succession to the late Sir William McCormick, F.R.S., as from October 1, 1930. Prof. V. H. Blackman, F.R.S., will serve as Chairman until October.

The Begbie Challenge Cup, competed for annually by the Committee of the Engineering and Allied Employers' London and District Association, was won at Richmond Golf Club on May 6 by Mr. A. Vines, President of the Committee and managing director of Evershed and Vignoles, Ltd., with a score of 150 for two rounds.

Leyton Town Council has adopted a recommendation by the Electric Lighting and Tramways Committee that having regard to the increase in the responsibilities placed on the electrical engineer and manager, Mr. J. W. Speight, and to the increased volume of business since his appointment, his salary be increased to its maximum of £1 050 per annum on July 1 next, instead of on July 1, 1931.

Burnley Electricity Committee has interviewed three of 73 applicants for the post of demonstrator at the electricity showrooms. The post as originally advertised failed to attract suitable applicants, and it was again advertised at an increased salary. Miss I. M. Ward (Harrogate), for 12 months head demonstrator and showroom assistant to Harrogate Corporation, who has had previous experience with the Credenda Conduits Co., was selected for the post.

Bedford T.C. has received from the Electricity Committee a report that the salaries of the technical staff should be increased as from July 1 next owing to the station having been transferred from class E to class F, as follows: Mr. N. Flemming, station supt., from £505 to £526; Mr. A. A. Nimmo, mains engineer, from £448 to £467; Mr. A. Wilson, assistant station supt., from £373 to £403; Messrs. F. H. Boud, A. H. Jones, H. Bush, J. Thompson, N. Boydell, J. McD. Tait, J. Blaikie, B. Crowsley, and J. Harvey, engineers, from £314 to £340; and Mr. R. V. Hepworth, mains assistant, from £244 to £264.

Speaking at the general meeting of the South Wales Power Co., Ltd., on May 9, Mr. W. North Lewis stated that Mr. J. W. Beauchamp, the company's engineer and manager, had been offered and had accepted an important position under the Central Board in connection with the South West England and South Wales Electricity Scheme. Readers will remember that Mr. Beauchamp was the originator of the B.E.D.A., and left that association in January, 1928 in order to join the South Wales Power Co. Before joining the E.D.A. he was engineer and manager at West Ham and was succeeded in that position by Mr. F. W. Purse. See page 629.

Obituary.

MR. WILLIAM M'KAY, aged 70 years. He was, until his retiral, electrical engineer at Dunbeath Castle.

MR. JAMES BLACKWOOD WILSON, on May 1, aged 76 years. An ex-Provost of Kilmarnock, he was convener of the committee which inaugurated electric lighting and tramcars in the burgh and was a member of the Ayrshire Electricity Board.

BUSINESS ITEMS.

FALK STADELMANN AND CO., LTD., have opened a new branch at 15–19, New Station Street, Leeds.

The makers or the London agents of the "BIRUM" vacuum cleaner are requested to communicate their address to the Editor.

THORPE AND BOSCO, LTD., announce that the name of this company has been changed to THORPE AND THORPE, LTD., the address being 38, Broad Street, Golden Square, London, W.1.

MR. J. H. CHARLESWORTH, late partner in the firm of CHARLESWORTH AND WHISTON, electrical engineers, of 12, West Street, Crewe, has commenced business on his own account at 18, Hightown, Crewe.

The Adelaide branch of the BRITISH GENERAL ELECTRIC CO., LTD., Australia, has been moved from "Magnet" House, 21, Pulteney Street, to Industrial Building, King William Street, Adelaide.

The "New Imperial" machine ridden by E. A. Mellors in the Leinster "100" road race, which won at a speed of 66 m.p.h. and, irrespective of class, made the fastest time of the day as well as being the fastest in the 250 c.c. class, was fitted with a B.T.H. magneto.

The PREMIER RADIATOR AND ENGINEERING CO., LTD., Skerne Works, Albert Hall, Darlington, has received orders for the water-cooled transformer oil coolers for the new Battersea power station, and also has in hand coolers fo the air blast type for the South East, Central and N.W. England sections of the grid.

Readers will be interested to hear that "Met-Vick" ultra-violet ray, high frequency and radiant heat appliances, as well as their "Savage" health motor, were conspicuous factors in the training of the successful Arsenal football team. Each member of the team had regular sunbaths of two-minute periods with the 12 A quadrupel arc ultra-violet ray set, "Met-Vick" high frequency apparatus and radiant heat lamps being exclusively used in the way of massage and local treatment for sprains, bruises and minor injuries.

In connection with the twin-screw motor-ship "Tuscan Star," which has recently started on her maiden voyage to South America, it is stated that the vessel has the largest refrigerated capacity of any craft afloat. Most of the electrical equipment was supplied by the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, W.C.2. The G.E.C. plant includes main generators, nearly 60 motors, and switchboards; electric cooking equipment; the whole of the switches, wall plugs and sockets, and also cabin heaters.

SUSSEX CONTRACTORS.

Annual Dinner of the Sussex Branch of the E.C.A.

PROPOSING the toast of "The Electrical Contractors Association and Allied Associations" at the annual dinner on May 10 at the Royal Pavilion, Brighton, of the Sussex Branch of the Electrical Contractors' Association, Mr. A. J. Ryan, of Hastings, referred to the success of co-operation in the various sections of the industry in promoting that all-electric age which was ultimately bound to arrive.

Mr. H. Willoughby Ellis, president of the E.C.A., in reply, applied the term of "fantastic dream" to the fears of those who seemed to think that on account of the extension of the "grid" under the national electrification scheme, chief engineers would be able to devote their time to wiring and sales, to the detriment of the electrical contractor. In his opinion the electrical contractor stood in no danger, and not 17% of the houses were properly wired.

Mr. H. L. Holford, of Hove, submitted the toast of "The Engineers of the Sussex Supply Stations," and in response Mr. J. K. Brydges, of Eastbourne, said there were six or seven municipal generating stations in Sussex and other smaller stations. He had at Eastbourne endeavoured to place as much work as possible in the hands of the local contractors and there were 1 000 electric cookers in Eastbourne alone.

A collection was subsequently taken up on behalf of the Electrical Trades Benevolent Institution.

E.C.A. CONFERENCE.

The papers to be read at the E.C.A. conference, which opens on June 25 at Llandudno, are, on June 26, "Future of Electrical Contracting," by Mr. C. H. Flower, and on June 27, "Specifications and Their Problems," by Mr. W. Cross. The remaining details of the conference were published in our issue for April 18.

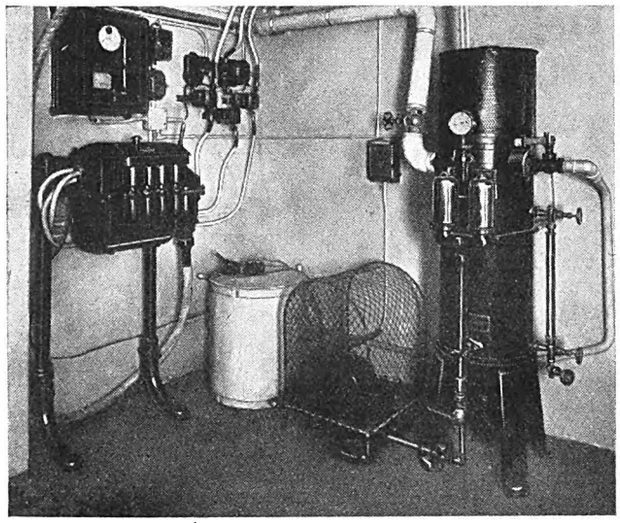
THE WHITE HOUSE.

An Interesting Installation on the Site of Original Grosvenor Galleries.

THE White House (Maison L. Giraud), 51, New Bond Street, London, W.1, which at one time formed part of the Grosvenor Galleries, and where once Michael Faraday had a work-



The Mascarini boiler and its controls as installed at the White House.

shop, is a business specialising in high-class lingerie and household linen, which has been established in Bond Street for twenty-four years. Expansion of business has necessitated increased accommodation, with the result that adjoining premises have recently been occupied and structural alterations carried out, making the shop one of the finest and most modern of its type in New Bond Street.

An entirely new shop front has been installed with modern window lighting by means of concealed silver glass reflectors, with cornice lighting in the entrance between the windows. The whole of the shop interior has been entirely re-constructed and re-decorated and new lighting up to modern standards installed. The heating of the entire premises is carried out by means of an electric panel system controlled by thermostats.

In order that the products of this house shall reach the public in the best condition possible, a laundry has been installed in the basement wherein all articles for sale are laundered and finished. The steam supply to this laundry presented some little difficulty, but was finally overcome by the installation of a 120 kW Mascarini electrode boiler. This is the first installation of this type in the country and has now been functioning for three months with entire satisfaction. The boiler is automatic in operation, the load taken from the mains being self-regulating according to the demand made for steam upon the boiler. Steam can be raised from cold within five minutes. The boiler is operated by the forewoman of the laundry who has no difficulty in carrying out the simple operations required for starting and shutting down. Steam is supplied at a pressure of sixty pounds per square inch to such machines as a rotary washing machine, a drying cupboard, a large 110 in. calender and a small 36 in. calender. Over the sinks where hand washing is done, is fixed a large Bastian thermal storage water heater. Should the demand be greater than this tank can handle water can be heated by blowing steam directly through the water in the sink.

The whole of the hand ironing is done by cordless type electric irons made by the Dowsing Radiant Heat Co., Ltd. These are of various shapes and sizes and are used in conjunction with control panels into which the irons are placed for heating up. These panels consist of a switch and pilot light and special contacts, which when the irons are placed on the stands make contact with lugs on the irons and so supply current to the elements. The canteen in which meals are supplied for the staff is equipped with "Jackson" electric cookers and small griller boilers for additional grilling.

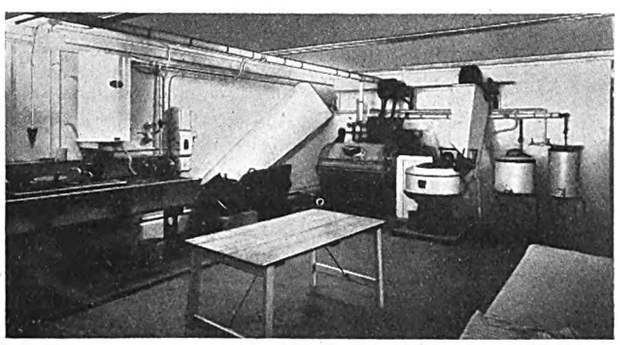
The premises are now completely electrified, there being no other form of either heating, lighting or power supply. The architect to the building is Mr. Billery, the consulting engineers, Messrs. Lucas and Pyke. The Mascarini electrode boiler was supplied by the Bastian Meter Co., Ltd., who also supplied the thermostatically controlled water heater. The installation was carried out by Griersons, Ltd., whilst Braithwaite and Co., Ltd., installed the laundry apparatus.

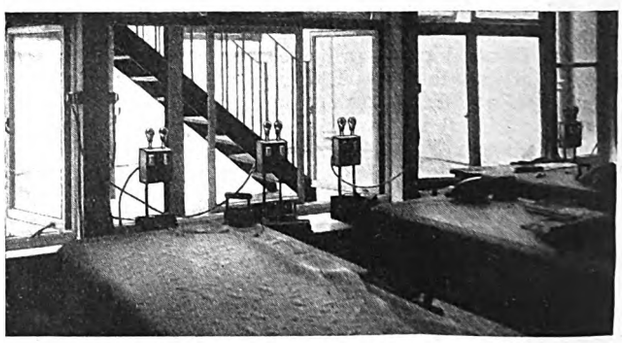
The connected loads of the installations are:—Lighting, 34 kW; heating, 81 kW; power, 8 H.P.; cooking, water, heating and iron heaters, 52 kW; and electrode boiler, 120 kW. It is interesting to note that 8½ miles of conduit and 10¼ miles of cables have been used in the lighting and heating installation, while the low temperature "Dulrae" tubular warming panels have a total length of 1½ miles of heating tube installed. This represents 183 warming panels having a total radiating surface of 2 700 square feet on the ceilings. The total cube of the rooms warmed is 211 600 cu. ft. Therefore, the heating load works out at approximately 0·38 W per cubic foot overall. Sufficient warming surface has been installed to maintain a temperature rise of 30 ° F. above the outside air, in showrooms, offices and workrooms, which are all controlled by means of thermostats, and a rise of 10° F. in storerooms, which are switch controlled. The heating tubes have a loading of 10 W per ft. run, and are spaced four inches apart. They consist of an element wire threaded through glass lined steel tubes, and the ends of each panel terminate in an octagonal header box to which the circuit conduits may be connected. Sheets of cork are attached to the joists and the panels are fixed on top of these. Expanded metal lathing covers the panels and the whole is embedded in the ceiling plasterwork, a suitable plaster being used for this.

THE EAST END HOSTELS ASSOCIATION.

A very distinguished company will assemble at the Mansion House on May 27 to hear the Lord Chief Justice and Mr. J. H. Thomas on the subject of the John Benn Hostel. Among those who have intimated their intention of being present we notice Lady Astor, M.P., Lord Clive, Lord Pentland, Sir John Barran, Mr. Max Bonn, Sir Harold Bowden, Mr. Geoffrey Duveen, Don Agustin Edwards, Mr. Gerald France, Sir Harry Hepburn, Sir Robert Kindersley, Dr. Herbert Levinstein, Sir Percy Mackinnon, Sir William Noble, Mr. Handley Page, Sir Denison Ross, Sir Henry and Lady Rothband, Air Commodore C. R. Samson, Sir Edward Stockton, and Commander H. S. H. Ellis.

Viscount Astor is presiding at the dinner and will receive the guests, and among the other speakers are the Rt. Hon. Wedgwood Benn, Lord Feversham, Mr. R. C. Sherriff, and Miss Haldane.





TWO further views of White House. On the left are seen the thermal storage water heaters over the sinks, and on the right are clearly shown the ironing facilities.

DOMESTIC ELECTRICAL APPLIANCES.

Many New Items to Interest the Contractor—Further Batteries and Valves for Radio Trade—A Bagless-type Cleaner.

A NUMBER of new lines for public consumption have been placed on the market recently and among these may be mentioned a high tension battery made up of a series of nickel-iron cells. The battery is intended for use with radio receivers and is kept charged by means of the low tension supply. The makers are HENRY MILNES AND CO., Ingleby Works, Brownroyd, Bradford, whose London agents are J. T. HAYTER AND CO., 30, Victoria Street, S.W.1. The "Milnes" unit, as it is called, employs "Alklum" nickel and steel plates, which are immersed in a steel preserving alkaline solution, and it is worked in conjunction with a series parallel switch. When the receiver is required for use the switch on the h.t. unit is moved to the correct position indicated, when the cells become series connected. In the "charge" position the cells assume parallel connections in groups of five.

H. E. ASHDOWN (BIRMINGHAM), LTD., have recently placed on the market an ingenious new type of adjustable 2-pin plug which is practically universal in its instant adaptability to all sizes of sockets. This plug—made of bakelite—is of substantial construction, shockproof throughout, and is simple in operation. Pins are automatically adjusted to hole-spacing of socket merely by turning the knurled outside ring, thus obviating the dangerous practice of finger adjustment with its risk of touch contact. The pins, which are removable and interchangeable, are of 3, 5 and 15 A. capacity and any intermediate sizes. The advantage of this type of plug will be instantly appreciated by all sections of the trade, since its universal adaptability obviates the necessity of carrying stocks of different capacity plugs. Facility of wiring is another strong feature. It is only necessary to unscrew the cap when wires can be immediately attached to the easily accessible pin terminals, while efficient cord grip is ensured by the cap-moulding screwing down on to the flex which passes through a slot in the thread.

Contractors whose business includes the installing of wireless in privately owned yachts, boats, etc., will be interested in the new portable equipment for communication by means of telephony or telegraphy on short wave lengths which has been produced by MARCONI'S WIRELESS TELEGRAPH CO., LTD. (Marconi House, Strand, London, W.C.2). It is known as the Type S.P.2 set, and works on wave lengths between 30 and 80 metres. The 10 W power for the transmitter is provided by a small hand-driven generator, the containing case for which is provided with a padded top and folding feet, so that it will form a convenient seat. The metal mast when complete is 28 ft. high; it is stayed rigidly at the centre. An ingenious arrangement allows a part of the mast to be used as the aerial itself for wave lengths between 45 and 80 metres. The upper part of the mast is insulated from the lower part and connected to the instrument box by a downlead 15 ft. long. When it is desired to communicate on any wave length between 30 and 45 metres, the top part of the mast can easily be removed, and the lead from the centre forms the aerial. The equipment is divided into three loads.

To meet the need for an extra large power valve the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C., has produced the L.S.6A, valve, stated to possess the same advantages as the L.S.5A., but with an output equal in that given by two paralleled L.S.5A. types. When operating the new valve the makers point out that provision must be made for sufficient air circulation to prevent overheating, in that the anode dissipation can be as much as 25 W. The maximum permissible anode current is 63 mA and alteration to grid bias voltage, insertion or removal of the valve from its socket should not be attempted unless the power supply is first disconnected. Some conception of the characteristics of the valve can be gathered from the following table:—

Volts on Anode.	Approx. Anode Current mA.	Average Negative Grid Bias. Volts.
400	63	93
350	60	78
300	55	63
250	47	50
200	40	36

The mutual conductance of the valve is good, the normal slope being 2·3 mA/V; the impedance at 100 V with zero grid volts is 1 300 ohms. The amplification factor is 3·0.

Another valve introduced by the General Electric Co. is the P.2, recommended particularly for use in portable sets. This valve is specially designed to give the output of a super-power valve, with, at the same time, the least possible increase in h.t. current. With an h.t. voltage of about 100, and negative grid bias of about 6 to 7½ V, the anode current is said to be little more than that of an ordinary small power valve, while the quality of reproduction due to the low impedance and high mutual conductance of the P.2, will, it is claimed, be equal to that provided by a super-power valve working under the same h.t. conditions. If used in a table type of set working from 2 V batteries, in which super-capacity dry batteries or an h.t. eliminator can be employed, the new valve can operate a moving coil loud speaker if required.

An interesting demonstration of a new cleaning apparatus was recently given to our representative by AIR-WAY, LTD., of 15-19, Cavendish Place, London, W.1. The "Air-Way Sanitary System" is a combination of vacuum cleaner, blower and floor polisher, and the main features claimed for it are light weight, the absence of attachments and the elimination of the ordinary bag. The cleaner has a self-adjusting floor nozzle mounted on sprung wheels; agitators of Egyptian fibre are used, having diagonally crossed channels in the horizontal plane, disposed at angles of 45° with the direction of motion of the cleaner.

A special point possessed by the Air-Way is a glass window which serves the dual purpose of an indicator to show when all dust has been collected (since the stream of incoming dirt is claimed to be visible) and of acting as an interchange lever. The circular glass bears an arrow and by turning the cap the direction of suction is reversed. The machine can then be used as a blower by connecting a flexible tube in one position, or as a suction cleaner for dusting furniture, etc., by connecting the tube to another outlet the handle of the Air-Way is hollow and one method is to attach the tube to its top end. Suction or blowing force may be regulated by turning the dial to a greater or less degree. An attachment is provided for introducing disinfectants if desired, when the machine is used as a blower. The bag is eliminated by the provision of a replaceable container of cellulose fibre, which is destroyed when it becomes full of dirt. It normally becomes full after about a month of use, and 12 containers are supplied with the cleaner.

THE NATIONAL REGISTER.

Fifteen Names Added to List at Last Executive Meeting.

A MEETING of the Executive Committee of the National Register of Electrical Installation Contractors was held on May 2 when application for registration by electrical installation contractors numbered nineteen. Of this number one application was withdrawn and the Executive Committee declined three.

The names of the successful applicants, together with their addresses, are as follows:—

Fowler, John E., Corn Exchange Buildings, Market Street, Wakefield.

Cooper, Ernest, 1002, Stratford Road, Hall Green, Birmingham.

Kempster, Fred, 11, Edward Street, Bury, Lancs.

Outhwaite, Elijah A., 34, Wade Yard, Wade Lane, Leeds.

Prior, T., and Sons, 5, Blenheim Terrace, Leeds.

Baker, George Edward, 79A, York Road, Leeds.

Burdette and Co., Ltd., 5, Pocock Street, Blackfriars Road, London, S.E.1.

Carlisle, John, and Son, 28, Headingley Lane, Hyde Park Corner, Leeds.

Tipping, George O., 168, Cape Hill, Smethwick, Staffs.

Bartley, C. J., and Co., Ltd., 11, Queen Victoria Street, London, E.C.4.

Goddard, Walter G., Birmingham Road, Bromsgrove, Worcs.

Robson, Richard, 37, High Street, Willington, Co. Durham.

Western Engineering Co., 162, Stanley Road, Liverpool.

Hopkins, G., and Sons (Clerkenwell), Ltd., 40-52, Holloway Road, London, N.7.

Chapman, Lowry and Puttick, Ltd., electrical engineers, Haslemere.

THE E.D.A. AND AMERICA.

Representatives to Visit U.S.A.—Supply Undertakings Policy to be Studied.

THE British Electrical Development Association has decided to send Lt.-Col. W. A. Vignoles and Mr. H. T. Young to America. Col. Vignoles will study policy and public relations in the electricity supply industry in the United States and Mr. Young will investigate electrification of industry and applications in the daily lives of American citizens. Their reputations justify the belief that this visit, which will include attendance at the annual conference of the N.E.L.A., being held this year in San Francisco, will have the effect of accelerating electrical development in England.

Col. Vignoles' record includes the past presidency of the Incorporated Municipal Electrical Association and among his present duties are those of Director and Secretary to the British Electrical Development Association. He served his apprenticeship with Messrs. W. T. Goolden and Co., electrical engineers, and in 1893 he was in full charge of an electrical coal cutting installation at Durham colliery. For over twenty-five years he was electrical engineer to Grimsby Corporation. After the war he carried out a scheme for the extension of the Grimsby electricity works which he had submitted in 1914. Until then the whole of the supply had been d.c. His scheme provided for generation at 6 000 V alternating current resulting in a large reduction in the cost of generation.

Mr. H. T. Young is a member of the council of the E.D.A., the Illimunating Engineering Society and the Institution of Electrical Engineers. He is also an active member of the Electrical Contractors' Association. His firm, Troughton and Young, Ltd., has been established in the West End of London over twenty years. Mr. Young was trained in the contracting side of the industry and has a wide experience in all forms of electrical applications. He was one of the first to assist in placing radio equipment in the hands of the public. More recently he has done a great deal of successful pioneering in architectural lighting design and established the first showroom in Europe for the display of modern lighting fittings in a modern setting. (See page 629.)

THE SOCIAL SIDE.

THE St. Helen's Cable Co., Slough, football team has won the Slough Town Cup for the second year in succession. It has also won the championship of the Windsor, Slough and District League.

Ald. W. H. Perkins, president of the Oxford Electric Co.'s football club, at the annual dinner, presented the Married v. Single Cup to Mr. F. Jones, captain of the single men's team He also handed a fountain pen to the secretary of the club, Mr. S. Wright, and an attache case to Mr. W. Sumersford. The first eleven has tied for the second position in its division of the County league, and the second eleven has won seven and drawn one out of eleven matches.

Members of the Field Station Department of the Marconi Company, held the first annual reunion dinner at Romano's Restaurant, London, on April 25. This department was started in 1907 and in 1921 formed the basis of the present field and air division, and it is worthy of note that of the original members of the F.S.D., Col. J. E. Cochrane, Mr. C. E. Prince and Mr. R. D. Bangay were present. Out of about 50 members of the department, 24 were present at the dinner, which was followed by a concert arranged by Mr. A. B. Stapleton and contributed to by Mr. E. E. Hughes, Mr. F. Munnion, Mr. E. Praill and Mr. G. E. Daggett. It was unanimously resolved to form a Dinner Club of all ex-members of the department and to hold the dinner annually. In order to communicate with as many ex-members as possible, Mr. A. Shore, of Marconi House, Strand, would be glad to hear from any members not notified this time, owing to their present address being unknown.

ELECTRICAL BALLADS.

Some of our readers will remember the "Electrical Engineer's Ballad Book," which was published by Biggs and Co. in 1907 and is now out of print, and will be interested to hear that the CROYDON CABLE WORKS, LTD., of Mitcham Road, Croydon, Surrey, have published in handy pocket form a stiff-backed book containing a number of reprints of the original verses

TRADE PUBLICATIONS.

MESSRS. SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham, have published a new conduit price list, No.1 201.

Specification No. A. 504 relative to a.c. switchboards, flat back type, has been issued by CROMPTON PARKINSON, LTD., Guiseley.

A special leaflet dealing with the new "Philips Merchandiser" has been issued by PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2.

Specification No. A 608 dealing with instrument current transformers, ring type, has been sent to us by CROMPTON PARKINSON, LTD., Guiseley.

H. O. SWOBODA, INC., of 3 400, Forbes Street, Pittsburgh, Pa., have issued bulletin No. 190 dealing with "Falcon" furnaces and superseding No. 140.

The current monthly blotter of the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, illustrates the "Junior" table cooker.

White enamelled electric bath-room fittings are dealt with in list No. P.1390 just issued by FALK STADELMANN AND CO., LTD., 83/93, Farringdon Road, London, E.C.1.

The "Igranic" transverse current microphone and control unit is the subject of publication No. 6651 by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.4.

MR. ALAN WRIGHT, of 117, Victoria Street, London, S.W.1, has sent us a new leaflet dealing with "Inventum" immersion heaters with thermostatic control and loadings of 1 000, 2 000 and 3 000 W.

"Are you Ready for the Big Load?" is the title given to a new issue by the W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1, relative to "Isco" ironclad service cut-outs.

A new price list dealing with this season's fans has been published by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38/39, Upper Thames Street, London, E.C.4. The list is numbered 433 and supersedes No. 201.

The FULLER ACCUMULATOR CO., LTD., Chadwell Heath, Essex, has issued list No. 104 dealing with "Sparta" batteries, and list No. 105 showing suitable "Sparta" batteries for various makes of cars of different years.

The LIVERPOOL ELECTRIC CABLE CO., LTD., Linacre Lane, Bootle, Liverpool, has published catalogue No. L.E.C. 2, dealing with the company's new all-bakelite accessories for use in connection with the "Lecite" wiring system.

The March issue of "VES MITTEILUNGEN," issued by the Vereinigung Elektrotechnischer Spezialfabriken, of Berlin, a union of German electrical manufacturers, contains articles on the Leipzig Fair and on "Service to the Customer," Voigt and Haeffner's protective apparatus, Prometheus household heating and cooking apparatus; Ziehl-Abegg silent motors; Aron tariff meters; Garbe, Lahmeyer induction motors for tramways and railways; the manufacture of enamelled wires by the Deutsche Kabelwerke A.G.; Bayeruchi Elektricitäts Werke d.c. high tension generators; an enclosed distribution system, by the firm of F. Klockner; measuring instruments by Dr. Siegfried Guggenheimer Aktiengesellschaft; automatically controlled motor generators, by Lloyd-Dynamowerke A.G.; automatic cut-outs, by Nostitz and Koch; electromagnetic switchboard instruments, by Excelsiorwerk Rudolf Kiesewetter; Kolner accumulators; Hackethal cables; mirror galvanometers by Geb. Ruhstrat A.G.; Siefert Rontgen-ray metal-heating equipment, etc.

OVERSEAS TRADE.

Four Month Electrical Exports Exceed Imports by Over £3 250 000.

UNITED Kingdom exports of electrical apparatus, machinery and materials during April last amounted to £1 410 763, as against £1 674 149 during April, 1929, a decline of £263 386. Electrical exports for the four months of the year amounted to £6 414 171, as compared with £6 123 591 for the same months of 1929, an increase of £290 580.

Imports of electrical goods and machinery during April last were valued at £652 765, as compared with £543 237 during April, 1929, an increase of £109 528. Similar imports for the four months of this year amounted to £3 136 300, as against £2 222 172 during the corresponding period of last year, the increase being £914 128.

These figures show that during April electrical exports exceeded similar imports by £757 998, while during the four months exports were in excess of imports by £3 277 871.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

AMALGAMATED ANTHRACITE COLLIERIES, LTD.—Six months' supply of electrical goods, etc. Particulars from the Controller of Stores, Eagle Chambers, Swansea; stamped, addressed envelope to be sent.

GLOUCESTER CORPORATION.—Manufacture and supply of electric cooking apparatus, for the purposes of the Corporation's hire-purchase scheme. Further particulars from the City Electrical Engineer, Commercial Road, Gloucester.

GAINSBOROUGH URBAN DISTRICT COUNCIL, May 16.—Twelve months' supply of paper insulated, lead covered, double steel tape armoured l.t. cables; and single-phase and three-phase meters. Further particulars from the Engineer and Manager, Electricity Department, Lord Street, Gainsborough.

GLASGOW CORPORATION, May 16.—Six months' supply of electrical fittings to the public assistance department. Specifications, etc., from the Contracts Department, 266, George Street, Glasgow.

TOTNES CORPORATION, May 16.—Electric motor and centrifugal pump. Particulars from the Borough Engineer.

WARWICKSHIRE AND COVENTRY JOINT COMMITTEE FOR TUBERCULOSIS, May 16.—Supply of a.c. motors, switchgear, wiring, etc., at the King Edward VII Memorial Sanatorium, Hertford Hill, near Warwick. Specifications, etc., can be seen at the offices of Mr. A. B. Mallinson, consulting engineer, 44, Brazennose Street, Manchester, and will be supplied to contractors furnishing references of similar work carried out; deposit £2 2s.

CHERTSEY RURAL AND CHERTSEY, WALTON, WEYBRIDGE AND WINDLESHAM URBAN COUNCILS' HOSPITAL COMMITTEE, May 17.—Electric light installation at Ottershaw Isolation Hospital. Specifications from Mr. F. J. Wareham, clerk, Council Offices, West Byfleet, Surrey.

ECCLES CORPORATION, May 17.—Twelve months' supply of single phase house service integrating watt-hour meters. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Cawdor Street, Patricroft; deposit £1 1s.

SALFORD CORPORATION, May 17.—Transfer of existing X-ray apparatus and installation of new apparatus. Specifications from the Medical Officer of Health, 143, Regent Road, Salford.

EAST GRINSTEAD URBAN DISTRICT COUNCIL, May 19.—Supply and erection of second-hand Diesel oil engine, suitable for coupling to 320 kVA, three-phase, 50 period alternator. Tenders to Mr. G. E. Coldwell, Council Offices, London Road, East Grinstead.

ATHERTON URBAN DISTRICT COUNCIL, May 20.—Supply of one 200 kVA, single-phase, oil-cooled transformer, 2 400/240 V, 50 cycles. Particulars and form of tender from Mr. B. Darby, electrical engineer, at the Council's sub-station, Atherton.

BAKEWELL RURAL DISTRICT COUNCIL, May 24–31.—Electric light wiring aud accessories in 30 houses at Beeley, Youlgreave and Tideswell. Specification, etc., can be seen at the office of the Clerk until May 24.

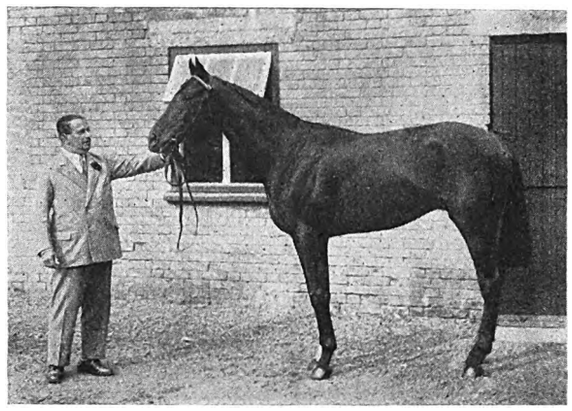
MANCHESTER CORPORATION, May 24.—Supply and erection of two rotary balancers, d.c. switchgear, cables, wiring, etc., at Haweswater, for the Waterworks department. Specification, etc., from the Engineer, Waterworks Offices, Town Hall, Manchester; deposit £2 2s.

MARGATE CORPORATION, May 24.—Electrically-driven booster pump set, with compression tanks, etc. Further particulars from the Borough Engineer, 40, Grosvenor Place, Margate.

LONDON COUNTY COUNCIL, May 26.—Supply, laying, etc., of cables at Blackwall Tunnel, in connection with new ventilating plant. Specification, etc., from the Chief Engineer, Old County Hall, Spring Gardens, London, S.W.1; deposit £1 1s.

EAST GRINSTEAD URBAN DISTRICT COUNCIL, May 27.—Supply and erection of 320 kVA, three-phase, 50 period 11 000 V alternator and switchgear, and 200 kW reversible rotary, complete with transformers and switchgear. Specification from Mr. G. E. Coldwell, Council Offices, London Road, East Grinstead; deposit £1 1s.

HULL CORPORATION, May 27.—Three 50-line, common battery, private branch telephone exchange switchboards. Forms of tender from the Manager and Engineer, Corporation Telephones Dept., Mytongate, Hull.



AS announced in our last issue, Sir Hugo Hirst's "Diolite," ridden by Fox, proved an easy winner of the Two Thousand Guineas at Newmarket on May 7. There was a field of twenty-eight runners, and "Diolite," seen here with Sir Hugo, is now favourite for the Derby.

OGMORE AND GARW URBAN DISTRICT COUNCIL, May 30.—Supply, erection and connecting up of about 2 000 route yards of 11 000 V overhead service line, with short lengths of interconnecting cables. Specification, etc., from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £1 1s.

PORTADOWN URBAN DISTRICT COUNCIL, May 31.—Supply, erection, etc., of eight sets of electric motors and pumps and automatic switchgears at three pumping stations. Specifications can be seen and forms of tender obtained at the offices of Messrs. Taylor and Wallin, 1, Saville Place, Newcastle-on-Tyne; deposit 10s.

BELFAST WATER COMMISSIONERS, June 4.—Electrically-operated pumping plant. Specification, etc., from the Secretary, Water Office, Belfast, deposit £1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of storage battery equipment, comprising emergency stand-by lighting storage battery, 15 kW motor-generator set, battery trickle charger, milking booster, and spare parts. Specification (No. 10) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of works supply sub-station 3 300 V and 400 V metal clad switchgear. Specification (No. 9) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

LIVERPOOL CORPORATION, June 6.—Installation of automatic telephone exchange at Central Police Station, Dale Street, Liverpool. Specifications from Mr. Walter Moon, town clerk, Municipal Buildings, Dale Street, Liverpool.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., May 16.—Supply of electrical fittings and materials. Specifications, etc., from the Company's Offices, 91, Petty France, Westminster, S.W.1, upon payment of 5s. (not returnable).

CAIRO MAIN DRAINAGE DEPARTMENT, May 17.—Supply of electric lamps, etc., for one year. Particulars from the Department, 2, Sharia Maleka, Nazli.

Digitized by Google

VICTORIAN ELECTRICITY COMMISSION, May 19.—Twelve months' supply of triple braided, h.d. copper aerial cable. (Reference B.X. 6 325.)

DUBLIN BOROUGH COMMISSIONERS, May 20.—One year's supply of electric lanterns for street lamps. Specification, etc. (5s.) from the Superintendent of Public Lighting, Tara Street, Dublin.

A NEW sales aid introduced by Philips Lamps, Ltd., of 145, Charing Cross Road, London, W.C. The equipment is called the "Philips Merchandiser" and as will be seen from the illustration, draws attention to lamps in particular.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 20.—Supply and erection of one 25 kVA, three-phase, 400/230 V, 50 cycle generator. (Reference B.X. 6 307.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20.—Supply of telegraph instruments (Schedule C. 579). (Reference B.X. 6 248.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., May 21.—Electric overhead travelling cranes. Specifications (10s., not returnable) from the company's offices, 91, Petty France, Westminster, S.W.1.

ANTWERP MUNICIPALITY, May 22.—Supply of a group air compressor, electric motor and petrol engine (cahier des charges No. 864). (Reference A.X. 9 567).

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22.—Supply of three electric horizontal centrifugal pumping sets piping, control switchboard, etc. (Reference A.X. 9 212.)

SOUTH INDIAN RAILWAY CO., LTD., May 23.—Supply of electric cables and wires. Specifications, etc. (5s.) from the company's offices, 91, Petty France, Westminster, S.W.1.

INDIAN STORES DEPARTMENT, May 26.—Two vertical and two horizontal centrifugal pumps, switchgear, etc. (Reference A.X. 9 416.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators, for Mangahao power scheme, section 215B. (Reference B.X. 6 300.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of cable clamps for 110 kV suspension insulators for, Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

GREAT SOUTHERN RAILWAYS CO., May 28.—Six or 12 months supply of electric cables (form No. 129), electric lamps (form No. 137), etc. Forms of tender (6d. each) from the Stores Superintendent, Inchicore, Dublin.

CAPE TOWN MUNICIPALITY, June 4.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

AUCKLAND HARBOUR BOARD, June 10.—Supply of submarine cable (contract No. 902). (Reference B.X. 6 354.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 12.—Supply of 2 000 V switch units and l.t. switchboards (tender No. 1 649). (Reference B.X. 6 365.)

BULAWAYO MUNICIPALITY, June 13.—One 5 000 kW turbo-alternator condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

MADRAS GOVERNMENT, June 15.—Complete electrical equipment of three 66/110 kV outdoor sub-stations, in connection with Pykara hydro-electric scheme. Specification (No. E.26) (price 30s.) and general conditions of contract (price 3s. 6d.) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4, on payment of the respective fees (not returnable).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of indicators (schedule No. C.588.) (Reference B.X. 6 333.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of multiple twin cable. (Reference B.X. 6 349.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of loading coil pots. (Reference B.X. 6 350.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 19.—Supply of metal-clad, 2 000 V switchboard, for Bloemfontein workshops sub-station (tender No. 1 657). (Reference B.X. 6 402).

INDIA STORE DEPARTMENT, June 23.—Supply and erection of 11 000 and 400 V a.c., and 220 V d.c. switchgear, power and control cables, etc., at Shanan power house. Forms of tender (£3 15s., not returnable) from the Director General, Belvedere Road, London, S.E.1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24.—Supply of 110 kV outdoor steelwork and switchgear for, Waitaki power scheme—section 71. (Reference B.X. 6 238.)

CAPE TOWN MUNICIPALITY, June 25.—Supply of single phase transformers (specification No. 495/1930). (Reference B.X. 6 378.)

EGYPTIAN MINISTRY OF THE INTERIOR, June 25.—Pumping machinery, electric motors, etc., for waterworks at Abou-Tig-Nekheila. (Reference A.X. 9 509).

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of condensers (P. and T. 151/2 240.) (Reference B.X. 6 308.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 8.—Supply of telephonists' telephones. (Reference B.X. 6 352.)

MELBOURNE CITY COUNCIL, July 9.—Supply of totally enclosed, metal-clad switchgear (specification No. 1 024). (Reference B.X. 6 401.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 17.—Supply of cable, switchgear and junction boxes. (Reference B.X. 6385.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 29.—Supply of auxiliary turbines and generating sets for Arapuni, power scheme.—section 305. (Reference B.X. 6 356.)

VICTORIAN RAILWAY COMMISSIONERS, July 30.—Supply and erection of turbo-alternators, condensing plant and control gear. (Reference B.X. 6 355.)

Tenders Accepted.

OLDHAM CORPORATION.—Union Cable Co., Ltd., supply of l.t. cable.

DUNDEE CORPORATION.—A. Westwood and Son, electrical work for one year.

CARLISLE CORPORATION.—Macintosh Cable Co., Ltd., supply of cables, £316.

MANCHESTER CORPORATION.—C. A. Parsons and Co., Ltd., two 750 kVA transformers.

Digitized by Google

AYR COUNTY COUNCIL.—Campbell Banks, electrical work in new County Council Buildings.

DARVEL CORPORATION.—M. and R. Young, electrical work in connection with housing scheme.

BARNSTAPLE CORPORATION.—F. Bickford, electric light installation at Albert Hall, £53 10s.

MALLING RURAL DISTRICT COUNCIL.—Drake and Fletcher, electric light installation at new offices, £40.

WORTH PARISH COUNCIL.—East Sussex Electricity Co., public lighting at Three Bridges with 36 lamps.

GENERAL POST OFFICE.—Fire alarm system, London County Council, Standard Telephones and Cables, Ltd.

DARTFORD URBAN DISTRICT COUNCIL.—Johnson and Phillips, Ltd., cable for equipment of transformer sub-station at Shepherd's Lane.

BRADFORD CORPORATION.—Armitage and Longbottom, electric light installation at Simon Convalescent Home, £244. (Recommended.)

HASTINGS CORPORATION.—Pinching and Walton, electrical fittings, £49 5s., and lamps, £8 11s., at Verulam Buildings. (Recommended.)

DARTFORD URBAN DISTRICT COUNCIL.—E. E. Beaven, wiring 14 council houses in Howard Road, £77 17s. 6d. (Recommended.)

BERMONDSEY (LONDON) BOROUGH COUNCIL.—Reliance Telephone Co., installation of intercommunication telephones at municipal offices.

FORFARSHIRE EDUCATION AUTHORITY.—J. E. Fenton, electric light and power installations at Arbroath High and Technical Schools.

MIRFIELD SUNDAY SCHOOL.—H. Senior, electrician's work in connection with erection of a Sunday School at Old Bank Road, Mirfield, £67.

CROYDON CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of cable-pressure testing set, estimated cost, £315. (Recommended).

PADDOCK CONSERVATIVE CLUB, HUDDERSFIELD.—A. E. Beaumont, electrician's work in connection with alterations and additions to club buildings.

LONDON COUNTY COUNCIL.—Alpha Manufacturing and Electrical Co., Ltd., supply of wireless apparatus to Northern Hospital, Winchmore Hill, £183.

EAST HAM CORPORATION.—Enfield Cable Works, Ltd., supply of high and low tension feeder cables, for Plashet sub-station, £4 548. (Recommended).

STOKE-ON-TRENT CORPORATION.—Craven District and Electrical Construction Co., Ltd., supply of overhead transmission lines for 12 months. (Recommended.)

WORCESTERSHIRE EDUCATION COMMITTEE.—Abell and Smith's Electrical Co., Ltd., electric light installation at Bredon School and teacher's house, £37 19s. 1d.

WATFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of sub-station kiosk, £183; W. T. Henley's Telegraph Works Co., Ltd., supply of cables for 12 months.

ASHBY WOULDS URBAN DISTRICT COUNCIL—Kemp Bros. (Coalville), electric light installation at houses at Albert Village, £2 2s. per non-parlour house, and £2 5s. per parlour house.

COLCHESTER CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., supply of cable, £13 042; Alfa-Laval Co., Ltd., supply of portable oil purifier, £90. (Both recommended).

SALFORD CORPORATION.—Bertram Thomas, electric light installation at Hope Hospital, £3 655 8s. 1d.; Glasgow Engineers, Ltd., provision of lifts at Hope Hospital, £1 578. (Both recommended).

MIDDLESEX COUNTY COUNCIL.—A. E. Dean and Co., supply of X-ray outfit for Park Royal Hospital, £219. (Recommended). Also tendered: Newton and Wright, £243; Watson and Sons, £226.

HALIFAX CORPORATION.—Bury Lighting and Heating Co., electrical work at new High School for Girls, £907; Craven and District Electrical Construction Co., Ltd., laying e.h.t. cable from Luddenden to Hebden Bridge, £3 055 11s. 6d.

WORCESTERSHIRE STANDING JOINT COMMITTEE.—Electric light installations at police stations: J. Ward, Ltd., at Evesham, £98 6s. 7d.; and at Stourport, £43 10s.; H. Burlingham and Co., at Harvington, £10; B. French, at Rednal, £20 17s. 6d.; Mr. S. Beard, at Romsley, £7 15s.

MANCHESTER CORPORATION.—Tudor Accumulator Co., Ltd., lighting battery replacements at City station.—Supply of electric cookers during next six months: Credenda Conduits Co., Ltd.; Jackson Electric Stove Co., Ltd.; Revo Electric Co., Ltd.; and Siemens Electric Lamps and Supplies, Ltd.

LONDON COUNTY COUNCIL.—Thos. Bolton and Sons, Ltd., copper bonds, £547; Pease and Partners, Ltd., insulator clips; Quasi-Arc Co., Ltd., and Premier Electric Welding Co., Ltd., electrodes; Marryat and Scott, Ltd., provision of electric goods lift at Stamford Hill Stores depot, £864 10s.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—Pirelli-General Cable Works, Ltd., supply and laying of three 1 000 V cables, with Bowden-Thompson protective shields, between generating station and Scrubs Lane sub-station, £27 742 3s.6d. (Recommended). Also tendered: Macintosh Cable Co., Ltd., £27 872 2s. 1d.; Enfield Cable Works, Ltd., £28 181 8s. 6d.; Standard Telephones and Cables, Ltd., £28 374 10s. 6d.; Siemens Bros. and Co., Ltd., £28 464 6s. 3d.; W. T. Henley's Telegraph Works Co., Ltd., £28 663 10s.

BIRMINGHAM CORPORATION.—United Electrical Co. (Birmingham), Ltd., installation of charging equipment, cables and wiring at electrical vehicle garage, Lifford; Rapid Magnetting Machine Co., Ltd., provision of electro-magnetic separator equipment, at salvage depot; Metropolitan-Vickers Electrical Co., Ltd., frequency changer and switchgear; Davison and Co., Ltd., works in connection with grit installation at Prince's power station; Ferguson, Pailin, Ltd., switchgear, at Handsworth and Saltley sub-stations; Sir William Arrol and Co., Ltd., electric crane, for Nechells gasworks.

LIVERPOOL CORPORATION.—English Electric Co., Ltd., supply of 12 1 000 kVA step-down transformers, £402 each; Ferguson, Pailin, Ltd., 33 000 V switchgear, for Pumpfields sub-station, £16 980; Switchgear and Cowans, Ltd., 6 000 V switchgear for Pumpfields sub-station, £18 974; 6 000 V switchgear for Lime Street district sub-station, £7 868; 6 000 V switchgear for Harrington Street sub-station, £8 486; Ferranti, Ltd., four 12 500 kVA transformers, for Pumpfields sub-station, £15 800; Ferguson, Pailin, Ltd., 33 000 V switchgear, £3 316; and two 33 000 V meter panels, £28 12s.; Mather and Platt, Ltd., two electrically-driven boiler feed pumps, with motors and control gear, for Clarence Dock power station, £3 522 17s.; C. A. Parsons and Co., Ltd., two 5 000 V transformers, £3 570; Cargo Fleet Iron Co., Ltd., 1 600 tons of Sandberg Silicon steel tramway rails, £11 5s. per ton; and 60 tons steel fishplates, £14 5s. per ton. Societé Anon. Des Usines and Acieries Allard, eight tons tramway fishbolts, £11 12s. per ton, and 80 tons steel tiebars, £11 3s. per ton; Hadfields, Ltd., tramway junctions, £723; Titan Trackwork Co., Ltd., tramway junctions, £692, and Edgar Allen and Co., Ltd., tramway junctions, £710 and £690; Mersey Welding Co. and Premier Electric Welding Co. (Mersey), Ltd., electric welding of 375 tramway rail joints, 11s. per joint, and re-treading rail surfaces, 1s. per in.

THE LEAD MARKET.

According to James Forster and Co., the market opened last week with a weak tone, May lead falling to £17 and forward to £17 2s. 6d. On Tuesday the opening was again flat at £16 15s. for forward, but at this point official support was given so that by Thursday May lead had risen to £17 10s. and August to £17 11s. 3d. Closing prices on May 9 were £18 for May and June, and £18 1s. 3d. for July and August, a rise of 15s. per ton on the week.

ELECTRICITY SUPPLY.

New Plant at Shrewsbury—Transfer of Godalming Undertaking—Buckie Supply Project—Growth of Demand in Winnipeg—Proposed Sale of Monmouth Undertaking—Sheffield to Supply Dronfield and Beighton—Eastbourne Extensions.

LONG Newton P.C. is to adopt electric street lighting at a cost of £300.

Bath City Council has received sanction to a loan of £20 000 for mains and services.

Coalville U.D.C. has withdrawn its objection to overhead cables in Charnwood Forest.

Plymouth Electricity Committee has obtained sanction for a loan of £7 687 for laying cables.

Maidstone T.C. has decided that the houses being erected on the Mote Park estate shall be all-electric.

Shrewsbury Corporation has approved proposals for extending the plant at the electricity works, at a cost of £9 400.

Southwark (London) Electricity Committee has approved estimates of £9 660 for new mains and £3 025 for renewals.

The output of the Canadian Hydro-Electric Corporation during the year ended March 31 last was 2 176 405 000 kWh, an increase of 40%.

Three new 10 000 kVA transformers are being installed at Blackpool electricity works to work in conjunction with the bulk supply from Preston.

The supply of electricity from Grimsby to Louth was commenced on May 5. During the week an electrical trades exhibition was held in the Town Hall.

The Aldershot Gas, Water and District Lighting Co. has applied to the Commissioners for authority to take over the Godalming undertakings of the Urban Electric Supply Co.

The Electricity Commissioners will hold an inquiry on May 27 into the application of Buckie T.C. for an Order to light the town and harbour electrically. The local gas company is offering opposition.

Hammersmith (London) Electricity Committee recommends the B.C. to authorise the carrying out of mains extensions, amounting to £63 884, for the relief of unemployment. The Unemployment Grants Committee has approved the payment by the Exchequer of 50% of the interest for 15 years.

Oldham Electricity Committee has decided that the rateable value system of charging for electricity be extended so as to include the dwelling-house portion of combined houses and shops, two-thirds of the rateable value of the combined premises (with a minimum of £10) being taken as representing such portion.

The annual report of the City of Winnipeg Hydro-Electric System records an increase of 11% in energy generated and purchased during the past year. Gross earnings exceeded $4 000 000 and surplus for the year reached the record figure of $310 478. The increase in domestic electricity per customer for the last four years is 53%.

A condition of the proposed wiring of the market stalls by Shipley electricity department was that all stallholders must use electricity. At the request of the Shipley Market Traders' Association, the scheme has been deferred.—The Engineer is to prepare a report upon the hire-purchase system in force in regard to electrical domestic appliances, especially as to the period for payment by instalments.

Monmouth Corporation gives notice of intention to apply to the Minister of Transport for approval of a proposal to transfer its electricity undertaking to the Monmouth Electricity Co., Ltd. The proposed purchase price is £15 900. The General Electric Co., Ltd., agrees to subscribe or obtain subscriptions for any capital required by the Monmouth Electricity Co. in connection with the undertaking.

The South Metropolitan Electric Light and Power Co. is to be asked to complete the lighting of the main Hastings Road in Lewisham on to the borough boundary. The Works Committee of the Lewisham Council recommends, as a result of its inspection of the recent gas and electric lighting experiments, that the Council should adopt high pressure gas lighting for all main roads in the borough over 50 ft. in width, with the exception of the roads at present lit or to be lit by electricity.

In accordance with a request from the Electricity Commissioners that constructional work should be expedited, in order to assist the Government in dealing with unemployment, Manchester Electricity Committee has approved a scheme to extend electric mains into streets where the demands are not at present likely to be remunerative. The cost, with substations, is estimated at £100 000. The annual debt charges will amount to £7 750, and the special grants receivable from the Government will amount to about £2 250 per annum for 15 years.

Chester Electricity Committee has received a letter from Manchester electricity department communicating resolutions passed at a conference of engineers, representing South-East Lancashire undertakings who still supply direct current, held for the purpose of constituting a common policy in regard to alterations to radio apparatus involved in changing over from d.c. to a.c. Chester has decided that consideration of the letter be deferred until the Commissioners have communicated the terms upon which they would be prepared to give consent to the change over.

At a recent meeting of the New Forest Association a resolution in opposition to the proposal to erect an overhead line in the New Forest area was discussed. After some discussion, the meeting passed a modified resolution to the effect that it was desirable where the line was to be carried overhead that it should be as near as possible to the railway; that if the expense was not prohibitive the line from the railway to Picket Post should be laid underground; that the grid ought to be kept close to the railway; that the matter was urgent and delay would be unfair to Ringwood and Burley.

The Electricity Commissioners are prepared to entertain an application by the Eastbourne Corporation to amend the present application for a Special Order to extend the area of supply to the parishes of Hailsham, Westham and Pevensey, by the inclusion of five further parishes, in lieu of requiring the Corporation to lodge a separate application in respect of such parishes. The Electricity Committee has approved of the adoption of the suggested procedure. The Committee has received sanction to borrow £11 332 for extensions of the distributing system and £11 430 for the supply of electricity to premises in Eastdean and Friston.

The purchase of the Buckfastleigh non-statutory undertaking by Torquay Corporation has now been completed. Steps are to be taken to maintain the supply from the existing works pending the completion of arrangements for a supply from the Newton Abbot station. The system of slot meters in Buckfastleigh is to be continued, and the Corporation will exercise its power to sell apparatus and fittings in that district. —The Urban Electric Supply Co. has offered to sell its Dartmouth and Kingswear undertakings to Torquay Corporation for the amount outstanding on capital account. The offer has not been entertained by Torquay Electricity Committee, and the company is to be informed that the Corporation is still willing to supply the Dartmouth undertaking in bulk.

At Sheffield Corporation's meeting on May 7, Ald. A. J. Blanchard moved the reference back of the proposal of the Electric Supply Committee to supply electricity to Dronfield and Beighton. He said they had no guarantee as to the demand. All they knew was that they were to spend £15 000 on the supply, and they had heard that they would receive something like £500 for the first year. Ald. T. H. Watkins said it would not be wise to ask for guarantees. Their experience was that where they could get hold of services in the environments of Sheffield it was an economic proposition for the city. Ald. Blanchard's motion was defeated, and the committee's proposal was adopted.—The existing sub-stations in Filey Street and Greystones Road are to be equipped with additional plant to enable an adequate supply of electricity to be given to the tramways, the cost being estimated at £15 820 for plant, mains and apparatus, and £2 350 for buildings.

Liverpool Tramways Electric Power and Lighting Committee is applying to the Commissioners for sanction to borrow £135 000 for the provision of equipment for the distribution of electricity energy from the new Clarence Dock station into the central area of the city. The estimated cost includes: switchgear, £81 000; plant, £40 000; buildings, £10 500; coupling up and contingencies, £3 500. The Clarence Dock Power Station Special Committee has obtained the consent of the Electricity Commissioners to the extension of the plant at the Clarence Dock station, by the installation of one three-phase 50-cycle turbo-alternator of 50 000 kW, m.c.r., with switchgear and auxiliary plant and extensions to buildings.

COMPANY NEWS.

British Electric Traction Dividend and Bonus—Ever Ready Co's Increased Profit—Expansion of Bournemouth and Poole Co's Output—Reports and Dividends.

GENERAL ELECTRIC shares during the past week have more than regained their recent fall, and a rise of over 4s. has brought the price up again to 51s. 3d. The other Transatlantic favourites have been comparatively firm, International Holdings remaining in the neighbourhood of 6⅜. Hydro Electrics easing only slightly to just under 47, Radio Corporation of America shares to a little over 50, and International Telephone and Telegraph stock to $64½. International Automatic Telephone shares have fallen from 35s. to 33s. 9d. Cables and Wireless issues are a point lower than a week ago.

The Electric Construction Company's ordinary shares have changed hands as high as 16s. 3d., and the price in the official list has been advanced from 11s. 3d. to that figure. The company's 7% cumulative preference shares have risen nearly 2s. to 21s. 3d. Crompton Parkinson 8% preference are 1s. 3d. up, at 23s. 9d. The leading cable manufacturers shares have shown weakness, Callender's, Enfield and W. T. Henley's each falling half-a-crown to £3 12s. 6d., £4 5s., and £6 10s. respectively. Telegraph Construction £12 shares have shed a point, to 21½. Associated Electrical Industries shares are quoted with the dividends deducted.

American Telephone and Telegraph capital stock has regained last week's fall, as also have Marconi International Marine shares, at 41s. 3d. Anglo-Portuguese shares are quoted just under 22s., ex rights.

Transportation shares have been quiet. Rio de Janeiro Tramway 50-year mortgage bonds, and Winnipeg Electric Company refunding mortgage have both risen a point, to 89½ and 87.

In the electricity supply section, Newcastle shares have regained the 6d. lost last week, and County of London 6% preference, Edmunson's 7% preference, and Westminster ordinary shares are likewise all 6d. to the good. Calcutta Supply ordinary shares have shed another 1s. 3d., as also have Bournemouth and Poole.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Directors have decided to offer 143 515 £1 ord shs. at par to ord. and "A" ord. shhldrs. in proportn. of one new sh. for every 5 held.

TRANSFER OF GERMAN COMPANY'S SHARES.—It is reported that the International Standard Electric Corporation has purchased from Philips' Glowlampworks, Ltd., its hldg. of 70% of the sh. cap. of the Lorenz Co., Berlin.

CAWNPORE ELECTRIC SUPPLY CORPORATION, LTD.—Net rev. for 1929, after mtg. deb. int., £79 944, agst. £75 063. To depreciatn. and renewals acct., £27 500; to gen. res., £2 500, to income tax acct. £4 000 and to deb. sinkg. fund, £7 827. Fin. div. on ord. shs. 7%, makg. 10% for year.

BRITISH ELECTRIC TRACTION CO. LTD.—Pft. subject to audit, for year ended March 31, 1930, £253 081 agst. £196 995. Cash div. of 5%, less tax, on dfd. ord. stk., and bonus of 10% in fully-paid £1 dfd. ord. shs., recommended (same rate as last year). Hldrs. of 6% cum. participatg. pref. stk. will receive further 1·89% by way of participatg. div. makg. 7·89% for year. Blce. of £65 547 added to undivided pfts. acct.

PETERBOROUGH ELECTRIC TRACTION CO., LTD.—Rev. for 1929, £79 074, increase £16 481. After provisn. for exes. and placing £10 500 to renewals acct., net pft. was £4 839, agst. £4 309. Div. on ord. shs. 5%, agst. 10%. Fwd. £5 557, agst. £4 232. L. and N.E. and L.M. and S. Railway Companies have acquired a joint int. in company equal to that of Tilling and British Automobile Traction.

EVER READY CO. (GREAT BRITAIN), LTD.—Rpt. states that pft. for year ended March 31, 1930, was £244 555, increase £34 388. Fin. divs., as announced in our issue of May 2, make 10% and 35% for year on pref. and ord. shs. respectively. To res., £30 000; to donatns. and staff benevt. fund, £1 272. Fwd. £34 000. Directors propose to increase cap. to £1 000 000 by creatn. of 1 000 000 5s. ord. shs.

NORTH SOMERSET ELECTRIC SUPPLY CO., LTD.—Rpt. for 1929, adopted at the recent gen. mtg., states that rev. was £68 519, agst. £51 856, and net pft. £23 522, agst. £17 585. Electy. supplied was 7 097 250 kWh, agst. 6 329 109. Div. on ord. shs., 7%, less tax; fwd., £1 458. Company has acquired practically whole of issued shs. of Burnham and District Electric Supply Co. and Mid-Somerset Electric Supply Co. These companies will be continued as separate undertakgs., but as a portn. of company's scheme. Arrangements are being made for extendg. supplies to Somerton and Langport district.

LOTS ROAD POWER HOUSE JOINT COMMITTEE.—The committee has informed hldrs. of Metropolitan District and London Electric Railways joint power house rent charge stk. that expansn. of the train service on the Underground Railways has increased demand upon power house, which necessitates certain additns. to plant. Extensns. and improvemts. are estimated to cost £1 350 936, of which £682 234 is chargeable to reserves and £668 702 to cap. The cost chargeable to cap. has been met to extent of £173 428 out of proceeds of last issue of rent charge stock. To provide for remainder of cost chargeable to cap. and also for exes. of issue, it is proposed to issue further amount of power house 4% rent charge stk. (not exceedg. £675 000 nom. value).

BRUSH ELECTRICAL ENGINEERING CO., LTD.—After providg. for gen. charges, maintenance of plant and bldgs., int. on deb. stks., income tax, and £16 289, for depreciatn. of bldgs. and plant, the net pft. for 1929 was £58 988. To gen. res., £5 413; to div. (10%), £48 743; further int. on prior lien second deb. stk., £2 044; to surplus acct. for apportionmt. between stkhldrs. and co-partners, £2 787. During year £5 360 has been distributed out of undivided pfts. acct. The members elected to receive £2 971 in form of fully-paid ord. stk. at par, and £2 389 was paid in cash. After deductn. of £5 360, and additn. of members' proportn. of surplus for 1929 (£490), undivided pfts. acct. stands at £77 947. Out of £9 839 allocated to co-partners in respect of surplus of year 1928, £8 058 was taken in form of fully-paid ord. stk. at par. Fwd. £77 947. Issued sh. cap. now stands at £487 430 and gen. res. at £260 218.

CANADIAN HYDRO-ELECTRIC CORPORATION, LTD.—Second ann. rpt. states that gross rev. for 1929 was $6 855 778, agst. $4 367 393 for 1928; net earngs. available for divs. amtd. to $991 882, agst. $776 063. Four qrtrly. divs. of 1¾% had been paid on 6% 1st pfd. stk. Peak load on corporation system for 1929 was 518 900 H.P., compared with 383 300 H.P., and output increased by 800 985 000 kWh to 2 097 793 000 kWh. Pendg. delivery of full amt. of 505 000 H.P. as primary power, surplus is being sold at secondary power rates for mfre. of steam by electricity. Earngs. reflect sale of only 250 000 H.P. primary power in first part of year, with increase to 324 000 H.P. effective for last three months. Increase in producth. was, in great part, due to largely increased deliveries of power to Hydro-Electric Power Commission of Ontario under its two contracts. Under the larger contract the Commission agreed to purchase 130 000 H.P. by October, 1931. Actually 150 000 H.P. was taken from October, 1929. Under second contract, which calls for delivery of an ultimate total of between 60 000 and 100 000 H.P., Commission is now taking 12 000 H.P. Initial stage of company's construction programme on Gatineau river was completed during 1928, and in 1929 Gatineau river generatg. statns. were physically interconnected with company's plants on other of lower Ottawa river tributaries, by a h.t. line from Gatineau, Quebec, to Calumet, Quebec, and Hawkesbury, Ontario. The large additional block of power to be taken in October, 1930, by the Hydro-Electric Power Commission of Ontario has necessitated provisn. of second 220 000 V line from Pangan generatg. statn. to a point on Ottawa river near Chats Falls. The line will be completed during coming season.

Company Meetings.

OSWESTRY ELECTRIC LIGHTING AND POWER CO., LTD.—At the final meeting of this company, whose undertaking has been bought by Oswestry Corporation, the chairman, Mr. Philip Minshall, announced the receipt of a cheque for approximately £20 000 from the Corporation, and said shareholders would probably receive 30s. for each £1 share. A liquidator was appointed.

PYE RADIO, LTD.—Sir Thomas A. Polson, presiding at the meeting on May 1, said trading profit and interest for year ended March 31, 1930, was £71 510. Net profit was £62 686. They were the largest independent British manufacturers in the radio industry. It seemed safe to predict a very prosperous future for the company. They had several interesting designs coming forward, including a talking picture amplifier. Mr. R. M. Ellis said the sales for April 1930 considerably exceeded the figure for April 1929.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—At the recent meeting Mr. R. B. Renwick read the speech prepared by Sir Harry Renwick (who was absent), in which he stated that receipts increased by over £6 000 in the past year, but that increase was extinguished by the increase of over £7 500 on the other side of the account, nearly the whole of which was represented by increased rates and taxes, which accounted for no less than £7 000. It was proposed to pay a dividend of 11%, the same as for last year. The company's new assessment had been increased, under the Rating and Valuation Act of 1925, from £1 976 to £15 165, and this militated against the possibility of reduction of their supply charges. New connections and units sold showed a very satisfactory increase, and the figures for the first three months of this year were also satisfactory and justified them in anticipating a good year. A large amount of the area had already been changed over from direct to alternating current. The report and accounts were adopted.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Lord Meston, presiding at the meeting on Monday, said in spite of the general political unsettlement and a good deal of labour trouble in other industries, the Corporation work of providing material comfort and industrial power had continued almost unchecked. They had sold 170 000 000 kWh during the year, against 148 000 000 in 1928, they had erected 17 miles of new overhead cables, and laid down 58 miles of new underground mains; 2 848 additional houses had been connected, and the demand for minor domestic services, cooking, refrigerating, etc., had been encouraging. The increased revenue had been discounted to some extent by an important concession to the consumer—namely, that from July 1 that section of their tariff for h.t. power which was based on the kilowatts of maximum demand, had been reduced by roughly 10% all round. They had within the last few weeks issued privately through Messrs. Robert Fleming and Co., on favourable terms, a block of 220 000 preference shares. It was hoped to issue, certainly before this time next year, and probably a good deal earlier, a substantial amount of ordinary shares, which it was their intention to offer to existing ordinary shareholders. The report was adopted, and the preference dividend and the final dividend on the ordinary shares, making 12% for the year, plus a cash bonus of 5d. per share, was approved.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Lord Erskine, presiding at the meeting on May 9, in the

Digitized by Google

unavoidable absence of Sir Harry Renwick, read the speech prepared by the latter, in which it was stated that units sold during 1929 were 15 526 668, increase 2 159 922, and new business secured amounted to 4 562 kW, making 36 912 kW connected. Total receipts were £277 066. It was proposed to distribute a final dividend of 9% on the ordinary shares, making 15% for the year, and leaving £7 798 to be carried forward. The total reserves, including the carry forward, amounted to £416 303. The company's new assessment for rates had been increased from £19 174 to the enormous figure of £46 797. There appeared to be no settled practice or formula for arriving at the new assessments, and the subject called for a thorough overhauling. It seemed to him that some system of adjustment should be adopted as between local rating and supply charges. Negotiations were still going on with the local authorities regarding an extension of the company's tenure, and he had faith in the local authorities to do the right thing for all concerned, notwithstanding the complications involved and the delays that had taken place. He referred, of course, to areas over which the local authorities had the option to purchase in 1932 and 1941, but they had other areas outside the borough, and further extensions were pending for areas adjoining, thus consolidating their present area, so that their eggs were not all in one basket. The new undertakings which they acquired last year had made substantial progress. There was an increase during the first three months of this year of over 50% in the kilowatts applied for. The report and accounts were adopted.

British Power and Light Corporation (1929), Ltd.—Mr. H. A. Vernet, presiding at the first ordinary general meeting on May 6, said the balance of profit and loss account was £20 535, which it was proposed to carry forward. The results had fallen short of the expectations formed at the time the corporation was launched. The time required to expand the sales of current had proved greater than was anticipated, while an unusual lack of rainfall from January to July last year caught the North Wales Co. short of water reserves, and caused an increase in that company's expenses. Current sold by the North Wales Power Co. to general consumers, as distinguished from the Aluminium Corporation, totalled slightly over 46 000 000 kWh., against rather over 41 000 000 in 1928, while the English distribution companies sold just on 1 000 000 kWh. As to the English companies; the trouble was to be attributed not to a lack of demand but to difficulties and delays in connection with various matters, such as wayleaves. Given time, the original estimates of sales should be found conservative. A depreciation account had been instituted as from May 1, the date on which they took over the North Wales Power Co., and there had been placed to this account from profits the sum of £14 992, while £5 000 had been transferred from profits to a special renewals fund. It was computed that the loss due to the drought was approximately £17 000. Their reserves of water at the beginning of this year were the equivalent of 5 000 000 kWh more than at the beginning of 1929, and on March 31 last the water storage was equivalent to 8 000 000 kWh more than at the corresponding date last year. Electricity Distribution of North Wales and District sold 85% more electricity than in the previous year. The report and accounts were adopted.

South Wales Power Co., Ltd.—Mr. W. North Lewis, presiding at the meeting on May 9, said the gross profit of the Parliamentary company (the South Wales Electrical Power Distribution Co.) for the past year was £93 666, against £89 060, which enabled it to meet its debenture interest and preference dividend, to transfer £15 000 to depreciation reserve, and to hand over to the South Wales Power Co. £8 331, against £3 724 in the previous year. The income of the South Wales Power Co., which the balances received from the Parliamentary company enabled it to meet in full its debenture interest and sinking fund, preference dividend, directors', trustees' and auditors' fees, with a balance over of £3 171, against £477 for the previous year, which the directors recommended should be carried forward, thus increasing the balance forward to £24 354. Sales of electrical energy had risen from 65½ million to over 76 million kWh, this being a record to date. Within the past year the company had put into commission the new 25 000 kW generating plant at the Treforest power station, and this new plant had been in use for less than half of the year, but the weight of coal consumed per kWh of electricity had been reduced by 10%. Cost of generation compared with the previous year was reduced by nearly 17%. With the addition of this new unit, the total up-to-date plant capacity of the station now amounted to 62 000 kW. The increase in the company's business was represented by 940 new consumers. In the areas in which the company held Electric Lighting Orders the number of consumers had increased by 11½% and electricity sold to them by 22%. During the year they had put into use a travelling showroom, which had proved an attractive method of advertisement. The proposals of the Central Electricity Board for South West England and South Wales were now available. It was anticipated that this seventh national scheme would be adopted by the Board in a few weeks, and they had reason to understand that the Treforest station would become a selected station under the scheme. The report and accounts were adopted.

New Companies.

Thompson and Dean, Ltd.—Cap., £1 000. Theatre furnishers, electrical contractors, etc. Reg. Office: 38, Hurst Street, Birmingham.

City Sign Co., Ltd.—Cap., £200. Manufacturers of glass, electric and other signs, reflectors, etc. Reg. Office: 49, Red Lion Street, Clerkenwell, London, E.C.1.

Electricity Distribution Co., Ltd.—Cap., £10 000. Electric light company, etc. Solicitors: Last, Riches and Fitton, 18, Bolton Street, London, W.1.

Electric Hammers, Ltd.—Cap., £1 000. Electric hammer manufacturers, electricians, electrical engineers, etc. Reg. Office: 160, Piccadilly, London, W.1.

Shardlow Electric Wires, Ltd.—Cap., £1 000. Manufacturers of electric wires and cables, etc. A director: C. A. Smith, 39, Melton Road, West Bridgford, Nottingham.

Weston Electric Lamp Co., Ltd.—Cap., £1 500. To acquire the business of merchants of lamp and other electrical appliances heretofore carried on by Weston Electric Lamp Co. at 35, Hatton Garden, London, E.C.

Rich and Bundy, Ltd.—Cap., £1 000. To acquire business of electrical engineers and transformer manufacturers now carried on at 13, New Road, Ponders End, Middlesex, by A. I. Rich and A. H. Bundy, as "Rich and Bundy."

British Sweeper Stores, Ltd.—Cap., £1 500. Dealers in, and manufacturers of, electrical and other sweepers, electric or other irons, kettles, heaters, radiators, lamps, etc. Reg. Office: 5, Gray Street, Oxford Street, London, W.1.

H. Evans Electrical Fittings Co., Ltd.—Cap., £1 000. To acquire business of dealer in electrical appliances, etc., heretofore carried on by H. Evans at 7, Charlotte Street, Fitzroy Square, London, W.1, as Evans Electrical Fittings Co.

British Electric Welding Machines, Ltd.—Cap., £20 000. Manufacturers of, and dealers in, electric resistance welding machines, manufacturers of, and dealers in, electric motors and generators, etc. Solicitors: Restall, Round and Gloster, 21, Waterloo Street, Birmingham.

Claude-General Neon Lights, Ltd.—Cap., £218 000. To adopt agreement with Georges Claude, A. G. für Elektrizitats Industrie and the General Electric Co., Ltd., to carry on the business of manufacturers of, and dealers in, illuminated signs, lamps, tubes and other apparatus for electric or other lighting, etc. Solicitors: Wild Collins and Crosse, Kennan's House, Crown Court, London, E.C.2.

COMING EVENTS.

Friday, May 16 (To-day).

Electrical Association for Women.—Fifth Annual Conference. Visit to Messrs J. Lyons and Co.'s Factory at Greenford, 10.30 *a.m.*; ball at the Park Lane Hotel, London, 9 *p.m.* to 2 *a.m.*

Institution of Electrical Engineers (Scottish Centre).—Technical College, Dundee. Twenty-first Kelvin Lecture by Mr. R. H. Fowler, F.R.S., on "Some Recent Advances in the Electron Theory of Metals." 7.30 *p.m.*

Saturday, May 17.

Institution of Electrical Engineers (London Students' Section).—Visit to the Brookmans Park Regional Station of the British Broadcasting Corporation. 2.30 *p.m.*

Association of Mining Electrical Engineers (South Wales Branch).—Esplanade Hotel, Porthcawl. Annual meeting. 5.30 *p.m.*

Wednesday, May 21.

Institution of Electrical Engineers (North Midland Students' Section).—Whole day visit to Hope Cement Works, by invitation of Messrs. G. and T. Earle, Ltd., of Hull.

Overhead Lines Association.—I.E.E. Building, Savoy Place, Victoria Embankment, London. Paper by Mr. G. W. Molle on "Corrosion." 5.30 *p.m.*

Polytechnic Electrical Engineering Department.—307-311, Regent Street, London. Lecture III (Course of six lectures), by Mr. W. H. Date, on "Thermioni Valves." 6.30 *p.m.*

Thursday, May 22.

Batti-Wallahs' Society.—Hotel Metropole, Northumberland Avenue, London. Luncheon. 12.30 for 1 *p.m.*

Friday, May 23.

Physical Society.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington, London. Discussion on "Magnetism," opened by Sir Alfred Ewing, with a contribution on "Ferro-Magnetism and Hysteresis." 3-4.30 *p.m.* and 4.30 to 5.15 *p.m.*

Royal Institution.—21, Albemarle Street, London. Paper by Mr. R. S. Whipple on "Some Scientific Instrument Makers of the 18th Century." 9 *p.m.*

Friday, May 23—Monday, May 26.

Institution of Electrical Engineers (Western Centre).—Sedbury Park Hotel, near Chepstow. Summer meeting.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BURNSTON, Mr. P., trading as HARPER ELECTRICAL CO., 30, Durward Street, E.1, electrician. £21 9s. 4d. February 13.

CURTIS MANUFACTURING CO., 30, Barden Road, Tonbridge, electrical engineers. £17 13s. 4d. March 20.

EADE, Jas., and SON, 48, New Road, Skewen, electric engineers. £10 1s. March 4.

EVERITT, Charles J., 248, High Street, Plumstead, wireless dealer. £12 7s. 8d. February 24.

HEATHERINGTON, Mr. R. W., 56, Fowter Street, South Shields, wireless dealer. £20 11s. 6d. March 20.

MULLIGAN, Laurence Alfred, GILLIVER, Frederick Herbert, 31a, Warwick Street, S.W.1, electricians. £13 2s. 6d. February 27.

SCHOLEFIELD, Mr. H., The Arcade, Waterfoot, master electrical engineer. £10 9s. 1d. March 14.

SIMKINS, Mr. F. W., trading as CORNER CABINET WORKS, Roxeth, Corner, Harrow, wireless dealer. £20 2s. 7d. March 17.

STIRLING RADIO CO., Station Stores, 183, High Road, Dagenham, dealers. £15 12s. 1d. March 26.

SULLIVAN (H. W.), LTD., 72, Leo Street, Peckham, electric engineers. £10 5s. 11d. March 19.

Deed of Arrangement.

HIRST, Richard Bows (dairy company's manager), trading as "FORWARD" ELECTRO-PLATING CO., St. Peter's Mills, Park Lane, Leeds. Dated May 1, filed May 7. Trustee, A. V. Lynas, Hylands Buildings, Wood Street, Wakefield. Liabilities unsecured, £985; assets, less secured claims, £138.

Receiverships.

RAVEN (PETER) AND CO., LTD. A. W. Watson, of 5, Waterloo Street, Birmingham, was appointed Receiver on April 10, 1930, under powers contained in debentures dated November 7, 1929.

ROSEWARNE (T. V.), LTD. S. W. King, of 32, Matheson Road, Kensington, W., was appointed receiver and manager on April 28, 1930, under powers contained in mortgage or charge dated March 28, 1925.

UBIQUE CONSTRUCTION CO., LTD. E. Hard, of 23, 24 and 25, Billiter Street, E.C., was appointed Receiver of the moneys due and payable to the company by the Manchester Corporation under a contract made on or about May 20, 1929, by Order of Court dated April 7, 1930.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

DALWIN, LTD., London, E., gramophone, motor and wireless dealers.—Registered May 3, £700 debenture, to L. J. C. Goodall, 55, Fore Street, E.C.; general charge.

HARMONIC RADIO CO., LTD., Nottingham.—Registered, May 3, £400 debenture, to Mrs. E. E. Kynaston, 172, Trent Boulevard, West Bridgford; general charge.

HUNT (JOHN A. H.), LTD., Birmingham, gas and electrical fitting manufacturers.—Registered April 25, £350 debentures, part of £5 000; general charge.

NORTHAMPTON RADIO, LTD.—Registered April 25, £200 debentures, to S. G. Crimes, 150, Southampton Row, W.C.; general charge.

ROLYAT ELECTRICAL CO., LTD., London, S.W.—Registered April 29, £1 000 debenture to Mrs. M. D. Taylor, 11, Furzedown Market, Tooting; general charge.

RUSKIN ACCUMULATOR SERVICE, LTD., London, N.—Registered April 29, £140 debenture, to G. G. Portch, 111, Queens Road, Buckhurst Hill, and another; general charge. *Nil. June 24, 1929.

WESTON ELECTRIC LAMP CO., LTD., London, E.C.—Registered May 1, £800 debentures; 2nd general charge.

WORTEX MANUFACTURING CO., LTD., London, E.C., electrical engineers.—Registered April 30, £4 000 1st debenture, to T. N. Bessunger, 26, Palace Court, Finchley Road, Hampstead; general charge. *£2 000. December 31, 1928.

WESTON ELECTRIC LAMP CO., LTD., London, E.C.—Registered April 22, £396 15s. debenture, to Universal Electric Lamp Co., 89, Great Eastern Street, E.C.; general charge.

Satisfaction.

ABINGDON ELECTRIC SUPPLY CO., LTD.—Satisfaction registered April 25, £2 500, registered July 5, 1925.

London Gazette, etc.

Winding-up Petitions.

K. N. ELECTRICAL PRODUCTS, LTD. A petition for winding-up has been presented by Marconi's Wireless Telegraph Co., Ltd., Marconi House, Strand, London, W.C.2; and is to be heard at the Royal Courts of Justice, Strand, London, on May 26.

PETO-SCOTT CO., LTD.—A petition for winding-up has been presented by Philips Lamps, Ltd., 145, Charing Cross Road, London; and is to be heard at the Royal Courts of Justice, Strand, London, on May 19.

RECORDAPHONES, LTD.—A petition for winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, on May 19.

Companies Winding-up Voluntarily.

BATTERY SUPPLIES, LTD.—By reason of its liabilities, May 2. R. Davies, certified accountant, 4, King Street, London, W.6, appointed as liquidator.

BORDER ELECTRICAL FACTORING CO., LTD.—By reason of its liabilities, April 24. T. E. Williams, 14, Lowther Street, Carlisle, incorporated accountant, appointed as liquidator.

OSWESTRY ELECTRIC LIGHTING AND POWER CO., LTD. By special resolution, May 6. G. N. Sinclair (of the firm of Garner, Pugh and Sinclair), Prudential Chambers, Oswestry, incorporated accountant, appointed as liquidator.

PETO-SCOTT CO., LTD.—Meeting of creditors at Incorporated Accountants' Hall, Victoria Embankment, London, W.C.2, Thursday May 15.

Bankruptcy Information.

RICHARDS, Sydney Ernest, and NEILSON, Alan Kelson, trading as RICHARDS AND NEILSON, 182, Tulse Hill, London, S.W.2, wireless and electrical engineers. First meeting, May 16, 11.30 a.m. and public examination, June 17, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

WILEMAN, Norman Arthur, trading as A. WILEMAN AND CO., 141, Commercial Street, Maesteg, Glamorgan, electrical engineer and contractor. First meeting, May 16, 12 noon, 34, Park Place, Cardiff. Public examination, June 19, 11.30 a.m., Court House, Wyndham Street, Bridgend.

Notice of Dividend.

HOBSON, Joseph, electrical engineer, Cross Street, Pendleton, Salford. First and final dividend, 1s. 11½d. per £, payable, May 19, Official Receiver's Offices, Byrom Street, Manchester.

Notices of Intended Dividends.

JACKSON, John Harold, Dock House, Winsford, Chester, electrical engineer. Last day for receiving proofs, May 26. Trustee, C. J. Pyke, 12, Lonsdale Street, Stoke-upon-Trent, Official Receiver.

MADDOX, Victor Frederick, 6, Homend Street, Ledbury, Hereford, electrical and wireless engineer. Last day for receiving proofs, May 28. Trustee, O. B. Wallis, 133, Saint Owen Street, Hereford, Official Receiver.

Bankruptcy Proceedings.

DOBBING, Anthony Chapman, and ROTHERY, Arnold Lloyd, (trading as THE RIPON ELECTRICAL COMPANY), 39, Kirkgate, Ripon, Yorks., electrical engineers. The public examination of these debtors was held on May 9, at Harrogate, when a statement of affairs was produced showing liabilities expected to rank at £810, against assets of £89, a deficiency of £721. Debtor Dobbing said, in reply to questions, that he commenced trading in February, 1928 in partnership with another. That was a failure and was dissolved in June of the same year. The debtor continued trading, and in November was joined in partnership by debtor Rothery. Under the partnership deed, the latter was to put in £250. The former did not contribute any money, but the building and goodwill were assessed at £500. He was to receive two-thirds of the profits, and Rothery one-third. The debtor Dobbing said that he had put the £250 into the bank. The business, he said, had never paid its way owing to lack of capital, and the delay in laying the main cables. They had expected to get a lot of work, most of it relying upon the Ripon Corporation laying cables. Between the commencement of the partnership in November, 1928 and April 10, 1930, they had incurred liabilities to the extent of £809, and the whole of the £250 contributed by Rothery had gone. Debtor Dobbing said that his sister had advanced him £250, and friends £50 or so. At the time of filing the petition, the stock in trade and fixtures was put down at £80. Debtor Rothery was next examined, and he said that his father had given him the £250 to put into the business. He had not known anything about the concern. He had no personal debts. The hearing was concluded.

The Bodleian Library

Built between 1450 and 1480, this world-famous library has, for over three hundred years, been without artificial light.

So valuable are the contents that, until to-day, the risk of fire forbade the use of any lights.

But now electric light has been installed and in such a way as to make the possibility of a fire non-existent.

The wires chosen for this installation, unique in the history of electric wiring, were the famous

Retrospect.

IN view of the fact that the foundation of the firm of BENN BROTHERS, the present proprietors of this journal, virtually coincided with the beginning of the electrical era, it seems specially appropriate that the family of periodicals controlled by this firm should include a newspaper which has been so intimately associated with electrical progress in all its branches. Like the Institution of Electrical Engineers, which originated as the Society of Telegraph Engineers, THE ELECTRICIAN was at first mainly concerned with telegraphy, which, with electric bells and electro-plating, long remained almost the only commercial uses of electricity. But a year or two before JOHN BENN founded "The Cabinet Maker" in July, 1880, a great forward movement in the application of electricity was beginning to take shape. The dynamo and the arc lamp, closely followed by the invention of the carbon filament lamp by Swan and Edison, had initiated a revolution in the artificial production of light, and the first telephone exchange had just been installed in London.

Not the least interesting part of the story told in the Special Jubilee Supplement included in this week's issue of THE ELECTRICIAN will be found in the section dealing with the part played by this journal in some of the great electrical controversies of the closing quarter of the nineteenth century. Mention may be made of the support accorded by C. H. W. BIGGS, then editor, to that eccentric genius, OLIVER HEAVISIDE, which has been characterised by Mr. ROLLO APPLEYARD, in his recently published "Pioneers of Electrical Communication," as "the finest action to the credit of technical literature in our time." The publication in 1894 of Dr. (now Sir) OLIVER LODGE'S treatise on "Signalling Across Space Without Wires," and the subsequent championship of LODGE'S claims in the long controversy which ended with the acquisition by MARCONI of the Lodge patent in 1911, was another notable instance of courageous editorial policy. Time brings its revenges and within the past few months we have found it necessary to suggest that the larger organisation of which the Marconi Company now forms part has not been altogether fairly treated by the Government in connection with the development of long-distance radio telephony.

It seemed fitting on this occasion to ask Col. Sir THOMAS PURVES, as President of the Institution of Electrical Engineers and Chief Engineer of the Post Office, and Col. R. E. CROMPTON, the *doyen* of the electrical industry in this country, whose years sit so lightly upon him, to contribute special articles. Sir THOMAS PURVES surveys the growth of telephony in this country from the opening of the Coleman Street exchange (the first to be established in Great Britain), in 1879, to the automatic switching system that is gradually abolishing the human element except for special duties in connection with trunk and international calls. In the past fifty years we have passed from the stage when intercommunication between subscribers in one restricted area was the limit of achievement to the new era, as yet in its infancy, of trans-oceanic radio telephony linking the Antipodes and bridging thousands of miles between ships and shore In fact, to-day the obstacles to vocal communication between any two persons, however widely separated, are financial rather than technical. Col. CROMPTON, who played a pioneering part in the development of electricity supply, recalls the early difficulties, both technical and legislative, which had to be overcome before house to house supply of current became practicable. Now the case is altered and attention is largely concentrated on how to stimulate a larger demand for the current that is so plentifully available. Col. CROMPTON has had a great deal to do with both aspects of the supply problem and we are particularly indebted to him for his ready compliance with our request that he should favour us with an article covering his half-century of active effort in the development of electric supply and manufacturing.

Current Topics.

E.A.W. Conference.

LAST week the Electrical Association for Women held its fifth annual conference, the business part of the occasion being supplemented by several very successful social gatherings, to which reference is made elsewhere in this issue. The E.A.W., in its five years of vigorous life, has grown into an organisation of more than 4,000 members, with branches all over the country, as Sir FELIX POLE remarked at the luncheon held immediately after the annual meeting. This is a record of which the Executive Committee and Miss HASLETT, whose onerous duties as director are so efficiently and amiably carried out, have every reason to feel proud. They are doing work which is of the highest importance in interesting the women of this country in the possibilities of electricity as a means of lightening their domestic tasks and in giving them some instruction concerning the handling of this new servant. Every supply undertaking, anxious to smooth out the Matterhorns from its load curve, and obtain a profile more resembling that of the Hog's Back, has an invaluable ally in the E.A.W.

S.W. England and S. Wales Scheme.

WE learn that the South West England and South Wales scheme will probably be formally adopted by the Central Electricity Board to-day and that the post which Mr. J. W. BEAUCHAMP has accepted under the Board is that of District Engineer in this area. Mr. BEAUCHAMP has done excellent work not only as an engineer and manager of supply undertakings but also in the sphere of electrical propaganda and we feel sure that he will prove a very valuable acquisition to the Central Board, whose satisfaction at having secured his services is in inverse ratio to the regret which the South Wales Power Company feels at parting with him.

Lamp Measurements.

THE May number of the "Journal of the I.E.E." contains a paper by Mr. G. T. WINCH, A.M.I.E.E. (a communication from the staff of the General Electric Company's Research Laboratories at Wembley), describing the construction of a simple photo-electric photometer suitable for measuring incandescent electric lamps of the vacuum and gasfilled 10 to 100 W types at commercial speeds under continuous service conditions. As an instance of the saving of time without loss of accuracy effected by the use of this apparatus it is mentioned that measurements which occupied five observers for four days, apart from the time taken to calculate the results, were made photo electrically without calculations by one observer in about four hours.

British h.t. Insulators.

EXAGGERATED suggestions of the uniqueness in Great Britain of the new Steatite and Porcelain Products factory and research laboratory at Stourport which have appeared in the daily Press have naturally caused resentment amongst other and old established British manufacturers of electric insulators. Sir FRANCIS JOSEPH, president of the North Staffordshire Chamber of Commerce, has circulated a letter in the course of which he points out that it is very regrettable that some respected names should have been linked with the claims in question (though they are not, perhaps, responsible for them) on the eve of the JOSIAH WEDGWOOD Bicentenary, when will be seen examples of the finest electrical porcelain in the world, manufactured by old-established British firms, who have been in the forefront of the industry ever since its inception. Sir FRANCIS JOSEPH adds that British electrical porcelain has been, since long before the War, in use on h.t. lines throughout the world. In many instances the British product has supplanted both the German and the American. The British specification for electrical porcelain is the severest known, and not only is super-high testing apparatus in general use by manufacturers, but the National Physical Laboratory is at the service of the industry. Electrical porcelain, made by old-established British factories has been used exclusively in the Grid scheme and on British Government wireless stations, and is incorporated on British transformers and switchgear, for both home and export.

Passamaquoddy Tidal Project.

IF the joint American and Canadian investigation (for which a resolution appropriating $45 000 was voted by the House of Representatives at Washington last month) results in overcoming Canadian opposition to the project, it is proposed to spend £15 000 000 to £20 000 000 on the harnessing of the tides of Passamaquoddy Bay to supply electricity to New England and the Maritime Provinces of Canada. The Dominion is to share the cost of the inquiry. Some £70 000 has already been spent on preliminary work in connection with the scheme which is opposed by fishing interests and by the Canadian Pacific Railway. It is stated that the work would occupy 5 000 men for four years and furnish about 3 000 000 000 kWh per annum.

H.T. Theft.

IN some parts of Africa it was, not so long ago, difficult to maintain telegraph communication owing to the propensity of the inhabitants for stealing the wire which was a much less troublesome way of acquiring useful metal than their own crude smelting, if there were workable ores in the locality, or buying it with their labour. One would hardly expect that in the United States such practices would be prevalent, yet it seems that the theft of transformers and copper wire from transmission lines alongside the roads in Arkansas is rife. The Arkansas Light and Power Company has even advertised in the Press asking for public co-operation in preventing this practice.

Small Rural Transformers.

At the April meeting of the Overhead Lines Association Mr. F. H. CLOUGH suggested the appointment of a committee composed of three members nominated by B.E.A.M.A. and three representatives of users, with Mr. DICKENSON, of the Electricity Commission, as chairman, to discuss the standardisation of small rural transformers with a view to the production of an improved type at lower cost. He mentioned that he had discussed the matter with Mr. DICKENSON, who had expressed his willingness to preside. We regret to learn that Mr. DICKENSON, on further consideration, has not found it possible to agree to do so, owing to pressure of other duties. For the moment the matter is in suspense, although the B.E.A.M.A. has agreed to appoint representatives on such a Committee. It is naturally of the greatest importance that the right man should be found to undertake this important work and we hope that the Overhead Lines Association will shortly succeed in finding him and inducing him to act so that the Committee can be set up and get to work.

FIFTY YEARS OF TELEPHONE PROGRESS IN GREAT BRITAIN.

London's First Exchange—Abolition of Earth Return Circuits—Copper Replaces Iron—Underground Cables of 1 100 Pairs—Magneto Calling—Central Battery System—Automatic Switching—World-wide Telephony Achieved.

By COL. SIR THOMAS F. PURVES, Engineer-in-Chief of the G.P.O. and President of the Institution of Electrical Engineers.

THE jubilee now being commemorated by a special supplement of THE ELECTRICIAN covers the period in which the telephone has been developed. World-wide telephony is now technically an accomplished fact and all that is necessary for its actual achievement between any two points is the reasonable assurance that the sinking of capital in various parts of the world will be justified by the traffic obtained. All telephone administrations now recognise that good service induces traffic and consequently the prospects in this country for world-wide telephone communication are bright.

The first telephone exchange was established in Great Britain in 1879 at 36, Coleman Street, E.C. (See Fig. 1). In those early days the only service contemplated was communication between subscribers situated in comparative proximity to each other. The telegraph system had already been developed with single conductors, the earth providing a return circuit, and such arrangements were naturally, for reasons of economy, at the outset adopted for telephone purposes. It was soon evident, however, that the very tiny currents involved in the transmission of telephone speech were easily disturbed by electrical energy reaching the circuit from an external source, and one of the most important early developments was the introduction of twin conductors which eliminated the common earth connection as a source of leakage disturbance and also permitted the two conductors to be revolved in a disturbing field, so that the inductive effects were balanced in the twin conductors and neutralised. Incidentally, one of the most troublesome forms of disturbance had been that due to the mutual interference of two circuits, resulting in the overhearing of conversations.

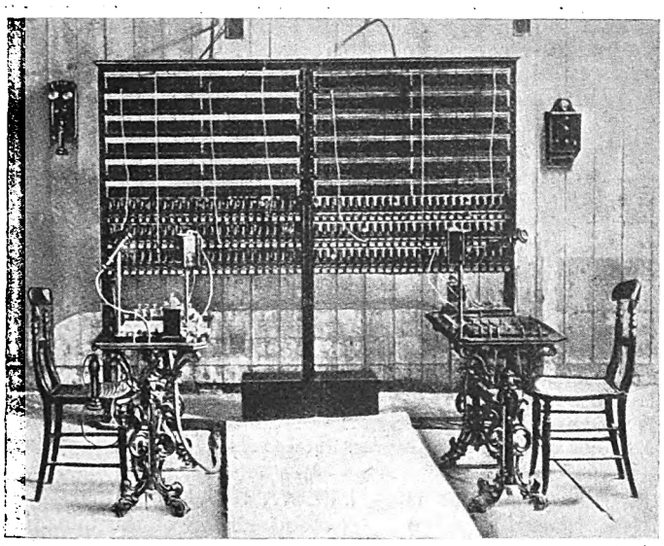

Fig. 1.—The first telephone exchange installed in Great Britain (at 36, Coleman Street, London, E.C., in 1879).

The conductors between the subscriber's office and the telephone exchange were at the outset galvanised iron wires. Although iron wire had many advantages mechanically and was cheap, it became evident very early that its conductivity for speech currents was too low, and between 1880 and 1890 experiments were carried out by Sir William Preece in collaboration with Messrs. Thomas Bolton and Sons, wire manufacturers, which resulted eventually in the production of hard drawn copper wire suitable for telephone purposes. Since that time iron wire has fallen out of use for telephone works. The use of copper wire changed the methods of construction, for much greater care was necessary in its manipulation than had been the case with iron wire. It is difficult to-day to realise the importance of the step taken when a suitable specification for hard drawn copper wire was produced; previously all the copper wire used for electrical purposes had been soft and, as such, was unsuitable for road line construction, thus copper appeared to be outside the realm of practical engineering until a system of hard drawing was designed.

In course of time, as the telephone system of the country grew, attention was devoted to the possibility of placing the conductors underground on grounds of security, cheapness, and economy of space. At first gutta-percha was used, but this was eventually superseded by air spaced, paper core, lead-covered cables, which were introduced experimentally in 1891. Speech over underground wires was restricted by the attenuation and distortion produced by the capacity of the circuit, and this, of course, was much greater in the case of gutta-percha than with air-spaced paper core cable.

For some years the use of cable was confined to local areas. It has proved so effective, however, for local distribution, that cables containing 1 000 pairs are now in general use and occasionally 1 100 pairs are placed in one cable.

Primary batteries were the only source of energy available in the early days and, furthermore, the operators were without any means of effectively supervising and controlling the connections they established; nevertheless, in a period of ten years more than 30 000 lines came into operation and it became abundantly clear that there was a demand for telephone communication over a much wider field, and as the telephone system of the country grew there developed a demand for a trunk service between the various cities and towns of the country. This was very much facilitated by the invention of hard drawn copper wire already mentioned, and until comparatively recent years increasing the gauge of conductors was the only known means of increasing the distance over which speech was practicable. Even just prior to the Great War circuits of a gauge of 600 lb. and 800 lb. per mile were the only means of establishing communication between London and the north of England and Scotland.

As the art developed it became necessary progressively to improve the switching equipment provided for the operators. At local exchanges an early development was the invention of the subscriber's multiple which enabled each operator to have direct access to every subscriber. The multiple was adopted first at magneto exchanges, i.e., exchanges in which the calling and clearing signals were given by the subscriber's turning of a small hand generator provided for the purpose. With the development of the multiple, of course, came the need for providing operators with a means of ascertaining (without interrupting him) whether a required subscriber was already engaged or not.

Glow Lamp Indicators.

The labour of maintaining the primary batteries in an extensive telephone system was not only expensive but difficult, and objectionable to the subscribers. In 1900 an exchange was installed at Bristol in which the power was supplied from centralised equipment at the exchange, and this rendered unnecessary the primary batteries at subscribers' premises. This improvement led to a number of incidental but also important developments. For instance, the clumsy indicator previously utilised on exchange switchboards was replaced by a small glow lamp that was lighted from the common power plant. The lifting of the subscriber's receiver from the hook was made the means of operating this lamp and also of controlling signals in front of the operator, enabling her to supervise a call and take down the connection promptly when the conversation had terminated. This was known as the central battery system and has been standard for large manual exchanges ever since. (See Fig. 2.)

The growth of the telephone business had meanwhile included the establishment of a trunk system which eventually in 1896 came into the hands of the Post Office, although the local systems continued for many years to be operated not only by the Post Office but by various companies and municipalities. It is not proposed to enter into an explanation of what might be termed the politics of telephony, but, briefly, the process was one of rationalisation, in which all the smaller telephone organisations were absorbed by the larger ones until, eventually,

Digitized by Google

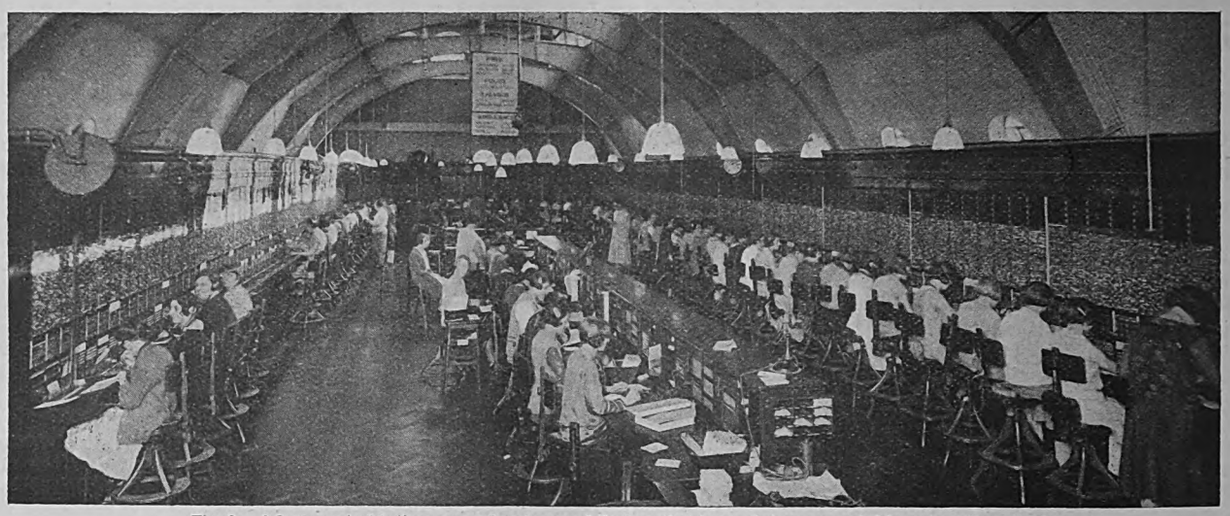

Fig. 2.—A large central battery manual exchange of the type that is now being superseded by automatic switching.

the whole of the telephone system of the country (trunks and local) came into the hands of the Post Office in 1912.

As in the case of the local exchanges, lamp signalling was adopted for all the larger trunk exchanges, giving the operators suitable facilities for controlling calls between towns.

Two important developments in telephony have influenced the growth of long-distance service. They were the introduction of the loading coil and the application of the thermionic valve repeater or amplifier. It has been stated previously that long-distance service has been carried on by means of heavy gauge expensive overhead copper conductors. Before the Great War the use of underground cables for long-distance calls had been small owing to the technical difficulties involved, but the introduction of the loading coil permitted the restrictive effect of capacity in telephone cables to be compensated, and so increased the distance over which underground conductors could be used for telephony. It was still impossible to use very light gauge conductors for underground work, and the cable circuits, therefore, had to be confined to comparatively short distances. During and after the War, however, rapid strides were made in the development of the thermionic valve amplifier, and the combination of loading and amplification have made universal underground service in this country possible. Practically the whole of the telephone system of this country is now underground, and long distance circuits of only 40 lb. per mile* are in operation between towns so far apart as London and Glasgow, with 20 lb. circuits on many routes. Thus a conversation which 15 years ago required the use of 280 tons of copper now demands only 14 tons and the speech transmission is superior in the latter case.

Meanwhile invention had produced the automatic exchange, so that in place of the switching operator, mechanism which could be controlled by the subscriber was provided for connecting a local call. At the date of writing there are in Great Britain 400 000 subscribers' lines operated on this system and the number is increasing progressively. A view of an automatic exchange is given in Fig. 3.

* The London-Glasgow circuit of 40 lb. per mile consists of two channels per conversation, each of 20 lb. per mile conductors, i.e., an effective (not actual) 40 lb.

Growth of International Calls.

International telephony has made rapid strides during the last five years and practically the whole of Europe is in regular communication with Great Britain. Service with America via a radio link was opened in 1927 and this was later extended to Canada, Mexico, South America and Cuba. On February 14 last, service to passengers on the White Star liner "Majestic" at sea was inaugurated, and last month a public telephone service to Australia was introduced. The following figures give a measure of the present trunk and international telephone business transacted in the interests of the 1 900 000 subscribers' stations connected to the 5 000 exchanges of the system.

Number of Inland Trunk Calls in 1929	116 488 568
Number of Outgoing International Calls in 1929	527 896
Number of Incoming International Calls ,, ,,	570 085

NEW CANADIAN ELECTRICAL CODE.

On June 1 Part I of the second edition of the Canadian Electrical Code, issued by the Canadian Engineering Standards Association, will become effective. This code has already been adopted by Nova Scotia, Quebec, Ontario, Saskatchewan, Alberta, British Columbia and by leading municipalities in New Brunswick; it is hoped that it will shortly become the standard for the whole of Canada. The code is to be revised periodically, probably every two years. Copies of this new edition, which is about half as large again as the first issue, can be obtained from the Secretary, Canadian Engineering Standards Association, 178, Queen Street, Ottawa, price 25 cents.

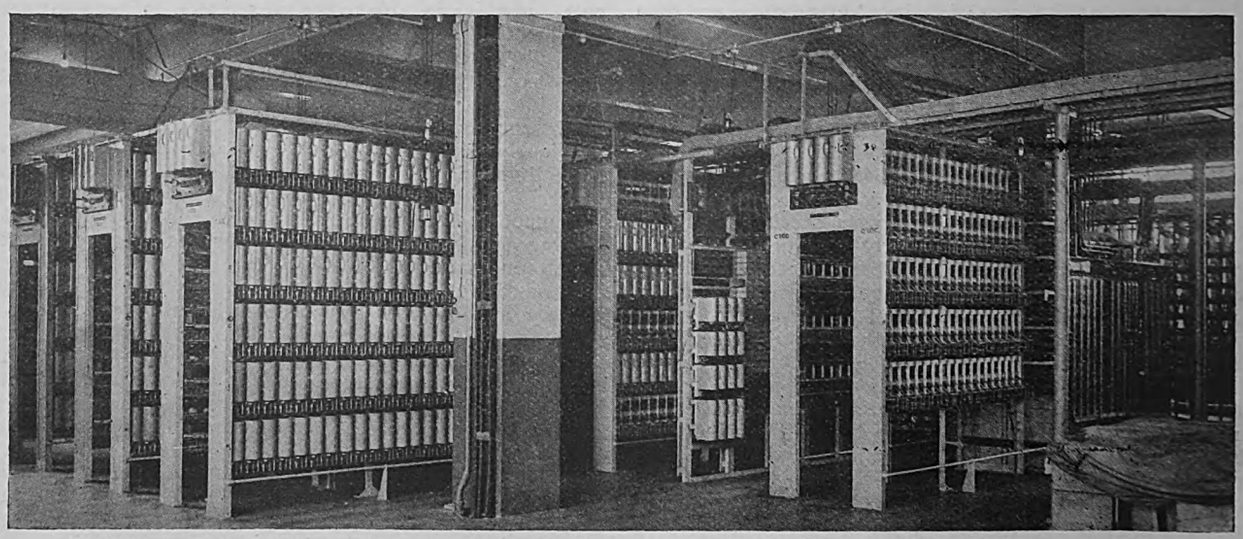

Fig. 3.—Part of an automatic telephone exchange. The contrast between this picture and that of the manually operated exchange is impressive.

HALF A CENTURY OF ELECTRIC SUPPLY.

Some Recollections of Early Engineering Development—Production of Efficient Dynamos—First Steps in House to House Supply—Efforts to Increase the Load.

By COL. R. E. CROMPTON. C.B.

THERE has recently been a tendency to date the commencement of the Electrical Age from Swan's and Edison's developments of the glow lamp, but I feel that this is a mistake, as the firm with which my name is connected commenced working out the arc lamp and dynamo business in 1878, so that we were able to commemorate the Jubilee of the foundation of our company in 1928. Moreover, the problems with which we dealt during the years previous to Swan's invention were very fruitful, for we then had to find out for ourselves the relations between e.m.f., current, and power, without which knowledge it was quite impossible to develop the designs of dynamos, lamps, conductors or other accessories used by us in the early days of arc lighting.

During those early years, our knowledge increased at a rapid rate as we had to deal in turn with the relations between the magnetic field and its power of inducing e.m.f. in the coils of the armatures of our dynamos. Although we applied to the then fairly well developed industry of the telegraph engineer, they had done little to help us ; resistance was measured then in miles of telegraph wire, e.m.f. in terms of Daniel cells. Again, when we began to study the further improvement in efficiency of our dynamos, we found ourselves quite at variance with the telegraph people, whose ideas on the production of e.m.f. from various kinds of batteries made them tell us that it was no use our reducing the internal resistance of our dynamos for it was well-known to them that the internal resistance of a battery must always exceed the resistance of the external circuit served by it. I well remember the late Sir William Preece telling me this, and suggesting that any further research to get economy in excess of 50% was a hopeless task, so that we had better drop it.

In spite of this, by constant experimenting and largely due to the assistance of men like Lord Kelvin (then Sir William Thomson), his brother James Thomson, and one or two others, we did hit on the idea that the most important direction in which we could hope to make progress was by reducing the internal resistance, by diminishing the number of armature turns and by increasing as far as possible the strength of the magnetic field in which the armature revolved. At any rate, at the time when Swan first showed me his successful lamps in his laboratory in Newcastle we had made such progress with our arc lighting plant that we were able at once to supply him with dynamos which enabled us to carry out installations of Swan's lamps on a large scale within a few months after Swan had made his invention. When we completed the lighting of the Law Courts in the latter part of the year 1882—the first installation of electric lighting on any considerable scale in this country or elsewhere—our Crompton-Bürgin machines were already quite reasonably efficient and were sufficiently self-regulating to maintain the lighting in the Courts almost as steadily as is possible to-day. Again, at that time, we had already seen the enormous advantage in reliability and regularity, that must follow the adoption of the Planté accumulator worked in parallel circuit with our dynamos.

The 1882 Act.

During the period which immediately followed the opening of the Law Courts, we were engaged in carrying out a large number of detached installations, lighting of country houses, and in a few cases of town houses, but our attempts to carry out house to house supply was entirely prevented by the severe terms of Chamberlain's 1882 Act, which limited the period during which we could develop our undertaking to 21 years.

In spite of this handicap in those days we made several preliminary investigations to develop house to house supply. At that time satisfactory lamps could not be produced to stand an e.m.f. above 100 to 110 V. We had to struggle with the whole question of how to lay down in the streets sufficient copper at a reasonable cost, but we now know that the designs we prepared in 1882 and following years for a supply station from Victoria to feed the Pimlico area, could never have been sufficiently extended to be profitably worked, so that when an opportunity offered itself to deal with electric supply on a large scale in the City of Vienna, in the year 1884, among the first problems that presented themselves was how to design dynamos which could be run at a speed not exceeding 600 r.p.m., so that they could be coupled direct to Willans high speed engines and give 500 V at their terminals. This led to the development of those improvements which practically resulted in the production of the d.c. dynamo in its present form. We then developed the idea of distributing from a central station at 500 V and cutting it down to 100 V by working out a 5 wire system. The lamps in the theatre at Vienna were supplied at 100 V by using four batteries of accumulators in series and this work turned out so remarkably successful that I had the temerity to take a short term licence under the old Chamberlain Act to work a district in London, immediately surrounding Kensington Court, in which the estate designer had provided subways under the principal streets. Although the Act of 1888 (and the Provisional Orders which followed thereon in 1889) for the supply of London did not allow of any considerable work being carried on in developing these Orders until 1889, our Vienna experience, supplemented by the additional experience of working our licence at Kensington Court, enabled us during the years 1886 to 1889 to develop a good deal of the main laying and distribution systems which have generally been adopted with modifications throughout London and many other large towns. So that it may be said that it was during the years which followed the opening of the Law Courts up to 1890 that I, with various co-workers, developed the d.c. system which was largely followed by municipal authorities who, owning their gas undertakings, also began to deal with electric supply.

Load Factor Improvement.

At that time Ferranti, at Deptford, and J. E. H. Gordon with his newly formed Metropolitan Company, were alone in developing alternating supply. For us the problems of d.c. supply were far simpler and more easily mastered than the difficult questions of parallel working, transformers and a.c. meters, which were so successfully dealt with by Ferranti. By the year 1890, we had encountered and dealt with the whole question of load factor and its important effect on the cost of supply to the user. In London and most towns where the demand for industrial power does not exist to any great extent this improvement of the load factor has been mainly due to finding new uses other than lighting by which the householder could benefit by electric supply.

At a very early date, we, at Cromptons, turned out electrical hotplates, by using a resistance wire embedded in enamel, and this idea has been generally followed, so that we now have a long range of electrical heaters, cookers and kettles and so on.

For years we have been working on developing the electrical load by using power in small quantities for housemaids' work, cleaning our carpets, walls and furniture by the various types of electrical sweepers with which we are now fairly familiar. One of the more recent developments has been the production of artificial cold—refrigerators which enable us to preserve our food in good condition for long periods.

At an early date we encountered the problem of the costly nature of electrical distribution where the users are widely distributed. The money expended on distribution mains in a country district is vastly in excess of that necessary for the town. It is perhaps an unfortunate thing that our politicians, when they advocated the 1926 Act, promised everyone that they would have a very cheap supply and that our farmers and villagers would have the same amenities associated with cheap electric supply that are enjoyed by town dwellers. But obviously, generation is a very small proportion of the total cost to the consumer, and most unfair comparisons have been made between England and other countries, such as Switzerland, where a cheap supply has been carried into country districts. It has been the fashion to suppose that this was due to the generating cost in Switzerland from water power being exceedingly low. Those who talk so loosely on these matters forget that all over Switzerland, a small country in which rural industries have flourished for many years, the points at which supply is taken in the houses and villages are grouped far more closely than is the case in any part of England outside our purely industrial districts, and that in England, in industrial districts where there is a heavy power load, the cost of supply has for some years past been very low.

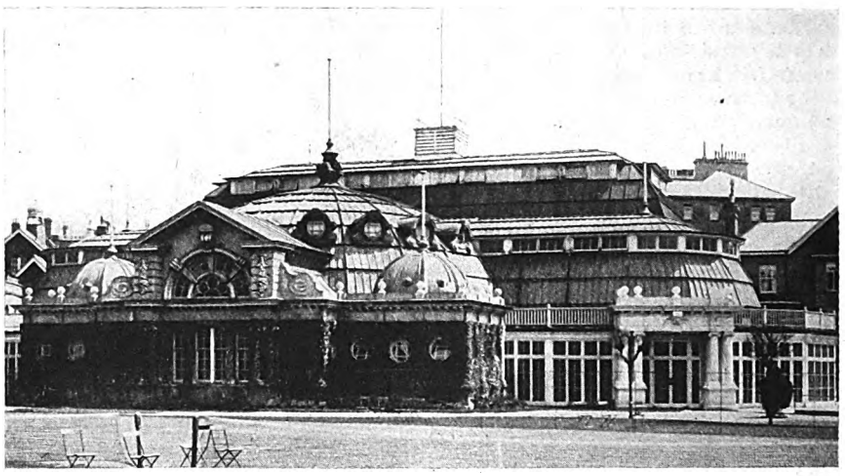
I.M.E.A. MEETING AT EASTBOURNE.

Next Week's Programme—Papers and Functions—The Corporation Electricity Works—A Progressive Undertaking—New Front Lighting.

NEXT Monday, the 35th annual Convention of the Incorporated Municipal Electrical Association assembles at Eastbourne. From 10 a.m. to 1 p.m. and from 2.30 to 9 p.m. the Convention office in the Winter Garden in Devonshire Park will be open for the issue of badges. The reception by the President, Mr. J. K. Brydges, M.I.E.E., who will be supported by the Mayor of Eastbourne, Coun. Lieut.-Col. Roland Gwynne, D.S.O., D.L., J.P., will be held in the Winter Garden from 8.15 to 8.45 p.m. Dancing and music will follow.

On Tuesday the serious business begins. At 9.30 a.m., members of the Council will meet, and ordinary members will assemble at 9,50 a.m. for the opening of the Convention. The morning's programme will include the civic welcome by the Mayor, the presidential address (at the conclusion of which ladies present are invited to meet Mrs. Brydges in the tea room of the Winter Garden), and the first paper and discussion. The paper will be read by Ald. R. S. Chatfield, chairman of the Eastbourne Electricity Committee, and will deal with "Obligations of Electricity Committees."



The Winter Garden, Devonshire Park, Eastbourne, in which this year's I.M.E.A. Convention will be held.

At 12.30 p.m. the official photographs will be taken, and at 2.30 p.m. there will be an official visit to the exhibition of electric cooking, water heating, refrigerating and other apparatus in Devonshire Park. The Mayoral reception will take place in Devonshire Park from 8.15 to 8.45p.m. The Mayor will be supported by the Deputy Mayor, Ald. Miss Hudson. Dancing and music will follow until 11.45 p.m.

At 10 a.m. on Wednesday, Mr. G. H. Lake, A.M.I.E.E., Borough Electrical Engineer, Derby, will read a paper on "Pulverised fuel firing as affecting Economic Boiler House Operation." The afternoon will be occupied with a visit to the Brighton Electricity Works or to the "grid" sub-station at Fishergate, and tea will be provided by the Brighton Electricity Committee and the Town Council at the Royal Pavilion.

Thursday will be Women's Day. The morning will be devoted to a paper by Mr. J. W. Burr, M.I.E.E., M.I.Mech.E., Borough Electrical Engineer, Swansea, on "Electric Heating of Buildings," followed by an informal discussion on "Domestic Water Heating," to be introduced by Mr. A. E. McKenzie, M.I.E.E., M.I.Mech.E., Borough Electrical Engineer, Wimbledon. There will be a luncheon in the tea room, Devonshire Park, at 1 p.m., and at 2 p.m. the exhibition will be visited. The Deputy Mayor and Mrs. Chatfield will receive the visitors. Tea will be provided by the Eastbourne Electricity Committee at 4 p.m.

At 2.30 the annual meeting of members of the Local Authority Committee will be held, and at the same hour there will be an engineers' meeting (members of A.M.E.E. only) in the Lecture Room.

The Annual Dinner will be held at the Grand Hotel (7 for 7.15 p.m.), and will be followed by dancing.

On Friday a meeting of the Council will be held at 9.30 a.m. The annual general meeting will follow at 10,30 a.m. In the afternoon there will be a coach trip to Bexhill, Hastings, Winchelsea and Rye.

On Saturday the Convention will conclude with a visit to the Eastbourne Electricity Works.

More than 1 100 intimations of intention to take part in the Convention have already been received, this number being about a hundred in excess of the attendance at Torquay last year.

Although the I.M.E.A. Convention has been held at Brighton on three occasions, it has never before met at Eastbourne. The town, sheltered by the high ground of Beachy Head from westerly winds, has an excellent sunshine record.

Eastbourne began its electrical history in 1881 when the Eastbourne Electric Light Company negotiated with the Local Board for the illumination of the Parade. In September, 1882, this was effected with 22 Brush arc lamps, Eastbourne being the first town on the South Coast to supply electricity from a central station for public lighting. In 1883 the generating station, on the site of the old Bedfordwell gasworks, contained two 25 H.P. semi-portable Robey boilers and Undertype engines, driving two 25-light Brush arc machines.

In 1900 the Corporation acquired the undertaking, which had been transferred to the Old Brewery, in Junction Road, in 1844. New works at the east end of the town were completed in 1902, two 400 kW Ferranti plants, two Stirling 11 800 lb. and one Babcock and Wilcox 9 440 lb. boilers being installed. Later additions were: (1907) one 750 kW Willans Bruce-Peebles turbo-alternator and a 23 000 lb. Babcock and Wilcox boiler; (1914) one 1 500 kW British Westinghouse set; (1915) one 1 250 kW Brush Ljungström set (old 150 kW and 200 kW sets being then scrapped); (1918) one 30 500 lb. Thompson water-tube boiler and underfeed travelling grate stoker (replacing two Hornsby boilers) and a 200 000 gallon water cooling tower; (1923) one Allen-G.E.C. 2 500 kVA turbo-alternator, a second cooling tower, and two 37 000 lb. tri-drum Stirling boilers; (1926) a duplicate Allen-G.E.C. turbo-alternator and a Vickers 50 000 lb. triple circuit three-drum boiler (two 5-drum Stirling boilers being scrapped); (1929) a third Allen-G.E.C. turbo alternator, boiler and two cooling towers were added.

During the winter of 1929 the maximum peak load reached was 8 065 kW, and the total number of units generated for the year ended March 30, 1930, was 18 150 000, compared with 12 323 210 in 1927–28.

Important extensions have recently been made to the distribution system, which includes two 11 000 V ring main cables about eight miles long encircling the town. Two 11 000 V feeder cables, each three miles long, to supply Meachants, Lower Willingdon and the villages of Eastdean and Friston have also been laid, and a substantial increase of transforming plant and switchgear has been necessitated.

In connection with the South-East England scheme, a transforming station is being installed adjacent to the existing electricity works. A partial supply from the grid has been promised for October, 1930, and by October, 1931, it is anticipated that the whole supply for Eastbourne and district will be taken from the grid. This will necessitate a good deal of modification of the distribution system.

Mr. Brydges has devoted much attention to street lighting. The specially designed decorative standards installed along the front with their three tiers of coloured lamps surmounted by Paisley lanterns, which were brought into use a few weeks ago, extend along the whole length of the front, and give it a very pleasing and distinctive appearance at night. In other directions, Eastbourne has played a prominent part in the development of street lighting practice. Electric House, the headquarters of the Corporation Electricity Department, is another example of progressive enterprise, and the tariffs in force are amongst the lowest in the country. Members of the Convention will, therefore, find much to interest them in the electricity undertaking managed by their President, and its methods.

MODULUS OF ELASTICITY OF STRANDED CONDUCTORS.

Determination of Sag—Difference Between Single Wires and Cables—Value of Modulus for Copper, Aluminium and Steel Conductors.

(FROM A CORRESPONDENT.)

THE modulus of elasticity of a cable, defined as the ratio of the applied stress to the elastic strain produced, is a factor of considerable importance in the correct determination of sag in overhead lines. It has been the practice to assume that the modulus for a stranded conductor is the same as for a single straight wire of the same material, but this is only true if the length of lay of the stranded wires is infinitely long, and the following theory suggests that the true value may be materially different for cables of normal construction.

The application of tension to a cable does not cause the same tension in all the individual wires, and, referring to

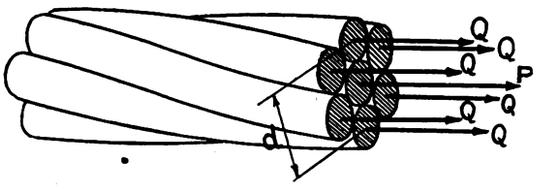

Fig. 1.

Fig. 1, while the tension in the inner straight wire is P-lb., that in the wires of the first stranded layer would be of some other value Q. Taking a length L'' of cable, which on the application of the load stretches to $(L+x)''$, the modulus of elasticity is defined as :—

$$E_c = \frac{nQ+P}{nA+A} \cdot \frac{L}{x} \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

where n is the number of wires taking tension Q and A is the area of each wire.

The modulus of elasticity for the centre straight wire will be :—

$$E = \frac{P}{A} \cdot \frac{L}{x} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

and similarly the effective modulus for the annular ring of stranded wires would be :—

$$E_1 = \frac{nQ}{nA} \cdot \frac{L}{x} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

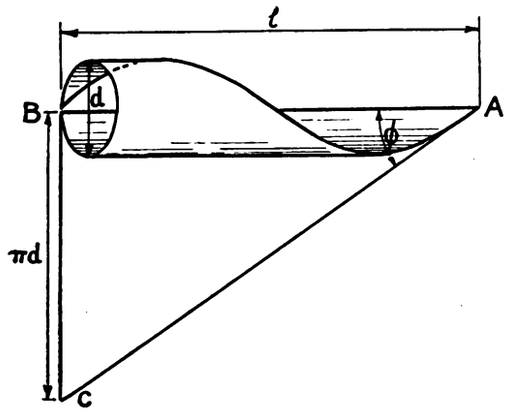

Fig. 2.

From these expressions it follows that :—

$$E_c = \frac{nE_1+E}{n+1} \quad . \quad . \quad . \quad . \quad . \quad . \quad (4)$$

Similarly, should the cable have a further layer of m wires, of which the effective modulus is E_2 then :—

$$E_c = \frac{mE_2+nE_1+E}{m+n+1} \quad . \quad . \quad . \quad . \quad . \quad (5)$$

If the wires in the different layers are not of the same size, the expression becomes :—

$$E_c = \frac{mE_2A_2+nE_1A_1+EA}{mA_2+nA_1+A} \quad . \quad . \quad . \quad . \quad (6)$$

where A is the area of the inner wire ; A_1 the area of one wire of the layer of n wires ; A_2 of the layer of m wires.

The modulus of elasticity for the cable can therefore be calculated from a knowledge of the effective moduli for the wires in the different layers.

The centre line of any stranded wire is inclined to the axis of the cable at an angle φ such that

$$\tan \varphi = \frac{\pi d}{l} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (7)$$

where d is the pitch diameter of the layer, i.e., the diameter of the circle through the centres of the wires, and l is the length of lay, i.e., the length in which one wires makes a complete rotation in the cable.

The derivation of this expression for tan φ will be obvious from Fig. 2, which indicates that if a right-angled triangle ABC of which AB is l and BC is πd is rolled up about side AB, the hypotenuse AC will form a helix corresponding to the centre line of one of the stranded wires in the cable.

In evaluating the effective modulus for a stranded wire, it is convenient to treat the wire as though it were unrolled from the cable into position AC as shown in Fig. 3.

When tension is applied to the cable so that it stretches by the amount x, then the load Q which is applied to the end C of one stranded wire will cause this wire to stretch and take up a

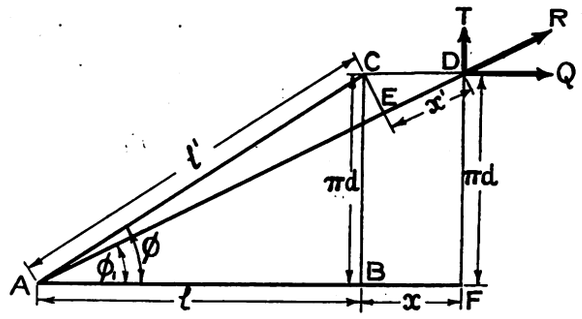

Fig. 3.

final position AD. The angle of lay will be slightly reduced to φ_1.

The application of tension Q to the wire will also bring into play a reaction force T, shown in the diagram, the value of T being such that the resultant R of T and Q acts along line AD. If AE is equal to AC, the original length of the unstretched wire, then ED or x^1 is the stretch in the direction of R, and the relation between x^1 and R must be :

$$E = \frac{R}{A} \cdot \frac{l^1}{x^1} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (8)$$

where E is the true modulus of the material.

Now as φ and φ_1 are not very different, little error is introduced by assuming that CE is at right angles to AE, and we can write

$$ED = x^1 = CD \cos \varphi_1 = x \cos \varphi_1$$

also $R = \frac{Q}{\cos \varphi_1}$ and $l^1 = \frac{l}{\cos \varphi}$

Substituting for R, l^1, and x^1 in expression (8) we get

$$E = \frac{Q}{A} \cdot \frac{l}{x} \cdot \frac{1}{\cos^2 \varphi_1} \cdot \frac{1}{\cos \varphi}$$

But the effective modulus E_1 is equal to $\frac{Q}{A} \cdot \frac{l}{x}$ . . (9)

Hence $E_1 = E \cos^2 \varphi_1 \cos \varphi$, or, very approximately,

$$E_1 = E \cos^3 \varphi \quad . \quad . \quad . \quad . \quad . \quad . \quad (10)$$

This very simple relation is sufficiently accurate for the cable sizes most used, but for large sizes of cable it may be desirable to go to a greater refinement by taking into account the lateral attenuation of the wires which accompanies any longitudinal stretch. When the longitudinal dimensions of the cable are increased by $\frac{x}{l}$ inches per inch of length, then the diameters of the wires are at the same time reduced by $\frac{\sigma x}{l}$ ins. per inch of diameter, where σ is Poisson's Ratio. In consequence, the

Digitized by Google

pitch diameter of the layer under consideration will be reduced by an amount $\frac{\sigma x}{l} d$, when the tension is applied. The final position of the stretched wire will not therefore be along line AD as in Fig. 3, but along AS, as in Fig. 4, in which $FS=\pi\left(d-\frac{\sigma dx}{l}\right)$

From this diagram, again assuming $\angle CEA$ is a right angle, we have

$$x^1 = CS\cos(\theta+\varphi_1)=\frac{CD}{\cos\theta}(\cos\theta\cos\varphi_1-\sin\theta\sin\varphi_1)$$
$$=x(\cos\varphi_1-\sin\varphi_1\tan\theta)$$

Also $\tan\theta=\frac{DS}{CD}=\frac{\sigma\pi dx}{lx}=\sigma\frac{\pi d}{l}=\sigma\tan\varphi$

Hence $x_1=x(\cos\varphi_1-\sigma\sin\varphi_1\tan\varphi)$ . . . . (11)

As before $R=\frac{Q}{\cos\varphi_1}$ and $l^1=\frac{l}{\cos\varphi}$, and substituting for these and for x^1 in (8)

$$E=\frac{Q}{A}\cdot\frac{l}{x}\cdot\frac{1}{\cos\varphi\cos\varphi_1(\cos\varphi_1-\sigma\sin\varphi_1\tan\varphi)}$$

and if we write φ for φ_1 we have

$$E=\frac{E_1}{\cos^3\varphi-\sigma\cos\varphi\sin^2\varphi}$$

Transposing, we get

$$E_1=E(\cos^3\varphi-\sigma\sin^2\varphi\cos\varphi) \quad . \quad . \quad . \quad . \quad (12)$$

The value for σ varies from 0·31 to 0·34 for copper and aluminium and assuming the average value is 0·33, expression (12) reduces to :—

$$E_1=E\cos\varphi(1\cdot33\cos^2\varphi-0\cdot33) \quad . \quad . \quad . \quad (13)$$

Using this latter expression, the following values are calculated for the ratio of the effective modulus for stranded wires to the true modulus for straight wires :—

Length of lay as multiple of pitch diameter. $\left(\frac{l}{d}\right)$	$\frac{E_1}{E}$
15	0·923
17½	0·942
20	0·955
25	0·971
30	0·980

These figures apply to copper and aluminium conductors and possibly with sufficient accuracy to steel or steel-cored aluminium as well, though Poisson's ratio for steel is somewhat smaller than for the non-ferrous metals (0·27 to 0·31).

The modulus of elasticity for straight wires is taken by the British Engineering Standards Association as :—

Copper	18×10^6 lb./sq. in.
Aluminium	$9\cdot9\times10^6$,,
Steel	28×10^6 ,,

and using these values the modulus for different types of stranded cables is calculated from formulæ 6 and 13, as follows :—

Material	No. of wires.	Length of lay.	Modulus of elasticity millions of lb./sq. in.
Copper ..	1	—	18
	7	20	17·31
	19	20 inner 17½ outer	17·09
	37	20 inner 17½ middle 15 outer	16·86
Aluminium ..	1	—	9·9
	7	20	9·52
	19	20 inner 17½ outer	9·39
	37	20 inner 17½ middle 15 outer	9·27
	37	30 inner 20 middle 17½ outer	9·44
Steel-cored aluminium	6 aluminium 1 steel	20	12·12
	30 aluminium 7 steel	20 inner 17½ middle 15 outer	12·56

This theory is based on the work of the Warrington Research Laboratories of the British Aluminium Company, who have done much research on the modulus of stranded cables of aluminium and steel-cored aluminium, and the theoretical values given in the foregoing tables correspond remarkably well with measured values. It will be recalled also that researches on this same subject were carried out in 1924 by the B.E.A.I.R.A., the results being published in the I.E.E. journal. The measured values there given also correspond reasonably well with the theoretical values corresponding to the actual lengths of lay.

It may be remarked that in all tests on stranded conductors, the apparent modulus of elasticity at light loads is very low.

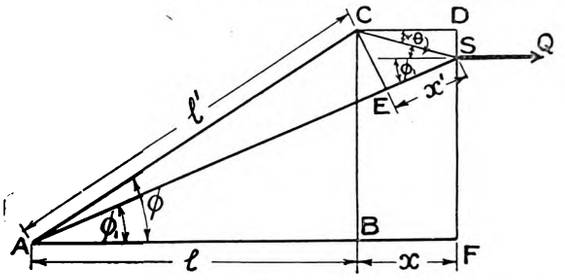

Fig. 4.

This is due to the fact that in an unloaded cable the stranded wires have a certain degree of looseness on account of their "springiness." At tensions higher than about 10% of the ultimate strength, however, this looseness is all taken out, and the modulus then corresponds very closely with the theoretical value. For overhead line purposes, as the cable is operated at loads well above 10% of the ultimate strength, the low initial value of the modulus can be ignored as of no account.

ANNUAL MEETING OF THE I.E.E.

Growth of Membership—£10 000 for Faraday Centenary Celebrations—Not Enough Full Members.

THE annual general meeting of the Institution of Electrical Engineers was held in London on Thursday, May 15.

In presenting the annual report of the Council, the President (Sir Thomas Purves) commented on the satisfactory increase in the membership during the post-war years, the total number of members now being 14 200, whereas the figure in 1921 was only 9 449. As regards the proposal to spend £10 000 on the Faraday Centenary Celebrations, the President said that though this might seem a large sum the Council was satisfied that it would be justified in the action proposed because it was the intention to endeavour to create a great public interest in electricity in connection with the celebrations.

Mr. F. W. PURSE commented on the fact that not only has the Institution only 1 959 full members but that the number has not been increased during the past year. It was a matter for surprise that the Institution, with such a large industry to draw upon, had so few full members and it seemed to him that some were not doing their duty either to the Institution or the industry in not transferring to full membership, because there must be many who were eligible.

The PRESIDENT promised that the point should be considered by the Council. He agreed that it was a matter of importance, but added that the position was entirely due to the fact that no proposal had been forthcoming.

Mr. W. C. P. TAPPER referring to the suggestion that the Faraday Centenary Exhibition would not be of an advertising character, asked how the public interest in electricity could be aroused if there was to be no advertising.

The PRESIDENT replied that the exhibits at the Exhibition would not be of the usual commercial and advertising character. As a matter of fact, a sum of probably £2 000 would be earmarked for propaganda in connection with the celebrations because it was the intention to make a really energetic push to stimulate public interest. The expenditure on 'propaganda would be carried out in conjunction with the British Electrical Development Association, which was rendering great assistance.

The COUNCIL'S Report was then adopted.

CAPTAIN J. M. DONALDSON (Chairman of the Finance Committee) presented the annual accounts in the absence of the Hon. Treasurer, who was unable to be present through ill-health. There was a slightly lower balance to the good for 1929, viz., £242, as compared with £6 040 in 1928. This was accounted for by special expenditure, some items of which would not recur while others could not occur for a long time. There had also been a small increase in management expenses. The Institution now had assets of £186 343 and liabilities of £10 200, a position which was £8 000 better than in 1928.

UNEMPLOYMENT AND WORK—IV.

Work or Maintenance

By SIR ERNEST J. P. BENN.

THE continual repetition of the Socialist slogan, " Work or Maintenance," has achieved its object upon an intellectually lazy world, and it is to be feared that the fallacy which it embodies is very generally accepted as truth. The notion is that the Government should arrange matters in such a way as to provide work, and failing that, maintenance, from which theory arises quite logically the absurd idea that the individual citizen has a claim on the Government in these respects. He is willing to work, the Government (or so the argument runs) is responsible for the absence of work, and that being so, maintenance becomes a citizen's right.

Two big mistakes are apparent in this way of looking at things. First of all it attributes powers to Government which that institution can never possess, and secondly it assigns to the citizen economic rights which in the very nature of things do not exist. The confusion of thought, now quite common, has developed in a very natural way. We began by claiming political rights, things which very definitely do exist. Political rights developed political power. We then began to think, quite wrongly, that political power could be used to provide economic benefit, and from that point the step to economic " rights " became easy and fatal.

Meaningless Jargon.

The phrase " economic equality " has, when examined carefully, about as much meaning in it as there would be if we spoke of " musical equality," " literary equality " or " moral equality." If it has any basis at all, I am entitled to complain because I cannot secure as many readers for my writings as Mr. Bernard Shaw. A potato might just as well complain because it was planted in poor soil while its fellow could fructify in a better field, and demand that the Government should make all soil equally good for all potatoes. The right to live sounds so nice, appears to be so just, fits in so exactly with the social sentiment of our day, that the phrase slips into our conversation and evades critical thought or examination. But where does it come from—this right to live? What exactly does it mean? Who confers it upon us? What does it consist of? If we think it out we may find that, like other paradoxical attributes of a civilised life, it exists only on condition that very little use is made of it. The wealth of London built on the gold standard gives us a clue to the truth of the matter. For centuries London has enjoyed pre-eminence in the money markets of the world because London always pays in gold. On further examination, however, we find the truth to be that people prefer to send gold to London rather than fetch it away. The Post Office Savings Bank is a simple illustration. People who put their savings into that safe keeping do so because they are assured of immediate payment when the savings are required. But if even a moderate proportion of the depositors asked for their money on any given day, the bank would burst. It will be observed that the security of the bank depositor, nebulous as it is, depends upon an introductory deposit having been made at some prior date. If such a security based on initial sacrifice is only available with such drastic limitations, how can it be argued that " the right to live," a far more comprehensive and expensive security, is freely available for all at all times. The thing is quite absurd, and those who endeavour to ease the hardships of people in trouble with any such dangerous dope are rendering them no service and undermining the stability of society itself.

Life is a struggle for existence against the forces of nature, and it is on that firm basis of truth that we must start any discussion which hopes to be useful on how to manage life, so as to secure the maximum of comfort to all. The " right to live " is a soft, comforting, easy lie, the constant repetition of which will lead us further and further into difficulties. As a civilised people, we can use our political power to say that when we are prosperous we will devote some of that prosperity to the care of the down and out, but such an attitude is necessarily governed by serious practical limitations.

It will be noted that our ability to care for the down and out depends entirely upon our prosperity. That prosperity must not be thrown away in the supposed interests of our social failures, for in that way we merely defeat our own charitable purpose. The first condition of our power to aid is that we should be prosperous, and proper attention to our own prosperity may prove to be a better service to the objects of our anxiety than direct attention to their particular needs.

There is another and more practical way of analysing this supposed " right to live." We are concerned, of course, only with the economic side of things, the provision of those material amenities which go to make a decent life according to modern standards. From this point of view, and taking only very simple illustrations, the absurdity of the proposition is apparent. For instance, does " the right to live " include a cup of tea? If so, how do you get it from China? Does the Chinaman recognise your right to live? Is he also possessed of any similar right and who confers it upon him? Has he some prescriptive claim upon English textiles and are we prepared to honour that claim? Such questions have only to be asked for the inherent absurdity of this " rights " idea to be completely exposed. Is a pipe of tobacco included in this much-talked-of right to live? If so, does it go as far as to give to the smoker the right to a choice of brand or flavour? Can he, if he prefers, select a cigarette instead of a pipe? Has the possessor of the right to live the privilege of reading Edgar Wallace or Arnold Bennett, and have these people any rights, and if so, what are they? Would these self-same rights include the right to a wife? And how shall we arrange matters in such a way as to square the account between the man who gets a wife who knows how to keep a home, and the other man who is not so fortunate? These are practical questions which ordinarily form no part of political speeches; in the sophisticated complications of present-day discussions they seem to be trivial, but surely they serve to bring us back to realities and enable us to realise that you cannot provide the living of the people by Acts of Parliament.

We can only live by rendering service one to the other. Further, that service must be valued by the person to whom it is rendered. When we get back to fundamental truths like this we shall begin to march along the road to prosperity, but beforehand we have to retrace a good many false steps. Those steps have mostly been taken in obedience to the erroneous idea of economic rights, forgetting that none of us have anything but economic responsibilities. We can, of course, acquire rights by a full recognition of our responsibilities, but these things must be placed in their proper relation to one another in the same inevitable way that the horse must be in front of the cart if the journey is to be accomplished.

Reflections such as these will, I am fully and painfully aware, bring little or no comfort to the reader who is an unfortunate victim of all our political mistakes and finds himself to-day in difficulties about to-morrow's dinner. I do not, of course, pretend to be discussing what practical steps should or should not be taken to bring momentary aid to such a case. But even the unemployed will agree as to the importance of right thinking and sound principles, and when they consider the disastrous failure of our efforts in recent years to remove the causes of their troubles, they themselves may begin to see that those who have talked to them about the right to live may after all be false leaders.

Price of Freedom.

We all possess an inherent sense of the wonderful complications of life and living which makes us doubt the wisdom or the practicability of simple political remedies. In our better moments we experience a sense of revolt against the idea that other people can arrange things for us better than we can manage them ourselves. In particular we resent the notion inherent in the political method that our troubles are always somebody else's fault. Temporary intellectual comfort secured that way always proves to be of the nature of the physical comfort obtainable through the use of alcoholic liquor. Both in the end are equally degrading.

Rights and freedom are not capable of bestowal at the hands of either demagogues or soothsayers. They are to be acquired only by those who will pay the price of them and they are wonderful value even for the heavy price involved. They are not the simple, stupid things that they are represented to be, but possess that paradoxical truth and charm underlying the old phrase, contradictory in its very words: " Whose service is perfect freedom."

DIESEL ELECTRIC LOCOMOTIVES FOR INDIA.

Trials of Two General Electric Units for the North-Western Railway—Details of Electrical Equipment.

THE General Electric Company, Ltd., has recently completed preliminary trials of two Diesel-electric locomotives on a branch line of the L.M.S. Railway in Scotland. These locomotives, the electrical equipments of which are constructed in accordance with the Oerlikon system, are required for duty on short runs on both main and branch lines of the North-Western Railway of India, and are intended to meet the steadily increasing competition from road transport experienced during the last two or three years.

For this purpose relatively high speed is of paramount importance, while, with Indian drivers, ease of control and maintenance are further essentials. It was specified that with a light load on a level track a speed of 50 to 55 miles per hour should be possible, while with a train consisting of three bogie vehicles having a gross weight of 100 tons the normal running speed should be 47 m.p.h., decreasing to 36 m.p.h. on a 1 in 300 gradient and to 13 m.p.h. on a 1 in 50 gradient. This means that the power of the locomotive would be intermediate between the 4–4–0 type steam passenger locomotive, which has a tractive effort of 19 000 lb. at starting, and the ordinary rail motor coach with trailer.

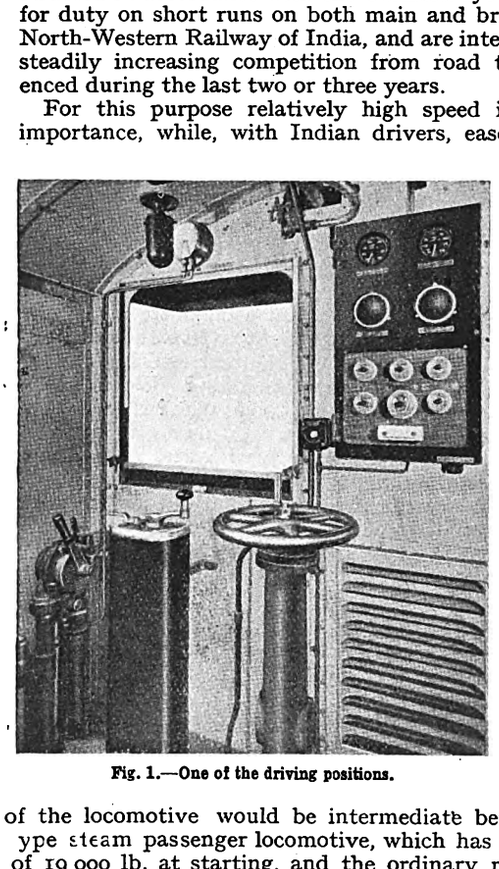

Fig. 1.—One of the driving positions.

The locomotives are of the double bogie type without articulation, the wheels being side equalised in order to give easy riding qualities over rough tracks. The superstructure follows the recognised design for electric locomotives, and consists of a long cab divided into three compartments. Driving compartments are arranged at both ends, each containing a master controller, driver's brake valve for the vacuum brake, engine indicators, lighting switches, brake pressure gauge and other controls arranged for the driver's convenience, while the central compartment houses the Diesel engine, generator, oil and water cooling radiators and other equipment. One of the driving positions is illustrated in Fig. 1, from which it will be seen that control of the locomotive has been reduced to its simplest form.

The principal dimensions and data relating to the locomotives are as follows :—

Length over buffers	35 ft. 10 in.
Height over cab	12 ,, 9 ,,
Width overall	9 ,, 0 ,,
Total wheel base	23 ,, 0 ,,
Wheelbase of each bogie	7 ,, 8 ,,
Centres of bogies	16 ,, 0 ,,
Distance from rail to platform	4 ,, 1 ,,
Diameter of wheels	3 ,, 0 ,,
Track gauge	5 ,, 6 ,,
Weight in running order	48 tons
Maximum tractive effort	10 000 lb.
Continuous H.P. of Diesel engine	350 H.P.
Number of driving motors	Four

In order to carry out trials in this country the design was so arranged that with few modifications the locomotives could run on British tracks having a gauge of 4 ft. 8½ in., and would conform with the British loading gauge. Wherever possible, components such as tyres, spring brake blocks, sand boxes, etc., are constructed to the standard types and sizes used on the Indian State Railways, thus making these components interchangeable with those on existing stock.

The Diesel engine is of the high speed type, built by Messrs. William Beardmore and Co., Ltd., and functions on the four cycle fluid pressure injection system. These engines have been operating for some years on the Canadian National Railways, the design being originally developed to provide a compact lightweight engine of steel construction having a low weight power ratio, which in this particular instance has the extremely low value of 21 lb. per B.H.P.

The six cylinders of the engine are arranged in line, and have each a bore of 8¼ in. and a stroke of 12 in., the engine developing 350 H.P. when running at 900 r.p.m. For short periods this can be increased to 420 H.P. The engine forms a self-contained unit complete with its own water and lubricating oil pumps, both of which are automatically controlled. Fig. 2 shows the engine and generator erected on the test bed.

Control of the locomotive speed of the engine is effected primarily by variation of the speed of the governor, the latter being arranged with four definite settings giving speeds of 400, 600, 750 and 900 r.p.m., while an automatic overspeed device is fitted which prevents the engine exceeding a speed of 1 050 r.p.m. by venting the fuel pump.

The governor setting for these four speeds is controlled by a series of electrically operated valves operated from the master controller in the driver's compartment. This method of controlling speed by altering the governor setting affords several distinct advantages, among which may be mentioned the considerable economy gained in fuel consumption when travelling down long gradients, and the simple manner in which a variable H.P. output from the locomotive is obtained.

The engine is started by supplying current from a storage battery. The control is so arranged that it is impossible for the driver to start the engine on full compression. This is an important point, as it considerably reduces the strain of starting on the battery. Furthermore, a safety device is introduced in the form of a special relay which prevents the generator passing a heavy charging current to the battery should the driver keep the starting connections in operation after the engine has started. The control consists of a push button suitably interlocked with the de-compression lever, both of which are mounted on the engine. Three push buttons for stopping the engine are also provided, and these are situated one in each driving position and one in the engine compartment. Thus the driver has always close at hand the means for stopping the engine either under normal conditions or in an emergency.

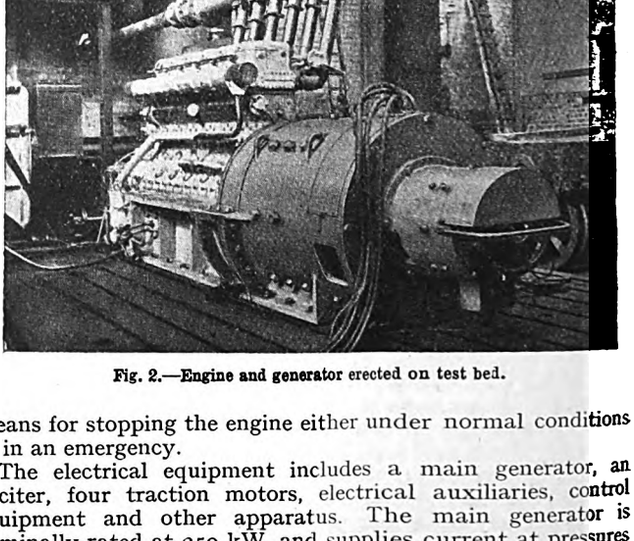

Fig. 2.—Engine and generator erected on test bed.

The electrical equipment includes a main generator, an exciter, four traction motors, electrical auxiliaries, control equipment and other apparatus. The main generator is nominally rated at 250 kW, and supplies current at pressures varying between 100 and 800 V, depending on the speed and load. Only one bearing is included in the construction of the machine, this being situated at the exciter end of the armature

Digitized by Google

shaft, the other end of which is coupled to the engine flywheel by means of a solid spigot and bolt coupling. This construction reduces the stresses which normally would be set up by the use of two bearings in the generator in addition to those of the engine. The single bearing employed is of the Hoffman roller type carried in a spherical seating which further ensures self-aligning of the shaft.

The frame of the generator is of cast steel, and is flanged at the coupling end for bolting to a similar flange provided on the engine bedplate. As the unit is carried as a whole on the main frame of the locomotive any tendency to distort is eliminated.

In order to obtain a heavy drooping characteristic the generator is provided with an inverse compound winding, which has the effect of limiting the output of the machine, the windings being so proportioned that the engine can never be seriously overloaded. A simple form of adjustment is provided in the form of resistances which will allow any subsequent alteration to be made to suit any special service conditions.

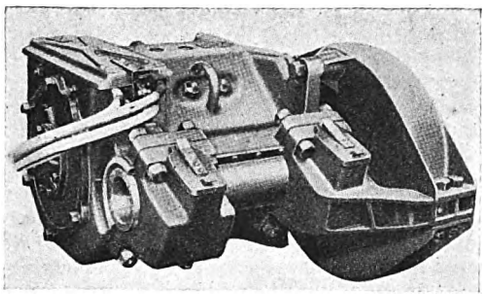

Fig. 3.—Traction Motor.

The overhung exciter follows normal practice and is rated at 10 kW with a normal voltage of 120. Actually the exciter would be more correctly termed an auxiliary low tension generator, as it is supplies current when running at speeds of 750 and 900 r.p.m., not only to the main generator field but also to the vacuum brake exhauster motor, while it also assists in maintaining the battery in a charged condition. An automatically operated series resistance inserted in the shunt field enables the exciter to maintain the same voltage at both the speeds indicated.

Below these speeds—that is, at 400 and 600 r.p.m.—the battery supplies the total low tension current required by the generator field, exhauster motor, lighting, and the control system.

As in the case of the main generator, the exciter is designed with a slightly drooping characteristic so that it automatically protects itself from heavy overloads. The nominal voltage of the low tension circuit is 110.

The traction motors (Fig. 3), of which there are four, follow standard practice, and are designed to meet the maximum service condition without undue heating. Their normal one-hour rating is 120 amperes at 600 V, but they will carry considerably greater loads than this, while in order to give the normal running speed of 47 miles per hour the motors are arranged for field shunting, approximately 35% field shunt being provided. The motors are axle hung, their drive being transmitted to the axles by single reduction spur gearing enclosed in oil-tight gear cases. The armatures are carried in grease-lubricated roller bearings.

Apart from the exciter, which has already been described, a small petrol engine driven generator is provided for the purpose of maintaining the battery in a properly charged condition. This auxiliary is rated at 5 kW, and supplies direct current at 110/135 V at a speed of 1 200 r.p.m. It should be particularly noted that the battery obtains sufficient charging current from the exciter during the normal running of the locomotive, but as the latter may, on occasions, be used in abnormal circumstances in out-of-the-way localities, it is considered necessary to have an auxiliary for giving the battery periodical gassing charges and thus keep it in good condition.

The battery installed in each locomotive cosnists of 50 cells, type K.L.17, supplied by the D.P. Battery Co., Ltd., having a total capacity of 224 ampere hours at the 5-hour rate of discharge. The elements are fitted in strong ebonite containers designed to allow the free circulation of air round each cell. The master controller is provided with an "off" position and eight steps as follows, in addition to a "forward" and "reverse" handle:—

(1) Engine, 600 r.p.m., weak field generator, full field motor.
(2) Engine, 600 r.p.m., full field generator, full field motor.
(3) Engine, 750 r.p.m., weak field generator, full field motor.
(4) Engine, 750 r.p.m., full field generator, full field motor.
(5) Engine, 900 r.p.m., weak field generator, full field motor.
(6) Engine, 900 r.p.m., full field generator, full field motor.
(7) Engine, 900 r.p.m., weak field generator, weak field motor.
(8) Engine, 900 r.p.m., full field generator, weak field motor.

Reversing is accomplished by means of the usual type of solenoid operated railway reverser, while other functions are carried out by means of contactors, the whole of which are operated from the master controller and are mounted on the various panels in the engine compartment.

Interlocks are introduced in certain cases for the safety of the equipment, so that faulty connections cannot be made in the event of any contactor failing or remaining closed. In the "off" position the motor circuits are entirely broken by the appropriate contactors.

The master controllers are provided with the usual mechanical interlocking between reverse and main drums, and the engine is also safeguarded from being started under load by "off position" interlocks on the controller.

For the control of the field of the main generator, two sections of resistance are employed, one section being used only for the first step, thus facilitating suitable control of the locomotive when running light.

In conclusion, it should be mentioned that the locomotives were built to the specification of the Consulting Engineers, Messrs. Rendel, Palmer and Tritton, the electrical equipment being manufactured throughout by the main contractors, the General Electric Co., Ltd., while the engines and mechanical portions respectively were constructed by their sub-contractors, Messrs. William Beardmore and Co., at their Parkhead and Dalmuir Works, Glasgow.

ROYAL SOCIETY CONVERSAZIONE.

Electrical Exhibits—New Heat Resisting Alloy for Furnaces.

THERE was a large gathering at the Royal Society's Conversazione at Burlington House on May 14. Sir Ernest Rutherford, the President, received the guests.

Exhibits of electrical interest included demonstrations of the frequency analysis of a modulated continuous oscillation and of the reception and recording of signals from the Orfordness rotating wireless beacon and an exhibit of radio transmitting and receiving apparatus for wavelengths of 4–10 m., by the National Physical Laboratory. The last named apparatus included a 1 kW 2-valve transmitter suitable for generating oscillations on wavelengths between 4 and 10 m., and a simple portable 2-valve receiver for reception on the same range.

X-ray photographs and crystal models illustrating the structure of vitreous and amorphous solids were shown by the Research Laboratories of the General Electric Company (Mr. J. T. Randall and Mr. H. P. Rooksby).

A micro-volt meter for investigating the flow of heat at a window, inwards or outwards, was shown by the Building Research Station (Mr. A. F. Dufton). An interesting exhibit was the electric furnace in operation, with heating elements of the new R.H.* heat resisting alloy, which has the high electrical resistance of 134 microhms per c.c at 20° C. with a low uniform temperature co-efficient of 0·000075 per °C. combined with remarkable resistance to heat scaling, shown by Sir Robert Hadfield, Bt., F.R.S. By means of this alloy, resistance type furnaces can be maintained continuously at temperatures as high as 1 200° C.

Next Sunday the cable laying vessel "Ampere," built by the Société Provencale de Constructions Navales to the order of the French Ministry of Posts, Telegraphs and Telephones, will be launched by M. Mallarmé, Minister of Posts and Telegraphs, at La Ciotat. The new vessel is 91·5 m. long with a beam of 12·5 m., and has a loaded displacement of 3 920 tons.

ELECTRICAL ASSOCIATION FOR WOMEN.

Fifth Annual Conference and General Meeting—Electrical Training for School Girls—Ministers' Tributes to the Association.

THE fifth annual meeting of the Electrical Association for Women was held at the Park Lane Hotel, Piccadilly, on May 15. Mrs. Wilfrid Ashley, president of the Association, was in the chair, and over 200 members were present.

A presentation of a pendant was made to Mrs. Hammer, on retirement from the chairmanship of the Council after five years' service, as a token of esteem and appreciation.

Officers elected for the ensuing year are :—President, Mrs. Wilfrid Ashley ; Chairman of Council, Mrs. G. Z. de Ferranti ; Vice-Chairman, Councillor Mrs. E. Gregory ; Hon. Treasurer, Mrs. Ll. B. Atkinson.

The following new members of the Council were elected : Lady Brooks, C.B.E., J.P., Mrs. H. Bentham, Mrs. M. B. Jackson, Miss M. Reading.

Councillor Mrs. Gregory (Chairman of the Higher Education and Public Health Committees of West Ham) proposed, and Mrs. H. K. Beale (president of the Birmingham branch) seconded, the following resolution, which was adopted :—

> In order that the school girl may receive some training in electrical matters during her school life, we, of the Electrical Association for Women, urge the value and importance of co-operation between educational and electrical authorities so that domestic science centres and schools shall be equipped with the most modern domestic electrical appliances.

Mrs. Beale detailed the work done by the Birmingham branch in connection with the Birmingham Education Committee, and Councillor Mrs. Price White spoke of activities in this direction in North Wales.

All branches were represented at the meeting, and remarkable accounts of progress were presented.

The fifth annual report, presented by the Director, Miss C. Haslett, recorded that all the local organisations with one exception, are in a very flourishing condition. " The Electrical Age," the magazine of the Association, is increasing its circulation and finding its way to many parts of the world. It is not only self-supporting, but brings in a small revenue.

Inquiries are being received from many countries as to the possibility of forming electrical associations for women, and a number of overseas members of the E.A.W. are being enrolled. An artistic brooch embodying the badge of the Association has been produced.

Mrs. Wilfrid Ashley, occupied the chair at a largely attended luncheon at the Park Lane Hotel on May 15, following the annual general meeting.

Miss Margaret Bondfield, Minister of Labour, proposed the toast of " Electricity in the Service of Women," and said that the average price of electricity was now 3·05d. per unit, a decrease of 2·7d. or 47%, since 1921–22. The retailing of electricity was still in a most unsatisfactory and unscientific state. She was glad to know that free wiring and hire purchase were increasing. She congratulated the Association on the part it had played in the publicity campaign, and referred to Miss Partridge's work in trying to make a real future for women in connection with the development of electrical plant. The Ministry of Labour was anxious to extend the work of training centres for girls on the electrical side so that in time there would be a larger supply of electric cooks, for whom the demand was in excess of the supply.

Changes in Domestic Economy.

Mr. Herbert Morrison, Minister of Transport, replying, said that women's organisations as well as statesmen ought to give consideration to the avenues through which modern science could lighten the labours of the housewife and particularly the lower middle class and working class housewife. Since the middle ages there had been a steady process of change in domestic economy. But it was still true that millions of British housewives got up each morning in the winter, made their individual fires, sprinkled their tea leaves, swept their individual carpets, and had to boil hot water specially as and when it was required. It was still true, therefore, that there was a mass of needlessly laborious work being undertaken which modern electrical science could largely eliminate.

The object of the Minister of Transport, the Electricity Commissioners and the Central Electricity Board, together with all branches of the electrical supply industry, should be to assure, in the words of electricity legislation, a cheap and abundant supply of electricity. In a large number of areas this cheap and abundant supply was not yet available, and in all areas the price of electricity was still not as low as it could be. If that end was to be achieved, not only must the administrative and other activities of national public authorities be stimulated in that direction, but the supply undertakings must pursue a policy of rapid development with sound and attractive tariffs. They must also expand and intensify their sales organisations.

There was an obligation upon women also to understand the possibilities of electricity, to have faith in the practical use of this great, wonderful force, and to be willing to use electrical energy for varied purposes in the household. All supply undertakings would be wise to pursue the policy of earning a modest profit on an increased turnover instead of being content with high profits and restricted development.

Splendid Educational Work.

The Electrical Association for Women was doing splendid educational work. Both the industry and women themselves owed much to the educational and pioneering activities of this important body, and he desired to congratulate their energetic president, Mrs. Wilfrid Ashley, who by voice and pen had done so much for the furtherance of the cause, and Miss Haslett, the director, who performed valuable and responsible duties in the organisation of the Association.

Sir Felix Pole, proposing the toast of " The Electrical Association for Women," said that in the five years since the Association was formed it had grown to a body with more than 4 000 members and branches all over the country. The propaganda of the Association had been thoroughly good ; it was up to date and practical. We needed people of vision—both men and women. It was foresight and vision which instituted the grid, and we must see that the use of electricity kept pace with the supply. He would like to see the same price charged for current throughout the country just as one could send a letter for the same charge to a neighbouring suburb or to Scotland. He would say to the Central Electricity Board : " You are going to be wholesalers of current ; why not be retailers as well ? " One result of electrification would, he hoped, be the repopulation of the countryside.

Mrs. Ashley, responding, said that there had been too much fuss about overhead construction. When windmills were first erected she had no doubt that a lot of people condemned them as ugly blots on the landscape, but to-day there was, she believed, a society for the preservation of windmills. We should hardly live long enough to see a society formed for the preservation of overhead lines, but there was no doubt that before long they would be accepted just as other innovations had been after the first reaction to change had disappeared. It was particularly necessary to bring down tariffs so that electricity could creep along the wires into every small home in this country.

Members visited the Home Office Industrial Museum in Horseferry Road, S.W., in the afternoon, and in the evening the London Executive Committee held a reception at the Institution of Electrical Engineers. A feature that was greatly appreciated was Mr. Ll. B. Atkinson's talk on " Some Electrical Reminiscences," illustrated with a very interesting series of slides of early dynamos and pioneers of the electrical era. Mrs. Hammer was in the chair, and Mrs. Lamb, of the Manchester branch of the E.A.W., proposed a vote of thanks to Mr. Atkinson. Mrs. Lamb, while also expressing the appreciation of the members to the Council of the I.E.E. for their invitation to meet within " these sacred walls," asked Sir Thomas Purves to admit that he had never before seen such a nice-looking audience in the lecture room of the Institution. The President, who was then called upon to speak, in his characteristically happy manner said that he was only too ready to make that admission without any prompting.

On the second day of the Conference (Friday), members visited Messrs. J. Lyons and Co.'s factory at Greenford in the morning, the afternoon being left free. In the evening a ball was held at the Park Lane Hotel ; the guests were received by Mrs. Wilfrid Ashley. Dancing continued until 2 a.m., a cabaret entertainment being interpolated.

THE NATIONAL PHYSICAL LABORATORY.

Report for Year 1929 Shows Good Progress—Work in Connection with the Grid—New a.c. Measurements.

THE Executive Committee of the National Physical Laboratory has published its report for 1929, and under the heading of research in the electricity department, electric standards division, are included investigations directed to improvement in the methods of measurement. A bridge method has been developed for high precision measurements of self-inductance and effective resistance at high frequencies; the measurement of the phase angles of potentiometers, potential dividers, etc., has been studied; the apparatus for the measurement of the relative phase and amplitude ratio of input and output voltages of amplifying systems has been further investigated and improved; and a comparison has been made of bridge and wattmeter methods of measuring total losses. The surface resistivities of various dielectrics have been examined under prolonged exposure to the action of light. Work on the primary standards has been proceeding steadily in accordance with the programme laid down by the Electrical Standards Committee. The Lorenz apparatus is being prepared for a fresh determination of the ohm in absolute measure, and work on the Campbell alternating current bridge method has continued: various improvements in detail have been effected. Good progress has been made in the overhaul and reconstruction of the current balance and its re-erection will be completed shortly. Standard cells have been set up during the year in accordance with the standing practice, and comparisons have been made with the batches of previous years. It is concluded from these comparisons that the standard can be reproduced with a probable error not exceeding one part in 100 000. Work has been done also on inductance and capacity standards. The laboratory secondary standard of inductance on which all ordinary determinations of inductance and capacity are based has again been compared with the primary standard: the maximum variation observed during the past three years has been two parts in 100 000, and the standard seems now to have reached a steady state.

In the programme of work for the Radio Research Board the accurate measurement of frequency is of primary importance, and examination has been made into the means of securing the highest accuracy possible in the comparison of the tuning fork used in measurements against the Shortt clock. The experimental and mathematical investigations into the quartz oscillator have been continued, and the influence of the circuits associated with the oscillator on its frequency and on the power output have been carefully studied. Among a number of other items of work in progress, mention may be made of the investigation into power losses in dielectrics which is in progress for the British Electrical and Allied Industries Research Association. New apparatus has been specially designed for these experiments, and the programme includes measurements on typical dielectrics under a wide variety of conditions.

Alternating Current Measurements.

The Electrotechnics Division continues to be largely occupied in the development of methods of carrying out alternating current measurements. A new standard of accuracy in testing and in practice has been introduced by the use of current transformers having nickel-iron cores. This has required re-examination of the whole range of a.c. carrying resistors from 2 000 A downwards, and determination of the phase angle due to their inductances to the order of 0·05 minute. The new transformers can be used for the accurate measurement of large currents, the secondary current being a constant fraction of the primary to about one part in 10 000 at all loads. Considerable advance has been made with the installation of precision measuring apparatus in the high voltage laboratory. Two electrostatic voltmeters have been installed, so that simultaneous readings may be made on the primary and secondary sides of the transformers, and an electrostatic wattmeter will also be provided. A special potential dividing resistor has been designed for the calibration of electrostatic voltmeters of this type, by which any voltage up to 550 can be obtained in steps of 0·1 volt. The method of measuring peak voltage described in the report for 1928 has been used for voltage measurements in testing work and for measuring the ratios of the supply transformers. Another method has been tried, using a condenser divider, a voltmeter being charged through a rectifying valve to the maximum peak voltage on the low voltage arm of the divider. The work involves the accurate measurement of the mean value of a small intermittent current, and different methods of doing this are under investigation. High voltage tests of insulator systems for transmission lines have been made during the year, several in connection with designs for use on the 132 kV national scheme. Tests have been made of vertical suspension insulator systems, both dry and under artificial rain. For high voltage tests of insulators in oil it has been decided, with the approval of the High Tension Committee, to instal a tank of insulating material, 14 ft. high and 4½ ft. in diameter. Tanks to contain the oil and centrifuging equipment for purification will also be needed. For the British Electrical and Allied Industries Research Association investigations have been in progress into dielectric losses in cables at high voltages and into the thermal properties of power cables, the work being done on a long length of cable laid along the tank building. Good progress has been made in the Wireless Division during the year with research for the Radio Research Board. Investigation has been made into the vertical distribution of radiation from an antenna, by observations in an aeroplane at Farnborough and Grimsby. The study of antenna systems for beam transmission has been continued and a simplified method of effecting the calculations to determine the field at varying distances has been developed.

Short Wave Investigations.

In the research on very short waves, analysis has been made of the various circuit arrangements suitable for transmission, and a 500 W transmitter based on the result of this work has been in constant use for experimental transmissions. A 1 000 W equipment is under construction. The apparatus has been employed with receivers of special design for attenuation measurements and direction finding experiments. Experiments have been continued with the rotating loop beacon devised by the Royal Aircraft Establishment and a beacon of improved design has been erected by the Air Ministry, in co-operation with the Board of Trade, at Orfordness. In connection with interference of wireless transmissions a programme of research on the spectral energy distribution of electric disturbances of the types which occur in wireless practice has been submitted to the Radio Research Board. Work has been continued on methods of absolute measurement of current at radio frequencies, and the method involving the passing of the current through a known resistance of mercury and observing the rate of expansion has been so far developed as to give a direct measurement of a current of 10 A consistently to a few parts in a thousand. Other subjects investigated include the measurement, at radio frequencies, of resistance and reactance, and of the power factor of variable condensers.

The work of the Photometry Division has been largely devoted to the study of two main problems. In connection with the fundamental measurements of candle power and the establishment of suitable standards, much attention has been given during the past few years to the use of a photo-electric cell, in place of the human eye, for the comparison of luminous intensities. The chief difficulty met with to-day in candle-power measurements is that light sources differ in colour. The response of the photo-electric cell to lights differing in colour is not ordinarily in proportion to that of the normal eye, and in interpreting measurements made with the cell a variable factor has to be employed to reduce the results to a standard basis. The study of different types of cell has led to the evolution of a more suitable type, the response of which approximates much more closely to that of the eye, and further improvement in this direction may be anticipated. The advance made, however, has led to the substitution of the photo-electric cell for the eye in much of the routine standardisation work, thus eliminating the uncertainties due to fatigue of the human observer, or to differences between one observer and another. A large amount of work in the introduction of the photo-electric cell for a variety of measurements remains to be done in ensuing years. The second outstanding feature of the year's work is the continued advance made in the study of glare in relation to lighting problems. This work is done with the advice and under the control of the Illumination Research Committee.

CIRCUIT BREAKERS.

Research Work and Manufacture and Assembly of Plant.

MESSRS. A. Reyrolle and Co., Ltd., and British Brown-Boveri, Ltd., exhibited at the St. James Picture Palace, Palace Street, London, last Friday, interesting cinematograph films dealing with oil circuit breakers.

The Brown-Boveri film depicted the whole process of rupturing heavy currents under oil, and the fundamental phenomena that enter into the process were portrayed by slow-motion pictures of the actual rupturing in a specially constructed circuit breaker with heavy glass sides illuminated by flood lights of 200 000 c.p. The development of the arc and the gas bubble during the rupturing process were clearly seen. With a single pair of contacts, 10 000 kVA at 8 000 V and 24 000 kVA at 8 000 V were broken. Tests were then shown on a breaker fitted with an explosion chamber, 10 000 kVA at 8 000 V being interrupted.

In the next test, multiple break contacts were used, and it was noticeable how the duration of the arc and the work done by the switch were diminished. This test showed 10 000 kVA at 8 000 V being ruptured by three pairs of contacts in line. This part of the film clearly demonstrated the advantages of the multi-break principle.

The next portion of the film dealt with the problem of counteracting the repulsive forces which are created between the contacts when closing breakers on short-circuit currents exceeding 10 000 A and which tend to make the contacts open again. A slow motion picture with a glass walled breaker showed that the repulsive forces are so considerable that with solid contacts the circuit is broken twice in succession and the contacts finally weld together, that repulsion and welding can happen also with the plug type of contact, and that contact repulsion can be prevented by the use of solenoid contacts wound in the same sense, and, therefore, attracting one another. Messrs. Brown-Boveri have developed contacts of this form so dimensioned that the effect of all the repulsive forces is balanced by that of the attractive force, so that solenoid contacts make it possible to close the breaker without danger on very heavy short-circuit currents. A normal oil circuit breaker was equipped with three different types of contact, and each in turn closed on a short circuit current of from 30 000 to 50 000 A. One pole was equipped with brush contacts and ordinary arcing contacts; another with plug contacts, and the third with solenoid contacts. When the solenoid contacts were closed the only visible indication that a heavy current had passed was the violent movement of the cables to the switch. On opening up the switch it was seen that the brush and plug contacts had been considerably damaged and burnt away; the solenoid contacts were undamaged.

The film exhibited by Messrs. Reyrolle demonstrated the manufacture, testing, and installation of switchgear of the metal-clad type, which had been designed as a practical application of the results of research similar to that which had been illustrated in the previous film, and also as a result of research into many other factors. A notable feature was a view of Reyrolle "self-grip" contacts after making 70 000 peak amperes at 17 000 V four times in succession.

Advantages of Multi-break System.

Mr. Brierley, of Reyrolle and Co., said the views of Messrs. Brown-Boveri and Messrs. Reyrolle on the subject of circuit-breaking had developed on parallel lines. Although the actual details of construction might not be exactly identical, both companies advocated open-type circuit-breakers embodying the multi-break principles for high-power and high-voltage switchgear. Research appeared to them to have proved the wisdom of advocating multi-break principles in preference to the explosion-pot principles adopted in America, and actual multi-break designs were being used for parts of the 66 kV and 132 kV systems now being erected in Great Britain.

The Reyrolle film also included some views of the high-power short-circuit test plant recently built at Hebburn, for the purpose of carrying out further research work at considerably greater powers than have hitherto been available in Great Britain. The film included an actual oscillograph record of one phase of a three-phase short-circuit obtained on the Hebburn testing plant. The initial peak current was 70 000 A, which, at the circuit voltage of 17 000, corresponded to a short-circuit of 1 500 000 kVA.

Finally, a film was exhibited showing details of the electrified St. Gotthard Railway.

BOOK REVIEWS.

High Voltage Cables: Theory and Practice of their Design and Operation. By P. DUNSHEATH. (London: Sir Isaac Pitman and Sons.) Pp. xii + 161. 10s. 6d.

The author's name is sufficient to assure us that this resumé of present day knowledge and experience in the design of high-voltage cables should be sound, but it is also wonderfully complete. When we had read it to the end and noted that the last page number was only 158 we were astounded, for it seemed hardly credible that so much information could have been contained and so clearly expressed in so short a space. As Mr. Dunsheath truly says in his preface, the subject is in such a state of flux and the development of theoretical conceptions of practical designs so rapid that the attainment of finality in the printed record is not easy, but he has brought us completely up to date "with the finger pointed in the direction of future development."

The first chapter gives curves showing the variation of capital cost, transmission losses, and transmission costs, with the voltage and the kilowatts transmitted. For the same kW transmitted transmission costs, of course, fall as the voltage increases, but the fact is clearly brought out that, except for very great loads, capital cost does not continue to decrease as the voltage increases; for instance, for a 10-mile transmission of 20 000 kW the capital cost is a minimum at 66 kV and actually increases with higher voltages, while for loads over 50 000 kW the 132 kV cable is fully justified. A table shows also that the kilowatt-carrying-capacity—if one may use the term—of ·1, ·2, and ·3 sq. in. cable is not quite proportional to the voltage and is a long way from being proportional to the sectional area; a ·1 sq. in. 33 000 V cable can transmit 7 200 kW, but a ·3 sq. in. no more than 13 500 kW.

Chapter II deals with the fundamental properties of a dielectric—capacity, conduction and absorption—and a discussion of the various theories put forward to explain the last of these is particularly interesting. The third chapter is on dielectric loss and power factor. It is explained that the departure from true quadrature between the voltage and the current is a measure of the imperfection of the dielectric, and that the probability that absorption is the underlying cause of normal dielectric loss has become almost a certainty in the light of recent experimental evidence. The factors affecting the "V-curve" connecting dielectric loss and temperature are discussed, and the methods available for the measurement of dielectric loss are described and compared.

The next chapter, on "Stress and Breakdown," leads us logically to the intersheath, and deals with ionisation and the other causes which contribute to the breakdown of a dielectric. The importance of the time-voltage characteristic is emphasised, and it is shown that indiscriminate testing of a cable far beyond its working voltage may diminish its useful life at working voltage even if it does not break down under test.

The physical properties of impregnated cables and causes of breakdown form the subject of the next chapter. It is suggested that when failures have been restricted to no-load periods they are probably due to the pressure of a partial vacuum—either by an increase of internal volume due to bending, or to sealing up the ends in the factory while the cable is still hot—followed by high mechanical pressures induced by expansion of the dielectric under load temperatures. It is interesting to read that experts are still not agreed on the use of resin as a constituent of the impregnating material, or whether the formation of "cable cheese" should be regarded as a cause or an effect of breakdown; but it is still more disappointing, in view of the impracticability of no-load tests on large cables with A.C. at very high voltage, that "there can be no true fixed ratio between the d.c. and a.c. breakdown voltage unless the conditions are very closely defined." Unfortunately this ratio must in the nature of things be a more or less arbitrary value as some of the causes of breakdown under alternating current conditions are entirely absent under direct current.

The next four chapters of the book are concerned with the actual construction of high voltage cables, current rating, sheath loss and jointing. The reason for abandoning the ordinary 3-core construction ("belted" 3-core cables) at 33 000 V and over is explained, and the author expresses the opinion that there is a good deal to be said in favour of metallised cores at 22 000 V or even at lower voltages. At 66 000 V the diameter and weight of 3-core cable is getting excessive, and at still higher voltages the use of single core, he says,

Digitized by Google

seems at present to be the only solution. The final chapter, "Special Cables and Systems," is all too short, but it could hardly be otherwise, as the 66 000 and 132 000 V cables which it describes have not been in commission very long. Included in the cables described is the one which has been adopted for the 132 000 V cable portion of the grid by the Central Electricity Board.

The present reviewer has derived so much pleasure and instruction from Mr. Dunsheath's work, that it would be ungrateful if he did not correct a slight historical inaccuracy in the opening chapter. The manufacture of the ordinary type of cable with stranded conductor and lead sheath was not commenced soon after Ferranti's paper-lapped copper tubes, but preceded them. In fact Ferranti's stiff tubular cable was designed to take the place of a lead-covered cable insulated with impregnated cotton which had failed to withstand 10 000 V. This previous cable was in a sense tubular also, for its central conductor was composed of six strands of No. 9 S.W.G. copper round a jute core, and the present writer gained some of his early experience in fault localisation during the factory tests on this 6/9 concentric cable which was stripped, re-impregnated and re-lead-covered for use on 2 000 V pressure. The dielectric thickness was so ample for this lower voltage that he would not be surprised to hear that some lengths of this cable are still carrying current.

F. C. R.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Stoke Pageant—An Omission.

[To the Editor.]

Sir,—In connection with the celebrations of the bicentenary of the birth of Josiah Wedgwood now being carried out at Stoke-on-Trent, I venture to draw your attention to Episode Eight of the Historical Pageant, described in the handbook as an "allegorical portrayal of the Modern Potteries Industries."

The industrial and commercial development of the Potteries is represented in the episode, symbolically by personifying the industries, and before the spectator pass the Ceramic Queen with attendant pages and princes representing coal, coke, gas, petroleum, dyes, printing and potters' colours. No mention, however, is made or representative appears of electricity.

This is a matter to which I think your paper as the mouthpiece of electrical opinion in this country might well draw attention, particularly when one reflects on the great progress which electricity supply has made in this district. The omission is all the more remarkable having regard to the great success which has attended the introduction of electrically heated kilns in the pottery industry. Eight such kilns are already in use in the works of the principal manufacturers, including the famous Wedgwood Works at Etruria, and several others are now being erected. These developments have been greatly stimulated by the specially low rates offered for such supplies.—Yours faithfully,

C. H. Yeaman.

Stoke-on-Trent,
May 15.

Safety in Rural Electrification.

[To the Editor.]

Sir,—After reading Dr. Ekstrom's article in your issue of May 16, I experienced a sensation of surprise that so many people should have survived the dangers to which they are exposed by the use of electricity. There is a great deal of truth in his article, and whilst recognising that he has not left much unsaid, I am of the opinion that it would be equally useful to have his views on the risks attached to the use of coal fires and other homely conveniences.

It is not too much to say that all progress is obtained with some risk, until the potential victims are educated up to the proper understanding of the new process. Gas can be blown out and left escaping yet no one comes forward with an automatic tap to save the life of the ignorant blower. Fire grates are provided, but I know of no Act of Parliament or Home Office regulation to prevent the fire being laid elsewhere.

Various suggestions are made from time to time arising out of the risks attached to modern transport devices, but, in the end, the pedestrian has to look out for himself, and is gradually becoming educated to the necessary "Safety First" standard. (My dog usually looks right and left before crossing a road, and has, in consequence, reached the ripe age of 5 years.)

The fact is that most people are capable of learning, and, moreover, the small number of electrical accidents causing shock or fire shows that there is a wide gulf between the possible and the probable, as is the case with every other source of energy.

There is a great danger that exaggeration of the possibilities may add rules and regulations so stringent that the rural population will have to continue to be exposed to the risks attached to the use of paraffin oil and the like. It would be more reasonable to recognise the electrical risks and take such simple precautions as suggest themselves. Amongst these may be included the use of linoleum mats in front of cookers, etc., when installed on stone floors. The education of the consumer to some understanding of the risks should be a gradual process. There is no need to point out their existence, because the majority of people are already fully aware of them, and some are tolerably nervous about it in any case. The provision of insulated appliances and "special protective measures" is suggestive of the application of the old expression "foolproof" to domestic life, and if all our actions are to be carried out under conditions suitable for the visual and mental defective, we shall cease to progress at the same rate as our apparatus and become careless.

If the insulation breaks down or the special protective measure ceases to protect, then, according to Dr. Ekstrom, we may die a well-merited death, but it is more than probable that we shall live to ask the supply company to restore the apparatus to its original state of sin and carry on with the fatal work.—Yours faithfully,

Bedford. "Shocked."
May 16.

[To the Editor.]

Sir,—I was delighted to find such early and complete corroboration of the views that I put forward recently in Dr. Ekstrom's article on "Safety in Rural Electrification," in which he reaches exactly the same conclusions as myself. I trust, therefore, that I may be permitted to make a brief reply to one or two critics of my own article.

Mr. Tuson has assumed that I have intentionally exaggerated the evils of indiscriminate earthing, but they need no exaggeration. He uses the well-worn arguments of the all-earthing man, so I should just like to put one question to him. If he were a contractor, would he, or would he not, earth an ironclad main switch mounted adjacent to an unearthed pre-payment meter? The fact that the supply authority *should* earth the meter does not enter into our calculations, as they are a law unto themselves.

I hope, also, that Mr. Tuson has read the March technical publications, where he would have found the following—"Electrical Contractor": "We are beginning to doubt the wisdom of earthing dining-table equipment." In the "Electrical Times" "Megohm" says: "There can be no hard-and-fast rule as to whether earthing of portables should be done or not. Each case must obviously be considered on its merits."

Mr. Taylor appears to advocate a rather revolutionary wiring system, but takes no account of the tens of thousands of existing installations; what is to be done about these?

I read with considerable envy Mr. Rawll's contribution to the discussion; his two or three paragraphs convey as much as a whole page of my own writings. Naturally, I am delighted to find that, after all, he holds similar views to my own, and if he can do anything to stimulate the demand of which he speaks, he will have rendered the industry a valuable service.

I am rather surprised that no champion arose to defend the claims of lead-covered wiring systems, and can, therefore, only conclude that there is general agreement with the very unfriendly things that I said about these systems.

The I.E.E. Regulations are shortly going into their tenth edition, and may we hope that the Wiring Rules Committee will take some note of the growing weight of opinion against indiscriminate earthing? Is it too much to hope that we may find earthing definitely prohibited in some cases, especially where, as Dr. Ekstrom so clearly puts it, "the outer metallic sheath does not form an effective earth shield"?

Should, however, the earthing of "all metal likely to become alive" still be insisted upon, then we shall also be compelled to utilise some such protective system as is mentioned in Dr. Ekstrom's article, further details of which we shall await with interest.—Yours faithfully,

Folkestone, T. C. Gilbert, A.M.I.E.E.
May 17.

NEWS IN BRIEF.

Welding Engineers' Competition—New Zealand Electrical Propaganda—Forthcoming Exhibitions—Societies' Arrangements—Appointments Vacant.

THE Physical Society will visit the Rugby works of the British Thomson-Houston Co., Ltd., on June 14.

The eleventh annual dinner of the Institute of Transport will be held on March 5, 1931, at the Connaught Rooms, London.

The summer meeting of the South Midland Centre of the I.E.E. will be held on July 2, when a visit will be made to the Maentwrog hydro electric station.

As a result of a recent Conference of Electric Power Boards, the New Zealand Government has decided to institute a Dominion-wide publicity campaign for encouraging the use of electricity.

It is reported that Amman, the capital of Transjordania, is to be electrified.

A wireless telephone service between London and Rio de Janeiro was inaugurated on May 15.

Tenders have been invited for the erection of telephone exchanges in Draycott Avenue, Chelsea, London, and at Chislehurst.

An electrical exhibition for Netherlands and Westphalia will take place at Ensehede, Holland, from June 19 to 30. Particulars from Zevenmijls, Stadsgravenstraat 50, Ensehede.

An international transport exhibition is to be held at Poznan, Poland, from July 6 to August 10. The Commercial Counsellor, Polish Embassy, 47, Portland Place, London, W.1, will supply further details.

The duty on wireless apparatus imported into India has been reduced to 12½% *ad val.* in the case of broadcast reception apparatus and components, and to 2½% in the case of other apparatus and components for wireless telegraphy or telephony.

Weymouth Electricity Committee has authorised the appointment of an architect to prepare a scheme for the provision of electricity showrooms on part of the site of 17 and 18, Royal Terrace, Weymouth, and for utilising the remainder of the site for other purposes.

The Second International Congress of the History of Science and Technology will take place in London in July, 1931. The headquarters is at the Science Museum, South Kensington, London, S.W.7, and further particulars can be obtained from the hon. secretary, Mr. H. W. Dickinson.

Matthew Murray Prizes to the amount of £5 are being awarded at the end of this session to day and evening students of mechanical engineering at the Leeds Technical College and to students of the Junior Technical School, Holbeck. These prizes will be continued from year to year as the balance of the fund allows.

The British Compressed Air Society has been formed to promote and develop the interests of British air compressor, pneumatic tool, and pneumatic appliance manufacturers, and to consider all questions connected therewith, except relationship between employers and employees. The offices are at 76, Victoria Street, London, S.W.1.

The Standing Committee appointed by the Board of Trade will hold an inquiry on July 7 and 8, and, if necessary, on July 14 and 15, as to whether imported magnetos, batteries, ignition plugs of all descriptions, etc., should be required to bear an indication of origin. The inquiry will be held at the Board of Trade Offices, Great George Street, London, S.W.1.

The "Financial Times" states that Siemens and Halske have obtained a concession to provide telephone services in the whole of Greece. The telephone system of Athens and the Piræus are first to be modernised and extended. The rights are to be transferred to a Greek company, in which Siemens and Halske will be the principal shareholders, and the whole of the equipment will become the property of the Government after 38 years.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of May 22, 1880, stated that the use of the electric light on shipboard was increasing, and mentioned that the steamers "Massachusetts" and "Rhode Island" had recently been fitted with Brush lights; the installation comprised the saloons, cabins and electric head lights.*

The Brush Electric Light Company had just received an order for nearly £20 000 worth of machinery and lamps from the British Government.

Gower-Bell telephones were being installed in the various Government establishments at Chatham.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *of May 26, 1905, an experimental electric locomotive, built by the Westinghouse Company for the Swedish Government to operate at a trolley voltage of 18 000 V, with reduction to a minimum of 3 000 V, proved capable of hauling a train of 70 tons at 40 m.p.h.*

Successful tests of tantalum lamps in America and Austria were recorded.

Fulham (London) Electricity Committee has decided to organise a first aid department at the electricity works.

The annual meeting of the British Association for the Advancement of Science will be held at Bristol from September 3–10.

The Stalybridge, Hyde, etc., Electricity Board is inviting tenders for builder's work in connection with the extension of its Hartshead power station, Stalybridge.

The second British Glass Convention will be held at Buxton from September 17 to 20, 1930. Mr. Walter Chance will preside. The hon. secretary is Mr. G. Marchand, Aldwych House, Aldwych, London, W.C.2.

An assistant station engineer is required at the power station, Royal Arsenal, Woolwich.

Grimsby Corporation is inviting tenders for extensions of the turbine and switch rooms at the electricity works.

It is proposed to alter the old Borough Offices in Upper Bridge Street, Walsall, to serve the purpose of electricity showrooms and office. The total cost will be £7 795.

The seventh annual radio show at the City Hall, Manchester, will be held from October 16 to 26. Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

Imports into Poland in February last included electric conductors, apparatus and other electrical material valued at 7 070 000 zloty (£163 114) and exports of similar goods were valued at 137 000 zloty (£3 163).

The South Wales Branch of the Association of Mining Electrical Engineers has been invited to the cable works of the Pirelli General Cable Works, Ltd., at Southampton, on August 14. Accepting members should communicate with the secretary without delay.

Electrical goods imported into the Irish Free State during March, 1930, were valued at £47 060, against £78 968 in March, 1929, and the imports of such goods in January, February and March were valued at £138 557, against £150 658 in the corresponding months of 1929.

The Dominion Water Power and Reclamation Service of the Department of the Interior, Ottawa, has issued the annual report of its activities for the year ended March 31, 1928. It describes the various administrative responsibilities of this service in regard to international waterway matters, water-power and reclamation.

Mr. D. Grant, chairman, speaking at the Conference of the Post Office Controlling Officers' Association recently, claimed that in spite of war-time interruptions of plans, enormous progress had been made in telephone development, and that the possibilities of fresh usefulness of the telegraph service were still unexhausted, as was demonstrated by the introduction of a picture telegraphy service between London and Berlin.

The sixth ordinary general meeting of the 30th session of the Scottish Centre of the Institution of Electrical Engineers was held on May 16 at the Technical College, Bell Street, Dundee, when Mr. R. H. Fowler, F.R.S., delivered the 21st Kelvin Lecture, on "Some Recent Advances in the Electron Theory of Metals." On the following day the members travelled by road to Loch Rannoch, where they inspected the Grampian Power Co.'s hydro-electric works.

The Institution of Welding Engineers offers a prize of £10 10s. and the gold medal of the Institution for the best original paper on "Welding Practices and Methods, based on My Own Experiences," by a *bona-fide* operative welder (either oxy-acetylene or electric), whether a member of the Institution or not. The competition will be judged by Major James Caldwell and Mr. L. St. L. Pendred. Entry forms from the Secretary, 30, Red Lion Square, London, W.C.1.

Digitized by Google

PERSONAL.

MR. H. Hepworth Thompson, managing director of Holophane, Ltd., was during his recent visit to South America, the first man to speak on the telephone from Brazil to London.

After many years' service with the Liverpool Tramways Electric Power and Lighting Committee, Mr. M. H. Wardle, chief assistant, lighting department, has retired on superannuation.

The election of Lt.-Col. R. K. Morcom, of Belliss and Morcom, Ltd., as a director of the Iron Trades Employers' Insurance Corporation, Ltd., was confirmed at the annual general meeting on May 8.

Mr. F. V. L. Mathias, the Warrington borough electrical engineer, last week, on behalf of the staff and employees of the electricity undertaking, presented an arm chair to Mr. Shaw Sykes, who retired yesterday after 30 years' service.

The Electricity Commissioners announce that Mr. H. Nimmo, electrical inspector and adviser to the Government of Burma, has been appointed chief engineering inspector of the Electricity Commission as from May 15, in succession to Col. T. C. Ekin, who has retired under the age limit.

In connection with the retirement in June of Mr. J. K. Bruce, general manager of the L.C.C. tramways, Mr. T. E. Thomas, traffic manager, has been promoted to the general managership at a salary of £2 000 per annum, rising by annual increments of £250 to £3 000 a year.

Mr. S. J. Cain, engineer and construction inspector at the Luton Post Office, has been promoted chief inspector at the sectional office at St. Albans, and has been presented with a Westminster chiming clock in recognition of five years' service as branch secretary of the Society of Post Office Engineering Inspectors for the district.

In connection with the announcement in our last issue that Mr. J. W. Beauchamp had been appointed to the Central Electricity Board, we are given to understand that Mr. Beauchamp will be District Engineer in South Wales and South West England. It is expected that the scheme applicable to that area will be adopted by the Board to-day, Friday.

Mr. William Grant has completed 25 years' service as general manager of the Ayr Corporation tramways, and on May 12 he was the guest of the Tramways Social Club. During the proceedings Mr. Grant was presented with a cabinet gramophone, and Mrs. Grant with a wristlet watch.

Mr. J. Sleigh, charge engineer, South Shields Electricity Department, who has been appointed to a similar position at Hammersmith, was the recipient from the staff and employees of a handsome mahogany clock suitably inscribed.

The Council of the Institution of Electrical Engineers has awarded premiums for papers read during the Session 1929–30, or accepted for publication, as follow:—The Institution Premium to Mr. H. H. Harrison; Ayrton Premium to Messrs. B. A. G. Churcher and A. J. King; John Hopkinson Premium to Mr. L. C. Grant; Kelvin Premium to Mr. T. G. N. Haldane; Paris Premium to Messrs. H. A. Humphrey, D. M. Buist, and J. W. Bansall; Extra Premiums to Messrs. S. W. Melsom, A. N. Arman, and W. Bibby; E. H. Smythe and E. G. Weeks; T. W. Ross and H. G. Bell; W. West; Bernard Leggett; J. C. Prescott; and H. W. Taylor. Wireless Section.—Duddell Premium to Mr. J. E. P. Vigoureux; Extra Premiums to Captain P. P. Eckersley and Mr. N. Ashbridge; Mr. G. Shearing, and Captain J. W. S. Dorling. The awards for papers read before the Meter and Instrument Section and the Students' Sections will be announced later.

Major W. H. C. Coates terminated his engagement with the English Electric Co., Ltd., with whom he had been connected since their inauguration in 1919, on May 7. Originally in the engineering department of the Great Eastern Railway Co., Major Coates joined Siemens Brothers Dynamo Works, Ltd., in 1906, and remained in their service until 1915, when he held the appointment of general manager of their Eastern branches with headquarters at Singapore. He resigned this appointment on receiving a commission in the Royal Field Artillery. Joining the English Electric Co., Ltd., in 1919, he was appointed general manager for India in 1920, and held that appointment until 1923. In 1925 he proceeded to South Africa to reorganise the English Electric Co.'s business arrangements in the Union, and was managing director of their local company until recalled in 1926 to undertake a special mission to Ceylon, Malaya and the Far East, from which he returned at the end of 1928.

Obituary.

MR. R. H. SELBIE, on May 17, aged 62 years. He was general manager of the Metropolitan Railway, London.

BUSINESS ITEMS.

THE address of "The Engineer" has been changed from 33, Norfolk Street, W.C.2, to 28, Essex Street, W.C.2. Tel.: Central 6565.

AT the annual display by pupils of the Dorelle School of Dancing, held at Trinity Hall, Hounslow, on May 16, one of the items on the programme was a ballet introducing well-known advertisements. Amongst the representations were Siemens "Popular Pair." The girl carried a dummy "Pearl" and the boy a "Silvalux Opal," and, as this illustration shows, a very pretty picture was the result.

A new 1 020 line central battery telephone exchange, manufactured by STANDARD TELEPHONES AND CABLES, LTD., Columbia House, Aldwych, London, W.C., was successfully cut-over at 1.30 p.m. on May 15.

Continuing their chain of electrical exhibitions, ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD., held a successful exhibition in the Scouts Hall, Goole, from April 25 to May 3. A similar display at the Rawdon Institute, Selby, opens to-day, Friday, for ten days.

The CURTIS MANUFACTURING CO., LTD., Conduit Place, Paddington, London, W.2, state that they have recently received a number of calls for alterations and repairs to wireless apparatus, for Peter Curtis, or the British Curtis Radio Co., and they wish it to be known that they have no past or present connection whatever with either of these companies.

Mr. J. Garnett Lomax, H.M. Consul-General at Bogota, is in attendance at the Offices of the Department of Overseas Trade (London), for a few days for interviewing representatives of U.K. firms interested in the export of British goods to the Republic of Colombia. Applications for interviews to the Comptroller-General of the Department. (Reference 26 617/1930.)

The EDISON SWAN ELECTRIC CO., LTD., 123/5, Queen Victoria Street, London, E.C.4, announces that standard V.I.R. taped and braided C.T.S. Virite, lead covered cables and flexibles have been reduced by varying percentages. All orders received since April 10 will be invoiced at these reduced prices. In addition to reduction in prices the company has decided to increase the rebate discounts on yearly contracts, the revised scale of discounts being as follows:—3¾% if amounting to £100, 5% if amounting to £250, 6¼% if amounting to £500, 7½% if amounting to £1 000, 8¾% if amounting £2 500, 10% if amounting to £5 000, 11¼% if amounting to £7 500.

STEATITE PRODUCTS.

Official Opening of New H.T. Laboratories at Burlish.

IN the presence of some 300 guests the newly established research laboratory of Steatite and Porcelain Products, Ltd. was inaugurated on May 15, when Dr. G. C. Clayton, in the unavoidable absence of Lord Melchett, switched on a surge voltage of 1 800 000. A description of the new equipment was given in our last issue.

Following a luncheon which preceded the opening of the laboratory, Sir Edward Crowe, of the Department of Overseas Trade, proposed "The Electrical Industry," and said that under the guidance of the Central Electricity Board we were on the way towards considerable progress. He hoped that we should speedily overtake the United States and Germany in the utilisation of electrical power, as we already shared with them the bulk of the world's exports in electrical machinery and apparatus. In this connection he mentioned that though our trade had increased since 1924 from £16 000 000 to £20 000 000, that of our two chief competitors had increased in even greater proportion.

Sir Philip A. M. Nash, managing director of Associated Electrical Industries, Ltd., in reply, said that this Stourport association of the porcelain and electrical industries was both interesting and important. The development of transmission of power was possible only through the perfection of insulation, and though many things had been tried glass and porcelain were the only two materials which gave satisfactory results. This was an age of transmission rather than of generation, and after mentioning what had been done in the way of exporting power from Germany to France, Poland, Switzerland and Czecho-Slovakia, Sir Philip said he believed that there was actually under consideration the possibility of using the water strongholds of Norway for generation, and transmitting power to Sweden, across the Baltic, to Germany. Just as a common railway gauge made possible the organisation of a system of international transportation, so, he believed, should we see in the future, a network of lines for the international transmission of power to the industrial centres of the world.

Sir John Brooke, Electricity Commissioner, gave the toast "Steatite and Porcelain Products, Ltd.," which was acknowledged by Mr. C. S. Garland, managing director of the company.

Dr. G. C. Clayton read a speech which Lord Melchett had intended to deliver, wherein tribute was paid to the assistance which the German pioneers in the steatite industry had given to the Stourport undertaking. Skilled workmen had been loaned to train British employees until such time as they could get along without them. After describing the equipment for research installed in the new laboratory, Lord Melchett said that he felt strongly that the porcelain industry in this country had arrived at a stage when its rationalisation could produce maximum advantages to all concerned.

ULSTER ELECTRICITY SUPPLY.

Adoption of New Scheme by Northern Ireland Government.

MR. J. M. KENNEDY, of Messrs. Kennedy and Donkin' has submitted and the Government of Northern Ireland has accepted an interim report upon the problem of electrical development in Ulster. The area dealt with in the report lies south of an imaginary line from Belfast to Dungannon and east of a line from Dungannon to Newry, it has an area of about 1 200 square miles, and has a population of 304 000. In the area there are 19 supply undertakings, three of which—Bangor, Holywood and Lisburn—take, or are about to take, their supplies from Belfast, while the others operate local generating stations. Mr. Kennedy is of opinion that electricity can be made available at the various centres of distribution at a lower cost than would be possible under the individual development of separate generating stations. It is proposed that a public, non-profit-earning authority or board should have power to purchase supplies at cost from the Belfast undertaking, and should be empowered to take over the existing distributing undertakings in the area at a cost of £250 000. A map showing the most important features of the proposed h.t. transmission scheme accompanies the report. The capital cost of the main transmission system is estimated at £245 000, and estimates of consumption and revenue indicate that the scheme should be self-supporting.

I.E.E. LONDON STUDENTS.

Report for the Session 1929-30 Shows Large Increase in Membership.

THE report of the London Students' Section of the I.E.E. for the present session shows that the number of students and graduates under 28 in the Section is now 1 535, an increase of 228 since last session. This increase in numbers is partly due to the new conditions whereby graduates between the ages of 26 and 28 have the privileges of students, but apart from this the number of new students joining the Institution has been about the same as in previous years. Eleven meetings have been held during the session, the average attendance being 112 members and visitors, an increase of 63% above the attendances last session. The Committee attribute this increase principally to the system of monthly notices which has been adopted during this session. Thirteen visits have been held during the session, the attendance being very satisfactory in most cases. Saturday afternoon visits continue to be very popular. The summer meeting was held from August 3 to 14, and consisted of a tour through northern France and a stay of five days in Paris; 26 students from London and the provinces took part.

The Committee states that the Council have agreed to the publication of a "Students' Journal" dealing mainly with the happenings in the Students' Sections. This journal will be supplied to all students and graduates under 28 in addition to the existing journal. The date of publication will be announced later. The Committee are considering a system of district representation, as it is felt that a large number of members have no adequate representation on the Committee. This is being considered in detail, and subject to the approval of the Council it is hoped to establish this new system next session.

IN PARLIAMENT.

Extension of Time Granted for Lochaber Water Power Company's Works.

A BILL promoted by the Lochaber Water Power Co. seeking an extension of time for the completion of works and amendment of the scheme, was considered last week by a Select Committee of the House of Lords. Mr. Keith, K.C. for the company, said although 66 % of the capital had been expended, only 33% of the water power had been obtained. The central feature of the scheme was a tunnel from Lake Treig through the mountains, coming out on the western flank of Ben Nevis. The tunnel was 15 miles in length and 15 ft. in diameter. The tunnel had been completed, and it was designed to carry the water for the whole scheme, which explained why the expenditure had been so large. The aluminium works for which this power was required were situated at Fort William. The works were authorised by Act of Parliament in 1921, which provided for their completion by July 28, 1931. The company also asked for power to abandon certain works, having discovered a less expensive and equally effective alternative. It was proposed to alter the site of the dam, thereby shortening the tunnel and saving approximately £78 000. Two proprietors of land had agreed to the scheme. The other landowner affected was Sir John F. Ramsden, who objected on the ground of damage to the letting value of deer forests, and because he would be unable to sell land in the Spey Valley at an adequate price while these works were in progress. When the 1921 Bill was promoted the company had come to an agreement with Sir John. The Committee decided to approve the Bill, subject to the 1921 agreement of the company with Sir John being renewed.

Transport Provisions in Glasgow.

A Select Committee of the House of Commons has had under consideration during the past fortnight Glasgow Corporation's Bill, which contains clauses relating to 'buses and tramways. Bailie Dollan said, during the last seven years the tramways had contributed nothing to the common good fund on account of competition. The tramways were run as a continuous service. The 'buses ran on the profitable routes at profitable times of the day. The Committee sanctioned the clauses giving the Corporation power to abandon tramways and run omnibuses, and agreed to grant protection to the Corporation trams and 'buses against the setting down or picking up of passengers by other 'buses in the city or in Renfrew or Rutherglen. No protection was given in regard to other routes outside the city.

CANADIAN TARIFFS.

Increased Preference for British Electrical Apparatus and Machinery.

BRITISH electrical machinery and apparatus manufacturers would be well advised to make a careful study of the new tariff changes proposed in the budget resolutions introduced in the Canadian House of Commons on May 1. It may be recalled that the threat of the American tariff to Canadian business has led to the adoption by the Canadian Government of a policy of switching over, wherever possible, trade now carried on with the United States to British or Canadian manufacturers. This is likely to be effected by the reduction of "preferential" rates on articles not largely made in the Dominion concurrently with the raising of the general tariff rates on American goods. In the case of goods of which a considerable proportion of the demand is met by Canadian producers, the market will be thrown farther open to British competition by the raising of the general tariff rates, whilst leaving the "preferential" rates at much the same percentages as previously. It is notable that decreases are proposed in no less than 270 tariff items, so far as the "preferential" rates are concerned, and free entry is conceded in 589 items out of the 1 188 items making up the complete tariff. Imports valued at $200 000 000 are affected by the increase in the margin of preference. Free entry under the British preferential tariff is provided on all non-specified machinery, such as engines, boilers, electrical equipment, etc., which is of a class or kind not made in Canada, coupled with increases in the general tariff rates. Lighting fixtures, heating and cooking apparatus, vacuum cleaners, refrigerators, are among the electrical equipment affected by the changed rates.

The following is a selection from the new Iron and Steel Schedule showing the new rates on electrical apparatus and machinery :—

Tariff Item		British Preferential Tariff	Intermediate Tariff	General Tariff
315a	Carbon electrodes exceeding thirty-five inches in circumference or outside measurement	Free	20 p.c.	20 p.c.
350	Wire of all metals and kinds, n.o.p.	15 p.c.	17½ p.c.	20 p.c.
351	Wire, single or several, covered with any material including cable so covered, n.o.p.	20 p.c.	27½ p.c.	30 p.c.
351a	Wire, twisted, braided or stranded, including wire rope and wire cable, coated or not, n.o.p.	17½ p.c.	22½ p.c.	25 p.c.
409o	Equipment for generating electric power for farm purposes only, viz.: engine, gas tank, generator, storage battery, and switchboard; and complete parts of all the foregoing	Free	10 p.c.	10 p.c.
410j	Battery renewal preparations for miners' electric safety lamps; all for use exclusively in mines	Free	Free	Free
410m	Diamond drills and core drills, not including motive power, and electrically operated rotaly coal drills, of a class or kind not made in Canada, and integral parts of the foregoing, for use exclusively in mining operations	Free	Free	Free
410n	Diamond drills and core drills, not including motive power, and electrically operated rotary coal drills, n.o.p., and integral parts of the foregoing, for use exclusively in mining operations	Free	10 p.c.	10 p.c.
415	Electric vacuum cleaners and attachments therefor; hand vacuum cleaners; and complete parts of all the foregoing, including suction hose, n.o.p.	12½ p.c.	20 p.c.	25 p.c.
415a	Refrigerators, domestic or store, of all kinds, completely equipped or not	12½ p.c.	20 p.c.	25 p.c.
415b	Washing machines, domestic, with or without motive power incorporated therein; complete parts of washing machines	Free	15 p.c.	25 p.c.
415c	Clothes wringers, domestic, and complete parts thereof	10 p.c.	15 p.c.	25 p.c.
415d	Sewing machines, with or without motive power incorporated therein; complete parts of sewing machines	10 p.c.	15 p.c.	25 p.c.
423	Electrical dental engines	Free	15 p.c.	20 p.c.
428b	Engines or boilers, of a class or kind not made in Canada, and complete parts thereof, n.o.p.	Free	15 p.c.	20 p.c.
428c	Engines or boilers and complete parts thereof, n.o.p.	15 p.c.	25 p.c.	30 p.c.
443	Apparatus designed for cooking or for heating buildings—			
	(1) For coal or wood	Free	22½ p.c.	25 p.c.
	(2) For gas	Free	22½ p.c.	30 p.c.
	(3) For electricity	Free	22½ p.c.	25 p.c.
	(4) For oil	Free	22½ p.c.	25 p.c.
	(5) N.o.p.	Free	22½ p.c.	25 p.c.
443a	Electric tumbler and rotary switches and electric relay switches for automatic oven control, when imported by manufacturers of electric apparatus designed for cooking or for heating buildings, for use exclusively in the manufacture of electric apparatus designed for cooking or for heating buildings, in their own factories, under regulations prescribed by the Minister	7½ p.c.	20 p.c.	25 p.c.
443b	Parts, when imported by manufacturers of electric switches for use exclusively in the manufacture of electric tumbler and rotary switches and electric relay switches for automatic oven control, for use on electric apparatus designed for cooking or for heating buildings	Free	12½ p.c.	17½ p.c.
444b	Lamp shades, n.o.p., and shade holders	15 p.c.	27½ p.c.	30 p.c.
445	Electric light fixtures and appliances, n.o.p., and complete parts thereof	15 p.c.	27½ p.c.	30 p.c.
445a	Electric head, side and tail lights, electric torches or flashlights	15 p.c.	27½ p.c.	30 p.c.
445b	Electric arc lamps and incandescent electric light lamps	15 p.c.	27½ p.c.	30 p.c.
445c	Electric telegraph or telephone apparatus and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445d	Electric wireless or radio apparatus and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445e	Electric and galvanic batteries, n.o.p., and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445f	Electric dynamos or generators and transformers, n.o.p., and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445g	Electric motors, n.o.p., and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445h	Electric insulators of all kinds, n.o.p., and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445i	Electric sad irons and complete parts thereof	15 p.c.	25 p.c.	27½ p.c.
445j	Electric apparatus, of a class or kind not made in Canada, n.o.p., and complete parts thereof	Free	15 p.c.	20 p.c.
445k	Electric apparatus, n.o.p., and complete parts thereof	15 p.c.	25 p.c.	30 p.c.

I.E.E. SCHOLARSHIPS.

Two New Scholarships Established by the Council for this Year.

THE Council of the Institution of Electrical Engineers have established the following scholarships, the first awards of which will be made this year :—

Duddell Scholarship.—Of the annual value of £150, tenable for three years. Each candidate must be nominated (not later than June 15, 1930) by a corporate member of the Institution. Preference will be given to candidates whose fathers or a near relative are, or have been, members of the Institution. Open to British subjects under 19 years of age on July 1, 1930, who have passed the Matriculation Examination of a British University or an examination exempting from Matriculation, and wish to take up a whole-time day course in Electrical Engineering.

Ferranti Scholarship.—Of the annual value of £250, tenable for two years. Each candidate must be nominated (not later than August 15, 1930) by the Professor or Teacher under whom he is working or has worked. Preference will be given to candidates whose fathers are, or have been, members of the Institution. Open to British subjects under 26 years of age on July 1, 1930, who are Students or Graduates of the Institution. have been such for not less than two years, have completed to the satisfaction of the Council a recognised electrical engineering course of at least three years, and desire to carry out whole-time research or post-graduate work.

Applications (specifically mentioning the name of the Scholarship) for particulars and nomination forms should be addressed to the Secretary of the Institution, Savoy Place, London, W.C.2.

I.M.E.A. CONVENTION.

Golf Competition in Aid of the I.E.E. Benevolent Fund.

AS in previous years, there will be a golf competition under medal play for the "G. P. Dennis" trophy at this year's I.M.E.A. Convention, which opens at Eastbourne on Monday. The competition will be held on the course of the Royal Eastbourne Golf Club, Compton Place Road, Eastbourne, and will be open to all those who possess a convention badge, from the afternoon of May 24 until 5 p.m. on May 29. Any number of cards can be taken out during this period.

It is hoped that all golfers attending the conference will play at least one round, and those who cannot find time to play may forward their entrance fee as a subscription to the funds to Mr. R. N. Torpy, either care of the Secretary, or to the Queen's Hotel, Eastbourne.

Rotary convertors are the subject of a new issue by the ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2. The reference is K.80.

List N.T.L. No. 9, relative to the company's cables, has been issued by the ENFIELD CABLE WORKS CO., LTD., of 296/302. High Holborn, London, W.C.1. This list cancels N.T.L. No. 8.

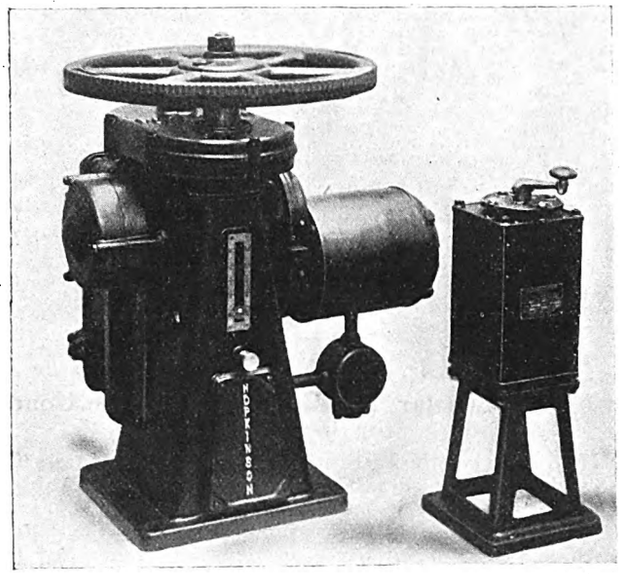
REMOTE CONTROL.

Electrically Controlled Steam Valves—Modern Power Station Practice.

THE principle of "distant" electric control for steam valves is now beginning to be extensively adopted, and the great advantages are obvious, especially in these days of very high pressures and large boilers and mains, rendering hand operation more and more difficult. During the past few years HOPKINSONS, LTD., of Huddersfield, have devoted special attention to the self-contained electrically operated steam valve, and now have a complete range of such valves for d.c. and a.c. supply and suitable for all pressures. The arrangement includes positively operated limit switches of special design, housed in the main casing, which control the travel of the valve spindle and in the design of these limit switches, no trigger springs are used. Also, the design is such that either wedge or mushroom valves are closed down completely, no final hand operation being necessary. There is a positive magnetic clutch device which comes into action when the small electric motor has attained full speed, and results in a slight blow or jerk being given momentarily, so that the valve always commences to open at once, even if it has not been in use for a long period. The valves can be operated by the ordinary handwheel as usual when desired, without disconnecting the electrical gear in any way.



Hopkinson electric control unit on floor stand with reversible controller and emergency push-button type switch.

The valves themselves are of the usual standard types, suitable for pressures up to 900 lb. or over, and for superheated steam temperatures up to 1 000 deg. F. such as recently ordered for the Delray No. 3 station, Detroit. As regards the motors, for either a.c. or d.c., these are generally mounted direct on the valve, but may also be fixed alongside on a separate column, and are arranged to give a high horse power for a short period. The actual power used, of course, is not great, an example being 6 H.P. for a 12 in. valve at 400 lb. pressure, while the motor is of ample capacity.

Various methods are available for operating the valves from the control panel, and often a small reversible drum controller is used, having a dial showing the actual position of the valve with respect to opening or closing. In another arrangement the panel is provided with push buttons for "open," "shut," and "stop" positions. Emergency panels are usually arranged for "shut" only, but any desired arrangement can be embodied to suit the individual conditions. An important feature of the systems installed by Hopkinsons is that once a push button is operated it remains in the "operative" position until the travel is complete, or the "stop" button is brought into operation. A complete system of interlocks is provided, so that no damage can be done if the wrong button is pressed, and among notable stations recently equipped, or to be equipped on these lines, may be mentioned the Barton station of Manchester Corporation, the new Kirkstall power station at Leeds, and the Yallourn station of the State Electricity Commission of Victoria, Australia.

LIGHTING PLANTS.

Small Plants for Country House Installations.

AT this season many think of installing lighting plants in summer residences and house boats. Several models of lighting sets are offered by the DELCO-LIGHT Co. (of Frigidaire House, Chapter Street, London, S.W.1), and among them may be mentioned Model 15 C1, which gives 110 V service. This Delco plant can operate motors up to 1½ H.P., or the pulley attachment can be used for driving shafting that supplies mechanical power up to 3 H.P. The generator operates when 300 W or over are taken from the line, so that only small loads are allowed to be fed from the battery. The 4-cylinder engine is air-cooled and copper pinned, and has a specially designed Delco-Light Zenith carburetter with one simple adjustment. The generator has an overhung armature direct connected to the engine; its full load output is 1 500 W. The switchboard controlling the automatic operation is mounted on the generator frame. The dimensions of the set are: height 27 in., length 38 in., and width 17 in.

Another new plant is the "Semoco" portable lighting set of SMALL ELECTRIC MOTORS, LTD. (Eagle Works, Church Fields Road, Beckenham, Kent.) This is a particularly light and handy set especially suggested for use in hot dry climates where sand and dust abound. As this suggestion infers, the engine is entirely enclosed and air-cooled by a centrifugal fan; and the dust-proof generator is of the enclosed-ventilated type. The engine cylinders are 60 m/m. bore, 80 m/m. stroke, 598 c./c. The pistons are of aluminium alloy and are fitted with 3 gas and 1 scraper rings. Roller bearings are fitted throughout and the gudgeon is of the floating type. The engine is equipped with a B.T.H. magneto and Solex carburetter (sand proof). The speed is 1 600 r.p.m. and the available H.P. is 3½. The generator is specially designed to withstand rough treatment. It is fitted with a cast steel body and aluminium end covers. It is doubly impregnated for tropical conditions and able to withstand considerable overloads with a low temperature rise.

THE SOCIAL SIDE.

THE G.E.C. eleventh annual sports and gala will be held at the G.E.C. London Sports Ground, Preston Road, Wembley, on July 5.

The Alton Battery Sports Club football team was successful in winning the Harvey Charity Cup and also the Alton and District Junior League. The team nearly succeeded in winning a third cup, and it is interesting to note that it was not defeated on its own ground all through the season. In fact it is necessary to go back to November, 1928, before finding a match on which the visitors were successful.

Arrangements are now being made by the Liverpool and District Electro-Harmonic Society for the fourth annual Allied Electrical Trades Golf Tournament which will take place on the course of the West Derby Golf Club on May 27. The tournament will be a stroke competition under handicap and is open to all members of the Society and friends who are engaged in the allied electrical trades within a radius of 10 miles from the Liverpool Town Hall. A putting competition and optional sweepstake will also be arranged. The competitor engaged in the electrical industry who returns the best net score will receive the Allied Electrical Trades Gold Challenge Cup and replica. Several other prizes have also been presented. Following the competition there will be a luncheon in the Club House, when the prizes will be distributed. The latest date for entries is May 23. Mr. E. G. Pulford, Jun., of 108, Whitechapel, Liverpool, is hon. secretary and Mr. W. A. Sloane, of 24, Preeson's Row, Liverpool, assistant hon. secretary.

GLANDS FOR CONDENSERS.

The B.E.S.A. has recently published a specification dealing with brass tubes and screwed glands for condensers for land purposes upon similar lines to the specification issued in 1921 for tubes and glands for marine purposes. The present specification, however, provides for eight sizes of screwed glands, from ⅝ in. to 1½ in. inclusive, and has, as in the case of the specification for marine purposes, clauses covering the quality of material, the dimensions of the tubes and the glands and mechanical and hydraulic tests.

Copies No. 378-1930, may be obtained from the B.E.S.A., 28, Victoria Street, S.W.1, price 2s. 2d. post free.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

CLYDEBANK CORPORATION.—Electrical installation at new Public Baths in Bruce Street, Clydebank. Forms of tender from Mr. J. W. Johnston, town clerk; deposit £1.

ST. JOHN'S CHURCH, BECKERMET, CUMBERLAND.—Electric light installation. Particulars from the Vicar.

BAKEWELL RURAL DISTRICT COUNCIL, May 24–31.—Electric light wiring and accessories in 30 houses at Beeley, Youlgreave and Tideswell. Specification, etc., can be seen at the office of the Clerk until May 24.

Low Tension Cable.

DARTFORD URBAN DISTRICT COUNCIL, May 24.—Supply of about 1 000 yards of l.t. cable. Further particulars from the Electrical Engineer, Electricity Works, Dartford.

MANCHESTER CORPORATION, May 24.—Supply and erection of two rotary balancers, d.c. switchgear, cables, wiring, etc., at Haweswater, for the Waterworks department. Specification, etc., from the Engineer, Waterworks Offices, Town Hall, Manchester; deposit £2 2s.

MARGATE CORPORATION, May 24.—Electrically-driven booster pump set, with compression tanks, etc. Further particulars from the Borough Engineer, 40, Grosvenor Place, Margate.

STAFFORDSHIRE EDUCATION COMMITTEE, May 24.—Electric light installation in existing Infants' Council School, Pelsall, near Walsall, which is to be enlarged and converted into a Senior Mixed Council School. Specification, etc., from Messrs. Moffett, Rosher and Mann, Union Chambers, Temple Row, Birmingham; deposit £5 5s.

WEST RIDING EDUCATION COMMITTEE, May 24.—Electric light installation in head teacher's house at Slathwaite Wilbirlee Council School. Specification from Mr. W. Heeley, 4, Macaulay Street, Huddersfield.

HARROGATE CORPORATION, May 26.—Construction of cooling reservoir at the electricity works. Tenders to the Borough Engineer.

LONDON COUNTY COUNCIL, May 26.—Supply, laying, etc., of cables at Blackwall Tunnel, in connection with new ventilating plant. Specification, etc., from the Chief Engineer, Old County Hall, Spring Gardens, London, S.W.1; deposit £1 1s.

EAST GRINSTEAD URBAN DISTRICT COUNCIL, May 27.—Supply and erection of 320 kVA, three-phase, 50 period 11 000 V alternator and switchgear, and 200 kW reversible rotary, complete with transformers and switchgear. Specification from Mr. G. E. Coldwell, Council Offices, London Road, East Grinstead; deposit £1 1s.

HULL CORPORATION, May 27.—Three 50-line, common battery, private branch telephone exchange switchboards. Forms of tender from the Manager and Engineer, Corporation Telephones Dept., Mytongate, Hull.

MERTON AND MORDEN URBAN DISTRICT COUNCIL, May 28.—Additional wiring at Council Offices. Specification, etc., from Mr. G. Jerram, Council Offices, Kingston Road.

COMMISSIONERS OF H. M. WORKS, etc., May 30.—Electric light shades, etc. Forms of tender from Controller of Supplies, King Charles Street, Westminster, S.W.1.

OGMORE AND GARW URBAN DISTRICT COUNCIL, May 30.—Supply, erection and connecting up of about 2 000 route yards of 11 000 V overhead service line, with short lengths of interconnecting cables. Specification, etc., from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £1 1s.

FARNWORTH URBAN DISTRICT COUNCIL, May 31.—Supply of l.t. cable. Specifications, etc., from Mr. A. J. Atkinson, Electricity Department, Albert Road, Farnworth, Lancs.

PORTADOWN URBAN DISTRICT COUNCIL, May 31.—Supply, erection, etc., of eight sets of electric motors and pumps and automatic switchgears at three pumping stations. Specifications can be seen and forms of tender obtained at the offices of Messrs. Taylor and Wallin, 1, Saville Place, Newcastle-on-Tyne; deposit 10s.

UPPER STOUR VALLEY MAIN SEWERAGE BOARD, May 31.—Treble ram pump (to deliver 15 000 gallons per hour), electric motor, automatic central gear and accessories. Particulars and tender form from Mr. G. P. Deeley, 13, Church Street, Stourbridge; deposit £1 1s.

BALLYMENA URBAN DISTRICT COUNCIL, June 2.—Provision of electricity supply equipment for the township. Specifications, etc., from Mr. James Scott, 358, Royal Liver Buildings, Liverpool; deposit £2 2s.

LIVERPOOL CORPORATION, June 2.—Supply of 41 motor-generator sets for cinema arc work, suitable for operation on 400 V, three-phase, 50 period supply, and to give d.c. output of 80A at 70 V. Tenders to Mr. Walter Moon, town clerk, Liverpool.

BELFAST WATER COMMISSIONERS, June 4.—Electrically-operated pumping plant. Specification, etc., from the Secretary, Water Office, Belfast; deposit £1.

CLACTON URBAN DISTRICT COUNCIL, June 4.—Two transformers and e.h.t. and l.t. switchgear (all of British manufacture) for Great Clacton sub-station. Specification, etc., from the Electrical Engineer and Manager, 1, Arcade Buildings, Station Road, Clacton-on-Sea; deposit, £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of storage battery equipment, comprising emergency stand-by lighting storage battery, 15 kW motor-generator set, battery trickle charger, milking booster, and spare parts. Specification (No. 10) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of works supply sub-station 3 300 V and 400 V metal clad switchgear. Specification (No. 9) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

LIVERPOOL CORPORATION, June 6.—Installation of automatic telephone exchange at Central Police Station, Dale Street, Liverpool. Specifications from Mr. Walter Moon, town clerk, Municipal Buildings, Dale Street, Liverpool.

GLASGOW CORPORATION, June 9.—One year's supply of l.t. and e.h.t. cables, small insulated cables and flexibles, electric cookers, meters and electric kettles. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

CENTRAL ELECTRICITY BOARD, June 11.—Construction of site works, foundation works and buildings in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.F.2) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 11.—Supply and erection of 33 kV transformers. Specification (No. S.E.E.–G.T. 1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.1; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 19.—Supply and laying of 33 kV and other cables in connection with Central England Electricity Scheme. Specification (C.E.-G.C.3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 23.—Supply and erection of 66 000 V and other cables in connection with Mid-East England Electricity Scheme. Specification (M.E.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade, (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

ABIDJAN (IVORY COAST).—Provision of electric power station and distribution system, under 50 years' concession. Details from Agence Economique de l'Afrique Occidental Française, 159, Boulevard Haussmann, Paris.

SOUTH INDIAN RAILWAY CO., LTD., May 23.—Supply of electric cables and wires. Specifications, etc. (5s.) from the company's offices, 91, Petty France, Westminster, S.W.1.

D

INDIAN STORES DEPARTMENT, May 26.—Two vertical and two horizontal centrifugal pumps, switchgear, etc. (Reference A.X. 9 416.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators, for Mangahao power scheme, section 215B. (Reference B.Z. 6 300.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27—Supply of cable clamps for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27.—Supply of 110 kV suspension insulators for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

GREAT SOUTHERN RAILWAYS CO., May 28.—Six or 12 months' supply of electric cables (form No. 129), electric lamps (form No. 137), etc. Forms of tender (6d. each) from the Stores Superintendent, Inchicore, Dublin.

CAPE TOWN MUNICIPALITY, June 4.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

AUCKLAND HARBOUR BOARD, June 10.—Supply of submarine cable (contract No. 902). (Reference B.X. 6 354.)

MELBOURNE CITY COUNCIL, June 11.—Supply of paper insulated, lead sheathed cables, suitable for use on three-phase, 50 cycle system at 6 600 and 420 V. (Reference B.X. 6 415.)

COPENHAGEN LIGHTING DEPARTMENT, June 12.—Two electrically driven gas compressors, with minimum hourly capacity of 20 000 cu. metres of gas at pressure of 1 metre water column. (Reference A.X. 9 598.)

BULAWAYO MUNICIPALITY, June 13.—One 5 000 kW turbo-alternator condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

MELBOURNE CITY COUNCIL, June 18.—Supply and installation of automatic electric signals for traffic control (contract No. 2 787.) Reference B.X. 6 421.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of 100 000 3¼ in. and 30 000 2 in. lead clips. (Reference B.X. 6 375.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 6.—Two pumping units, for Ameria pumping station, including two Diesel engines, two centrifugal pumps and two small d.c. generators, electrically driven compressor, 10 kW auxiliary d.c. generator, with engine, etc. Specifications (£1 os. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 17.—Supply and erection of 15 electric pumping stations, with pumps, motors, switchgears, etc., in the isolated basins, Oswin Province. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1. (£10 5s. per set, not returnable.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 17.—Supply and erection of 15 electric pumping stations, with pumps, motors, switchgear, etc., at the isolated basins between Esna and Aswan. (Reference A.X. 9 594.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 19.—Three single phase transformers, to step up from 22 000 V to 57 600 V between phases, for Penrose sub-station, Arapuni power scheme, section 308. (Reference B.X. 6 427.)

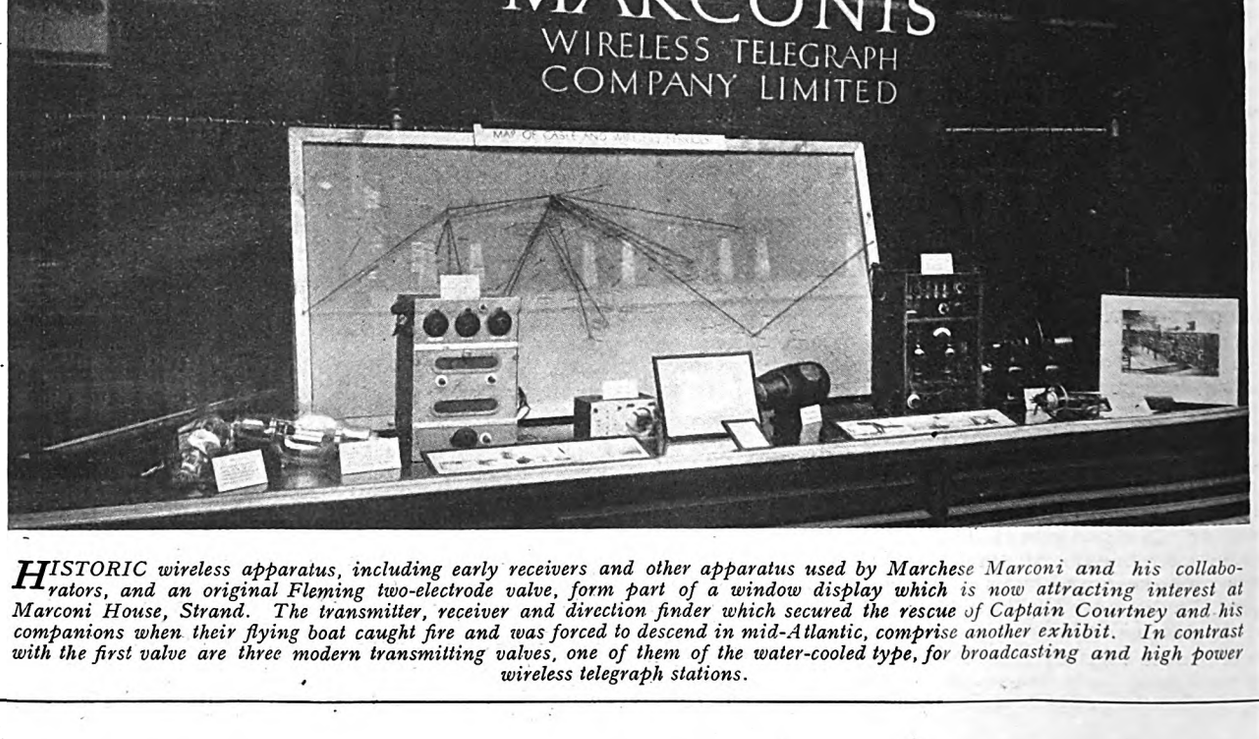
THE "JOHN BENN."

New London Ferry Boat Christened After Founder of Benn Brothers, Ltd.

THE many years of civic work given to London by the late Sir John Benn (the founder of Benn Brothers, Ltd., publishers of THE ELECTRICIAN) will be commemorated in a striking way next Friday (May 30). On that day the "John Benn" a newly-built ferry-boat, will make her maiden trip from the South Pontoon, Woolwich. She has been given her name by the London County Council as a tribute to the late Sir John and with the cordial consent of the members of his family.

In the years of useful service that lie before the new vessel there will, not inappropriately, be reflected something of the inspiring endeavours of the man from whom her name is derived, although her course will be through waters less troubled than those which Sir John found it necessary to navigate in his efforts to remould the administration of London in a nobler and more efficient shape.

When the new boat makes her maiden trip there will be present a large gathering of the children and grandchildren of Sir John, together with a large party of boys from the John Benn Hostel in Stepney, through which the present baronet, Sir Ernest Benn, has, on his part, commemorated his father's life and work.



HISTORIC wireless apparatus, including early receivers and other apparatus used by Marchese Marconi and his collaborators, and an original Fleming two-electrode valve, form part of a window display which is now attracting interest at Marconi House, Strand. The transmitter, receiver and direction finder which secured the rescue of Captain Courtney and his companions when their flying boat caught fire and was forced to descend in mid-Atlantic, comprise another exhibit. In contrast with the first valve are three modern transmitting valves, one of them of the water-cooled type, for broadcasting and high power wireless telegraph stations.

WORK IN PROSPECT.

ASHBY-DE-LA-ZOUCH.—Houses (26), for the Rural Council. Particulars from the contractors, Harris Bros., Marebay. Derby.

BIRKIN.—Parish hall extensions. Particulars from Tennant and Smith, Ropergate Chambers, Pontefract.

CHICHESTER.—Houses (72), for the City Council. Particulars from the architects, Whitehead and Whitehead.

DERBY.—New Mitre Hotel, Allenton, for Marston, Thompson and Evershed, Ltd., Burton-on-Trent.

ECCLES.—Two schools to cost £68 800, for the Borough Education Committee. Particulars from the Director of Education.

HUDDERSFIELD.—Further proposed housing schemes. Particulars, Mr. L. Smith, 26, Ramsden Street, Huddersfield.

LEWISHAM.—Cinema theatre, High Street. Particulars from the architects, J. S. Beard and Clare, 101–3, Baker Street, W.

MIRFIELD.—Sunday School. Particulars from Marriott, Son and Shaw, Church Street, Dewsbury.

ROTHWELL.—Proposed school (£30 000). Particulars from Mr. H. Wormald, County Hall, Wakefield.

WEYBRIDGE.—Additional 18 houses. Particulars, the Surveyor.

WILLASTON.—Church schools. Particulars, Willink and Dodd, Liverpool.

WINCHESTER.—Houses (132), for the City Council. Particulars from the City Surveyor.

WOLVERHAMPTON.—Branch library, Low Hill, to cost £4 984. Particulars, the Town Clerk.

WRENTHORPE.—Proposed new hotel. Particulars, Mr. James Parish, architect, Vicar Lane, Leeds.

YORK.—School, for the Roman Catholic Managers. Particulars, Rev. M. O'Connell, St. George's Rectory.

YORK.—Works extensions, for "The Yorkshire Herald" Newspaper Co., Ltd. Particulars, Blackmore, Sykes and Co., Scale Lane, Hull.

COMING EVENTS.

Friday, May 23 (To-day).

PHYSICAL SOCIETY.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington, London. Discussion on "Magnetism," opened by Sir Alfred Ewing, with a contribution on "Ferro-Magnetism and Hysteresis." 3-4.30 *p.m.* and 4.30 to 5.15 *p.m.*

ROYAL INSTITUTION.—21, Albemarle Street, London. Paper by Mr. R. S. Whipple on "Some Scientific Instrument Makers of the 18th Century." 9 *p.m.*

Friday, May 23—Monday, May 26.

INSTITUTION OF ELECTRICAL ENGINEERS (WESTERN CENTRE).—Sudbury Park Hotel, near Chepstow. Summer meeting.

Monday, May 26—31.

I.M.E.A. CONVENTION, EASTBOURNE Winter Garden, Devonshire Park.—Delegates Assemble. President's reception, 8.15 *p.m.*

Tuesday, May 27.

INSTITUTE OF PHYSICS.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Presidential address by Dr. W. H. Eccles on "The Influence of Physical Researeh on the Development of Wireless." 5.30 *p.m.*

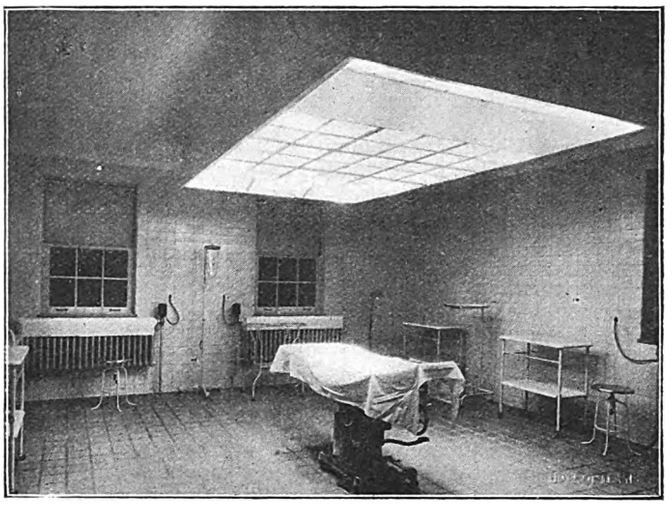
Wednesday, May 28.

POLYTECHNIC ENGINEERING DEPARTMENT.—307–311, Regent Street, London. Lecture IV (Course of six lectures by Mr. W. H. Date on "Thermionic Valves." 6.30 *p.m.*

HOSPITAL LIGHTING.

New Shadowless Equipment for Operating-Table Lighting.

THE problem of hospital table lighting calls for a very high intensity of concentrated illumination which must be practically shadowless, but must give a high vertical component of intensity, ensuring penetration into deep cavities. The



An example of Holophane operating-table lighting.

intensity must be confined to the wound area, at the same time sufficient illumination must be given around the room to prevent eye-adaption difficulties, and yet not so much as to compete with the wound illumination. The high intensity should be produced without striations or glare, and the light unit should be as unobtrusive as possible. To fulfil these conditions, a special unit has been developed by HOLOPHANE, LTD., Elverton Street, London, S.W.1, consisting of a number of prismatic plates formed into a panel or false ceiling of relatively large area. The prism construction of the plates is such as to refract the light rays which reaches them into a converging beam of high intensity. Each plate is 12 in. square, and is formed with quarter-concentric prisms. They are used in groups of four, each group forming one large lens 24 1/4 in. square, having a 12 1/4 in. focus. The complete unit consists of either 15 groups of 4 plates each, approximately 10 ft. by 6 ft., 18 groups 12 ft. by 6 ft., or 21 groups 14 ft. by 6 ft. Over each group of four plates is fitted a lamp and reflector in such relation to each other that the maximum beam strikes the centre of the operating area, this with a 15 group system, the combined 15 concentrating beams coming from different directions, build up and focus their rays over the predetermined area.

The method employed differs from a reflector system in so much that concentration from the large refracting area secures adequate diffusion, avoids harmful shadows and absolutely avoids glare. The overflow from the lens system gives sufficient general illumination to avoid contrast glare, and the optical characteristics of the lens are such that a three-dimensional soft or dissolving spot is developed to take account of varying thicknesses of bodies and heights of tables. The illumination results taken with a 15-lens system employing 15 150 W lamps—i.e., 2 250 W—have been plotted by the company, the maximum horizontal illumination being 1 050-ft. candles, the illumination on a plane 45° from the vertical 725 ft.-candles, and the illumination on a vertical plane facing the centre of the table 175 ft.-candles, and these intensities without any semblance of glare.

THE LEAD MARKET.

The market opened last week with a firm tone, and according to James Forster and Co., 7s. 6d. per ton higher, while on the Tuesday prices were steady at a further 2s. 6d. advance. Since then the market has steadily declined, and prices are now 15s. down from the top. In sympathy with the firmer tone in London, the American price was raised on May 13 to 5·60 cents. Closing prices on May 16 were £17 15s. for May and June, and £17 16s. 3d. for July and August, a fall of 5s. per ton on the week.

ELECTRICITY SUPPLY.

Battersea Power Station and the Fume Problem—Burton-on-Trent and the Central England Scheme—Proposed Voltage Change at Weymouth—Supply in the Aberdeen Area.

HARROGATE Electricity Committee recommends the Council to borrow £59 473 for various works.

Rawtenstall Corporation has decided to seek borrowing powers for £20 000 for the extension of electricity mains.

The Holderness Trust, Ltd., has applied to the Electricity Commissioners for a Special Order to supply the Wigtonshire area.

Carlisle Electricity Committee has authorised the electrical engineer to invite tenders for the supply of cables during the ensuing year.

Bradford Electricity Committee has decided to provide automatic switchgear for further sectionalising supplies for traction purposes, at a cost of £1 380.

The switching on of the electricity supply at Barnard Castle took place last week. Energy is taken from the Cleveland and Durham County Electric Power Co.

Application for a Special Order for authority to supply electricity in an area within three miles radius of the town hall is being made by Kendal Town Council.

The Saskatchewan Legislature recently voted $3 000 000 for expenditure by the Saskatchewan Power Commission, including $750 000 for h.t. transmission lines.

The City Electrical Engineer of Inverness is to prepare a plan and an estimate of cost of promoting a Special Order for the extension of the Corporation's supply area.

Bradford General Purposes Committee has decided that, for experimental and comparative purposes, half the length of Canterbury Road be lighted by electricity and half by gas.

The Newcastle-upon-Tyne Electric Supply Co.'s Weardale electricity project is to be carried a stage further by the extension of the overhead transmission lines to Rookhope and Cowshill.

The borough electrical engineer of Eccles is to obtain information with reference to schemes of assisted wiring, with a view to the adoption of a scheme when the new showroom is established.

Biggar T.C. is to borrow £2 000 for its electricity supply scheme. The Clyde Valley Co., which is to supply the town, expects to have the scheme completed by the beginning of the next lighting season.

Lichfield City Council proposes to extend the supply to Alrewas by means of an 11 000 V overhead transmission line, at an estimated cost of £5 448. A loan and an unemployment grant are to be sought.

Chichester Corporation has decided to apply for an unemployment grant, with a view to carrying out schemes of extensions in connection with the electricity undertaking at an estimated cost of £58 016.

Wrexham T.C. has applied for an unemployment grant towards the cost of changing over from d.c. to a.c., and in the event of a grant being received will apply for a loan of £7 770 for carrying out the work.

Burton-on-Trent Electricity Committee has obtained sanction to borrow £4 458 in connection with the extension of the electricity mains from Hartshorne to Milton to give an alternative supply to Milton waterworks.

Cardiganshire County Council has received a letter from Mr. W. Thomas, of Pontypridd, asking the Council to support a scheme for supplying hydro-electric power in the Rheidol Valley, and it has been referred to a committee.

The Electricity Commissioners for Northern Ireland have informed Portstewart U.D.C. that they are now prepared to agree to the installation of an additional generating set having a rated capacity of 75 kW, increasing the capacity of the station from 67 to 142 kW.

Electricity Distribution of North Wales and District, Ltd., has given Whitchurch U.D.C. an assurance that electricity will be available for the district during the present year at a price less than the maximum of 9d. per kWh. The Council has approved the company's proposals.

Nantwich R.D.C. has received from Audlem P.C. a letter urging the necessity of the parish being supplied with electricity before September 20, in view of the closing down of the gas company. The R.D.C. will apply to the North-West Midland Electricity Co. for a supply of electricity for the parish.

East Ham Corporation has received sanction to borrow £24 985 for the extension of distribution cables in various streets. The Corporation has approved the estimate submitted by the Borough Engineer, amounting to £1 440, for the erection of the Plashet sub-station buildings, and the work is to be proceeded with.

Weymouth Electricity Committee has decided that the 50 kVA transformer at Overcombe be removed and a 200 kVA transformer substituted, utilising the 50 kVA at Osmington. The Preston scheme is to be modified by providing a kiosk with a 100 kVA transformer, which will be connected with the Overcombe transformer.

Aberdeen T.C. has applied to Kincardine County Council for sanction to a scheme for supplying North Kincardineshire. The Grampian Electricity Supply Co. has informed the County Council that it has prepared a scheme for supplying the whole county, and Aberdeen's application is being left over for the new County Council to consider.

The Ministry of Transport has informed Westminster City Council that the London Power Co. has not yet completed the experiments with regard to the treatment of sulphur fumes in connection with the erection of the electricity power station at Battersea. The Electricity Commissioners are pressing the company to complete the experiments and make a report as soon as possible.

Hampton U.D.C. has been informed that terms have been provisionally agreed between the London and Home Counties Joint Electricity Authority, and the Twickenham and Teddington Electricity Supply Co. for the transfer of the electricity undertaking in the district. Representatives of Hampton Council are to discuss with the officers of the Authority the question of the lighting of streets by electricity.

Colchester Electricity Committee has obtained the approval of the Unemployment Grants Committee of the completion of the outer h.t. ring main at a cost of £19 500, and the laying and erection of electricity lines in various parishes at a cost of £20 430.—The Committee has asked the consulting engineer to proceed with the survey of routes for further e.h.t. transmission lines to serve Tiptree, Manningtree and Mistley.

The question of the amount of the contribution which the Central Electricity Board will make towards the cost of the extension of the switchgear and switchhouse at the Burton-on-Trent power station, necessitated by the operation of the Central England Scheme, has now been agreed, and Burton Electricity Committee has decided to obtain tenders for the supply of switchgear and the extension of the switchhouse.

Marylebone (London) B.C. seeks sanction to borrow £18 567 for carrying out improvements of the public lighting in about 9 miles of streets in the borough. The proposal involves the substitution of 270 single-bracket standards and 21 double bracket standards for 667 converted gas-standards which are used for low power electric lighting. Lamps of 750 c.p. are to be used on the single-bracket standards and 560 c.p. on the double-bracket standards.

In reference to Weymouth Corporation's application for permission to alter the electricity supply system in certain areas in the borough, the Electricity Commissioners have asked for information as to the voltage, etc., of the existing system and as to the system and pressures now proposed to be adopted. The Commissioners have also suggested that the Council should make application in respect of the whole of the borough, which would enable the alteration to be carried out as and when convenient. The Electricity Committee proposes to comply with the suggestion.

The Weald Electricity Supply Co. had informed East Grinstead R.D.C. that 80 applications have been received from residents at Forest Row for a supply of electricity, and the company has asked for the Council's consent to an application for a Special Order. The Council has decided to approach East Grinstead U.D.C. with regard to terms for a supply from that body, and to ask the Commissioners for guidance. East Grinstead U.D.C. has declined an offer by the Weald Electricity Supply Co. to purchase the council's electricity undertaking for £10 000, plus capital charges on outstanding loans of about £43 000, as the amount offered is considered inadequate.

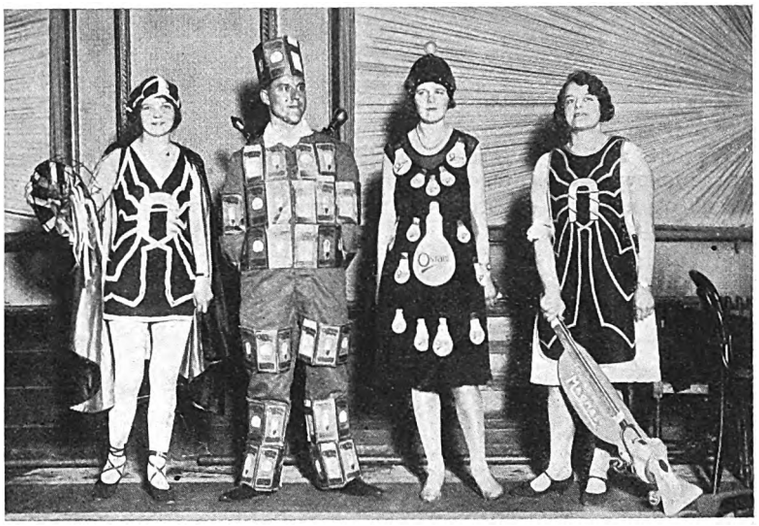
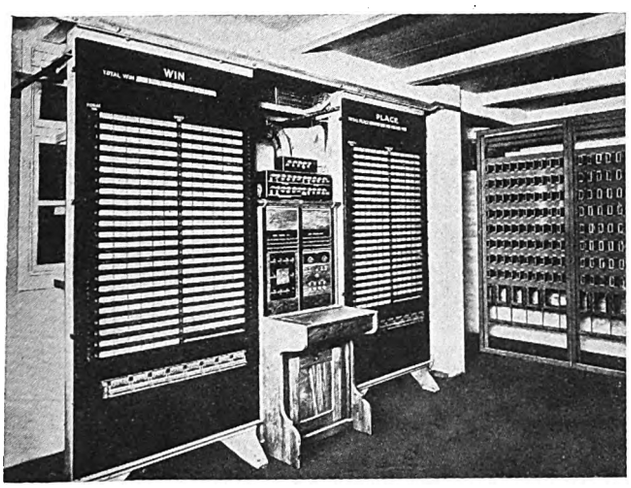
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mrs. C. H. Yeaman as Queen Erminilda in the Stoke-on-Trent Historical Pageant, in connection with the Josiah Wedgwood bi-centenary celebrations which were inaugurated by Princess Mary on Monday.



The majority of the dancers at the British Empire Ball, held at Belfast last week, assumed costumes representative of British enterprise. Among the most notable trade personalities may be mentioned the "Mazda" and "Magnet" girls. "Mazda" lamps were represented by the popular dancing girl in feathered ballet skirt, while the "Osram" products were featured as above.

Mrs. Wilfrid Ashley, President of the Electrical Association for Women, occupied the chair at a well-attended luncheon at the Park Lane Hotel, London, on May 15, following the annual general meeting. A report of the speeches and other details of the conference are given on page 646.



The first detailed account of the R.C.B.C. standard all-electric totalisator, which is manufactured by the British Thomson-Houston Co., Ltd., and the Automatic Telephone Manufacturing Co., Ltd., was published in THE ELECTRICIAN of February 7. The main control room at the Newmarket course, seen here, bears a striking resemblance to that at Thirsk, but caters for 45 runners.

Mr. Vincent Z. de Ferranti, chairman of Ferranti, Ltd., at the outset of his flight from Hollinwood to Stourport, to attend the opening of the h.t. laboratory of Steatite and Porcelain Products, Ltd., on May 15, the laboratory being equipped with Ferranti transformers. The aeroplane is normally used in connection with radio research. See page 652.

The principal items in the accounts of Brush Electrical Engineering Co., Ltd., for past two years, are compared below :—

BRUSH ELECTRICAL ENGINEERING CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928
Trading Profit	£125 247	£141 948
Net Profit	58 988	67 406
Allocated to Depreciation, etc.	16 289	16 682
To Reserve	5 413	6 010
Creditors	122 897	135 360
Stock	219 899	226 592
Debtors	202 214	231 754
Cash	134 759	82 748
Dividend	10%	10%

Recently the ordinary stock was quoted at 129. There are four issues of debentures aggregating £257 753. Last year, 1% was paid out of undivided profits in addition to the dividend of 10%.

The continued expansion of Ever Ready Co. (Great Britain), Ltd., is reflected in the following comparative figures :—

EVER READY CO. (GREAT BRITAIN), LTD.

	Mar. 31, 1930.	Mar. 31, 1929.
Trading Profit, etc.	£263 760	£224 840
Net Profit	244 555	209 804
To Reserve, etc.	31 272	41 130
Preference Dividend	20 000	20 000
Ordinary Dividend	189 980	148 000
Stocks	74 857	66 097
Debtors	150 196	97 280
Cash	95 834	6 262
Creditors	66 517	43 805
Dividend	35%	35%

At 30s. 6d., the preference shares, which enjoy a dividend of 10%, return 6·56%, while at 19s. the 5s. ordinary shares yield 9·21%.

COMPANY NEWS.

Extension of Cawnpore Co's. Plant—Chairman of Brush Co. on Trade Unions' Policy—Ferranti's Rearrangement of Capital—Directors' Reports, &c.

ANOTHER 1s. 3d. fall in the price of Bournemouth and Poole Supply ordinary shares has brought down the quotation to 58s. 9d., compared with 62s. 6d. a month ago. County of London shares have dropped half-a-crown to 46s. 3d. Newcastle shares have zig-zagged back 6d. to 26s. 3d., and Yorkshire Power have shed 7½d. Victoria Falls shares have eased 7½d. to nearly 63s. Clyde Valleys have provided a bright spot, the ordinary improving from under 37s. to over 38s., and the 8 per cent. preference putting on 6d. to 28s. 6d. Calcutta Supply shares have regained last week's 1s. 3d. loss, and the Tramways Company's ordinary shares have also improved to 12s. 6d.

British Electric Traction 6 per cent. preference stock is a point higher, as also is the 5 per cent. preference stock of the British Columbia Electric Railway. Underground Electric Railways ordinary shares are 6d. down at 22s. 6d., London Electric Railway 4 per cent. preference and Metropolitan 3½ per cent. debenture stocks are each ½ a point lower, and Central London Railway 4 per cent. debenture stock has dropped a point.

Cables and Wireless Stocks have been an up-and-down market, and close slightly lower than a week ago, the "A" ordinary at just under 50, and the "B" at below 23. American Telephone and Telegraph stock is steady at 255; Marconi International Marine shares are down to £2 again. Radio Corporation of America shares are below 49. Internationals are unchanged and Hydros ⅛ up.

International Automatic Telephone shares at 32s. 6d. are 1s. 3d. down, as also are British Insulated Cables at 75s. W. T. Henley's ordinary are 2s. 6d. lower at 127s. 6d., and Siemens ordinary shares at 24s. 4½d. have lost 7½d. General Electric ordinary are unchanged at 51s. 3d.; the "A" preference have improved 3d. to 23s. 9d. Crompton Parkinson ordinary have risen from 23s. 9d. to nearly 24s. 6d., but Ever Ready 7 per cent. participating preference shares have weakened from 30s. to 29s. 6d.

RIO DE JANEIRO CITY IMPROVEMENTS CO., LTD.—Rev. for 1929, £338 156, agst. £321 343; net blce., £188 150, agst. £170 554. To res., £30 000. Div. 10%, tax free; fwd. £37 661, agst. £22 644.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—The scheme for the reorganisatn. of the sh. cap. has been confirmed by Canadian Courts and supplemental charter has been granted giving effect to arrangemt. Shhldrs. will be notified when the new definitive certs. in respect of the registered shs. of no par value will be ready for delivery against surrender of existg. sh. certs. Hldrs. of share warrts. to bearer will in due course be requested to present their warrts. for purpose of having same endorsed to represent shs. of no par value. Under the scheme the $100 Pref. shs. will be converted into no par ord. in ratio of six for one, and old $50 ord. sh. for sh. into new no par ord.

INTERNATIONAL PAPER AND POWER CO.—First annual rpt. shows earngs. for 1929, after all prior charges and deductn. of depreciatn. reserves, of $4 011 762 for the pfd. and common stks. of International Paper and Power Co., substantially same as the $3 949 206 realised for same stks. in 1928. Earnings of company showed progressive increases each quarter during 1929. For full year earngs. available for depreciatn. and for divs. on the shares of International Paper and Power Co. amtd. to $13 151 265, total div. paymts. on shs. of company to $8 834 511 (pfd. divs., $6 447 651 and class A common divs., $2 386 800), and depreciatn. to $9 139 503, leaving deficit for year of $4 822 749.

SIEMENS BROTHERS AND CO., LTD.—Rpt. for 1929 states that greater volume of orders was secured, and mfg. increased, only exceptn. to greater activity in the various shops at Woolwich works being in the case of submarine telegph. cables, for which demands continued small. A larger proprtn. of orders carried out has been for overseas, but to secure this work low prices had to be accepted. Issue to Siemens and Halske, A.G., of 450 000 ord. shs., unissued blce. of company's authorised cap., has been completed. Pft. of £314 465 is shown by accts. agst. £335 758 before charging int. on and redemptn. of 4½% deb. stock. The pref. div. requires £55 000. Div. for year on ord. shs., 7½% (same). Fwd. £338 511, agst. £313 360.

Company Meetings.

FERRANTI, LTD.—At meetings of holders of the 6% cumulative preference shares and the 7% preference shares on May 16 resolutions were passed to convert and consolidate the two classes of preference shares into one class, to increase the ordinary share capital to £400 000, divided into 800 000 ordinary shares of 10s. each, to capitalise £200 000 of the undivided profits and allot 400 000 ordinary shares of 10s. each, credited as fully paid, to the ordinary shareholders. The total capital will be increased to £900 000.

PHILIPS GLOWLAMPWORKS, LTD., EINDHOVEN.—At the meeting on May 16 the chairman stated that the company had sold its interest in the General Electric Co. of New York at a price considerably in excess of the purchase figure. The General Electric Co. of New York retained its interest, 20% of the share capital, of Philips' Glowlampworks. Liquid assets had increased by approximately £1 250 000, and the financial position was favourable. The board had decided to erect a factory in Australia, for which it would be unnecessary to issue new shares. Turnover and profit during the present year had been larger than in the corresponding period of 1929. With regard to the sale of the Lorenz shares, the sales of Philips' receiving sets had to be stopped in Germany, but the sales of valves continued as before. The report and accounts were adopted.

CRAIGPARK ELECTRIC CABLE CO., LTD.—Dr. Magnus Maclean, presiding at the meeting on May 12, said there had been a large output during the year, resulting in a gross profit of £47 718. There was £15 223 cash at bank and in hand. Reserve at £20 000 would become £30 000 if the recommendations put forward were carried. That would bring the reserve to the figure at which it stood before the large transfer was made to write off losses through drop in price of rubber. The company had been able to accomplish that in two trading years and pay 10% dividend this year in addition. If the company was to be progressive it was essential to instal certain additional plant, involving some works reconstruction,

Digitized by Google

and to erect a building for offices and stores. To provide for these the directors propose to issue 15 000 new ordinary shares. The report and proposals were adopted.

CAWNPORE ELECTRIC SUPPLY CORPORATION, LTD.—Mr. J. G. B. Stone, presiding at the meeting on May 13, said the cost of generating and distributing electricity in the past year was £56 143, a reduction of over £1 000. They generated just over 37 000 000 kWh, compared with just under 32 000 000. This showed a satisfactory reduction in generating costs per kWh. Electricity sold exceeded the 1928 figure by nearly 20%. The amount transferred to profit and loss account was £79 944, against £75 063. They had transferred £27 500 to depreciation and renewals account, £2 500 to general reserve, £4 000 to income tax account and £7 827 to debenture sinking fund. A final dividend of 7%, making 10% for the year, was recommended, leaving £6 241 to carry forward. Two of the existing turbines at the Riverside station were to be replaced by others of greater output, a new turbine and alternator was to be added, and larger and more modern switchgear was being put in.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD.—Sir A. Henry McMahon presided at the meeting on May 13, and, after dealing with the figures in the accounts (abstracted in our issue of May 9), said the new automatic telephone system at Singapore was brought into operation on April 18, and the successful completion of this work reflected great credit both on their own staff and that of the contractors, the General Electric Co. of London. The new system was working satisfactorily, and they anticipated appreciable economies in working. The position in Mauritius was still far from satisfactory. Unless the sugar production industry was placed upon a remunerative basis the outlook for the future in that island could not be regarded as encouraging. The Bombay Telephone Co. showed continuous progress, and paid a dividend of 6%, as against 4% for 1928. The debenture stock which they held in that company was convertible into ordinary shares as from July 1 next, and those shares would participate in any higher dividends declared upon them, instead of earning a fixed interest of only 6½%. The dividend of the Bengal Telephone Corporation had increased from 7½% to 8%. During the year the Madras Telephone Co. made an issue of shares to the existing shareholders, of which the Oriental Co. was the largest, and they had increased their holding by 25 754 shares. To stimulate local interest they placed upon the market a certain number of these shares, and 4 325 were taken up. The Madras Co. offered concessions to its subscribers in the form of a reduction of rates. In the case of the Rangoon Telephone Co. there was a slight set-back, though the company had been able to maintain its dividend at 7%, tax free. The Hong-Kong Telephone Co. showed good progress with an addition of 464 exchange lines, and they might look for better results when the new automatic system was in full operation. They had since learned that the change-over took place on May 3.

BRUSH ELECTRICAL ENGINEERING CO., LTD.

Reduced Price Level Due to Competition—Importance of Economy of Production—General Reduction of Wages Undesirable—Trade Unions' Absurd Restrictions.

THE forty-first general meeting of the Brush Electrical Engineering Co., Ltd., was held on Tuesday, at the Holborn Restaurant, London, W.C.

Mr. E. Garcke (chairman of the company) said, in the course of his speech: The credit on the profit and loss account shows £140 529, compared with £153 857, and, after deducting all expenses, which show a reduction on nearly all the items, there is a surplus of £58 988, compared with £67 406. After making the agreed reserve and paying the standard dividend of 10% for the year on the ordinary stock, the net surplus distributable under the co-partnership scheme is £2 787 for 1929, compared with £11 711 for 1928, and with £10 764 for 1927, £8 835 for 1926 and £8 751 for 1925.

I will explain in a moment why this setback has taken place. Speaking generally, the business of the company has not undergone any change for the worse. The general condition of the company is satisfactory, and the financial position is strong, our liquid assets, not counting stock of goods and material, being 45 per cent. of our total capital in debentures and ordinary stock. The products of our manufactures continue to enjoy the high reputation of previous years.

The reason for the decline in profits is due to the policy based on sound business principles which I have explained to the stockholders on previous occasions—that we decline to do business at a loss. During the past year the trend of competition has still further reduced the low price level that prevailed already in 1928 and previous years, and we have deliberately declined to take orders which, if we had accepted, would, I feel sure, have still further reduced our net profits. The relatively small setback, which I sincerely hope is only temporary, if the general conditions of industry in the country can be improved, does not at present hit the stockholders. They receive, if you approve, the same dividend which they have received for many years past, but the reduction of the co-partnership surplus from £11 700 to £2 700 is a great disappointment to the employees of the company, especially as the co-partnership surplus has been an increasing one for each year since the inauguration of the co-partnership scheme. About 25 per cent. of the stockholders are employees of the company.

The chairman proceeded to review at length the industrial conditions of the world at the present time, pointing out, *inter alia*, the apparent paradox that while the basic industries of Great Britain were in a depressed condition, the general standard of living in the country was higher than ever before. In his opinion, if methods were not changed and the economy of production was not raised, there would be disillusion some day. Great Britain must export more if they wished to continue to import as much as they did. Continuing, he said: We have demonstrated in this company the considerable benefits that result from a well-thought-out co-partnership scheme. The relations between the management and the works are excellent, by reason of the collaborations that take place from time to time and of mutual interests that have been established. The co-partners have had the benefit, during several years, of seeing the surplus increase. This year they have an adverse experience, but they have taken it in good spirit, and we are all working hard, by conjoint efforts, to make good, and I hope we shall succeed; but what I want to say quite generally, and not with any reference to particular undertakings, is that the most serious barriers to successful co-partnership are the rigid Trade Union regulations, which prevent the man who does more, or better, than another from being paid better, and the converse by which a slacker is paid as much as one who does his best. We all have experience of people who, unfortunately, are not able to do as well as others, but under trade union regulations a dead level of uniformity has to be maintained.

Then there are the absurd restrictions as to output and the resistance to labour-saving machinery. We must all, however, recognise—and sympathise—that the fear of unemployment on the part of men who see the volume of work diminishing is only natural, and this fear of unemployment is going to be a serious obstacle to rationalisation of industry, by reason of the displacement of labour and consequent temporary unemployment that may follow on the adoption of the new policy. "Rationalisation" is a clumsy word, and has many technical definitions. Broadly, it is best understood as working and carrying on industry in a rational way. Therefore, if rationalisation means displacement of labour, something must be done to deal rationally with this problem. Platitudes would not suffice, but why have any unemployment at all? This is a common-sense question which very few seem willing to tackle. Under our present system we are asking for it. Nature is appealing to our senses and our reason to be put to service by men for the welfare of man, and yet man is encouraged to stand by, idly clamouring for employment.

I set my face against general reduction of wages, because I feel convinced there is no remedy that way, but only more trouble. Under present conditions our principles should, I submit, be: (1) Greater economy by elimination of waste; (2) higher efficiency by elimination of inefficient machinery and methods; (3) larger output to neutralise low prices, by removal of trade union restrictions; (4) better relations between all concerned in industry by adoption of well-thought-out schemes of co-partnership appropriate to such industry; and (5) nationally and internationally—that is to say, politically—we must revise our general outlook by taking off our personal blinkers. The report and accounts were unanimously adopted.

Deeds of Arrangement.

BRADFORD, Oliver Hubert, 2A, Hill Street, and 38, Broad Street, Griffithstown, electrical and wireless engineer. Dated May 14, filed May 19. Trustee, R. H. Coath, 67, Queen Street, Cardiff. Secured creditors, £5; liabilities unsecured, £780; assets, less secured claims, £109.

DRING, Richard, 257, Freeman Street, Grimsby, and 52, High Street, Cleethorpes, electrician. Dated May 7, filed May 13. Trustee, A. G. Pearson, 1, Town Hall Street, Grimsby. Liabilities unsecured, £2 529; assets, less secured claims, £1 481.

FERRIDAY, Lancelot, Empire Arcade and West Villas, Stockton-on-Tees, wireless dealer. Dated May, 9, filed May 14. Trustee, J. V. Baines, 115, High Street, Stockton-on-Tees. Liabilities unsecured, £277; assets, less secured claims, £90.

SQUIRES, Herbert Leslie, 2B, Sparkenhoe Street, Leicester, radio and electrical instrument dealer. Dated May 9, filed May 16. Trustee, E. R. Carr, 10, Gallowtree Gate, Leicester. Secured creditors, £40; liabilities unsecured, £366; assets, less secured claims, £195.

Receivership.

BARNETT (C.) LTD. F. T. Smith, of 150, Southampton Row, W.C.1, was appointed Receiver and/or Manager on May 5, 1930, under powers contained in debentures dated November 15, 1928, to March 1, 1930.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HILLER, J., 52, Whitechapel Road, E.1, electrical and radio expert. A meeting of the creditors was held on May 16 at the offices of Mr. James Mortimer, accountant, 12, Coleman Street, E.C., when the representative of the Marconiphone Co., Ltd., the largest crecitors, presided. A statement of affairs was submitted which disclosed liabilities of £1 115, of which £982 was due to the trade; there were private creditors for £82, and the bank were creditors for £51. The assets amounted to £212, less £14 preferential claims, a deficiency of £917. According to an approximate trading account for the year ended May 15, 1930, the sales were £6 000, against purchases of £4 600; there was a gross profit of £1 350; the expenses were £1 969, and there was a net loss of £619. It was reported that the debtor commenced business about five years ago in partnership with his brother. Two years ago the partners executed a deed of composition to a trustee, and in May, 1929, the partnership was dissolved, and since then the debtor had been trading on his own. The debtor was called into the room and said that although he had sold a considerable number of wireless sets during his trading, in the majority of cases his customers knew very little about wireless, and in practically every case they were delivered on the hire purchase system. If anything went wrong with the sets the debtor had a service agreement to put them right, and if that were not done the customers, in many cases, would not pay the instalments due. In practically every instance the debtor lost money on the transactions. He made an offer to his creditors of 2s. 6d. in the £, to be paid within a month, which, after discussing the position, the creditors decided to accept.

PETO SCOTT CO., LTD. (THE), manufacturers and distributors of wireless apparatus, 77, City Road, E.C., 62, High Holborn, London, W.C., and at Liverpool and Manchester. The creditors met on May 15 at the Society of Incorporated Accountants, London. It was stated that the position of the company was due to insufficient working capital, although the accounts for the past financial year showed a very substantial profit, and the directors felt justified in proposing a scheme for reconstruction.

A statement of affairs showed ranking liabilities of £29 275, made up as follows: trade creditors and expenses £12 716; British Radio Gramophone Co., Ltd., £7 586; Mrs. A. M. Worthington, £7 133; and partly secured creditor, £1 840. The total claim of the latter was £15 840, but securities valued at £14 000 were held. In addition, there was a fully secured creditor for £1 298. According to the books, the assets totalled £25 303, and they were estimated to realise £14 010. After allowing £1 069 for preferential claims, the net assets were £12 941, or a deficiency of £16 334. The assets comprised Holborn lease £250; lease of Keystone Works, £1 000 plant and machinery, £789, estimated to realise £250; furniture, fixtures and fittings, £1 043, expected to produce £250; stock, £10 102, valued at £3 000; deposits, £150; cash at bank, £110, and book debts £12 369, estimated to realise £9 000.

It was stated that the directors had been in consultation with some of the principal creditors, and the financial houses concerned in the hire purchase business, with a view to a scheme being carried through without any meeting being held. The negotiations proceeded favourably up to a recent date, when they broke down. The directors then decided to call meetings of the shareholders and creditors in connection with the voluntary liquidation of the company, but a petition had been presented for compulsory liquidation. A conference of the principal creditors had taken place the previous day, when it was decided that the hearing of the petition should be adjourned for a month, and that active steps should be taken to bring forward a proposal for the carrying on of the business and making arrangements with the creditors. It was also decided by the principal creditors that if an acceptable scheme was not brought forward, then neither the shareholders nor the creditors would oppose a winding up order.

After a short discussion, the creditors unanimously decided to confirm the resolution passed by the principal creditors. The following are the principal creditors: Cossor, A. C. Ltd., £286; Colvem, Ltd., £139; Cole, E. K., Ltd., £185; Edison Swan, £432; Ede and Townsend, £105; Formo Engineering Co., £136; Ferranti, Ltd., £291; General Electric Co., Ltd., £687; Garnett Whiteley, £326; Jackson Bros., £138; Kolster Brandes, Ltd., £321; London Electric Wire Co., £173; Mullards Wireless Service Co., Ltd., £747; Oldham Accumulator Co., £220; Philips Lamps, Ltd., £2 231; Rich and Bundy, £160; Regent Radio Supply Co., £189; Radio Instruments, £106; Radio Manufacturers Association, £123; Standard Battery Co., £162; St. Helens Cable and Rubber Co., £187; Ultra Electric Co., Ltd., £363.

London Gazette, etc.

Bankruptcy Information.

GARTSIDE, Harry, The Arcade, Waterfoot, Lancashire, trading as H. TAYLOR AND CO., electrician and wireless dealer. Receiving order, May 13. Debtor's petition.

Notice of Dividend.

THORNTON, William Haigh, 25, Bridge Street, Burnley, electrical and wireless engineer. First and final dividend, 4¼d. per £., payable May 28, Official Receiver's Office, District Bank Chambers, Blackburn.

Application for Discharge.

LEE, Edward Francis, trading as FRANCIS NEWTON, 340A, Kings Road, Chelsea, S.W.3, electrical engineer. Hearing, June 20, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Partnership Dissolved.

BOOKER AND TARRAN (Lawrence Edward BOOKER and Martin Smith TARRAN), motor and electrical engineers, the Garage, Waltham Street, Hull. By mutual consent as from March 28, 1930. Debts received and paid by M. S. Tarran, who will continue the business.

Bankruptcy Proceedings.

RICHARDS, Sydney Ernest, and NEILSON, Alan Kelson (trading as RICHARDS AND NEILSON), wireless and electrical engineers, 182, Tulse Hill, London, S.W. At the statutory first meeting of creditors, held at Bankruptcy Buildings, Carey Street, a joint statement of affairs was submitted showing liabilities £554 and assets nil. It appears from statements that have been made by the debtor Richards that in February it was decided to dispose of the business as a going concern to his wife, and Mrs. Richards is now carrying on business as an electrical and wireless engineer in her own name, he acting as her manager. He states that he and his partner filed their petition because they had no means of meeting the claim under certain promissory notes.

The ALLEN WEST ORGANISATION

AT any time during the I.M.E.A. Convention, visitors will be welcomed at the Allen West Works at Lewes Road, Brighton, where various types of Allen West control gear may be inspected in course of manufacture, erection and testing.

These two works at Brighton, together involving 200,000 sq. ft. of floor space, will remain the headquarters of the Company, while the bulkier and heavier products will be manufactured at the recently acquired works at Woolston: these, which are illustrated at the top of this page and the inside back cover, have a floor space of 400,000 sq. ft.

The New South Factory, Brighton: floor space 100,000 sq. ft.

Among the products of the Company are: (1) High tension oil-immersed switchgear; (2) Industrial oil-immersed switchgear, including starting gear for squirrel cage and slip-ring motors; (3) Crane control gear

Rural Electrification Policy.

IN a foreword to the fourth report of a series by the Rural Electric Service Committee of N.E.L.A. on "Developing Electric Service for the Farm," Mr. C. S. RUFFNER, chairman of the Board of the New York Power and Light Corporation, writes: "The time has long since passed for the power industry to consider electric service to farms as an experiment, something to be entered upon gingerly, to be done with as little trouble and expense as possible, and to be regarded as more or less of a charitable enterprise. Farm service should be a fixed part of the industry's commercial and new business activities, and should be recognised for what it is, one of the most promising methods of load building at our disposal." Mr. RUFFNER points out that the benefits of the application of electric power to industry generally have been increased efficiency, higher wages and lower prices for the manufactured article; the farmer has not prospered in anything like the same degree. Without entertaining any illusions as to an overnight transition from poverty to prosperity, it is permissible to predict that providing the farmer with more efficient power at a lower cost will give him an advantage that he has hitherto lacked.

In these difficult days of deflation, with prices of agricultural produce at levels which are generally unremunerative throughout the world and productions almost everywhere in excess of demand, the condition of the farmer is, or should be, a matter of serious concern to all governments. Even in the most highly industrialised countries agriculture is the largest single industry, and, as the source of food supply and of the raw materials of so many of the secondary industries, its maintenance on a reasonable level of prosperity is of supreme importance to the State. There can be no doubt that the depressed condition of farming in this country since the war has reacted to a very considerable extent on the internal demand for a great many of the products of our factories, thereby preventing that reduction in the cost of production which can only be achieved by operating at a higher percentage of works' capacities than has been the case in so many of our principal industries in recent years. It would be unduly optimistic to imagine that a large extension of rural electrification will, in itself, suffice to bring back prosperity to British farming. Yet it can render powerful aid in that direction, given an adequately co-ordinated system of low tariffs, assisted wiring, hire or hire purchase plans for the acquisition of machinery and a well considered instructional campaign.

Mr. RUFFNER regards as the prime requisites in rural service activity the adaption of apparatus to the requirements of the farm—in this field America and the Continental countries of Europe are a long way ahead of us—ability to sell the farmer appliances at a price that he can afford to pay and the framing of tariffs which will permit him to operate them economically. Even in the United States it would seem that greater co-operation in this field between manufacturers and supply undertakers is needed. Doubtless we shall learn a great deal from the Bedfordshire experiment, but without waiting until the knowledge to be acquired from that quarter has been accumulated and sifted, we can with some confidence lay down certain principles that are inseparable from a successful policy of extending rural electrification. Distribution must be undertaken by large units—a three county basis is probably the minimum area that can be effectively developed in the less industrialised parts of the country. Undertakings must build up the rural load in much the same way as a railway company builds a branch into a thinly populated district. Progress towards an adequate return on the capital expended may be slow, but with vision and capable management the reward will eventually be reaped.

I.E.E. Summer Meeting.

ON Monday the summer meeting of the I.E.E. opens in Dublin, and those taking part will number about 200. An attractive programme of visits to various points of interest in the Irish Free State and Northern Ireland has been arranged. Chief among these is the Shannon hydro-electric plant and distribution system. This has been the subject of severe criticism on economic grounds, but it may be recalled that Colonel WILFRID ASHLEY, M.P., in a speech in Edinburgh, on the occasion of the opening of the Central Scotland grid, expressed the opinion that it was going to become a great success by developing the rural load. There is a disposition in some quarters to regard conventions and meetings as excuses for joy rides. We believe this to be an entirely wrong-headed view. The papers read at the I.M.E.A. Convention this week and the discussions that followed them have been as usual of a highly instructive character, and the social side of such gatherings has a very real value in bringing together men and women from all parts of the country, enabling them to exchange views on current problems and stimulating the birth and dissemination of fresh ideas.

Devonshire Park Exhibition.

THIS year's electrical exhibition at Eastbourne, held in connection with the I.M.E.A. Convention, is one of the largest yet staged, and over forty well-known firms are taking part. Perhaps the outstanding impression gained from a visit to the Winter Gardens is the large number of manufacturing firms which cater for electrical water heating on the thermal storage system. Practically every stand features this contribution to domestic science, and the variety of apparatus from which to choose is almost embarrassing. Without doubt manufacturers are fully alive to the possibilities of developing the off-peak load, and, though many supply authorities already encourage consumers by special tariffs to instal thermal storage plants, there remain many who have yet to be convinced of the wisdom of giving such facilities. Another popular exhibit at Eastbourne is the electric washer, and one exhibitor advises us that certain builders are now installing these washers in houses for sale, instead of the more common gas boiler. The builders themselves claim that the inclusion of these washers in the purchase price of the house increases their chances of selling, and one builder alone has placed an order for over 1 000 machines. This figure is worth noting by supply engineers, for with 1 000 washers concentrated in one area the load is considerable, while the more usual necessity of first establishing that load has been kindly shouldered by the builders.

America and Unemployment.

THERE seems to be a growing impression in England that America is likely to be tempted to follow our example and make some official provision for relief of unemployment. That impression is not unnaturally fostered by our social reformers, who would be glad to have the moral support of America for their own bad economics. An American body, the National Association of Manufacturers, has just issued a pamphlet which examines this question at some length and disposes of any fear of the introduction of the dole on the other side of the Atlantic. Two quotations are sufficient to show the attitude of America. Mr. HOOVER, addressing the President's Conference on Unemployment in 1921, declared: "In the other countries that have been primarily affected by unemployment as a result of the war, solution has been had by direct doles to individuals from the public treasury. We have so far escaped this most vicious of solutions that can be introduced into government." On February 25, 1929, the Committee on Education and Labour of the United States Senate in its report said:—"Government interference in the establishment and direction of unemployment insurance is not necessary and not advisable at this time. Neither the time nor the condition has arrived in this country where the systems of unemployment insurance now in vogue under foreign governments should be adopted by this Government." Unemployment has, it is true, increased greatly in the past fifteen months, but it will take more than a temporary depression to induce the robustly individualistic people of the United States to experiment with the decadent social nostrums that have done so much to weaken the fibre of our own population.

A Hydro-Electric Problem.

ONCE more a considerable area of the United States faces the possibility of a serious shortage of hydro-electric power, on account of the absence of any prolonged rainfall since last summer, when power plants throughout the country burnt nearly three million additional tons of fuel to make up for the rainfall deficiency. In the Pacific north-west the situation is again becoming acute. It will be recalled that last December the City of Tacoma, which depends for its light and power upon a municipal hydro-electric plant, "borrowed" the aircraft carrier "Lexington" which was connected up with the city's distributing lines as a generating plant for 30 days at a cost to the taxpayers of more than half a million dollars. For two years there has been a subnormal precipitation in Washington and Oregon, and already the temporary relief of spring rains has been largely exhausted. This again brings to the front the importance of the "run-off," which varies much more than "rainfall." When the ground is very dry it absorbs all the rainfall, and there is no run-off, which means that no part of the rainfall finds its way to the streams to become available for generating hydro-electric power.

New Light in Ancient India.

ALTHOUGH the Southern generating station of the Calcutta Electric Supply Corporation was only opened a little over three years ago, the growth of demand for current has already necessitated the installation of a new unit. A 20 000 kW turbo-alternator with boiler equipment is now being put in, and provision is being made for the replacement of existing plant at the Cossipore station by larger and more modern units. A cable tunnel under the Hooghly to carry current from the Southern station to Howrah is being built and should be completed in about a year's time. Thus, in spite of the disturbed political conditions, electricity is making great headway in India, even in places where religious prejudice might be expected to form a barrier. Lord MESTON, in his speech as chairman at the annual meeting of the Calcutta Electric Supply Corporation, gave an instance of the new order of ideas. The ancient Hindu temple at Serampore has now been electrically lighted for over a year, the switching on of the current having been performed with appropriate ceremony.

WEATHER conditions were not too promising on Monday morning when the registration office opened for the issue of badges to members attending the 35th Annual Convention of the I.M.E.A. at Eastbourne. Later in the day an improvement began, and by tea-time, when the trickle of arrivals that had been flowing since morning began to gain volume, the sun came out and the sky cleared. Eastbourne was plainly making a great effort to redeem its reputation, which had been sadly tarnished by a week-end that moved even the residents to unguarded comments in the presence of visitors.

In the exhibition marquee the finishing touches were being given to a comprehensive exhibition of domestic electrical appliances, and in the grounds outside the Winter Garden trial flights of the Osram captive balloon—shaped exactly like a lamp bulb—were being staged.

The list of members and visitors attending the Convention contained 1 102 names, easily establishing a new record, and all the hotels along the front from the neighbourhood of the pier to the western end of the Parade had their share of the influx.

At the President's reception in the Winter Garden on Monday evening the members and visitors soon established contact. Dancing followed until shortly before midnight and the first evening in Eastbourne was an enjoyable curtain raiser for the more solid business of the Convention.

On Tuesday morning the official opening took place in ideal weather conditions. Members of the Council met at 9.30 a.m. and shortly afterwards the large hall of the Winter Garden began to fill up. The Mayor of Eastbourne, Councillor Lieut.-Col. ROLAND GWYNNE, D.S.O., who was accompanied by the Deputy Mayor, Alderman Miss HUDSON, welcomed the members of the Convention, who remarked that he should have accompanied the other Mayors of Sussex towns to France that day in connection with a ceremony in one of the French towns adopted after the war, but when he learned that the I.M.E.A. Convention was coming to Eastbourne he had felt it incumbent on him to be present. The Mayor and Deputy Mayor then withdrew and Mr. BRYDGES gave his presidential address. Much merriment was caused by a slip of the tongue by which he converted "sanguine" into "sanguinary" when referring to the Electricity Commissioners' estimate of the reduction in the cost of production of electricity to be expected as a result of the standardisation of frequency.

Alderman R. S. CHATFIELD's paper on "Obligations of Electricity Committees" was, at his request, taken as read, but he elaborated some of the chief points brought out in the paper before the discussion took place. This over, the members were grouped for the official photograph in the grounds outside the Winter Garden, the sun continuing to shine with an intensity which caused the stall holders in the exhibition marquee to arrange for further ventilation in readiness for the official visit in the afternoon.

In the evening the Mayor and Deputy Mayor held a reception in the Winter Garden. There were dancing and music afterwards until midnight.

Wednesday was an interesting day. In the morning Mr. G. H. LAKE's paper on "Pulverised Fuel Firing as Affecting Economic Boiler House Operations" was taken, and in the afternoon there was a motor-coach excursion to Brighton with the alternatives of inspecting the power station or the Fishergate sub-station of the grid, with tea at the Royal Pavilion provided by the Brighton Electricity Committee and Council. The evening was free from any formal function and visitors had an opportunity of appreciating the beauties of Mr. BRYDGES' new lighting scheme on the parades.

Thursday was Women's Day. Mr. J. W. BURR's paper on "Electrical Heating of Buildings" was the first item on the programme, and Mr. A. E. MCKENZIE then set going a discussion on "Domestic Water Heating." After luncheon, arranged by the Electrical Association for Women, in the Tea Room, the exhibition was inspected, the DEPUTY MAYOR and Mrs. CHATFIELD receiving the visitors. Meanwhile the Local Authority Committee members and the members of the A.M.E.E., were holding their meetings, and the afternoon arrangements ended with the tea provided by the Eastbourne Electricity Committee for the Women's Day visitors. The Convention's annual dinner and dance were held at the Grand Hotel last night.

To-day brings the formal part of the Convention to a close, the annual general meeting taking place in the morning when the president, vice-president and officers for the ensuing year will be elected.

PRESIDENTIAL ADDRESS.

How the Grid will Influence Trade—Overhead Lines and the Sussex Downs—Brighton's Part in the National Scheme.

By J. K. BRYDGES, M.I.E.E.

IN his Presidential address on Tuesday, Mr. J. K. Brydges said that his mind went back to those days of his early experience in the U.S.A. when electricity was used only for lighting and tramways. Public street lighting then consisted either of 10 ampere direct current arc lamps arranged to burn in series of from 20 to 50 lamps per machine or low voltage carbon filament incandescent lamps, run either in series with

The President and Mrs. Brydges who received the I.M.E.A. delegates on Monday evening.

the arc lamps, or in separate series across the alternating current supply. Arc lamps were used in the main thoroughfares and the incandescent lamps in the less important streets. In the event of the burning out of the filament of an incandescent lamp, a simple cut-out, consisting of two contacts separated by a thin piece of paper which punctured, came into operation and closed the circuit of the faulty lamp. The switchboard consisted of a number of circuits, grouped on one, or more, machines, as parallel running was unknown in those days, and when circuits were switched from one machine to another the supply was interrupted—a drawback that would never be tolerated in these days. Distribution was by overhead wires supported by glass insulators fixed on wood pins attached to wood cross arms, screwed to untreated cedar or chestnut wood poles from which the bark only had been removed. Small transformers for each house, or group of houses, were attached either to the poles or the sides of the buildings with small high and low tension fuses contained in boxes cast in the transformer cover. It could well be imagined what a delightful job it was to replace a blown fuse on a rainy night, sitting on a transformer near the top of a high pole, as high tension switches for controlling individual transformers were unknown in those days. Similar types of plant were, at that time, and even later, in use in this country, examples being found in the early days of the Eastbourne Electric Light Company, when the lighting of the parades was effected by open type arc lamps, arranged in two series circuits, supplied from Brush constant current dynamos each driven by a single acting horizontal engine mounted under its respective locomotive type of boiler. The alternators were rope driven by slow speed horizontal engines and at a later period high speed single acting engines directly coupled to dynamos were introduced.

It was in 1885 that the steam turbine was invented by Sir Charles Parsons and a steady conflict of opinion commenced between advocates of the old and the new type of steam driven prime movers, similar to that which existed in the earlier days of electricity supply between the two systems of direct current generation in conjunction with accumulators and of alternating current generation with static transformers.

Continuing, the President said, probably the main reason for the decision to use alternating current was the continued increase, during the last twenty years, of the use of electricity for industrial and domestic purposes. So long as the system applied to lighting only, it mattered little; but now that industry had come more and more to rely upon electric energy the decision would appear to be a very wise one and, indeed, a very necessary one. The effect of this progress had been to increase the density of the demand on the distributing mains, which, in order that they may be maintained of an economic area, must consequently be fed at more frequent intervals.

These preliminary remarks were little more than retrospection and, perhaps, a prophecy of what may be standard practice in the future. After all, far as we had progressed, we were still on the fringe of a wider field in which electricity was bound to find a premier place. There could be no shadow of doubt that, both nationally and economically, electricity was the force to which we must look in the future for all those industrial developments on which the country depended for its place in the sun. It was not so many years since, that is, in January, 1867, that Dr. Siemens communicated to the Academy of Science in Berlin, and a little later Wheatstone, to those interested in London, the details of the first dynamo, commonly called the Wheatstone machine, and this was exhibited to the comparatively few then interested in that which was destined to revolutionise industry. That was just over sixty years ago, and who could say that we had not progressed since?

We prided ourselves, not without reason, upon the conditions of our electrical developments to-day. There was hardly a town of the meanest importance in the kingdom which did not boast its own supply and, even in villages, small industries were run with the aid of a motor and the local supply.

But were we to take those lines as final? Were we to remain inert and be satisfied with the contemplation of what, a few years ago, would have been regarded as perfection? Perhaps we would have been inclined to do so had it not been for the War, which upset all our pre-conceived ideas of economic security. Before 1914, we possessed perhaps the greatest economic unit in the world, and that lay in our coal mines. It was still there to a certain extent, because experience had proved to our foreign competitors that, in the long run, English coal was the best and cheapest. But conditions had changed. Unless we could bend business conditions to the change which had come over Europe and even America during the last ten years, we should be left behind in the race which, to us, was a vital one.

Overhead Charges.

What we needed more than anything else to enable us to regain our position in the forefront of nations was cheap energy and power. We should not get it from the coalfields; we should not get it from them even if the distressed miner gave his labour for nothing. But we could use him and his industry and, in the long run, restore what he had lost, by a judicious blend of coal and electricity. We should, in other words, bring about a happy condition of affairs resulting in the lowering of overhead costs. This was the black spot of British industry—the cost of production. Lower the cost of production within economic limits and the languishing flower of trade would raise its head like some garden bloom after a welcome shower of rain. And, unless our industrial experts were entirely wrong, we should bring this about through electricity. And this raised the question of rationalisation.

Now what is rationalisation? Like most long words with an imposing air of pomposity, it had a simple meaning when you came to examine it. After all, it was no more than a distribution of rations in properly organised circumstances. In our case it meant the gathering together of all the electrical forces in the Kingdom and distributing them to the greatest advantage amongst the industrial troops of the nation.

The Central Electricity Board was created with the object of assimilating the generation of the whole country, so as to supply in bulk to local authorities and power companies authorised to control electricity within their various areas. It was the business of the Electricity Commissioners to prepare and transmit to the Board the different schemes for dividing the country into districts, and these decided which existing stations shall be retained or new ones created. The various schemes also embraced inter-connection by main transmission lines known as the "grid" and each scheme provided for the standardisation of frequency. It need hardly be said that the main principle of policy in this direction would be to concentrate production in approved areas in order to reduce cost to the lowest economic figure.

At the moment there were some 620 undertakings in the practical area, possessing between them 490 generating

Digitized by Google

stations. And whilst some of these could be regarded as more or less obsolete, others stood out as some of the most efficient in the region of electrical undertakings. At the same time, we must not lose sight of the fact that this mass of stations, working individually and without economic consideration, had reduced a large amount of plant to comparative uselessness, or, perhaps, inefficiency, being required only to carry the "peak load" and to provide a proper measure of safety in case of a breakdown. Few, therefore, would be found to argue that this was anything like an economic system. True, the combined capacity of these plants would generate electricity in a greater measure than the country required, though, on the other hand, nearly every station was inadequate to deal with the calls on its area. Hence the call for the "grid," which would bring about a radical change and link these solitary units up so as to form one single system.

It is only two years since the Act came into operation and already schemes for six areas had been adopted, and one was under consideration, embracing 68 per cent. of Great Britain and 95 per cent. of the population. In these, 116 stations had been selected and 340 will ultimately be closed down. It was estimated that these schemes would release about £10 000 000 represented in plant which had hitherto been more or less inefficiently employed. Contracts for nearly £11 000 000 had already been placed; indeed, over two parts of the "grid" current had already been passed. It had been arranged to spend a similar sum on the standardisation of frequency, the Electricity Commissioners estimating that their six schemes will, in as many years of operation, reduce the cost of production by £11 000 000, which should be liquidated for the benefit of the public. Whether or not this is a sanguine estimate time only would show.

On the face of it, therefore, the promoters of this tremendous revolution appeared to have good grounds for their optimism. The scheme for rationalising supplies would, at a conservative estimate, involve an expenditure of something over £33 000 000, which sum would probably be covered by a Government loan. Already approximately £18 000 000 was the sum the Commissioners had consented to raise, the Board being entitled to ask for a Government guarantee for all the capital it needed. In May of last year the Board decided upon a preliminary issue of £3 000 000 and in January a further £7 000 000, these without Government guarantee, which seemed to show that the Board had the courage of their convictions. The Board had two sources of revenue, the one dealing with the standardisation of frequency, and the other from commercial sales. It should be noted in passing that the Government decided that the cost of standardisation should be a direct charge on the industry. The 1926 Act, therefore, gave the Board powers to recover the interest and sinking fund from the Electricity Commissioners, but, in the main, the Board's revenues would be derived from the sale of electricity.

The Operation of the Grid.

Although the Commissioners seemed to regard their scheme as being, in every way, economically sound, and believed that very substantial savings would be effected by their various schemes, it was by no means certain that these sanguine estimates would materialise, at any rate not for some years to come. "I am speaking now of the consumer who is looking forward to the time when his light and power will cost him, on an average, a great deal less than it does at present." In time, no doubt, the new departure would be a boon and a blessing to man, but it seemed as if that day was not likely to dawn just yet. The fact must be borne in mind that electric light and power was, in this country, still, to a certain extent, a luxury—it was certainly dearer here than in many other countries. If one read the various Acts bearing on this subject carefully, it looked as if the distributors and not the consumers would be the first to benefit from the lowering of costs. Capital charges —interest and sinking fund—had to be met until the plants taken over were paid for; in other words, consumers must meet these burdens as they cannot be liquidated by any other means.

"Without being unduly pessimistic, I have felt it my duty to point out that there are yet many obstacles in the way of that electrical millennium which seems to have been confidently anticipated in more than one quarter. That we are progressing and that there are better times ahead for the consumer of electricity is beyond question."

Mr. Brydges then alluded to the opposition which had been going on for a considerable time, in Eastbourne, with regard to the erection of lattice steel towers, "incorrectly called 'pylons,' to quote Sir Harry Haward" on the Sussex Downs. The agitation has had powerful interests behind it, powerful enough, at any rate, to ensure the reception of an influential deputation from the district to the Premier who, in person, debated the subject of it. As was anticipated, the deputation was informed that, much as Mr. MacDonald regretted the fact, there could be no deviation from the scheme as already laid down by those responsible for it. "And, after all is said and done, I think it will be found, when the work on the Downs is finished, that the passing of time and its mellowing hand will show that the evil has been considerably exaggerated." In an essentially commercial community like ours, the amenities of the countryside must, occasionally, suffer. It was a deplorable fact, no doubt, but there was no getting away from it. We could not live in Arcadian simplicity and hold our own in trade conditions with the rest of the world unless we made some sacrifice, so far as the artistic side of life was concerned. It was maintained that portions of the new overhead line between Brighton and Hastings should be placed underground. But, in the economic conditions under which we were suffering at the moment, such a desideratum was entirely outside the range of practical politics. To bury these lines, not only locally, but all over the country, would have swamped the new scheme entirely. It seemed to him that the opponents of the towers lost sight of these hard facts in their very laudable endeavour to point out to the powers-that-be that the line, as projected, would pass over considerable stretches of the beautiful Sussex downlands and seriously affect the amenities of the district. It was also pointed out that the town of Eastbourne had expended a large sum of money in purchasing a considerable area of the Sussex Downs, with the object of securing control thereof and thus preventing the erection of objectionable structures which would detract from the beauties of the landscape. Still, as the result of many protests made by local authorities here and there, considerable alterations were made by the Central Electricity Board in the route of the transmission lines, as originally laid out.

Lt.-Col. Roland Gwynne, Mayor of Eastbourne, and the Deputy Mayor, Ald. Miss Hudson, whose civic welcome to the Convention was given on Tuesday.

So far as the main grid in his part of the country was concerned, Eastbourne was on a ring main which served the counties of Sussex and Kent, extending from Brighton on the west to Folkestone on the east. The line between Brighton and Tunbridge Wells passed through Three Bridges, where facilities would be provided for the supply required by the Southern Railway for the electrification of the Brighton section of their line. As regards the secondary lines, alterations had also been made with a view to reducing the length of the line in this county without any diminution of the service given therefrom. The amended scheme provided a double circuit line between Eastbourne and Newhaven via Polegate, Hailsham and Lewes. In respect to the secondary line from Brighton, the ring originally designed had been replaced by two lengths of duplicate lines from Brighton to Hurstpierpoint and from Three Bridges to East Grinstead and Horsham. These secondary lines had resulted in comprehensive schemes for distribution in the areas hitherto unoccupied or only partly so. Eastbourne itself was proposing to take a supply from the secondary line in connection with an Extension Order covering Hailsham, Polegate, Pevensey, etc. Brighton was the only selected station on the south Coast in this district, but

Digitized by Google

arrangements had been made with Hastings whereby the station there would be available for grid purposes for some time. The general arrangement of the grid sub-stations at Eastbourne and Hastings were on similar lines comprising two three-phase transformers, each of a capacity of 20 000 kVA and a voltage ratio of 132 kV/11 kV, but at Brighton the design was dissimilar on account of the different conditions which had to be met with.

It might be of interest to mention that Worthing was now receiving a supply from Brighton through a secondary line, and that a feature of this line was the use of spun reinforced concrete towers which were the first example of this type to be used in the country.

Since Mr. Brydges had already alluded to the layout of the grid scheme and its reactions on the rural amenities, he decided to make no further reference to the subject. Possibly the time was not far distant when all cables would be underground, owing to the recent important departure that had been made in the design and construction of cables suitable for operation at the extra high pressure of 132 000 V.

Cable Difficulties.

It was a far cry to the early days of our industry when Ferranti made the first high pressure paper insulated cable, and very little development in that direction had taken place since until quite recently. In the interim, between the year 1888, when Ferranti first pointed the way, and the present moment, there were many serious obstacles on which he did not dwell—referring in particular to cable difficulties—which had recently been overcome mainly by covering each core of a high pressure three-phase cable with a lead sheath, thus reducing the electrical stresses within the cable to such dimensions as did not permit of active ionisation. Following this departure a method of construction of a cable was devised having a duct or hollow core, and at suitable intervals along its length external containers were fitted so as to accommodate the excess oil due to expansion. When the loads on this cable were such as to produce heat and consequent expansion of the impregnating oil, the amount of oil due to expansion moved through the duct into the external containers which in turn pressed it back into the cable as the temperature and expansion decreased. This method relieved undue pressure on the lead sheath and prevented the formation of voids, and thus the conditions which invited ionisation were overcome.

There were yet many difficulties in the way towards the electrical millennium which the general public had been led to expect. We were adopting a gigantic scheme of which few of us in this country had had working experience. One could foresee many obstacles before the ambitious programme was safely accomplished. There would be difficulties in paralleling large generating stations each operating with its own power factor, and similar troubles could be anticipated with smaller stations synchronising their plants with the grid supply. The use of high voltage may overcome surging dangers to some extent, but there still remained the secondary grid to reckon with.

The Trade Associations.

Concluding his remarks, Mr. Brydges said that though the British Electrical Development Association, the British Electrical and Allied Industries Research Association and the British Engineering Standards Association were outside the sphere of his address, he could not conclude without paying brief tribute to the part they had played in making the high standard what it was, and what it was going to be in the future. Not forgetting, of course, the Electrical Association of Women. As a mere matter of evolution woman came after man, and, as some anonymous cynical philosopher remarked, she had been after him ever since. But not so very long after in these progressive days. Much water had flowed under bridges since the days of the "Votes for Women," and to-day, so far as we were concerned, it seemed to be more of a case of "Volts for Women" and "Watts in the Home." There was yet another branch for the E.A.W. to which he made allusion, and that was in regard to salesmanship. To-day most of our fittings, including domestic fires, were so refined and artistic that they must of necessity appeal to the artistic tastes which lie dormant in every woman. One could see a wide field in showroom and kitchen demonstration in which our women could play a wonderful part.

OBLIGATIONS OF ELECTRICITY COMMITTEES.

The Duties of the Committee Man—Developing the Domestic Load—Profits and the Relief of Rates—The Income Tax Problem.

By ALDERMAN R. S. CHATFIELD.

At the conclusion of the Presidential Address, Ald. R. S. Chatfield read a paper entitled "Obligations of Electricity Committees to Municipal Electricity Undertakings," and said that in every municipal body, one could name two or three, or perhaps more, committees whose chairman would each contend that his committee was more important to the welfare of the people than another. Without entering into any discussion as to which was the most important, everyone must admit that no committee did more or shouldered bigger responsibilities to promote the general well-being of the community, not only in regard to its health, its comfort, its safety, but also its prosperity and advancement, than did the electricity committee. Although it was realised that we were, as yet, still in the early stages of electrical development in this country, nevertheless the author only stated a truism when he said that the use of electricity had so permeated every human activity to-day that it could safely be described as an essential raw material for every form of manufacture and commerce. It followed then that the deliberations of an electricity committee were just as important nationally as locally. The committee had to provide for the future, just as much as for the present. Unless future requirements were properly and efficiently anticipated, industrial development was retarded, and that in turn militated against the prosperity of the country. "Give us electricity—Give us cheap electricity," demanded industry. "Give us electricity for lighting and power for working appliances at rates we can afford," demanded the housewife. If we are to progress, their demands must be met. The solution rested with every member of an electricity committee, and therefore, as one who, after serving an apprenticeship as a committee man for a number of years, occupied the chair and had seen more of the inner working of an electricity supply undertaking than the ordinary committeeman, the author endeavoured in his address to explain in simple terms some of the obligations of members of electricity committees to municipal electricity supply undertakings.

Ald. R. S. Chatfield, chairman of Eastbourne Electricity and Street Lighting Committee.

Every member of a municipal electricity supply committee occupied a responsible position, and had very definite obligations to fulfil if he was to justify the trust reposed in him by the council, the chairman of the committee, the engineer, and the consumers generally. There must be a very large number of members of electricity committees who had not really taken their responsibilities to heart, or probably had never really considered their obligations, and it was these that the author principally had in mind. It should be remembered that an electricity committee was composed of a number of people who were prepared to give some of their time and leisure to matters connected with the development of the municipal electricity supply area, and that they constituted the link between the supply undertaking, the electricity consumers and the general body of ratepayers.

The newly-elected committee man should first of all realise that he had become directly associated with a great and important industry with enormous possibilities of development both in respect to supplies for lighting, heating and cooking, and in respect to the provision of electrical apparatus, which, apart from its importance in improving the load factor, also provided opportunities for profitable retail trading in the department showroom either by direct trading or by arrangement with the local branch of the Electrical Contractors' Association. He should from the first take every opportunity of studying his subject. His obligations did not end with

Digitized by Google

attendance at meetings and taking an intelligent interest in the proceedings. He should, throughout his period of service, be prepared to devote himself to the whole question of electricity supply, particularly distribution, and to seize every opportunity of educating non-consumers to the abiding benefits of electricity. His general interest in matters electrical should not be confined to his own undertaking, but should be extended to the whole of the electrical world. It was only by his knowing what was going on outside his own undertaking that he could acquire an adequate knowledge of the subject. He should obviously practise what he preached and use electricity and electrical appliances in his own home.

The committeeman should use his best endeavours to ensure that the benefits of a continuous supply of electricity were available to every ratepayer, whatever his means may be, and that such supply was given as cheaply as possible.

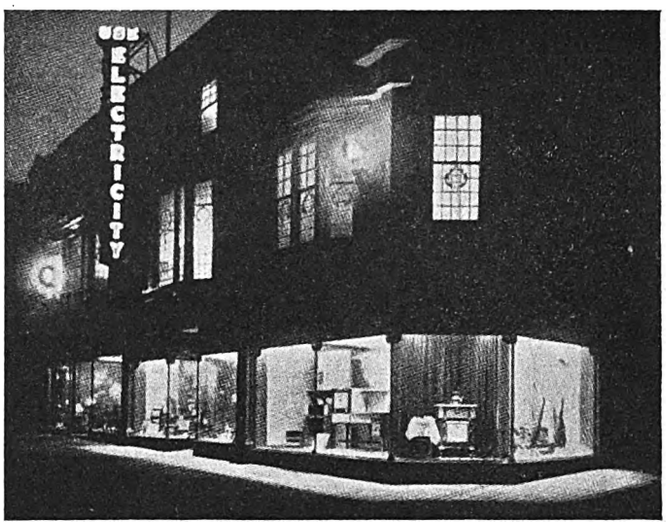
Future extensions and developments of a supply undertaking were matters requiring constant attention. Throughout the country one could not fail to be impressed with the rapid growth of electricity supply. Everywhere could be seen new power stations being erected and extension work being carried out, and now the national grid system was being established a still greater acceleration of supply might be expected. This was a matter which concerned every committeeman. He would be asked before long to vote large sums of money for development and extension works, and in the interests of efficiency and economy he should work both for to-day and for several years ahead.

Many committees were keenly alive to the fact that some method must be devised for connecting up to non-consumers a supply which they could afford. There was not the slightest doubt that everyone wanted electricity, but it was not everyone who could afford to pay cash down for the necessary wiring, etc. A number of schemes were in operation throughout the country, the most popular probably being the assisted wiring scheme. This certainly meant tying up capital, but in the long run it was highly productive and profitable. The surest way of promoting the wider use of electricity was to introduce cheap rates, and this question was one of great importance to the committeeman. Cheap rates for lighting encouraged a higher intensity of light being used, which in turn increased materially the units consumed. Cheap rates for power meant that electricity would be used in the home more freely for heating, cooking and washing. Large consumers using power for industrial purposes should be given every consideration, and if present electricity rates were economically too high every avenue should be explored to see if the granting of special rates was possible.

Having provided the ratepayers with cheap rates and placed them in a position to take a supply, it devolved upon the electricity committee to so handle finances and so fashion their outlook that facilities for rapid development were made possible. To do this the committee should, when carrying out extensions, take a very long view to ensure that distributing mains of ample capacity were laid down to meet future needs for at least five years, bearing in mind the class of home and the domestic load that would eventually have to be carried by the new distributors. The number and size of the houses should be taken into consideration, and where open space occurred between them allowance should be made against the time when it was built upon.

Extensions Attendant with Difficulties.

Owing to the fact that the future had not been fully provided for, all sorts of difficulties had been met with when extensions had been needed. Fully developed land with highly valuable capital sites had to be purchased purely through lack of vision when the initial supply was laid down. The expensive method of burrowing under the ground had even had to be resorted to. Particularly in new districts the rule should always apply that the planning of the electricity distribution system was settled at the time of planning the streets. Land should be acquired when yet in the agricultural state, making full provision for giving a supply to the new area, and protecting it against spoliation of its amenities by kiosks and sub-stations being erected wherever they could be squeezed in. The committee man, as a representative of the people and a trustee of his own undertaking, should take his share of the responsibility of seeing that his undertaking is run on sound business lines. The suggestion offered was that the electricity committee should be independent of any other committee, and have, as far as possible, plenary powers, reporting from time to time to the Council as a whole, who would judge them on their balance sheet as in the manner of shareholders. It was practically impossible for the electricity committee to make suggestions for expenditure for development work, etc., to a separate finance committee, as members of that committee could have no possible knowledge of the requirements of the undertaking, and the duties and responsibilities of the committee might



Ald. Chatfield pointed out in his paper the importance of showroom accommodation, and here is seen Electric House, the showrooms of the Eastbourne undertaking.

be hindered in consequence. It was necessary, however, that the electricity committee should have at all times the opportunity for consultation with the corporation's financial adviser.

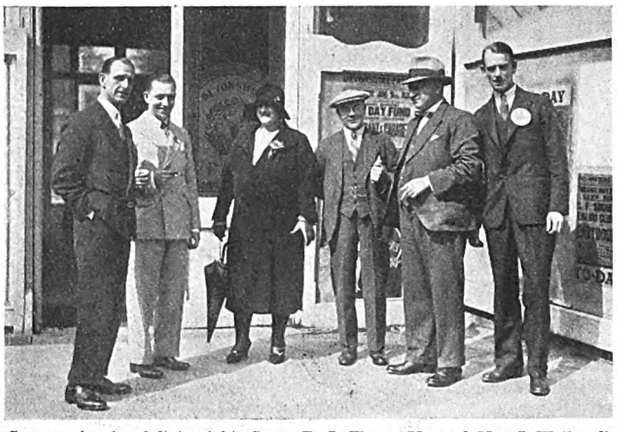
An important side of the business requiring the keen interest of committee members was the showroom of an electricity supply undertaking. The various apartments should be well furnished, and the various fittings and appliances, etc., tastefully displayed. The staff of assistants should be fully qualified to discuss electricity from all angles with potential users. Demonstrations of the appliances should always be a special feature. The windows should be well dressed and attractive, and at night should be a blaze of light, as an example to local shopkeepers, and a silent tribute to the power and attractions of electricity.

Good street lighting was an essential factor to the comfort, convenience and safety of the community, and was a matter which concerned members of electricity committees, if that committee was the one responsible for street lighting. A satisfactory system of street lighting was one that permitted of the adequate lighting of pavements and roadways for normal vehicular and pedestrian traffic, to operate as safely by night as by day. Road crossings especially should be well lighted in order that they may be negotiated with perfect safety. In planning a street lighting system many factors must, of necessity, be considered, and the requirements of each class of street and district had to be considered separately, since it was obvious that streets and thoroughfares in the principal traffic centres will require a greater degree of illumination than those situated on the outskirts of the town. There were more than local conditions, however, to which adequate consideration should be given in the design of the successful street lighting installation. Important factors such as light distribution and intensity entered into the question, these, in turn, depending upon mounting heights, spacing, candle power of lamps and the efficiency of the equipment. But these were technical considerations for the chief electrical engineer. At seaside resorts, and inland places possessing attractions, great care should be taken to ensure that the lighting be attractive and in harmony with the local conditions. Parade and pier lighting at seaside resorts, and the special lighting of certain features, required painstaking attention, as upon this depended to a large extent the popularity and, therefore, the prosperity of the resort.

The question of the utilisation of profits had been argued on many occasions. Some contended that as this was the surplus of a trading undertaking it belonged to the ratepayers, and in the event of profits being made the surplus should be used for the relief of local rates. This theory, however,

Digitized by Google

was economically wrong. The committeee were responsible for the development of the supply in their area, and any surplus should be set aside for this development work and building up adequate reserve, and not before every householder was provided with an electrical supply cheap enough for its use for power as well as lighting should the surplus be allocated for the relief of rates. If annual profits be used for rates relief consumers would never be able to have a cheap supply, growth would be hindered, and the goodwill of the



Group : showing left to right, Coun. E. J. Thorn, Mr. and Mrs. J. Wetherell, Coun. J. Hillier, and Messrs. D. Thomas and R. Cox.

undertaking would suffer. A trading undertaking of a corporation occupied a special position, and financial control should play just as important a part as in any other commercial undertaking. However successful an undertaking may be in producing an electricity supply at the lowest possible rates, their efforts could be easily nullified by careless finance. It was a first essential, therefore, that the committee should be fully alive to their responsibility in this matter and carefully consider the effect upon the earnings of the concern of all schemes of extensions and other items of capital expenditure submitted to them by their engineer and manager. An ordinary commercial business had, of course, outside competition to contend with, and in order to compete successfully must keep its organisation efficient and up-to-date, but a monopoly undertaking had not that incentive, and special care should be taken to prevent it slipping into a "good enough" policy. Reports on all important questions should therefore be submitted periodically and very carefully considered. As a rule municipal undertakings could be financed more economically than other concerns, but nevertheless care should be exercised in the method of borrowing, and loans placed with due regard to the effect on the price per unit.

Depreciation, too, was an important factor. In theory the provision for repayment of borrowed capital should be sufficient reserve for depreciation, but in an electrical undertaking it had been found by experience that obsolescence and breakdown risks rendered it imperative to provide a reserve fund of sufficient strength to meet these unforeseen contingencies. It was advisable, however, to scrutinise these requirements carefully, as too large a suspension of profits both on reserve and as working capital was undesirable for obvious reasons.

The high rate of income tax now prevailing raised the important question as to the advisability of earning profits in any undertaking. Prior to the Electricity (Supply) Act, 1926, it did not matter to any large extent because there was a right of set off against the general rate fund liability after allowance for tax retained by deduction from loan interest paid by the undertaking. Up to March 31 last, however, the Inland Revenue Authorities contended that the set off was limited to 1½ per cent. of the outstanding debt. In Eastbourne this had the effect of reducing the set off figures from £22 000 to £4 200, or a cash loss to the town of £3 560. After this date this set off would be lost unless the reserve fund amounted to one-twentieth of the aggregate capital expenditure. This being so, it seemed folly to earn large profits for the sake of paying income tax rather than to give as much benefit to consumers by a reduction in the price per unit.

In conclusion, Alderman Chatfield said there was a definite obligation on the part of electricity committees, individually and collectively, to support all those various associations which are so closely associated with electrical development. The author was aware that this particular matter was dealt with last year in the presidential address of the immediate past president, but he felt that it would not be out of place in a paper written by a chairman of committee for the information of electricity committee members generally, to make a reference to the matter again.

The author pointed out that for a number of years, and more particularly since the war, it had become necessary to consider many of the problems arising in municipal electricity supply from a national rather than from a purely local aspect. It was no longer possible to consider that the functions of a municipal electricity committee could be regarded solely from their local bearing. National legislation and co-operation in development, to mention only two factors, had led undertakings throughout the country to act in combination with others, and the view sometimes expressed in the past that an electricity committee could satisfactorily conduct its own business without relation to or interference from any outside body could now seldom be held. The association which perhaps more than any other should have the fullest support of municipal electricity supply undertakings, and of which it was surely incumbent upon every undertaking to become a member, was the British Electrical Development Association. There are also the British Standards Association and the British Electrical and Allied Industries Research Association, whose work, if not directly, did certainly indirectly, benefit municipal electricity supply undertakings by the standardising of materials and products and the improvement of design and quality. No doubt the great majority of electricity committees had already realised their obligations in this respect, but there were many who apparently had not yet done so.

Discussion.

The discussion of Alderman Chatfield's paper was opened by Alderman H. B. Vorley, J.P., chairman of the Islington Electricity Committee, who remarked that certain chairmen, including himself, were thought to enjoy the freehold of the job. Other committees made a practice of changing the chairman every two or three years. He believed that a chairman required some years of training before he became efficient. Having secured a chairman—it was not always easy to get a suitable man—the next thing was that the chairman himself should study every member that came on to the committee and find out his capacities. It must also be remembered that the vice-chairman was usually in the succession, so that it was very important that when a vice-chairman was chosen, an eye should be given to the future.

Having had considerable difficulty in getting sub-stations in the congested area in Islington, he had looked into the matter of compulsory powers of acquisition of sites by local authorities under the Act of 1929. The remedy was worse than the disease. When one wanted to obtain land for a sub-station in his district, it paid to give double the market price

Left to right: Mr. Mrs. and Miss McLean, Mrs. and Coun. Bolland, Mrs. and Mr. Jarvis.

rather than indulge in the procedure of compulsory arbitration. Apart from price, it might take twelve months or longer to attain one's object. Some alteration in the law was required to enable sub-stations to be opened in a much shorter time than at present.

It was no doubt the ideal state of affairs for an electricity committee to be able to ignore the finance committee and go direct to the Council, but he doubted if that would come in our time. It was not always recognised, however, that the

finance committee was not the final court of appeal; the finance committee's control should be limited solely to the financial side of the problem.

Alderman A. E. Gough, chairman Cardiff Electricity Committee, said that it was a very dangerous thing to have too many experts, particularly lay experts, on a committee. (Hear, hear!) It was even more dangerous to attempt to train laymen to be able to discuss technical questions. For a long time they were able to persuade electricity committees in Cardiff that extension of supply and a better tariff were not merely things that should be provided in justice to the poorer consumers, but a real commercial proposition. In practice, they had found that if there was a solitary consumer at the end of a street it was worth while to give a supply, because later they would have a whole street of consumers who would come on to the mains as a result of the example set by the one first connected. All profits should be allocated to extend supply and reduce tariffs. It was not advisable to go too fast in the matter of reducing tariffs, as it did a lot of harm if it was subsequently found necessary to raise them again. It was better to fix on a fairly reasonable tariff that could be maintained for a number of years. He did not agree that finance committees should exercise the amount of supervision over electricity committees that they did at present.

In the matter of research and other associations to which committees were asked to contribute, he suggested that these bodies should engage in more propaganda explanatory of their activities, so that committee men would be better informed as to the objects for which they were being asked to vote funds.

Alderman W. Walker said that twenty years ago the great bulk of opinion was in favour of that dishonest proceeding—the taking of profits in relief of rates. There ought to be no profits in the case of an electricity undertaking. The appearance of a profit in a balance sheet simply meant that there was a sum of money at disposal for reducing tariffs during the coming year. He suggested that the form of agenda provided for many committees could be usefully improved. In Manchester, it was the practice for every member to receive by post a day or two before the meeting a set of papers giving full particulars of all the matters which would come before the committee. This system gave committee men a real opportunity of learning what was to be discussed, and also of keeping some record of the work of the department.

In the case of supply to a small group of houses erected a mile or two outside the area, to which normal building development had extended, he thought it was fair to ask them to contribute towards the cost of connecting them.

Referring to a statement made by Alderman Gough, Alderman Walker pointed out that since March 31 of this year there had been an alteration in the powers of Councils to take part of the profits, and that the $1\frac{1}{2}$% could only be taken if a reserve of one-twentieth of the capital expenditure existed.

It was a matter of great importance that electricity committees should secure the confidence of the Councils as a whole. Where this confidence existed, committees found it much easier to get what they wanted without friction.

In the matter of standardisation of appliances he said that no two manufacturers had produced a single appliance with one part interchangeable. As a result of the demand, a standard form of appliance had now been devised. The I.M.E.A. had had to take a strong line on this point.

Alderman E. Huntsman, chairman of the Nottingham Electricity Committee and president of the British Electrical Development Association, deprecated taking too exclusive an electrical view of the relationship between electricity and finance committees. In dealing with problems of finance as affecting electricity, they ought to remember that the electrical department was part of a still larger body. There were cases in which it was almost treason to electrical development to take anything from the electricity undertaking, but there were occasions when it might be the duty of the undertaking to contribute something to the general trade of the city.

Recently there had been some disposition on the part of local authorities to look with suspicion at the activities of outside bodies like the Central Electricity Board and the Electricity Commissioners. He was able to deal with the situation as it existed at present, but it was necessary to educate councils as to the new state of affairs.

Inspections of foreign installations ought not to be limited to technical men only. If he had his way, he would make it incumbent on every chairman and vice-chairman, with their engineer, to spend a fortnight every year in visiting those centres in Europe where electricity had been most profitably developed. The first thing for anyone going on to an electricity committee was to take a large view and not look at matters from a narrow local standpoint.

Mr. W. C. P. Tapper, Stepney, said that with an increasing number of undertakings taking their supplies from the grid instead of continuing to generate themselves, it would become necessary for committees to concentrate their activities on the selling side. E.D.A. assisted every committee very effectively in selling electricity. Many committee men still did not realise this fact. Members of the I.M.E.A. who had not yet joined E.D.A., or who were not paying the full scale of contribution, ought to do so. We were sadly missing the late Dr. Ferranti in the matter of tariffs. He had set up a committee on tariffs shortly after becoming president of E.D.A., but since his death the work had flagged to some extent. It must be pushed forward. Much more might be done in the operation of assisted wiring schemes than was actually being done. Under the assisted wiring scheme in force in Stepney 3 500 consumers had been connected, representing 13 000 points.

Councillor H. Coates, chairman of the Watford Electricity Committee, said that large consumers' tariffs were best left entirely to the engineer. In Lancashire an excellent consumer had been lost because the committee could not appreciate the reasons for the special tariff proposed.

Alderman Chatfield, replying to the discussion, said that he felt it was a sound thing for members of committees to practice what they preached in the matter of using electricity as freely as possible. He himself was an engine driver—he mentioned the fact as an indication of the size of his income—but he had built a small house without chimneys, and his experience proved that it was a practical proposition for people of small means.

ECONOMICS OF PULVERISED FUEL FIRING.

Influence on Cost of Steam Generation—Saving of Floor Space—Control Instruments—Feed Water Treatment—Disadvantages and Advantages of Pulverised Fuel.

By G. H. LAKE, A.M.I.E.E.

ON Wednesday morning Mr. G. H. Lake, A.M.I.E.E., Borough Electrical Engineer, Derby, provided the Convention with a very well documented examination of the economics of pulverised fuel firing, based largely on his own experience at Derby. The circulated copies of his paper, which was entitled "Pulverised Fuel Firing as Affecting Economic Boiler House Operation," contained a large amount of tabular matter illustrated with numerous graphs and diagrams.

Mr. G. H. Lake.

Mr. Lake's paper began by recalling that thirty years ago boiler capacities were necessarily small, so that large batteries of small boilers were involved, with all the attendant troubles occasioned by multiplicity. The boiler was then certainly the weakest link in the process of converting the heat value of the raw material into electricity. In 1905 there was a general move towards adoption of water tube boilers; capacities, pressures and temperatures commenced to increase with their corresponding decreases in the cost of steam generation. For some considerable period thereafter boilers of 20/25 000 lb. per hour capacity were considered as large as could be justified on either technical or economic grounds. The war and immediate post-war periods saw a gradual increase in size, yet in 1922 the author installed an extension to the boiler plant at Derby comprising six water tube boilers each having a capacity of 25 000 lb. per hour, indicating the nature of the rut into which the principles of steam generation had become stagnated. For an engineer about to purchase new equipment for his station there were to-day two alternatives—viz., stoker-fired plant or pulverised fuel equipment.

The average pressure and temperature obtaining until quite recent years was of the order of 250 lb./sq. in. with a final steam temperature of about 650° F. In the table below an indication of the advance made in this direction is clearly shown. These figures have been abstracted from a paper read by Mr. George A. Orrock at the World Power Conference at Tokyo in 1929.

INCREASE IN PRESSURE AND TEMPERATURE AND GAIN IN THERMAL EFFICIENCY.

Year.	Name.	Pressure lb. Abs.	Temp. Deg. F.	Thermal Efficiency, carnot.	Act. B.Th.U. per kWh	Overall Thermal Efficiency, per cent.
1770	Newcomen	15	212	2·7	416 000	0·82
1810	Watt	30	300	9·17	61 000	5·60
1900	Wildwood	215	400	20·8	19 200	17·75
1922	Modern	265	650	35·00	18 000	19·00
1928	Loeffler	1 700	932	61·2	11 500	29·7*
1928	Benson	2 500	1 000	63·0	10 950	31·2*

* Estimated from H.P. to vac. regenerative cycle.

Reference was made to the choice of a pressure of 800 lb./sq. in., with a final steam temperature of 846° for the Billingham plant of Synthetic Ammonia and Nitrates, Ltd., as a clear indication that the technical and commercial claims made for higher temperatures and pressures had justification. In America and other overseas countries still higher pressures and temperatures had been employed. It would be incorrect to suggest that simply to be modern one should go in for these high pressures and temperatures; there were many cases where on financial grounds alone, they could not be justified. As a rule the deciding factor was the question of capital cost, and with present construction, materials and methods, there was usually a certain pressure and temperature for any given boiler capacity that would secure the most economical results. A very important influence on the cost of steam generation was the number of boilers required to generate a given quantity of steam for equal reliability, the heating surface required for this duty and the floor space occupied.

The table below compares these factors for the conditions obtaining at Derby about 1922 and those relating to the extensions during the period 1926–1930.

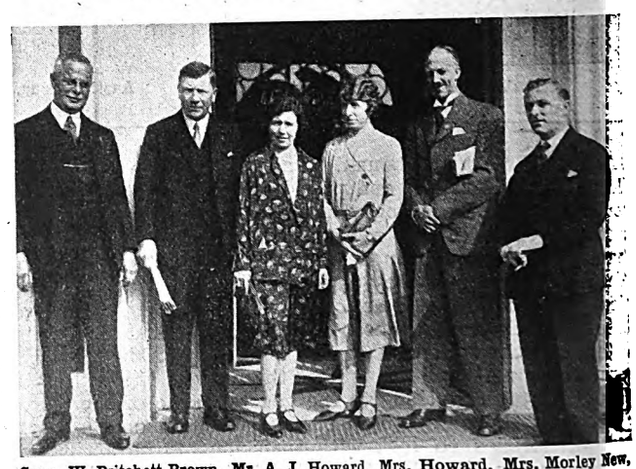
COMPARISON OF CAPACITIES, HEATING SURFACE AND FLOOR AREAS (DERBY POWER STATION).

	Lancashire Boilers. (1900).	Water Tube Boilers		Steam Generator 1930.
		Stoker Fired (1922).	P.F. Fired (1927–28.	
No. of boilers	6	6	3	2
Average capacity per boiler, lb./hr.	5 000	25 000	60/80 000	60/80 000
Total capacity, lb./hr. ..	30 000	150 000	240 000	160 000
Total heating surface, sq. ft.	—	43 690	51 470	15 880
Heating surface per 1 000 lb./hr.	—	290	214	99
Floor space, sq. ft.	2 820	7 350	8 560	
Floor space per 1 000 lb./hr.	94	49	21	

While furnace volumes had been largely responsible for the reduction in floor space, the increase in evaporation per sq. ft. of heating surface had also assisted. This increase was apparent from the practice now generally in force whereby boilers are rated at a normal capacity which corresponds to their most efficient load, a maximum continuous rating up to 25–30 per cent. above the normal rating, and finally, a peak rating generally some 50 per cent. above normal rating, at which the boiler will supply a sudden demand for a short period.

With the modern boiler, one of the primary influences on the possibility of increased rates of evaporation was the induced and forced draught fan capacities. If these were sufficiently liberal, the boiler evaporation could be pushed to unexpected rates, particularly in the case of powdered fuel installations.

Advances in design associated with control and recording instruments have had their influence on the increased efficiency now generally obtaining. This result could be ascribed to continuous research. In spite of the generally recognised and accepted benefits resulting from the careful control of the electrical side of every undertaking, many plants had still to instal modern control and recording instruments for the steam side. It was difficult to defend this position for even if such equipment and control was comparatively expensive in first cost, the savings effected would in a very short space of time more than cover the expenditure involved. The only way to attain maximum efficiency in coal consumption was to have



Coun. W. Pritchett Brown, Mr. A. J. Howard, Mrs. Howard, Mrs. Morley New, Mr. C. G. Morley New, and on the right, Mr. Penwill of the E.C.A.

the means of following the load demand as closely as possible. The more closely this was followed by the boiler plant, the higher would be the average operating efficiency over a period. Again, the installation of the proper control instruments enabled a continuous record to be maintained of the conditions obtaining throughout the day, from week to week, and from year to year. Thus the engineer was able at any time to note how the station was operating, and from past experience and facility in reading the records to be in a position to alter any undesirable feature in the method of operation for the given conditions.

Our cameraman musters a few more delegates for our pictorial record of the Convention.

Definitely associated with the developments previously referred to was the all important question of boiler feed water and its treatment. Owing to the increased capacity of the plant, the increased velocity of the water in the tubes, the necessity for keeping the boiler on the line for maximum periods, a continuous study had been made of the factors tending to reduce troubles to a minimum. Attention had naturally been focussed on the problems of providing suitable feed water for the modern boiler.

Feed water heating and steam bleeding from the turbine are established practices, and the extended use of these methods had brought about continuous advance in design. These features were recognised by all engineers responsible for generating steam efficiency, economically and with a minimum amount of trouble, and in nearly all modern boiler plants evaporated water was used for the boiler feed. With the high and positive circulation resulting from the more recent design of boilers continuous operating periods of nine months and even longer without shut-down were not only possible, but would in time become the rule.

In the early days of pulverised fuel development (only some five or six years ago) the greatest difficulties were experienced as a result of the restricted volume of the combustion chamber. In consequence of research and numerous experiments, increased attention was focussed on boiler settings. The coincident application of preheated air at once brought about trouble owing to increased furnace temperatures, irrespective of the type of plant installed.

Coming to the furnace itself, there was the question of the high maintenance of furnace walls experienced in the past, and the by no means negligible slagging troubles. Water cooling of the walls and the ash had very much reduced the incidence of this factor. The paper gave a brief description of the latest plant now in operation at Derby and other places and pointed out that we had now reached the stage when the terms "boiler" and "furnace" were practically synonymous, and the high pressure heating surface was reduced to a minimum. If the definition of a boiler as a heat reclaiming unit was borne in mind, it would be apparent that there was still a large amount of heat reclamation to be performed after the gases had left the interior of the boiler proper. It was here that the steaming economiser and air preheater played their parts. If the temperature of the leaving gases was sufficiently high, the normal economiser became a low temperature boiler, final heat extraction from the gases being performed by the air heater and returned to the furnace proper as preheated air. This heating surface was the cheapest part of the heat reclaiming unit, being subject to no steam or water pressure of any description. The most economical use had been made of the heat extracting material in the boiler, since only the most efficient portion was subject to full steam pressure and temperature. The importance of the advances made in boiler design from this development was apparent when comparing this with the settings now becoming general for stoker fired plant. In effect, the stoker designer was following in the steps of the pulverised fuel engineer.

Digitized by Google

Additional to the features associated with pulverised fuel were the many developments in other forms of combustion equipment. Mechanical stokers and the various furnace constructions common to this form of equipment had advanced rapidly in recent years to meet the increasingly severe conditions brought about by the phenomenal rise in the size of boilers, the inevitable demand for higher combustion ratings, the tightening up of smoke regulations and the gradual rise in the temperature of the air for combustion. The travelling grate stoker in particular had been developed to combat challenges from other styles of equipment, and retained at present its position as the most widely used apparatus for water-tube land boiler firing in Europe. A few installations of retort type stokers had been made in this country recently, but it had still to be demonstrated that this type of apparatus was capable of dealing with the many grades of fuel burned on travelling grates.

A Majority Vote.

Replies from many of the foremost municipal and industrial engineers to an extensively circulated questionnaire (these are given in the form of a table and appendix to the paper) were in the majority of cases favourable to the adoption of pulverised fuel firing; the capacity of plants operated with this system represented a large volume. Every one of the replies received showed a full appreciation of the difficulties involved in the pioneering effort which had been restricted to a period, as far as these records went, of little more than five years.

On most of the early pulverised fuel installations a number of disadvantageous features were experienced, such as :

1. Preparation costs associated with the drying and pulverising of the fuel.
2. The difficulty of storage connected with central or bin and feeder systems.
3. Feeder and burner problems associated with correct combustion conditions.
4. Heavy furnace maintenance was experienced on many plants.
5. Slagging troubles associated with coals having a low fusing ash temperature.
6. Bird-nesting of boiler tubes.
7. The air vent nuisance or leakage of coal dust either internally or externally.
8. The dispoal of the ash which still remains without a market.
9. The emission of dust from the boiler stacks.
10. The human element which is generally averse to doing anything different from what his predecessors have been doing for countless years before him.

All these features had been experienced at some time or another in a greater or less form, and the experience of the pioneer had often been very unhappy, particularly when faced with the necessity of maintaining the public supply with the threat of an injunction hanging over his head for creating conditions which at times were admittedly not in the public interest.

Refinements and developments produced in the past two or three years enabled the engineer responsible for the design of a new station to instal this apparatus without the possibility of any one of these previously undesirable features being present.

Present Advantages.

Advantages which appeared to have become general in all operating experience to date are :—

1. The removal from the combustion zone of all moving parts which is a logical and progressive development.
2. Increased operating periods without interruption.
3. The unquestionable flexibility of the plant which enables the load demand to be followed accurately.
4. Greatly decreased coal costs per unit of electricity generated.
5. Effective control of combustion conditions irrespective of load on the unit or grade of coal being consumed.
6. Reduction in overall maintenance of the plant.
7. Higher daily and annual operating efficiencies.
8. The increase in evaporative ratings.
9. The reductions in the space occupied yielding valuable savings in capital costs.
10. The rapidity of raising steam to meet a sudden demand.
11. A definite advance on the labour conditions associated with operation.
12. The elimination of all banking losses.

During the whole of the period in which the pulverised fuel plant had been in service at Derby all records of costs had been most carefully followed and a number of interesting figures had been published from time to time. Taking the amount of coal pulverised and burned each year the maintenance costs on the pulverising plant, conveying plant, feeding and burning equipment, boiler and furnace maintenance, had resulted as follows :—

	Coal Pulverised.	Maintenance, including Labour.
1926/1927	25 000 tons	8·02d. per ton
1927/1928	24 800 ,,	9·20d. ,, ,,
1928/1929	30 077 ,,	7·65d. ,, ,,
1929/1930	30 844 ,,	7·04d. ,, ,,

This gives an average over the whole period of 7·97d. per ton.

Similarly with operation, and quoting from records over an extended period, it was found that these averaged out as follows :—

LABOUR.	
Preparation of coal from receiving hopper to pulveriser, pulverising and conveying to pulverised fuel bin	6·1d. per ton
To cost of boiler operation	3·6d. ,, ,,
To cost of ash removal and general cleaning	3·08d. ,, ,,
POWER.	
For operating elevators, dryers, pulverisers, conveyors and feeders. An average of 23 units per ton at 0·25d. per unit	5·75d. ,, ,,
	18·53d. ,, ,,
Add for maintenance costs	7·97d.
	26·50d. ,, ,,

Or 2s. 2½d. per ton.

These figures had resulted in a steady reduction in the costs of generation as illustrated by the returns for the past five years :—

Year.	Coal cost per unit sold.
1926	0·19d.
1927	0·45d. (affected by colliery supplies)
1928	0·15d.
1929	0·13d.
1930	0·12d.

The position reached to-day was such as to necessitate more than ordinary consideration being given to the choice of combustion equipment for any new plant, for the reliability factor was now so pronounced as to permit of stating that stability in design, space occupied, and costs per 1 000 lb. of steam were definite factors, not varying as formerly.

Dust Emission and Ash.

The principal problems from the operating point of view had been those connected with dust emission and the final ash. With the gas washing system now in use the early difficulties had been overcome, and once an effective use was found for the final ash deposit (there were a number of experiments for this purpose being conducted) the whole of the original list of disadvantages would have then also have been overcome.

It must be borne in mind that the coal which should be consumed as far as possible was of a type which could not possibly be utilised in any other way. When it was realised that from 83% to 88% of the available heat in this fuel was capable of being converted into potential energy and that large quantities of this fuel were available, pulverised fuel firing was sound and deserving of wider support.

The first year of operation at Derby with pulverised fuel was in the period 1926-27. During that year every power station was affected by the difficulties in the mining industry so that records for operation had not been included for comparison with those established during 1927-8.

During 1928-9 the increased number of units of electricity distributed in comparison with the previous year was 2 011 000, which at an average price of 1·45d. per unit sold gave an increased revenue of £12 149 15s.; the reduction in the annual coal bill as compared with the previous year was £2 326, yielding a grand total of £14 475 15s. This was not only a phenomenal return on the investment represented by the increased capital costs of the plant (£20 000) but an economic factor of such importance as to establish permanently the claims made for this development.

The latest designs of plant showed a very great reduction in floor area for each individual boiler. To emphasise this point, particularly in view of the importance attaching to this question of reduced capital costs, the following table gives

Digitized by Google

the results based upon figures or firm quotations received for the establishment of a central station of modern design investigated for three alternatives.

Type of Plant.	No. of Boilers.	Capacity per blr. lb./hr.	Total evapn. lb./hr.	Total Coat of Plant £	Cost per lb. of steam per hr. £
Stoker fired	10	100 000	1 000 000	301 500	0·3015
Pulverised fuel fired ..	6	175 000	1 050 000	300 000	0·2850
Pulverised fuel fired ..	6	166 000	996 000	285 000	0·2850

These costs were based on boilers of the size considered most suitable for the type of firing involved and covered all necessary equipment from raw coal bunkers to ash sump but excluded

Mr. and Mrs. D. Blackshaw, and Mr. and Mrs. Hudson, on their way to one of the meetings.

the civil work. Hence prices were strictly comparable with the exception that no allowance had been made on account of the smaller space which the modern pulverised fuel fired boiler occupied.

The only other factor requiring consideration was that of coal costs. There existed a great diversity of opinion, but from investigations into available supplies, costs of transport and location of plant, the balance in favour of establishing pulverised fuel equipment in all large power stations appeared to be economically as well as scientifically sound.

The establishment of the largest individual boilers in the world, at the East River station, right in the centre of New York, was not without some bearing upon the economic factors associated with the pulverised fuel development. When considering the East River plant extensions, tenders were called for designs incorporating the largest boilers which could be arranged in the limited space available. In operation these boilers had produced the almost incredible figure of 1 250 000 lb. of steam per hour. Such facts clearly left very little argument available to dispute the fact that the development of pulverised fuel was of economic importance and ensured, even though the capital cost might be, in special cases, slightly higher, a most valuable source of revenue leading to reduced generating costs, in the author's opinion, irrespective of the location of the plant. It would in any event be conceded that there was no other form of combustion equipment which had permitted such rapid development, or which could have been considered for operating boilers of such gigantic capacities.

In summarising the balance which supported the case for pulverised fuel, it was proposed at once to capitalise the whole of the boiler house operating progress witnessed during the past three years. There had, unquestionably, been an all-round increase of efficiency on the part of pulverised fuel; this was inherent on account of the nearer approach to the theoretical or scientific conditions of combustion. On other forms of combustion equipment, the improvements effected, through the challenge previously referred to, had been brought about by the creative genius of the large body of engineers, many of them present at this conference, and the combined results appeared to indicate that the average all round increase in boiler house efficiency in municipal practice during the past three years was as much as 10 per cent. As the movement was not entirely confined to electrical power stations but had spread into many of our large industries, it became difficult to assess the value of the savings in costs of operation in terms of money. Even on conservative estimates the figure was colossal, and might be assessed as representing a total for the past three years of £1 000 000. When consideration was given to the reduction in tariffs which had been made to the consumer as a result of this progress, how the lower charges had attracted additional business represented by the continuous increase in the output from almost every electricity undertaking, and the improvement which was being effected in the social conditions of all modern households, then the full economic force or aspect of the latest boiler house developments became more clearly displayed. The author claimed that the whole of this improvement in boiler house practice was the result of the greater efficiencies associated with pulverised fuel firing or by the challenge which its introduction into boiler house operation had brought about.

A final balance would appear to show one or two reasons on the debit side such as :—

(1) Certain grades of very hard coal entail high maintenance costs on the preparation plant.
(2) Dust emission from the stacks is still held by many to remain incurable.
(3) Fuel transport costs, particularly fuel of a low grade character, are often held to rule out the possibilities of their utilisation.
(4) Generally accepted standard boiler designs do not permit of full advantage being obtained from pulverised fuel firing.
(5) The design of the equipment is held by many to be in its early stages of development.

On the credit side and in addition to the boldness of the claim already made for this development, were the following merits of the system which appeared to emerge naturally from a consideration of the contents of this Paper and from the extended experience with this apparatus on the Derby plant :—

(1) From the technical point of view the modern plant is unassailable.
(2) The introduction of water cooling has enabled the designer to take the fullest advantage of the new method of combustion which has led to new and revolutionary practice in steam generation.
(3) From the results of the pioneering experience carried out, it can be claimed that it is now possible to design and construct a boiler plant for any new capital station which takes full advantage of pulverised fuel, where the capital costs will be very much lower than with any other form of equipment.
(4) Pulverised fuel equipment has completely emerged from its experimental stages. Thus the importance of all the factors involved are thoroughly appreciated and the means for rational solution along well defined lined are now available.

After allowing for past troubles which, as the result of experience, would not recur, the results seemed entirely to justify this modern system of utilising potential energy of coal both on scientific and economic grounds. The direct result of its application and development indicated that the design of future plants might closely define the following :—

(a) Increased capacities of boilers.
(b) Smaller and cheaper buildings.
(c) Partial de-sulphurising of gases and dust elimination as a continuous process.
(d) Continuous operating efficiencies of 86 per cent.
(e) Utilisation of fuels of a cheap character which will keep costs of generation uniformly low.
(f) Remote, automatic and complete control under all conditions of load.

In this manner boiler house operation would completely evolve to a highly efficient process, and although the claims made might appear unreasonable to many of the present generation, it could safely be predicted that posterity would not be unreasonable in recording its appreciation of the efforts, which the past few years had witnessed, in the all round improvement made in boiler house operation and the valuable conservation of the national wealth by the increased efficiency now being secured from the basic raw product, coal.

Discussion.

The President said that Mr. Lake had presented a most interesting paper giving very useful data in regard to the latest applications of powdered fuel which would no doubt be the method employed for raising steam in the large power stations of the future, although some might endeavour to dispute it.

Mr. P. J. Robinson (Liverpool) said that Mr. Lake's paper was of absorbing interest to all engaged in the generation of electricity in this country. He did not agree with everything contained in it. He would like to suggest that we should adopt a mixture of stoker firing and pulverised fuel firing, because in other places we were dealing with fuel on a much larger scale than at Derby. One unquestionable advantage of pulverised fuel was that it permitted the benefit of a cheap fuel market to

Digitized by Google

be reaped. Experience at Liverpool was that pulverised fuel was only cheap because there was no large demand, and directly a demand was created the price rose heavily.

It would be interesting to know whether the author was able to assess continuity and reliability of supply as an economic factor.

In Liverpool, as long ago as 1923, a number of experiments were carried out with stoker fired boilers by increasing the size of the combustion chamber, and eight boilers were bodily lifted for the purpose, eventually reaching 14½ cu. ft. per sq. ft. of grate area. Very little difference in efficiency was noted between stoker and pulverised fuel firing. In the new station being constructed at Liverpool, which would be 100% Bailey Block it was expected to obtain equally good results from the stoker fired boilers. Pulverised fuel had been imposed on these boilers in order to obtain more control of the fuel market.

Mr. Robinson wholly disagreed that the use of fine sprays for dealing with the grit and sulphurous fumes was the right way of tackling the problem. With a fine spray and a draught a small proportion of the sulphurous fumes were carried up the chimney and the advantage of spreading the fumes over a larger area was lost, a noxious mixture being brought down close to the station. In Liverpool they had devised a scheme which it was hoped would overcome the trouble. Three independent consulting chemists had told them that their method was right and it did not include the use of a spray. One of the problems which came up was the building of chimneys. In up-to-date plants it was almost essential that the chimneys should be superimposed on the boilers. They were putting in chimneys of chrome steel. It sounded very expensive, but if the chimney was properly designed he thought that a very efficient apparatus could be made at a cost of approximately 6s. 8d. to 6s. 9d. per kW.

A Bird-Nesting Experiment.

Mr. W. M. Selvey said that many of Mr. Lake's colleagues were perhaps too close to the problem to get a proper perspective which would allow them to appreciate how much he had done on the line of development which was summarised in his paper. It fell to his (Mr. Selvey's) lot to carry out a 100 hours' continuous load test on the first of these boilers. Certainly, during the course of that trial they got quite a lot of that stuff which Mr. Lake said looked like coal but looked to the speaker like anything but coal. The earlier type had an air-cooled refractory lined combustion chamber. They were getting on fairly well when the stuff in question got through. That new stuff came in when they were using a fuel with a much lower melting point. Rapid birds'-nesting started on the tubes of the boiler. The operators tried to knock it off with poles. They said they would have to put on the stoker fired boilers again. He asked to be allowed to cut off all secondary air for about 20 minutes. As he expected, the temperature at once went up very considerably and all the birds'-nesting stuff was melted off. The man in the basement came up in a great state and said: "My God, sir, they're stalagmites." The lesson was that it was necessary to get away from maintaining the temperature of combustion chambers by means of refractory material. The evolution of the all-metal combustion chamber was first mooted in a crude way by an American engineer who died during the war. The practical development of the method was due to Mr. W. R. Wood, the real inventor, who collected some commercial ability to go with his inventive powers. If our best engineers set their minds on administrative matters they would find that their technical abilities could be used in larger spheres to a very marked extent. Pulverised fuel firing was now well and truly born. When it came to this country it was only in a half-baked state. It fell to English engineers to put a little polish on it. It was not yet completely baked and would not be until the problem of grit and fumes was finally solved. That problem had several aspects to which there was certainly no conclusive answer.

Grit Emission.

Fan corrosion, or erosion, or both, was giving considerable food for thought to engineers. Was there any striking advantage in taking out the dust before it reached the fan for the sake of saving fan erosion? If one did not do that or, alternatively, washed first in order to prevent grit going to the fan at all, were we not likely to run into trouble, corrosion of fan by washing gases? No method would take out the whole 100% and that which was not taken out was very sticky stuff and was inclined to gather in any place where it lost its velocity. The chimney and the ducts leading to it were no longer to be considered as something producing draught, but passages to conduct something to the upper atmosphere, as might be most convenient. Certain cement mixtures properly applied might be quite as efficient and successful as Mr. Robinson's drastic expedient of using chrome steel. The expense of dealing with waste material represented a considerable part of the total costs. When our American friends started this pulverised fuel propaganda they said that they were putting this stuff into the air and nobody seemed to mind. Now a lot of people did seem to mind. Perfectly dry dust was not suitable for removal by the ordinary methods available. Even if a part of it was washed out, the product—slurry—was an entirely new product of power stations and could not be put into the sewer or drain. Mr. Lake was a pioneer in this field also and he had borrowed the methods of those who had to deal with metallic slimes.

Mr. F. Forrest (Birmingham) said that Mr. Lake had presented the facts very fairly and drawn his conclusions very fairly also. With most of his conclusions he concurred. For a very large modern station pulverised fuel firing gave a flexibility which was not possible with stoker firing. Although engineers could go to a lot of expense to reduce coal costs by small decimals of a penny, the gentlemen at the coal exchange could send costs up in spite of all economies in the boiler house.

(*Continued on page* 682.)

They had had considerable experience in Birmingham with the bin and feeder type. They did not agree as to its advantages, and were going in for the unit type. In America they had come to the same conclusion. Their reasons were lower maintenance, lower capital charges, and greater flexibility of control. Pulverised fuel was difficult to store. Even the humidity of the atmosphere was sufficient to make it cake, and it did cake. The station of the future would have at most two boilers per turbine and separately water-cooled furnace walls, automatically controlled, and with very high chimneys. American chimneys were between 250 and 300 feet high above ground level. Here we had gone too far in the other direction, and put up too low chimneys. This might have some bearing on the nuisance question. The material emitted fell into a certain area, and if one could spread one's favours over a wider area, the nuisance would be reduced. Just as we had a governor on turbines we should have an automatic governor on the boilers that supplied the steam to the turbines. It seemed very necessary that in case a grid line switch tripped and disconnected 50 000 kW of load, they should have some automatic governor on the boiler.

He did not think that spraying at the base of the chimney was the solution of the dust problem. If the particles were going through the spray at a certain rate they did not get damped down at all, and the object aimed at was not achieved. He hoped that if Mr. Lake had any figures on the question of dust and sulphurous fumes he would let us have them.

A Vexed Question.

Dr. S. L. Pearce (London Power Co.) said that he had had no experience of pulverised fuel firing. When he had to take a decision on this subject some 18 months ago in connection with the new station at Battersea he came down on the side of stoker firing. There was a great deal to be said on both sides. He thought it was quite impossible to dogmatise and say that pulverised fuel was the right thing in all cases and situations. For the large boilers now being installed in the United States he thought it might be said that only pulverised fuel could be used. In this country up to 400 000 lb. steam capacity there was no difficulty in meeting the case with stoker firing. The company with which he was associated had been doing a great deal of research work in the past 18 months. A White Paper had been published and another would be issued shortly giving further results. He would be reading a paper before the World Power Conference in Berlin next month which would give particulars of the work they had been doing.

Mr. R. E. Rycroft (Babcock and Wilcox, Ltd.) remarked that Mr. Lake's paper was really one of a series describing the experiments which he was conducting at Derby. He thought we should settle at once the point as to whether it was necessary to divide themselves into two distinct and opposing camps. He was very pleased to hear Mr. Robinson say that in his opinion there was room for both systems. Their duty as combustion engineers was to consider the particular fuel they were called upon to burn, and when they knew the class that it suited them best to buy and consume, then they should carefully weigh all the points in regard to burning fuel pulverised or in what might be called its raw state. They were faced with this very important fact, that if one studied the excellent figures prepared from year to year by the Electricity Commissioners one found that, so far, no stations entirely operated by powdered coal had reached within 3% of the efficiency of stations operated by stoker firing. There were four stations with a thermal efficiency of over 21%. All these stations were stoker fired. The nearest pulverised fuel station had an overall efficiency of only a little over 18%. As to the matter of rapidity of steam raising, the majority of experienced engineers would suggest that the time given in the paper for running up Lancashire and water tube boilers was excessive. They could certainly be run up in much less than one hour. In the recorded tests of evaporated capacity of the Derby unit the normal capacity was never once reached. The maximum recorded for the two units was 118 000 lb. The average for the whole 24 hours was rather less than half the normal evaporation. The figure of 85% mentioned was being obtained in many stations throughout the year. He thought that Mr. Lake's excellent coal figures could almost be described as a geographical accident. The Electricity Commissioners' figures for 1929 gave the average coal consumption per unit generated at Derby as 2·2 lb. The cost appeared to be 8s. 6d. per ton delivered into the Derby station.

Mr. C. G. Morley New (Cardiff) said that six or seven years ago he had a somewhat similar problem in connection with reconstruction of the boiler house. He did not take very literally the claims of manufacturers that there would be no dust or clinker problem. Their problem in South Wales was quite different. They had good fuel, but it was certainly not cheap. The cheaper fuels had low volatile contents and it was quite impossible to burn them in the Wood boiler shown on the screen by Mr. Lake. Further to the west of Cardiff anthracite dust (with a volatile content of 7 per cent.) was obtainable at 1s. 6d. to 2s. per ton, but when it reached Cardiff he might just as well burn the local coal as far as cost was concerned. There was too much talk of thermal efficiency. His station had a very low one, but the operating costs would bear comparison with those of any other station.

Mr. R. A. Chattock said that we were still doing pioneer work and this could not be done without spending money. It was not fair to take the capital costs of pulverised fuel fired stations up to the present and compare them with those of stoker fired stations which were on a permanent basis. The cost of pulverised fuel firing was being reduced and within a few years they would produce something quite as cheap and get a higher efficiency. It was necessary to simplify the arrangement for pulverising and for firing the boilers. We must also adopt automatic control. It was possible to get down labour costs very considerably. Three men could now do the work of nine men in a stoker-fired station. That saving of labour had not been sufficiently stressed in the paper and discussion and it was that saving that would tell in the cost of operating a station. In regard to feed water treatment, he thought that the steam heated evaporator interfered with the general efficiency of the station. It was better to bend the turbine in several stages and so allow the steam to do a certain amount of work before it returned to the boiler. He did not know of a large station in this country where pulverised fuel was exclusively used. They would soon have one or two, but until then it was not possible to compare thermal efficiency with stoker-fired stations. At Hams Hall they were obtaining an efficiency of 23 per cent. This was not entirely due to pulverised fuel, but also to the operation of the turbines and the saving of as many heat units as possible and getting them back into the boilers. In short it was due to the general conditions of the station. To make reliable comparisons one must know the whole cycle of operations of a station. During the coal trouble in 1926 they burnt 10 000 tons of pit mound stuff (55 per cent. ash) a week. They were able to burn it by itself and obtained full combustion of the pulverised fuel and full duty from the boiler. It saved the situation in Birmingham during that difficult period and they did not have to buy an ounce of coal from outside the country.

Mr. Lake Replies.

Mr. Lake, replying to the discussion, said that he would like to inform Mr. Robinson that there was a combination of pulverised fuel and stoker firing operating on a large scale in this country. It had now closed down the whole of the stoker-fired plant and was running entirely on pulverised fuel. During the whole of the time that the plant had been in operation at Derby they had had only one instance of a boiler shutting down. After about two years' experience of the plant they were able to determine the life of various pieces of machinery likely to give trouble. It had always been the policy not to wait until a breakdown occurred, but to adopt a fixed time for these various pieces of apparatus and take them out and renew them. So far as Derby was concerned continuity was a straight line. He knew of no plant in the country operating with stokers that could give a continuous efficiency of the same order as pulverised fuel right through the load factor of a station. They had found that the grit from the last two steam generators put in at Derby was of a different character from that of the fish-tail burners. Research was going on and he had no doubt that they would be successful in incorporating a modified dust catcher with the water sprays. When they ran at Derby for nine months with a new brick chimney there was quite a negligible quantity and no complaints from residents in the area in regard to grit. The birds' nesting experience was most interesting and instructive. They had been able to evolve from one design to another, so that in the steam generator there was no possibility of dust accumulating anywhere. They had been able to run for 350 hours without using a soot blower. Their brick chimney was lined with a special kind of cement for about 30 feet up and the water sprays were about 30 feet high. The major portion of the ash was deposited in the dust catcher or the slurry pit. There was no difficulty in operating the plant whatever kind of coal came through. They got practically a straight line of CO_2.

ELECTRIC HEATING OF BUILDINGS.

Direct and Indirect Methods—Automatic Electrode Boiler System—Effect of Coal Price Fluctuations—Standardised Charges Impracticable—Tremendous Potential Load.

By J. W. BURR, M.I.E.E., M.I.Mech.E.

THURSDAY morning was devoted to the paper prepared by Mr. J. W. Burr, M.I.E.E., M.I.Mech.E., Borough Electrical Engineer, Swansea, on "Electric Heating of Buildings," the discussion being followed by an informal discussion on "Domestic Water Heating," introduced by Mr. A. E. McKenzie, M.I.E.E., Borough Electrical Engineer, Wimbledon.

Mr. J. W. Burr.

Mr. Burr's paper referred at the outset to the report which he had prepared for his Council on the "Engineering Requirements for a New Mental Hospital," which was the outcome of several years' investigation of the possibilities of heating public buildings. The two principal points dealt with in that report were :—

1. The supply of electricity to the hospital for lighting, power, cooking, etc.
2. The generation of heat for water and steam.

The architect's specification of works required to be done at the hospital dealt with the provision of boiler plant and reciprocating engines. The steam engines were to be used for generating electricity and the exhaust steam therefrom utilised for other purposes, such as warming the buildings and providing hot water for domestic and similar draw-off purposes.

At the outset the author was not convinced that electricity could be used economically to heat the hospital and for the other services, but after going carefully into the matter he changed his mind and has attempted to express clearly in this paper his train of thought in seeking a solution to the problem.

As an indication of the difference of opinion, the following statements which had appeared quite recently might be cited :

(1) Total electric heating costs half as much as central heating with coal-fired boilers.
(2) Since a unit of electricity contains 3 415 B.Th.U.'s, as opposed to 13 000 to 14 000 B.Th.U.'s in 1 lb. of coal, electricity must of necessity be very costly for heating purposes.

It did not require much investigation or special knowledge to realise that both these statements were equally wrong and misleading. The author realised at the outset that published statements and figures were of little or no value to him, and that it was necessary to consider the problem purely from the local point of view.

Considering first the direct electric heating method, the author pointed out that from the consumer's point of view this method had generally proved to be more or less expensive according to the local heating tariff, but had made great strides on account of its comfort, convenience and cleanliness. From the supply authority's standpoint, the load was always considered to be very desirable, and strenuous efforts were made to obtain it. It was considered that a large radiator load would materially assist in improving the load factor, but experience had shown that this was not always the case. In one particular undertaking, 4 000 kW of electric radiators were obtained, but since most of these were used in public buildings they came into commission between 9 a.m. to 12.30 p.m. and 2 p.m. to 6 p.m., and synchronised with the peak load, without any appreciable effect upon the off peak period. The valleys in the load curve consequently became deeper.

The effect of the radiator load upon his last year's peak load was still fresh in the author's mind, and, under these circumstances, the installation of electric radiators, or convectors and immersion heaters did not appeal to him. He therefore considered that an economic figure for electricity could be reasonably offered to the consumer for this class of load.

In the case of indirect heating—really a modification of the familiar central heating plant—the generation of heat in the boiler could be effected in various ways. Recently much attention had been paid to the generation of steam and/or hot water by electric boilers. The City of Basle, in Switzerland, had, by adopting this method, increased the load factor of its electrical plant from 13/14 per cent. to no less than 80/90 per cent. in a few years.

After mentioning the two practicable ways of converting the electrical energy into heat—electric water heaters or resistors and electrode boilers (which have been constructed for voltages up to 30 000 V) the paper records the inspection of the Regent Street Polytechnic installation, consisting of a 2 000 kVA electrode boiler operating at 6 600 V 3-phase 50 cycles, with three thermal storage vessels of a capacity of 26 800 gallons.

Like many other engineers, the author had serious doubts with regard to the earthing of high tension electrode boilers. Tests carried out, however, had shown that the amount of earth current was negligible.

During last year, the Electricity Commissioners were approached with a view to securing an amended form of Regulation 3 of the "Regulations for Securing the Safety of the Public," so as to admit e.h.t. supplies being given to any premises. It is understood that the Commissioners have now agreed to the words "or except for the purposes of thermal storage installations" being inserted in the paragraph in question. A further condition imposed by the Commissioners upon the supply authority is that all metalwork enclosing, supporting or associated with the consumer's installation, other than that designed to serve as a conductor must, where necessary to prevent danger, be efficiently connected to earth.

Complete automatic operation of electrode boilers was a workable proposition and the labour was reduced to the control of temperature alone. This, of course, would be done by the caretaker or handyman. Since the supply would be switched in at a predetermined hour from the generating station, automatic devices were required to ensure safety and efficient operation. These plants could be safely left unattended during the loading periods, generally 10 p.m. to 6 a.m. An alarm bell placed in the caretaker's quarters warned him of the stopping of the plant for any reason other than normal operation. The author could state definitely that the insurance company was willing to accept as an ordinary risk the insuring of electrode boilers working under the foregoing conditions.

Reading from the left : Coun. T. Crowe, Ald. H. Cassels, Mrs. Cassels and Mr. H. G. Fraser.

Another important point was the regulation of the temperature of the water supplied for domestic use. It would readily be understood that some provision must be made to prevent the temperature of this water reaching such a point as to

Digitized by Google

endanger the inmates and domestics by scalding. This was taken care of by means of thermostats which regulated the amount of steam to the calorifiers and maintained even temperature.

A comparison of the capital costs of (1) installing coal-fired steam boilers or (2) installing electrically heated boilers, current being obtained from the public supply, showed that there was little difference between the two types of plant. The erection of a stack was a costly procedure and account must be taken of the saving in capital costs on the two buildings necessary to accommodate the alternative plants. The thermal storage vessels were usually placed below the sub-basement level and therefore occupied no useful building space.

It was reasonable to assume that the average calorific value of the coal it was proposed to use would be about 13 500 B.Th.U.'s per lb. As the load would fluctuate greatly and the banking periods be lengthy, the average boiler and economiser efficiency was not likely to exceed 50 per cent. This figure included the blow-down loss. The actual available heat per lb. of coal for conversion into steam was therefore :

$$\frac{50 \times 13\,500}{100} + 6\,750 \text{ B.Th.U's.}$$

As a pressure of 80 lb. per sq. in. was required at the calenders, the boiler pressure would be about 100 lb. per sq. in. The total heat required to produce 1 lb. of steam at 100 lb. per sq. in. pressure was approximately 1 190 B.Th.U's. As the condensate would return to the economiser at a temperature of approximately 175° Fah., the balance—i.e., 1 190—175= 1 015 B.Th.U.'s, must be taken from the coal. The corresponding evaporation was therefore :

$$\frac{6\,750}{1\,015} = 6{\cdot}65 \text{ lb. of steam per lb. of coal.}$$

As the electrical method would probably mean separating the plant into two separate sections, one for the storage of steam required in the kitchen and laundry, and the other for the storage of hot water for warming the building and for domestic supply purposes, there would be no calorifier losses. The steam and hot water plant could be placed as near the centre of distribution as possible, so that the heat losses would be reduced to a minimum. Current consumption for any given amount of steam would be :

$$\frac{\text{Lb. of steam} \times 1\,190}{3{,}415 \times {\cdot}96 \text{ (efficiency of plant)}}.$$

In practice less heat was required by the electrical method than by the less flexible coal-fired plant, due to ease of regulation and automatic temperature control. In some cases there had proved to be an actual margin in favour of electricity equal to 32 per cent. of the estimated energy consumption. A figure of 20 per cent. was regarded by the author as safe and was used by him in his calculations.

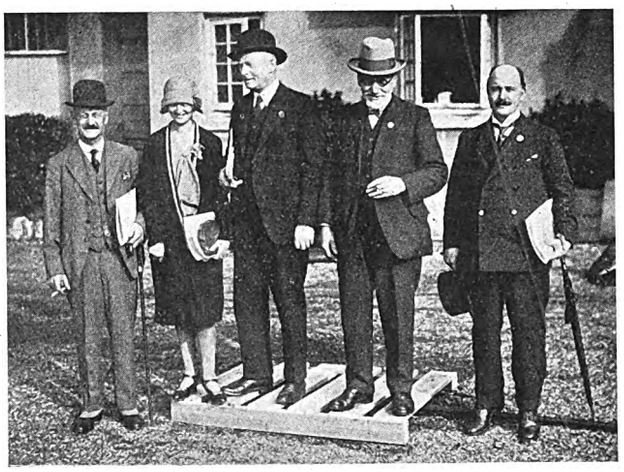
Labour charges would be heavy with the coal-fired plant. From the reference already made to the automatic operation of the electric plant, it would be seen that labour charges would be practically non-existent.

Calculations made in the manner described did not always give the true aspect of the situation as it would apply to a hospital. There were certain additional charges which should be added to the coal-fired scheme ; for instance, there would be no deterioration of stonework and buildings generally, and less cleaning and decorative renewals. There was also the cost of maintenance of private roads to be taken into consideration. After allowing for everything, however, an extremely low charge had to be made for electricity before electrode boilers could compete with the coal-fired plant.

What was an economic figure to charge for power consumed in this way ? Regard must be had to many varying factors. In the circumstances the author could not convince himself that it was possible to standardise the method of charging for electricity used for heating different types of public buildings. The question was : How cheaply could we afford to supply energy under any specific conditions ? In the case of the hospital already mentioned, assuming a thermal storage system, the installation would consist of electrode boilers which would generate heat during off-peak hours, the heat being stored in thermal storage vessels until required. Supposing the control of the supply to be in the hands of the generating staff, who would use the consumer's load to even up the valleys in the station load curve, the following points would have to be considered :—

(1) Capital expended in giving the special supply, i.e., switchgear and cables from station to consumer.
(2) Direct profit from sale of units required.
(3) Indirect profit by increase of thermal efficiencies.

The draft regulations of the Electricity Commissioners included a method of division of standby heat losses. The basis of the calculation was the assumption that the no-load



Some more well-known personalities caught by our camera.

heat loss per kW of maximum demand sent out was 989 B.Th.U.'s per hour, which on a kW maximum demand generated basis is approximately 955 B.Th.U.'s. Taking the effect of an increase of daily load factor on an undertaking having a peak load of, say, 13 000 kW, the standing loss would be :—

$$13\,000 \times 24 \times 955 = 297\,960\,000 \text{ B.Th.U.'s per day.}$$

It might be further assumed that the undertaking consumed 2·0 lb. of coal of a calorific value of 13 000 B.Th.U.'s per lb. at 15s. 6d. per ton, when working at a 30 per cent. load factor. The standing losses per unit generated decreased as the units generated increased, hence the coal cost per unit generated would also vary inversely as the units generated. The tabulated data showed that if we were able to produce 31 200 units more per day we should increase the load factor by 10 per cent.

Taking the case of a 30 per cent. load factor and presuming 31 200 units were sold at 0·2d. per unit for a controllable load such as previously mentioned, we had :—

Load factor increased to 40 per cent.
Coal cost per unit generated = 0·1 609d.
Direct profit = 31 200 × (0·2 000—0·1 609)
= 31 200 × 0·0 391d. = £5 1s. 8d.
Indirect profit would be :—
93 600 × (0·1 660—0·1609)
= 93 600 × 0·0 051d. = £1 19s. 9d.
Total gross profit = £7 1s. 5d.

It would be seen that the total gross profit would be £7 1s. 5d. for any 10 per cent. increase in load factor ; the direct profit increased as the load factor increments were added and the indirect profit became less, but the total profit was constant.

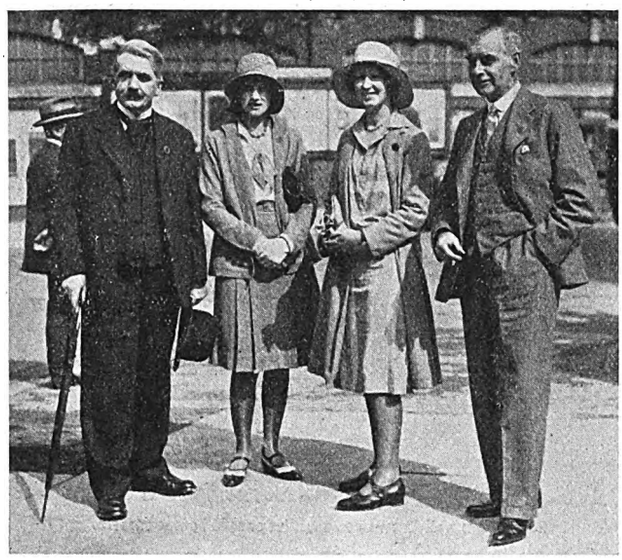
The B.Th.U.'s loss per unit generated per day depended solely upon the load factor. Hence, knowing the price and calorific value of the coal at any particular station, the loss in pence per unit generated per day might easily be calculated for various load factors, and the direct and indirect profit produced by the sale of any given number of units. In his calculations the author has only considered the coal costs ; other factors enter the question. The water consumed per unit is a direct charge but is very small, probably in most cases, say, half a lb. of water per unit, with water at sixpence per 1 000 gallons.

The question as to whether the wages of workmen would be increased was purely a local matter and depended upon factors which might vary, both with the individual undertaking and also with the particular load conditions. For instance, the night load, or off-peak load condition might be such that x boilers at full load and one boiler at half load were necessary and sufficient to carry the load. If the addition of the pro-

Digitized by Google

posed load meant that the one boiler at half load took the extra load and became a full load boiler, then no extra firemen were required, whereas if an extra boiler had to be run then the extra wages might have to be taken into account.

The author has only taken into account heat losses in the boiler house. Other savings also accrued from the increase of load factor. The stand-by heat losses in the engine room and also the units used on works might not vary with the



The Mayor of Shrewsbury (left) with Miss M. H. Johnston and Miss L. Woollam on the right.

increased load. The author was therefore of opinion that the actual coal cost per unit and a fairly safe basis on which to calculate for off load heating in large amounts. Having arrived at the gross profit it was only necessary to adjust for :—

(1) Units lost in transmission, etc.
(2) Capital costs on special cables, etc.
(3) Discount (if any) for prompt payment of accounts,

in order to arrive at the net profit.

One of the difficulties was the adoption of a coal clause which would be mutually satisfactory to both parties.

In order to arrive at an equitable charge for varying coal prices it was necessary to take into consideration the indirect as well as the direct profit.

The tabular matters given in the paper showed an average rate of decrease of net profit of £1 3s. 2d. for each shilling increase in the cost of coal per ton.

A capital charge of £730 per annum (i.e., £2 per day) was deducted to allow for the cost of giving the special supply from station to consumer. Hence, taking the units sold as 95% of 31 200 we had 29 640 units to bear the cost of £1 3s. 2d. per shilling increase in the price per ton of coal. This worked out at 0·00469d. per unit per sixpence increase or decrease in the price per ton of coal. The method assured that the undertaking would receive a constant profit over a wide range of coal costs, but did not necessarily meet all contingencies, such as the burning by the undertaker of cheap low grade fuel, or conversely a dear but high grade coal, such as washed steam beans. This factor could only be covered by the addition of a calorific value clause in the agreement, which provided for an adjustment in the price per unit charged corresponding to the increase or decrease in average calorific value of the coal consumed, such increase or decrease to be at least five per cent. variation in the standard or basic calorific value.

In such an event as the general strike and prolonged coal stoppage of 1926 the consumer had to pay heavily for the energy consumed, but it must be remembered that if the consumer had his own coal-fired plant then his coal cost would probably rise even higher in proportion than the cost of coal to a supply authority.

The conclusions arrived at in the paper were as follows :

Supply authorities were placed between two limiting conditions :

(1) The price the consumer could afford to pay ; and
(2) The price at which the undertaker could afford to supply.

It was not possible to offer a tariff to prospective consumers which would bear direct comparison with the cost of alternative systems unless all the advantages and economies mentioned in the paper were taken into account. Little difficulty should be experienced, however, in justifying rates of from 0·2d. to 0·3d. per unit.

It was not feasible to standardise methods of charging for electricity used for heating large public buildings. Each case must be considered on its own merits and under its own local conditions.

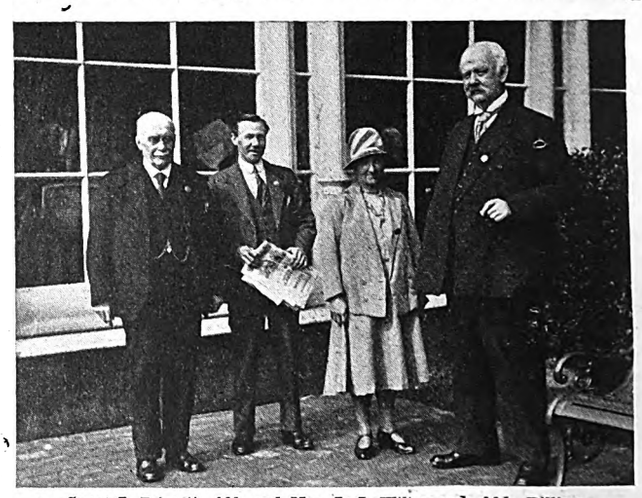
There was no question that the matter should be undertaken seriously and with vigour. Consumers should be approached before building operations or even plans had been commenced.

The question of tariffs really resolved itself into the consideration of how cheaply could they, as public supply authorities, afford to sell energy for this particular purpose. Due regard must be given to all aspects such as direct profit, indirect profit and the general advancement of the undertaking.

The potential load from this class of heating was tremendous. Some idea of the consumption which might be expected from a public building was afforded by the fact that the hospital already mentioned was estimated to consume about ten million units per annum. The other figures mentioned in the paper had no particular reference to the hospital in question. The author expressed his appreciation to his personal assistant, Mr. H. A. Haines, B.Sc., for assistance in the preparation of the paper.

Discussion.

Discussion of Mr. Burr's paper was combined with the discussion on domestic water heating which was opened by Mr. A. E. McKenzie, borough electrical engineer, Wimbledon, who said that electric water heating was a branch of business that deserved attention of every supply engineer. He hoped that the report of the special E.D.A. Committee on the use of hot water in the home on which he was serving would shortly be available. In most districts the popularity of electric cookers was already well-established, and as every electric cooker was a potential advertisement he suggested they should devote attention to electric water heating as some other countries had done. It offered unique opportunities for improving load factor, more, he suggested, than any other type of load. Improvement of load factor was of utmost importance, particularly as so many undertakings would shortly be taking supplies from the grid on a two-part tariff. Unfortunately, the average householder had no idea of the quantity of hot water used daily. It would pay most undertakings to employ a special assistant for the development of this class of business with the following qualifications. Good address and education, good knowledge of electricity and of various types of water heaters, and most important of all, ability to trace out existing piping arrangements and make suggestions for their improvement where



Coun. J. Priscott Ald. and Mrs. J. J. Wilton and Ald. Billing.

desirable. He should be able to advise consumers as to which type of heater would best suit their requirements. In Wimbledon they employed such a man who was able to give a complete price for carrying out work. The consumer appreciated this as he only had one firm to deal with and knew exactly what the cost of installation would be. They had to adopt this practice because they found that the order frequently fell through when the consumer received a plumber's estimate for the cost of the alterations. It was important that supply

engineers should co-operate with builders so that water heaters should form part of the heating arrangements. In his district builders came to inquire as to what type of tank should be put in so that immersion heaters could be inserted later, if required. To every applicant for electricity supply in Wimbledon literature was mailed about water heating, with a request that the department should be allowed to submit the estimate. They supplied heaters made by any reputable firm, preferably British. They had early formed the opinion that it was useless setting out one tariff and forcing everybody to take that.

Immersion Heaters Preferred.

Their policy was to get the water-heating load by one means or another. It had been generally found that immersion heaters of 2 kW loading were sufficient to provide all the hot water required in the average household. To date they had installed 1 300 heaters in Wimbledon, mostly of the fixed loading type. As a result of a special push in the last four weeks 200 applications had been received and a large proportion were going forward. Speaking of hand and electrically wound time switches Mr. McKenzie said that the former usually required winding monthly and electrically wound switches were better for that reason. British types of time switches were renowned throughout the world but they were too expensive for water heating with current at 3 units a penny. Synchronous motor switches could be thoroughly recommended. At Amsterdam, by April 3 last, 8 825 night tariff water heaters had been installed and the night load was increased more than 8 000 kW. Water heaters were being put in at the rate of 200 weekly, all control being by synchronous motor switches. The tariff was two-fifths penny from 11 p.m. to 7.30 a.m., and from noon to 2.30 p.m., and four-fifths penny at other times. At The Hague 7 776 water heaters had been installed, with a night load of 5 000 kW. Maintenance costs were less than with time switches and the synchronous switches had proved absolutely reliable. Fixed rentals were charged according to size of heaters. No difficulty occurred in maintaining accurate frequency so that there was no cumulative error. The use of instantaneous electric heaters comparable with gas geysers should be discouraged. It was far better to argue on the basis of value for money and better service by the electric method than by comparison of costs. They should be wary of converting existing systems and not assume that it could be done in every case, particularly in large houses with long runs of piping. Water heaters should preferably be cut off over the station peak load now that apparatus for achieving this end could be obtained at a reasonable price. Until the prices of water heaters were reduced electric water heating would not make the headway that we all desired.

Mr. H. C. Lamb, Manchester, said he thought it rather dangerous to say that electricity could compete with coal for the heating of large buildings on a pure cost basis. If they attempted to do anything like that the price would be so low that there would be no margin left to make it worth while. For the heating of these large buildings on the thermal storage principle they could not compete with coal at a satisfactory price to themselves unless other important factors were taken into account by the consumer. If they were to secure that class of business there must be present factors such as space valuable to the consumer and a desire to avoid dust and dirt by banishing coal and ashes from his premises. In such cases there was a chance of securing such business on reasonable terms. When water was required in large quantities for washing it was much more difficult to make a satisfactory contract for a heating supply on the thermal storage system in competition with coal or oil and they had a far better chance when it was purely a case of heating a building. The essential condition was that the supply should be given without any capital cost to the undertaking in order to avoid misunderstandings with other consumers. The Manchester Corporation had arranged a contract for a large building at a price well above Mr. Burr's lower limit of 0·2d. There were special advantages because the authorities concerned were determined not to have a chimney or dust and dirt.

Mr. L. Romero, Salford, said he had also found the synchronous time switch an excellent device. He hoped that as a result of the E.D.A. Committee's activities we should get a scheme that we could all adopt. If water heaters with thermostatic control with sufficiently low loading were used, the load factor was extremely good. In his own house the figure was 80%. For the class of consumer that predominated in Salford it was essential that water heaters should be let out on simple hire and that the charge should include cost of fixing. They had adopted a rather special type of heater, similar to the lagged storage system thermostatically controlled and designed to be fitted in place of the existing hot water cylinder with connections behind the kitchen boiler. This enabled consumers to feel their way and use the fire or electricity as best suited them.

Mr. C. H. Smith (Electric Fires, Ltd.) said that the night tariff system was bound up very closely with large storage capacity. He suggested wiring the heater past the cooker with a pilot lamp to remind the consumer to switch over when the change was necessary. A central heating load would not fill up the valleys of the load curve in summer but a water heating load would improve the load factor throughout the year.

Alderman Mrs. S. E. Hammer, Hackney, said that women did not care much about load curve valleys but they did want their current as cheaply as possible. Experience had taught them that if they had to give up all their electric appliances except one they would keep the water heater. Electric water heating in the home would be an enormous success if they once got it introduced, and for this they needed the right men and women to talk to householders about it. Women found it difficult to understand tariffs and to realise why charges could not be standardised throughout the country.

Mr. E. Seddon, Edinburgh, said that only half the story had been told in Mr. Burr's paper. He asked whether any comparative costs had been prepared between coal-fired plant and electric supply. He had been asked to prepare a statement to show if electricity could be used for wash-houses. He found that at one farthing per unit the cost of supplying the 3 000 lb. of steam required per hour for ten hours daily would cost £4 472 per annum, including capital charges, whereas the charge for a coal steam-raising plant would be £857. At that price per unit he did not believe that electric heating by thermal storage could be done at a profit to the seller.

Conditions in New Zealand.

Mr. E. E. Sharp (Venner Time Switches, Ltd.) said that the figures given by Mr. McKenzie for Amsterdam were supplied by the designers of the switch mentioned. The Hague had ordered 1 000 English time switches and were negotiating for another two or three thousand, so there was something to be said on the other side. It ought not to be a question of whether to buy time switches in England or synchronous motor switches from Germany or America. Users in this country had recently been circularised as to what they wanted, but very few of them had answered. He hoped that when they went after water heating they would not put out such confusing printed matter as Wimbledon had done. They had suffered from too many tariffs in the past and they did not want to lose business by confusing the consumer. So far they had heard only of Continental practice. In New Zealand, habits and customs of the people were more in conformity with ours. In New Zealand they began water heating as an aid to electric cooking, but water heating was proving so much more popular in Auckland that there was one water heater to every two consumers against one cooker to five consumers. Over 10 000 water heaters were at present operated under time-switch control there and the rest of New Zealand was following suit. Conditions in New Zealand were very similar to what they would be here shortly. The Government generated current and supplied it to the power boards on a kW basis, so it was very important to have the water heaters kept off the peak load.

Mrs. H. A. Howie, Walsall, mentioned the need for a system which would allow houses to use their kitchen fires for water heating in the winter and change over to electric heating from May to October.

Mr. E. E. Hoadley, Maidstone, said that in Maidstone they had found that at a halfpenny per unit there was quite a lot of business to be done in water heating. Water heating was going to be one of the biggest things the electricity supply industry had ever embarked upon.

Mr. C. G. Nobbs (Geo. Nobbs, Ltd.) and Councillor Mrs. Gregory, London, also spoke, the latter emphasising the need of cheaper electrical appliances.

THE I.M.E.A. EXHIBITION.

Interesting Display of Domestic and Power Equipment at the Winter Garden, Eastbourne—Brief Description of Some Outstanding Items.

THE electrical exhibition held in connection with the I.M.E.A. Convention is this year staged in the Winter Garden, Eastbourne, and was visited by the delegates on Tuesday afternoon.

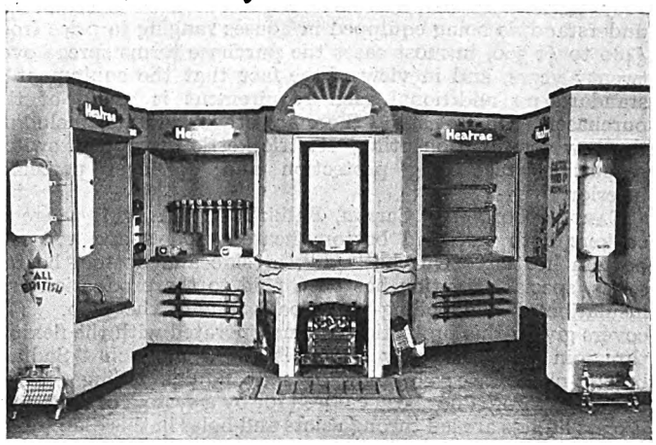
J. H. TUCKER AND CO., LTD., Tyseley, Birmingham, are making a special exhibit of a new heater type switch, the chief features of which may be summarised as follows: The switch is of the quick make-and-break type, is of skeleton construction, the contact clips, mechanism, etc., being mounted on a steel frame, no porcelain being employed. The contact clips and contact are insulated from non-conducting metal with mica and all switches are subjected to a flash test of 1 100 V a.c. The mechanism embodies a complete positive drive both when making and breaking the circuit. The moving contact arm is a separate part from the rocker, and initially at the commencement of the stroke is directly operated and slightly displaced by the operating dolly prior to the dolly actuating the rocker. This results in the positive drive being effective throughout the stroke of the operating dolly. The conducting parts of the switch are robust and amply proportioned, the stationary clips being of phosphor bronze to provide maximum flexibility. The steel frame, rocker, cradle and bridge are galvanised as rust preventative. The spring is of the compression type in steel, copper-plated to prevent rusting. The operating dolly incorporates a long straight shank designed for foot operation, particular consideration having been given to avoid the possibility of "tipping" the fire when operating the switch. Full rated load test of 15 A 250 V d.c. has been carried out, completing 32 270 operations (on and off) without electrical or mechanical damage.

The BASTIAN METER CO., LTD., Farnham Road, Trading Estate, Slough, in addition to their standard water heaters and boilers, are showing typical component parts of a thermal storage electric heating system. Of special interest are the samples and data shown on various heat insulation materials, automatic temperature control valves and the electro-steam boiler and hot water calorifier.

DRAKE AND GORHAM WHOLESALE, LTD., 67, Long Acre, London, W.C.2, are making a special display of water heating equipment, including heaters with time switch or relay control, gravity feed type cisterns with capacities ranging from 4½ to 55 gallons, domestic cisterns of 1½ gallons capacity and barbers' cisterns. The switchgear exhibited includes the "Metesco" oil switch fuse. A further useful unit is an e.h.t. ring main controller, which condenses in a minimum space the maximum amount of control for heavy current ring mains up to 12 000 V. The firm claims to have further developed what is known as the type I.E.P. automatic oil switch fuse which is useful under certain circumstances. A fuse blowing in any phase brings out the whole switch. Whilst the "Metesco" switch fuse is said to be the simplest piece of apparatus, this rather more elaborate automatic oil switch fuse is suitable under certain conditions. Another exhibit is the "Busy Bee" refrigerator, two self-contained models of which are to be seen. The rotary compressor with its three moving parts is practically silent in running.

The JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1. The exhibits here cover a representative range of cookers including the models hired by the Eastbourne Electricity Department, but owing to the small space available, the full range of cookers made by the company cannot be shown. Special attention is drawn to the Nos. 50J and 51J table models, the latter model in "de luxe" finish, including the well-known marblon all-enamelled mottled interior. The exhibit also includes the well-known "Quick-service" water heaters for sinks, surgeries, etc. (capacity two to three gallons), also one of the new series "Jackson" storage water heaters which have now been slightly modified and fitted with elements which can be removed without breaking any water joints. A range of fires in fabric finish is also shown, while the new competition type washboiler and the new automatic kettle, the body of which is made without any soldered joints, completes the company's comprehensive exhibit.

BULPITT AND SONS, LTD., Swansea Works, Birmingham, are displaying a wide range of water heaters of the storage type. The consumption of the 10-gallon size heater is only 0·75 kW, while the loading of the 15-gallon tank is 1 kW. Temperature is adjustable by the thermostat setting, and can be varied between 120 deg. F. and 200 deg. F. An immersion heater of an improved and robust type is employed, worked at a relatively low heat to ensure long life. The renewal of the element can be effected by turning a cap with a bayonet



The stand of Electric Fires, Ltd., as erected at the company's works before taking up its official position in the Winter Garden.

joint, which allows the porcelain former and heater to come away bodily without breaking any water joints. The thermostat is of a type which operates the mercurial switch by means of a bi-metallic spiral strip. When set up, a covering cap encloses all the controls and preserves a clean outline to the tank with no pockets to trap dust. In one type of tank, adapted for pressure service, the cold water feed is from the usual ball cistern at the top of the building, or from the mains, the hot water being led off from either top or bottom of the heater to the required site and controlled by stop-cocks on the outlets. In another type of tank, there is a free outlet for the hot water, and it is operated on the "push-through" system, with a stop-cock on the cold inlet only. Another feature of considerable utility is the means adopted for obtaining a small quantity of hot water almost immediately the heater is switched on. The pocket containing the heating element is surrounded by a somewhat larger cylinder, the top of which is open and immediately under the hot water outlet syphon. The bottom of this cylinder is perforated and the small volume of water which enters it is immediately raised to a high temperature by the immersion heater and rises to the top of the tank where it collects in a hot layer ready for use.

ELECTRIC FIRES, LTD., Heatrae Works, Norwich, are also specialising in water heating, their exhibit consisting of several types of thermal storage systems shown in such a way that the construction can be examined, and all the latest improvements are brought clearly forward. There is a cistern type tank containing its own ball valve chamber and working on the principle of constant temperature and variable volume. This is a complete hot water system in itself, and is suitable for direct connection to the cold water main; it will supply hot water to several points such as the bath, wash basin and kitchen. An example of a 10-gallon thermal storage water heater, that can be operated either as a displacement type heater or be connected to a ball valve tank and piped to several points according to the job for which it is intended, is shown. A new type 1½ gallon thermostatically controlled heater is another item, and this has been designed specially for sinks and wash basins. The apparatus is of particularly simple construction, and all parts are readily accessible. Other "Heatrae" exhibits include hot pipes or tubular heaters, low temperature air warmers, towel rails, warming plates, immersion heaters and electric fires.

SANTON, LTD., 149/150, Dock Street, Newport, Mon., are exhibiting, in addition to their well-known electric geysers, circulators and tank belts, the new "Santon" multi-plug which allows of a number of appliances being connected to a common point.

Digitized by Google

L. G. HAWKINS AND CO., LTD., 30/35, Drury Lane, London, W.C.2, have a special exhibit of their new family size "Hera" electric washing machine. Originally this was introduced as a portable electric washer, but many builders of large estates have decided to instal this equipment as standard in their new houses. It is an interesting fact that each one of these builders is advertising in the Press the inclusion of a "Hera" electric washing machine. In some instances these electric washers are being equipped with 3 kW heating elements, thus giving an efficient wash boiler in addition to the electric washing machine. It will be appreciated that any one electrical appliance that is put out in such large quantities will give valuable additional revenue to lighting companies with a very materially reduced sales expense. The "Hera," we understand, is being equipped in houses ranging in price from £480 to £1 500, in most cases the purchase terms spread over twenty years, and in view of the fact that the equipment is standard no additional cash requirement is asked of the purchaser. On this stand there are other exhibits, including the new combination utility electric kettle fitted with switch regulation, fuse plug protection and porringer porcelain interior.

CARRON COMPANY, Carron, Falkirk, show a wide range of cookers both side and bottom heated models and top and bottom heating. On the "M", or side and bottom heated series, special attention has been paid to the production and insulation of the boiling-plate leads under the hob. The covers giving this protection are incorporated with the flexible three-pin plug assembly which is fitted to each "Sadia" boiling-plate. The draining of spilt liquids falling on the under diaphragm has been catered for by a system of channels. Excess liquids are led through slots and holes in this diaphragm to the white enamelled plate which extends half way across the top of the grill chamber or warming cupboard. A tray can be drawn out on runners for cleaning purposes.

Turning to the top and bottom heated "P" type cooker, the key-note of the design is accessibility from the maintenance engineer's point of view. All component parts, i.e., boiling plates, grill and oven elements, are all of the plug-in type. The exhibit also includes thermal automatic switch kettles and vitreous enamelled irons and fires.

The "Dolphin" Range.

DOMESTIC ELECTRIFICATION, LTD., Townsend House, Greycoat Place, London, S.W.1, are showing a range of "Dolphin" heating and cooking appliances, including three cooker models. The standard cooker embodies mottled enamelled hob, all mottled enamelled interior and shelves for the oven; this has rounded corners of wide radius for easy cleaning. Ample space has been provided round both oven and door for lagging, and a new design of latch with heat resisting handle ensures a perfectly tight-fitting door. Elements are of plug-in type for ease in replacement. The boiling plates are solid type circular pattern. The oven elements in the smaller model are at the top and bottom; a solid shelf is provided to allow the oven to be sub-divided, so that when only one dish is being cooked, only one element need be used. For compactness and convenience the grill has been placed at the top of the oven, permitting ample space for plate warming in the bottom. The No. 616 cooker also shown, has been designed for the family of from 6–10. It has ample oven space, two large circular boiling plates and a grill. A let-down door provides a hot cupboard for plates under the hob. This hot-cupboard is vitreous enamelled and has rounded corners. The oven elements can either be fitted at the top and bottom or at the sides. All elements are controlled by a three-heat switch and care has been taken throughout the cooker to protect all connections from overflow of liquids. The "Dolphin" fires are of pleasing design; some models having the elements placed vertically with chromium plated reflectors. The company's automatic safety iron with "Klixon" thermostat, is being shown for the first time. A working model of this thermostat on the stand is interesting to watch and at the same time shows the action and construction.

CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham. On this stand is staged examples of the latest types of "Creda" electric cookers as hired by Eastbourne Corporation and elsewhere. Special interest is centred on two new models shown for the first time. Plug-in elements are fitted throughout and the design includes many novel features. In addition there is also shown the new "British Standard" electric cooker, arrangements having been made for the manufacture of these in conjunction with several other leading cooker manufacturing concerns. Other items of special interest on the stand are samples of the new "Creda" tubular heating system. It will be recalled that "Creda" cooking apparatus was installed on the airship R.100.

The MANOR ELECTRIC OVEN AND FIRE CO. (E. ELLWOOD), 303, High Street, Chiswick, London, W.4, is showing the standard range of "Manor" products including a new 4–6 person cooker, a new design water heater, and table cooker.

CHESTERTON JONES AND CO., LTD., David Works, Rushey Lane, Tyseley, Birmingham, are showing among other appliances their No. D. 705 and D. 702 cookers, descriptions of which have already been given in these pages.

Another Water Heater.

BERRY'S ELECTRIC (1928), LTD., Touchbutton House, 85/86, Newman Street, London, W.1. In addition to new Magicoal fires, this company is showing for the first time the "Canvary" electric water heaters, in which the inner cylinder is suspended within highly efficient insulating material, and is in no way metallically connected with the outer case. The heaters are automatic, being controlled by a thermostat, designed to operate without the use of springs. The element is of solid construction with a large heating surface. There is a non-drip device. The element and thermostat are removable without emptying the tank. The outer case is finished in cellulose enamel, with coloured bands to tone with surroundings. The heaters are made in sizes from 1½ to 22 gallons.

ARCHIBALD LOW AND SONS, LTD., Merkland Works, Partick, Glasgow, W.1, show a comprehensive range of domestic apparatus and appliances, together with a 6 kW baking oven and 6kW bakeplate for scones, pancakes, etc. Electric continuous supply water boilers for tea making, tramcar tubular heaters, etc. are also included.

The BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION includes in its exhibit a typical window display, a poster display, a display of all the papers and journals in which the association advertises, a display of E.D.A. literature and reports, a 1930 refrigeration display window cut-out, and other examples illustrating the E.D.A. services to the industry.

SADIA, LTD., 22, Newman Street, London, W.1, are featuring automatic electric water heaters of the pressure type, self-contained heaters, with ball tank, heaters with a novel anti-drip device, new type table stoves, thermostats and time switches, immersion heaters and heating pipes, etc.

The HORSTMANN GEAR CO., LTD., Newbridge Works, Bath, are exhibiting a complete range of Newbridge automatic electric time-switches suitable both for public lighting and for shop window lighting control, and other indoor uses.

FERRANTI, LTD., Hollinwood, Lancs. In addition to a stand at the official exhibition this company has taken showroom premises at No. 2, Carlisle Buildings, in Carlisle Road. At both these two centres there is displayed and demonstrated an extensive range of fires and water heaters, together with thermostats and relays of various type for off peak control of thermal storage equipment. In addition, bell-ringing transformers and certain other similar small appliances of domestic interest are also shown. Visitors to the firm's showroom will also have facilities of hearing various all-mains wireless receiving sets and moving coil loud speakers. Ferranti water heaters are now supplied in all sizes from two gallons upwards, all thermostatically controlled. The smaller heaters are of the wall pattern, intended primarily for connection direct to the pressure main for operation on the displacement principle, to deliver hot water to one point only. They can be used in connection with ball valve feed tanks to give a supply of hot water at several taps. The larger heaters, of capacities from 20 gallons upwards, are arranged for floor mounting, and are intended generally for central storage supplies of hot water for all household needs. Heaters of this type can, of course, be installed to work on true thermal storage principles, the electricity supply being controlled by means of a load levelling relay, time switch or other device to restrict its consumption to off peak conditions of the supply system. With heaters of suitable size this restriction of electricity supply does not, of course, in any way restrict the hot water service. Particular interest will no doubt centre upon a new construction of a fire which when built into an ordinary flue still delivers into the room 96% of the heat generated in the elements, and utilises the remaining 4% for the purpose of ventilation sufficient to provide two changes of air per hour in a room measuring 15 ft. by 15 ft. by 8 ft.

LINE CORROSION.

The Problem of Protection against Atmosphere, Salt and Fog.

AT a meeting of the Overhead Lines Association on May 21, Mr. G. W. Molle read a paper entitled "Corrosion with Special Reference to Overhead Lines." It was known that there were two chief types of corrosion—chemical and electro-chemical—and that the presence of impurities or difference of stress in metals or change in molecular structure or the lodging of foreign bodies on the surface of a metal, or the occurrence of cracks, could start corrosion. In this connection the vibration of overhead conductors, due to wind—might cause such molecular changes as to initiate corrosion. Atmospheric corrosion depended on the presence of moisture and acid gases or on the deposition of water and salts on a metal surface. In practice there were two chief types of corrosion: (*a*) general, caused by acids and (*b*) local or pitting, caused by salt and water.

The paper then outlined the views held by workers who have carried out researches into the theory of corrosion. Coming to some of the more practical details dealt with, it was pointed out that steel containing 0·2 per cent. of copper has such resistance to atmospheric corrosion that it loses only 4 per cent. of its thickness under conditions where ordinary steel loses 70 to 90 per cent., and that copper-steel is being used for transmission towers on the Central England Electricity scheme. The life of galvanised steel towers and poles, it was pointed out, is generally reckoned as from 14 to 50 years, according to local conditions. In a bad industrial atmosphere it had been found that galvanising is not so efficacious as painting. Some difference of opinion existed as to the best method of protecting steel supports. Reference was then made to research work carried out on deterioration of reinforced concrete poles and the precautions necessary when dealing with zinc, copper and aluminium were outlined by way of references to previous publications. It was also pointed out that in the presence of moisture, corona causes the formation of nitric acid with possible deterioration of conductors on high voltage lines, but it was added, troubles at one time attributed to this were now attributed to vibration.

Discussing forms of protection other than galvanising and painting, metal spraying was mentioned, as was the fact that chromium plating has been used for outdoor overhead switchgear. An interesting application was the spraying of porcelain insulators inside and outside as a preventative of corona; zinc, tin or copper being used. Cable clamp jaws have also been coated with copper to overcome the inconvenience of losing loose copper linings in the field. The estimated life of sprayed steel frameworks is 15 years, and it is also claimed that as there is no necessity to provide for corrosion losses, comparatively light steel can be used, the saving in steel paying for the coating process. There are other methods of protecting metal but in Mr. Molle's opinion the only one of importance from the overhead line point of view is sherardising. Stainless steel and cadmium plating were coming into use in connection with open air switchgear. It had been found in America that aluminium wire was the best for hornbreak fuses in situations where corrosion is likely to occur. If carbon tetrachloride fuses were used, the bursting of a glass tube may release the corrosive fluid and damage surrounding ironwork.

Discussion.

Mr. C. H. E. RIDPATH (British Aluminium Co.) said the liability of aluminium to corrosion depended on its purity and on the actual conditions of wire drawing. Against cases of corrosion with aluminium there were innumerable instances in which highly satisfactory results had been obtained over long periods.

Mr. F. SWARBRICK (Basingstoke) said as regards aluminium conductors, some 15 years ago he erected a line on the west coast and when he saw the line 12 months ago the corrosion was negligible.

Mr. J. H. C. BROOKING said the Navy, which probably had the greatest difficulty of all in regard to corrosion, depended on ordinary paint.

Mr. F. CHRISTY (Chelmsford) said he had experienced trouble with electrolysis at Bude on the north coast of Cornwall.

Mr. W. FENNELL drew attention to the fact that various metals were attacked in different ways in different parts of the country and suggested that the Central Electricity Board should expose samples of the metal it proposed to use for its towers and cables in various parts of the country and see the effect of the atmosphere before erecting such gear.

RESEARCH AND WIRELESS.

Presidential Address to Institute of Physics—Contributions to Science.

By DR. W. H. ECCLES, F.R.S.

THE stability which the Institute had attained after a life of ten years showed that its founding was justifiable, and the subject of wireless telegraphy and telephony had been chosen for the address as an illustration of the constructive work of the physicists in a typical modern enterprise. In preparing an account of the contributions of physicists to wireless Dr. Eccles omitted all reference to the engineers who had adorned the industry, as otherwise his address would be a complete history. With this intention of making a case for the physicist, he began by pointing out that Hertz's experimental demonstration in 1888 of the physical existence of electric waves was the foundation of wireless. But Hertz's apparatus was insensitive, and therefore the detectors discovered by Lodge, Branly and Minchin in 1889 and 1890 were an essential apparatus to any prospective practical application.

After these purely scientific investigations had provided the means and materials, wireless telegraphy was born at the British Association meeting at Oxford in 1894, when Lodge sent Morse signals from a spark apparatus worked by a telegraph key and recorded them on a moving paper tape by receiving apparatus at a distance. Later, in 1897, Lodge's laboratory produced the method of tuning aerials by inductance coils, thus enabling each transmitting station to correspond with a selected receiving station tuned to it. Another laboratory product was the arc generator of continuous waves (due to Duddell and Poulsen). It led the way to wireless telephony, which was developed rapidly by Fessenden, a professor of physics, until in 1907 the human voice was heard across the Atlantic. This ranked as the greatest achievement of wireless up to that date, for telephony was then impossible on long cables.

The Thermionic Valve.

In 1913 the amplifying valve came to maturity; it was purely the work of physicists, the use of a grid being traceable to the experiments of a German physicist in 1902. The coming of the valve brought two consequences, firstly the scrapping of the spark stations which had been laboriously developed during 15 years of pioneer engineering work, and, secondly, after the war, the popularisation of wireless telephony in the form known as broadcasting.

At the present moment the industrialists of this country were indulging in profound self-examination and there was much discussion of the process called rationalisation, which was brought into prominence in 1927 by the World Economic Conference at Geneva. The main object of rationalisation was to reduce the costs of production and operation in important industries, and its aspects were multitudinous. But keeping to the technological side, an important instrument of rationalisation was standardisation, and another was the modernisation of plant and products by the introduction of the latest invention and knowledge. Now there was a certain amount of contradiction here, for standardisation was opposed to modification; and the conflict had, so far as he knew, not yet been thoroughly discussed. To put the matter another way, it was not economic to standardise machinery or products too soon, that was before the latest improvements had been incorporated, and, on the other hand, it was not economic to modify a standardised form until the costs of adopting it had been recovered. This conflict was well illustrated in the history of wireless, and unceasingly appeared in many industries, such as the electrical industry, and therefore the physicist was deeply concerned in it. To those responsible for making decisions it was no easy task to settle when to introduce improvements and when to stop improving in order to standardise. They probably regarded the physicist as the villain of the piece, for he had been, in certain industries, the cause of many a sudden change of direction, the source of many a revolutionary idea. But the better view of the position of the physicist in this matter was that he possessed potentialities for helping as well as for disturbing the stability desirable even in progressive motion; being intimately connected with the laboratories whence sprang the sort of invention that shattered the established technique, he was better equipped than others to forecast in some degree the direction of forthcoming change and to materially assist in deciding the instant and mode for standardising and for modifying.

POWER STATION DEVELOPMENT OF THE ELEKTROWERKE COMPANY.

Special Features of the New Plant at Golpa-Zschornewitz Power Station—730 000 kW Installation—Turbo Generators of 100 000 kVA—Lignite-fired Boilers.

By DR. A. PEUCKER *

THE Elektrowerke Company has a share capital of 90 million marks (about 4½ millions sterling) which is entirely held in Germany, but has also received loan capital from the United States to the extent of $12 500 000 (about £2 570 000). The company generates power in three brown coal (lignite) power stations and delivers it by means of an 110 kV network to cities, provinces, distribution companies and chemical industries over the whole of Central Germany. The lignite is obtained primarily from open workings, which yielded 4 803 678 metric tons in 1928. A small part of this output was sold. The lignite has a moisture content of 54 to 56 per cent., 6 per cent. ash, a heat value of 2 000 to 2 250 calories per kg. of fuel (3 600 to 4 050 B.Th.U. per pound), and an ash melting point of 1 150° C. (2 100° F.). In the three power stations of the

One of the new boilers of 1 000 sq. m. heating surface at the Golpa-Zschornewitz power station of the Elektrowerke Company.

company, plant of a total installed capacity of 460 000 kW was available during 1928, and it produced a combined output of 2 009 915 700 kWh. During 1929, the plant capacity was increased to 730 000 kW, equivalent to 868 490 kVA. The new machines were put into operation at the end of that year, the output being 2 332 million kWh ; they include two units of 100 000 kVA each, together with boiler-plant of a remarkable character. For these extensions, the existing boiler pressure of 16 atmospheres (235 lb. per sq. in.) was retained, because high pressure boilers and plant for at least 100 atmospheres (1 470 lb. per sq. in.) had not been sufficiently tested for large central stations, and with a cheap fuel like lignite such plant would not prove an economic proposition. An intermediary pressure was not to be recommended, as the ultimate adoption of at least 100 atmospheres with a step-down arrangement was foreshadowed, and the necessary intermediary superheating would be more advantageous at 16 atmospheres (235 lb.) than at an intermediate pressure. The new boiler houses of the Elektrowerke Company have boiler units of 1 000 sq. m. (10 764 sq. ft.) heating surface each, with cast iron gilled pipe economisers, plate air-pre-heaters and super-heaters. The boilers are fired with raw lignite, which is delivered in large capacity wagons which carry the fuel direct from the land-dredger excavators to the boiler house conveying plant. Despite the low heating value of the fuel, a duty of 60 tons of lignite per hour has been successfully accomplished for one boiler. It is hoped, with further improvements during the next few years, to reach 70 tons per hour per boiler.

The boilers have drums which are bent round and rivetted, a system in contrast to that used in the United States, which system has given satisfaction for a number of years to the Elektrowerke Co. The boilers are fitted with automatic underfeed stokers, operated by oil-pressure rams. The feed water is heated by the regenerative method to 110° C (230° F.) before it reaches the economiser, the remaining utilisation of the hot flue gases takes place in the air heater up to a temperature of 170° C (338° F.). The low melting point of the ash forbids a higher degree of the air heating. The boiler feed-water is de-gassed to a degree of less than 0·1 milligramme of oxygen per litre, and it is passed through the economiser at a speed of at least 0·5 metres (about 20 inches) per second; by these means, corrosion has been completely eliminated. The boiler house has a fuel bunker capacity equivalent to 0·536 cubic metres (18·9 cubic ft.) per kW.

Capacity of the Plant Installed.

The turbines, each of 100 000 kVA capacity, take steam at 360 to 385° C. (680 to 725 ° F.). One of these machines is of the two cylinder type, the other has three cylinders ; both, however, are of single-shaft construction.

The three cylinder machine has a purely hydraulically operated control gear for starting, regulation, and stopping. Both machines are bled twice to heat the feed-water to 110° C. (230° F.) and to distill a 3 per cent. make up feed. Quick acting double shut off gear is placed in the main steam supply pipes, consisting of a valve and a controlling arrangement with two separate independent safety regulators. Each turbine unit has a condenser with 6 000 sq. metres (64 644 sq. ft.) of cooling surface, operated by steam pumps of 1 000 kW. The generators are wound for 13 000 V. The stator weighs 210 metric tons, and the rotor 120 tons, the turbine operates at 1 500 revs. per minute. The cooling air for each generator is circulated by means of a fan placed near the exciter generator on the main turbine shaft. The construction of the whole turbine unit is such that with an over-speed of 25 per cent., there is still for every part a factor of safety of two. The turbine house is fitted with two 110 tons overhead travelling cranes ; it requires, including all auxiliary plant space, a building capacity of only 0·3 cubic metres (10 cubic ft.) per installed kilowatt. The main transformers are placed near the respective turbo-generators and step up to 115 kV. The connection between each step up transformer and the main switchboard is made by means of 115 kV cables ; for each turbo-set there are 3 single-core cables, each of 525 sq. mm. conductor area, with a fourth as a spare. The copper conductor is not of the hollow oil-filled type, but is of the normal type with the usual cable-form ; the paper dielectric is 18 mm. One of the two sets of cables has a protecting sheath of non-magnetic steel wire over the lead, the other is without such an arrangement. The length of each cable is about 700 metres and all cables are made in two sections to enable the joint construction to be tested. A patented combined concrete and tile system of construction for the cooling towers was adopted.

As the plant has only been in operation a short time, the author cannot give the operating efficiency data, but the heat input of the turbine, including auxiliaries, is about 3 250 kg. calories (12 900 B.Th.U.) per kWh, and with a 60 tons of fuel evaporative duty per hour the boiler efficiency will be about 86 ; a favourable figure when taking into account the low steam pressure, the use of raw lignite and of artificially cooled condensing water.

PNEUMATIC PLANT IN POWER STATIONS.

Installation at Deptford—Methods of Pneumatic Conveyance—Handling Riddlings and Soot—Grit Emission and the Remedy.

THE extension of electric power stations in connection with the grid scheme is giving increased prominence in the minds of engineers to two significant problems. The first and perhaps less important of these is the question of conveying and making use of riddlings and disposing of soot. The second is the vital subject of preventing grit emission. Our attention was recently called to the work being done to solve these problems by Pneumatic Conveyance and Extraction (1929), Ltd., of Broadway Buildings, Broadway, Westminster, S.W.1. The Deptford East station affords a good example of the methods used by the firm for achieving efficient pneumatic conveyance, while the other side of its activities—grit extraction,—is illustrated at the Croydon power house.

Before describing in detail the apparatus employed at Deptford it is proposed to give a general outline of the "Pneuconex" system as used in power stations. The first necessity is a system of tubing extending the length of the boiler section of the station and from bottom to top. Through parts of this tubing the riddlings are induced by vacuum action, while it is the function of other parts to dispose of the soot. Arrangements have to be made for the collection and discharge of the material to be dealt with, for creating the suction, for eliminating the difficulties caused by bends in the tubing, and for separating fine gauge grit from the air stream before it can pass into the exhausting machinery and so injure it. In this connection it must be made clear that the system of pneumatic conveyance here described does not operate on the principle of a pump, but arranges for the introduction of air to the collection end of the system at a velocity sufficient to accelerate and float the material to be conveyed. The material is carried in suspension to the discharging point, where—owing to a considerable decrease in the air velocity—it is deposited in bunkers, thence to be remixed with fuel and passed to the stokers, as in

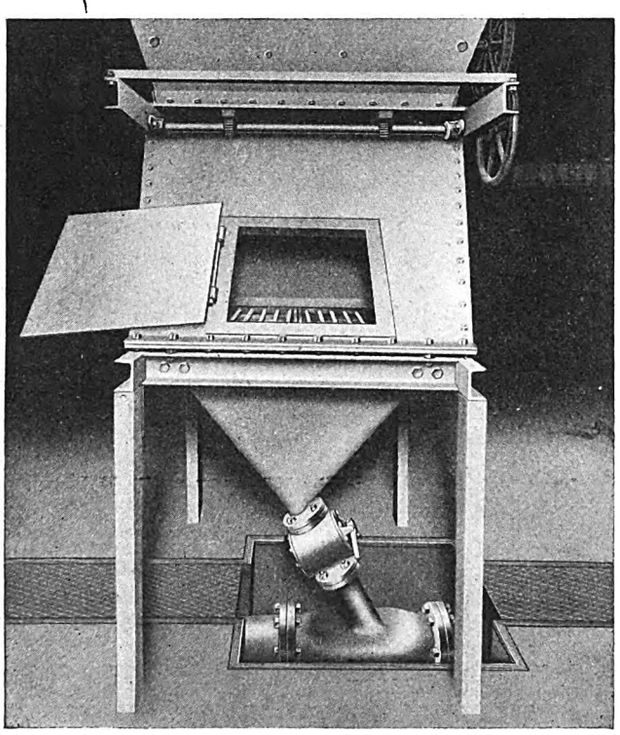

Fig. 1.—Close-up view of loading unit at Deptford power station.

the instance of riddlings, or to be delivered to wagons or barges, as in the instance of soot.

Fig. 1 is a close-up view of one of the patented loading units of the pneumatic installation at Deptford—handling riddlings from chain-grate stoker fired Babcock and Wilcox boilers. It will be noticed that the feeding pipe enters the horizontal main at a particular angle, this being one of the features of the firm's tangential method of introducing material. The pipes are so arranged that only a certain fraction of the cross sectional area can be occupied by the material, which gravitates through the openings in the horizontal plate (seen through the open door in Fig. 1), the limit of occupation being determined by the frictional coefficient of the particular substance to be conveyed. After passing through the openings the material forms a series of pyramidal piles inside the piping, and conveyance is effected by opening the isolation valve. Air is admitted from the basement in which the equipment is installed; the high velocity air steam passes the loading orifices at right-angles, and the induction takes place on simple ejector

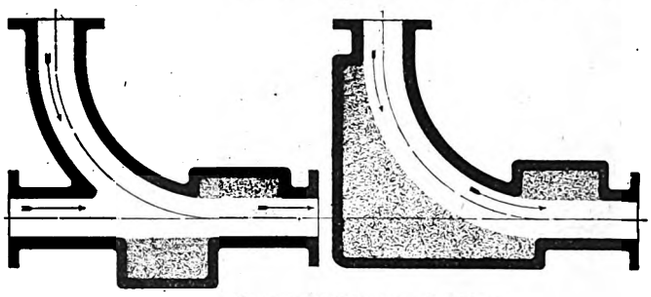

Fig. 2.—Sections of "Pneuconex" fittings.

principles—the direction of flow in the main pipe being from left to right.

When they have passed the collection point the riddlings enter into the next stage of their journey—the mains—which are ordinarily of mild steel. Large diameter systems such as this have flanged joints throughout, but smaller installations are provided with flanges for connection to cast-iron fittings—or, where initial economy is essential, screwed muff couplings are utilised. The joint rings are of an asbestos and rubber composition. Independent of the conveying mains are the air mains, which transfer—in effect—the partial vacuum produced at the exhauster to the various points in the station where it is to be applied. It may be compared with other potential sources of energy, such as a compressed air system or an electric circuit, as it may be tapped wherever desired and its uses are not necessarily confined to the particular purposes for which it is primarily installed. Thus at Deptford the system is also employed for vacuum cleaning; brass capped nozzles are provided at several points, and by screwing on lengths of flexible steel house, the exteriors and interiors of the boilers and other parts of the machinery may be readily cleaned.

One of the inherent difficulties encountered in the design of pneumatic conveyance systems is the necessity for changes in direction. Such abrasive substances as riddlings, where constantly driven against the angular portion of a fitting, tend to destroy it in a comparatively short time. This trouble is overcome by the use of patented fittings, which are recessed in the manner shown in Fig. 2. The two special cavities are thus filled with the passing material, which forms a shield against the bombardment of fresh divisions of its kind—while at the same time it facilitates the travel of the substance through the fitting, by damping the blows of the riddlings both at the point where the two lines of direction meet and at the point that normally receives the ricochet. The recessed portions of the fittings are, in addition, made detachable, so that when they do become worn they can be simply replaced by unscrewing a few nuts.

The riddlings are raised by the conveying mains a vertical height of 130 ft., after which they are discharged into one of a pair of bunkers. When one of these two bunkers becomes full, the flow of riddlings is diverted into the other by the manual operation of a valve. The riddlings can then be mixed with the graded coal, in the desired proportion, and re-supplied to the mechanical stokers. Although automatic discharges are available for use with the "Pneuconex" system, none are employed at Deptford, where the section of the system dealing with soot discharges into a large bunker in the power station basement; from this bunker the soot can be disposed of, when convenient, by means of the hydraulic sluice.

Having arranged for delivering the riddlings at the requisite point the next necessity is to separate the residue of solids from the air stream—before the latter passes through the exhauster and into the open. At Deptford this is accomplished by a machine known as a rotary separator, which operates by combined centrifugal force, reduction of air velocity and the

Digitized by Google

provision of a winding path for the air stream. The circular element of the rotary separator is illustrated in Fig. 3. The shaft is driven by an electric motor, and to it are secured perforated discs, of which the peripheries rotate in an annular chamber. To the faces of the discs are fixed runners, which create the necessary centrifugal action and counter-flow.

The separator is claimed to remove from the air stream some 98% of the solid particles, which are chiefly in the form of very fine dust. The balance is in turn extracted by the air washing plant. A section of the "Pneuconex" patent air washer is shown in Fig. 4. Air is admitted through the chamber A, of which the lower end is bell-shaped to facilitate the exit of the air and to direct it in the desired direction. Chambers B and C are fitted with baffles D, one overlapping the other, and disposed slightly below the horizontal to enable them to be easily flushed. For the more complete breaking up of the air stream louvred baffles E are provided; space does not permit us to mention the various ingenious features of the detailed design. Nozzles F, for flushing and filling, are shown in the two top corners of the central rectangle.

Beyond the air washer is the rotary exhauster which supplies power to the whole system. At Deptford the exhauster is situated in one corner of the main basement, where it takes up a pleasantly small amount of space. Its 500 V motor, manufactured by the Lancashire Dynamo and Motor Co., is rated at 60 B.H.P., but the average output is in the neighbourhood of 40 H.P. Hoffman ball or roller bearings are used throughout and the design agrees with the special recommendations of the Hoffman Manufacturing Co. The machine consists essentially of a carcase, rotor, hinged vanes, connecting rods and crankpin. The drive is transmitted by chain to the rotor, which is mounted eccentrically in the carcase. The crankpin is at all times stationary, the function of the connecting rods being to limit the movement of the vanes, so as to prevent them coming in contact with the carcase. The carcase and rotor are of cast iron, and the vanes of aluminium, while crankpin and connecting rods are forgings.

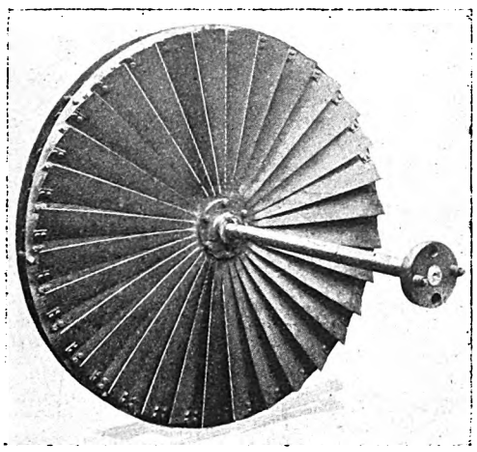

Fig. 3.—"Pneuconex" rotary separator.

The cleansed air is discharged to the atmosphere through a large silencing chamber built of brick.

Grit Extraction.

The grit catching equipment at the County Borough of Croydon Electricity Works is of particular interest, in view of the extensive troubles caused by grit emission at Croydon before its installation. The cyclonic method of separation is employed, and the design is such that centrifugal force and gravity combine to eliminate the dust from the flue gases. The grit catchers are not standardised, but have to be specially adapted to circumstances—and where they are installed in previously erected power stations, many difficulties have to be overcome. At Croydon, the grit catchers have had to be designed to fit in under the sloping glass roof of the station, at the top of which there was little enough space to spare, as shown in Fig. 5.

The grit catchers operate by providing a relatively long and circular path for the flue gases, in such a way that the solids—carried at high velocity—are flung towards the periphery of a conduit of triangular section. The solids pass through an orifice in the periphery or inverted apex into a bunker, from which they are discharged by way of a vertical pipe and are removed to dump by trucks on the ground level of the station. Though the sides of the cones and inlet bends are normally manufactured from hardened steel having a Brinell figure of 270 to 275, at Croydon these are of ordinary mild steel plate, ¼ in. thickness. The four equipments have been in operation for some considerable time but no undue wear has taken place. The reason for introducing the hardened plate is in anticipation of the abrasive wear of the grit during the process of extraction. Cones normally operate in parallel; the outlet slot of each being usually about 20 ft. in length; a breeches piece is fitted at the inlets, connecting the supply duct to each cone in a manner ensuring the equal division of gases at this point. The increase of velocity essential to efficient extraction is only operative across the inlet bends and cones, the consequent resistance normally being overcome by the induced draught plant, which is, of course, an integral auxiliary of up-to-date steam raising plant.

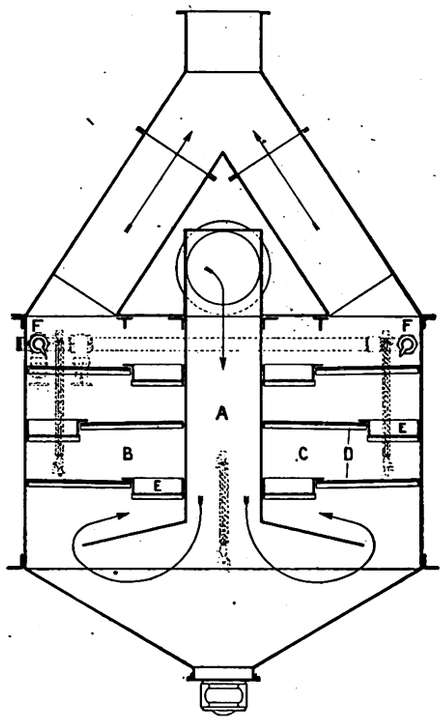

Fig. 4.—Section through "Pneuconex" airwasher.

Though only a very small percentage of the gases escapes through the slot, a certain amount of such escape is inevitable, and adequate steps are taken to return the gases to the cones. The return is effected by allowing sufficient area between the cones and bunker sides, to ensure that the escaping gases rise slowly through this space to the "pressure relief ports," which

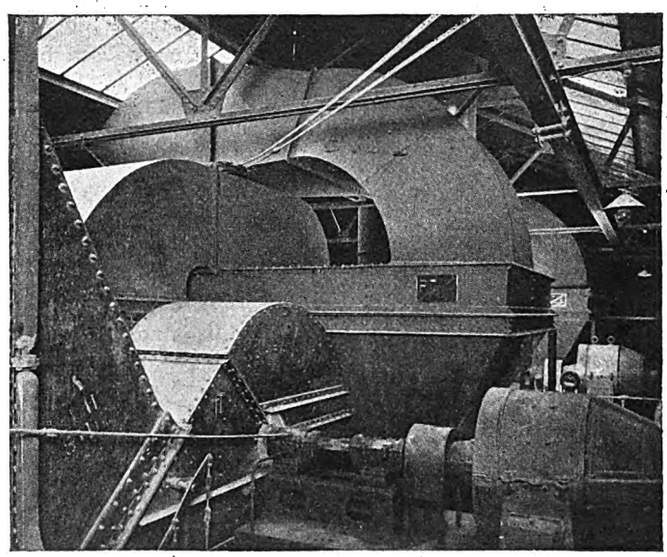

Fig. 5.—Grit catchers at Croydon power station.

are placed at the inlet ends of the cones. The gases thus re-enter the system, and are again treated before passing from the unit.

An analysis of the grit extracted at Croydon has shown that 55·5 per cent. will pass through a 200-mesh sieve.

Bangor Electricity Committee is in favour of laying distributing mains where there is a potential use of electricity, irrespective of whether there is an immediate demand for supply or not. The Electrical Engineer has been instructed to submit a programme of cables which might be laid in the future.

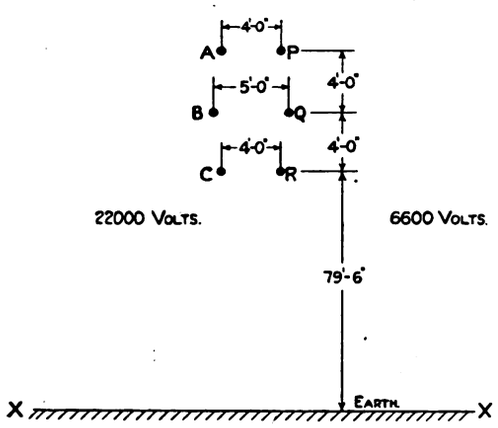
INTERFERENCE BETWEEN POWER LINES.

Case of 22 000 V and 6 600 V 3-phase Overhead Lines on the Same Poles when the 6 600 V Line is Entirely Disconnected.

By S. AUSTEN STIGANT, M.I.E.E., F.Am.I.E.E., and H. MORGAN LACEY, B.Sc., A.K.C., A.M.I.E.E.

THE effect of electrostatic and electromagnetic induction between adjacent parallel circuits is usually of importance only when telephone circuits are in close proximity to overhead power lines. A case recently came to the authors' notice, however, where there was a likelihood of interference between two separate power circuits where it was proposed to utilise the same set of poles for two 3-phase overhead power lines, the pressures being 22 000 V and 6 600 V respectively, and the frequency 50 cycles. While it was not thought that any serious effects would follow this procedure, it was still considered advisable to calculate the magnitude of the various inductive effects before putting the proposed scheme into operation.

The particular case considered is when the 22 000 V line is in use and the 6 600 V line is entirely disconnected from all other apparatus, both at the sending and the receiving ends of the line. This case is chosen because the inductive effects are likely to be worst under these conditions. If the 6 600 V lines are connected through machines, or other apparatus, having a low impedance, it is probable that the various induced pressures will be neutralised by the flow of equalising capacitance currents, the latter being, in all probability of very small magnitude. This aspect of the case is dealt with in greater detail at a later stage.



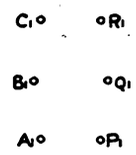


Fig. 1.—Line spacings.

In setting out the calculations involved, it is not proposed to attempt anything in the nature of proof of the various formulæ employed, the object of the article being merely to indicate the method of arriving at the desired results.

In Fig. 1 the 22 000 V conductors are indicated by the letters *A*, *B* and *C*, while the 6 600 V conductors are marked *P*, *Q* and *R*. The ground is indicated by the line *XX*, and the images of the various conductors by corresponding letters with dashes. In order to calculate the various capacitances, it is necessary to know all the distances between conductors and their images. All the distances required in the calculations are set out in Table 1. The distance between any two points (*i.e.* any one line and any other line or image) is given in this table by the figure common to the line and column marked with the letters corresponding to the points in question. The only other dimensions required are the radii of the various conductors, and it so happens in this example that these are all equal.

Radius of each conductor = 0·2075″
= 0·0173′

Electrostatic Effects.

e_b ,, ,, ,, ,, ,, *B*.
e_c ,, ,, ,, ,, ,, *C*.

Then if e_{pa} be the pressure induced in line *P* by the pressure e_a, it can be proved that

$$e_{pa} = e_a \times \frac{M_p}{M_a + C_p}$$

where M_p is the mutual capacitance of *P*, and *A* with its image *A′*
M_a ,, ,, ,, ,, *A*, ,, *P* ,, ,, *P′*
C_p is the capacitance of *P* to earth.

It can also be shown that—

$$M_p = \frac{b_1}{b_1 b_2 - a_1 a_2}$$

$$M_a = \frac{b_2}{a_1 a_2 - b_1 b_2}$$

$$C_p = \frac{a_1}{b_1 b_2 - a_1 a_2}$$

where—

$$a_1 = 2 \log_e \frac{AA^1}{r}$$

(NOTE.—$\frac{1}{a_1}$ is the capacitance per unit length of line *A* to earth).

$$a_2 = 2 \log_e \frac{PP^1}{r}$$

$$b_1 = 2 \log_e \frac{PA^1}{PA}$$

$$b_2 = 2 \log_e \frac{AP^1}{AP}$$

Thus the total pressure e_p induced on line *P* by lines *A*, *B* and *C*, at any instant is given by—

$$e_p = e_a k_a + e_b k_b + e_c k_c$$

where

$$k_a = \frac{M_p}{M_a + C_p}$$

$$k_b = \frac{M_p}{M_b + C_p}$$

$$k_c = \frac{M_p}{M_c + C_p}$$

If the particular instant be chosen when e_a is at its maximum value, say *E*,
Then

$$e_b = E\left(-\tfrac{1}{2} + j\frac{\sqrt{3}}{2}\right)$$

$$e_c = E\left(-\tfrac{1}{2} - j\frac{\sqrt{3}}{2}\right)$$

Line P.

1. With respect to *A* :—

$$a_1 = 2 \log_e \frac{AA^1}{r} = 2 \log_e \frac{175}{0{\cdot}0173} = 2 \log_e 10120 = 18{\cdot}44$$

$$a_2 = 2 \log_e \frac{PP^1}{r} = 2 \log_e \frac{175}{0{\cdot}0173} = 18{\cdot}44$$

$$b_1 = b_2 = 2 \log_e \frac{PA^1}{PA} = 2 \log_e \frac{175{\cdot}1}{4{\cdot}0} = 2 \times 3{\cdot}781 = 7{\cdot}562$$

$$M_p = \frac{b_1}{b_1 b_2 - a_1 a_2} = \frac{7{\cdot}562}{(7{\cdot}562)^2 - (18{\cdot}44)^2} = -\frac{7{\cdot}562}{26{\cdot}0 \times 10{\cdot}878} = -0{\cdot}02674$$

$$M_a = \frac{b_2}{a_1 a_2 - b_1 b_2} = 0{\cdot}02674$$

$$C_p = \frac{a_1}{b_1 b_2 - a_1 a_2} = -\frac{18{\cdot}44}{26{\cdot}0 \times 10{\cdot}88} = -0{\cdot}0652$$

TABLE I.

$$a_2 = 2 \log_e \frac{PP^1}{r} = 18.44$$

$$b_1 = b_2 = 2 \log_e \frac{PC_1}{PC} = 2 \log_e \frac{167.1}{8.94} = 5.86$$

$$M_p = \frac{b_1}{b_1 b_2 - a_1 a_2} = \frac{5.86}{(5.86)^2 - 18.27 \times 18.44} = \frac{5.86}{-302.7} = -0.01937$$

$$M_c = \frac{b_1}{a_1 a_2 - b_1 b_2} = 0.01937$$

$$C_p = \frac{a_1}{b_1 b_2 - a_1 a_2} = -0.06037$$

$$k_c = \frac{M_p}{M_c + C_p} = \frac{-0.01937}{-0.04100} = 0.4724$$

Total Effect on Line P.

At the instant when line A has its maximum pressure to earth—

$$e_a = E = 22\,000 \times \frac{\sqrt{2}}{\sqrt{3}} = 17970$$

then, $e_b = -8985 + j\,15\,570$

$e_c = -8985 - j\,15\,570$

and $e_{ps} = (17\,970 \times 0.6955) - (8985 \times 0.574) + (j\,15\,570 \times 0.574)$.
$- (8985 \times 0.4724) - (j\,15\,570 \times 0.4724)$

$= 12\,500 - 9400 \times j\,1582$

$= 3100 + j\,1582$

$= 3475/27^\circ\,5'$ volts.*

Line Q.

1. With respect to A :—

$$a_1 = 2 \log_e \frac{AA^1}{r} = 18.44$$

$$a_2 = 2 \log_e \frac{QQ^1}{r} = 2 \log_e \frac{167}{0.0173} = 18.37$$

$$b_1 = b_2 = 2 \log_e \frac{QA^1}{QA} = 2 \log_e \frac{171.1}{6.02} = 6.7$$

$$M_q = \frac{b_1}{b_1 b_2 - a_1 a_2} = \frac{6.7}{(6.7)^2 - 18.44 \times 18.37} = -0.0228$$

$$M = \frac{b_1}{a_1 a_2 - b_1 b_2} = 0.0228$$

$$C_q = \frac{a_1}{b_1 b_2 - a_1 a_2} = \frac{18.44}{(6.7)^2 - 18.44 \times 18.37} = -0.06275$$

$$k_a = \frac{M_q}{M_a + C_q} = \frac{-0.0228}{0.0228 - 0.06275} = \frac{-0.0228}{-0.03995} = 0.5707$$

2. With respect to B :—

$$a_1 = 2 \log_e \frac{BB^1}{r} = 18.37$$

$$a_2 = 2 \log_e \frac{QQ^1}{r} = 18.37$$

$$b_1 = b_2 = 2 \log_e \frac{QB^1}{QB} = 2 \log_e \frac{167.1}{5.0} = 7.02$$

$$M_q = \frac{b_1}{b_1 b_2 - a_1 a_2} = \frac{7.02}{(7.02)^2 - (18.37)^2} = -\frac{7.02}{25.39 \times 11.35} = -0.02436$$

$$M_b = \frac{b_1}{a_1 a_2 - b_1 b_2} = 0.02436$$

$$C_q = \frac{a_1}{b_1 b_2 - a_1 a_2} = -\frac{18.37}{25.39 \times 11.35} = -0.06375$$

$$k_a = \frac{M_q}{M_b + C_q} = \frac{-0.02436}{-0.03939} = 0.6183$$

3. With respect to C :—

$$a_1 = 2 \log_e \frac{CC^1}{r_a} = 18.27$$

$$a_2 = 2 \log_e \frac{QQ^1}{r_q} = 18.37$$

$$b_1 = b_2 = 2 \log_e \frac{QC^1}{QC} = 2 \log_e \frac{163.1}{6.02} = 6.6$$

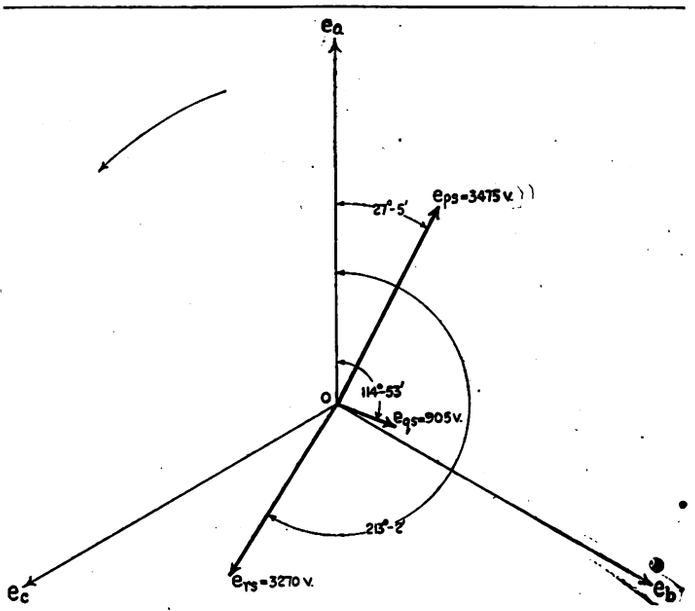

Fig. 2.—Vector representation of electrostatically induced pressures on lines P, Q and R.

$$M_q = \frac{b_1}{b_1 b_2 - a_1 a_2} = \frac{6.6}{(6.6)^2 - 18.27 \times 18.37} = -0.0226$$

$$M_c = \frac{b_1}{a_1 a_2 - b_1 b_2} = 0.0226$$

$$C_q = \frac{a_1}{b_1 b_2 - a_1 a_2} = -0.06254$$

$$k_c = \frac{M_q}{M_c + C_q} = \frac{-0.0226}{-0.03994} = 0.5656$$

Total Effect on Line Q.

$e_{qs} = (17970 \times 0.5707) - (8985 \times 0.6183) + (j\,15570 \times 0.6183)$
$- (8985 \times 0.5656) - (j\,15570 \times 0.5656)$

$= 10260 - 10640 + j\,820$

$= -380 \times j\,820$

$= 905/114^\circ\,53'$, volts. (See Fig. 2.)

Line R.

1. With respect to A :—

$$a_1 = 2 \log_e \frac{AA^1}{r} = 18.44$$

$$a_2 = 2 \log_e \frac{RR^1}{r} = 2 \log_e \frac{159}{0.0173} = 18.27$$

$$b_1 = b_2 = 2 \log_e \frac{RA^1}{RA} = 2 \log_e \frac{167.1}{8.94} = 5.86$$

$$M_r = \frac{b_1}{b_1 b_2 - a_1 a_2} = -0.01937$$

$$M_a = \frac{b_1}{a_1 a_2 - b_1 b_2} = 0.01937$$

$$C_r = \frac{a_1}{b_1 b_2 - a_1 a_2} = -0.06092$$

$$k_a = \frac{M_r}{M_a + C_r} = \frac{-0.01937}{-0.04155} = 0.4662$$

2. With respect to B :—

$$a_1 = 2 \log_e \frac{BB^1}{r} = 18.37$$

$$a_2 = 2 \log_e \frac{RR^1}{r} = 18.27$$

* This result means that the total pressure e_{ps} induced electrostatically on line P by lines A, B and C, has a maximum (peak) value of 3475 V and its vector lags 27° 5′ behind the pressure vector representing e_a (see Fig. 2).

$$b_1=b_2=2\log_e\frac{RB^1}{RB}=2\log_e\frac{163\cdot1}{6\cdot02}=6\cdot6$$

$$M_r=\frac{b_1}{b_1b_2-a_1a_2}=-0\cdot0226$$

$$M_b=\frac{b_1}{a_1a_2-b_1b_2}=0\cdot0226$$

$$C_r=\frac{a_1}{b_1b_2-a_1a_2}=-0\cdot06288$$

$$k_b=\frac{M_r}{M_b+C_r}=\frac{-0\cdot0226}{-0\cdot04028}=0\cdot561$$

3. With respect to C:—

$$a_1=2\log_e\frac{CC^1}{r}=18\cdot27$$

$$a_2=2\log_e\frac{RR^1}{r}=18\cdot27$$

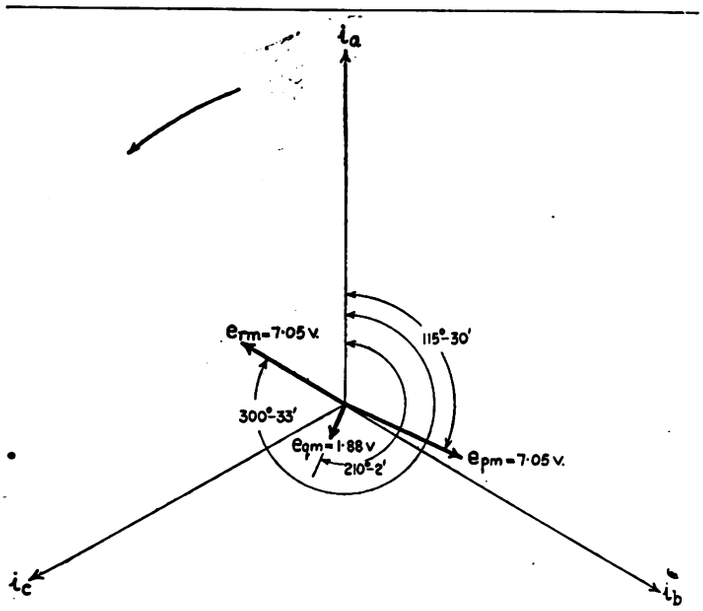

Fig. 3.—Vector representation of electromagnetically induced pressures on lines P, Q and R.

$$b_1=b_2=2\log_e\frac{RC^1}{RC}=2\log_e\frac{159\cdot1}{4\cdot0}=7\cdot366$$

$$M_r=\frac{b_1}{b_1b_2-a_1a_2}=\frac{7\cdot366}{(7\cdot366)^2-(18\cdot27)^2}=-\frac{7\cdot366}{25\cdot64\times10\cdot9}=-0\cdot02635$$

$$M_e=\frac{b_1}{a_1a_2-b_1b_2}=0\cdot02635$$

$$C_r=\frac{a_1}{b_1b_2-a_1a_2}=-\frac{18\cdot27}{25\cdot64\times10\cdot9}=-0\cdot06536$$

$$k_e=\frac{M_r}{M_e+C_r}=\frac{-0\cdot02635}{-0\cdot03901}=0\cdot6754$$

TOTAL EFFECT ON LINE R.

$$e_{rs}=(17970\times0\cdot4662)-(8985\times0\cdot561)+(j\ 15570\times0\cdot561)$$
$$-(8985\times0\cdot6754)-(j\ 15570\times0\cdot6754)$$
$$=8380-11120-j\ 1780$$
$$=-2740-j\ 1780$$
$$=3270/213°\ 2',\ \text{volts. (See Fig. 2.)}$$

With the lines P, Q and R disconnected, there is therefore no statically induced pressure in excess of that for which the lines are designed. The results of the electrostatic effects of the 22 kV line upon the 6·6 kV line are summarised in Table II. If apparatus having a sufficiently low impedance is connected to the 6 600 V lines, equalising capacitance currents will flow. The remaining pressure due to electrostatic induction from lines A, B and C on lines P, Q and R will then be the vectorial sum of e_{ps}, e_{qs} and e_{rs}. Thus, if e_s be the resultant electrostatically induced pressure—

$$e_s=e_{ps}+e_{qs}+e_{rs}$$
$$=(3100+j\ 1582)+(-380+j\ 820)+(-2740-j\ 1780)$$
$$=-20+j\ 622$$
$$=622/90\ \text{deg. volts.}$$

NOTE.—This resultant induced pressure vector lags 90 deg. behind the pressure vector representing e_a.

ELECTROMAGNETIC EFFECTS.

These effects are based upon the assumption of 100 amperes (peak) i_a, i_b, i_c, in lines A, B and C respectively.

LINE P.

Inductance of line P with respect to lines A, B and C.

$$=\left(\log_e\frac{BP\times CP}{AP^2}+j\sqrt{3}\log_e\frac{CP}{BP}\right)\times10^{-9}\times160934\ \text{henrys per mile.}$$

$$=\left(\log_e\frac{6\cdot02\times8\cdot94}{4\cdot0\times4\cdot0}+j\sqrt{3}\log_e\frac{8\cdot94}{6\cdot02}\right)\times10^{-9}\times160934$$
$$=(1\cdot215+j\sqrt{3}\,0\cdot3963)\times10^{-4}\times1\cdot60934$$
$$=(1\cdot955+j\ 1\cdot104)\times10^{-4}\ \text{henrys per mile}$$

If e_{pm} be the maximum (peak) value of the pressure induced electromagnetically on line P by lines A, B and C.

$$e_{pm}=j\,I\,\omega\,L\ \text{where}\ \omega=2\pi n=314\cdot16$$
$$e_{pm}=j\times100\times314\cdot16\ (1\cdot955+j\ 1\cdot104)\times10^{-4}$$
$$=-3\cdot468+j\ 6\cdot14$$
$$=7\cdot05/115\ \text{deg. }30',\ \text{volts per mile.}*$$

*This result means that the total pressure e_{pm} induced electromagnetically on line P by lines A, B and C has a maximum (peak) value of 7·05 V and its vector lags 115°–30′ behind the current vector representing i_a (see Fig. 3).

LINE Q.

$$\text{Inductance}=\left(\log_e\frac{BQ\times CQ}{AQ^2}+j\sqrt{3}\log_e\frac{CQ}{BQ}\right)\times10^{-9}\times160934\ \text{henrys per mile.}$$

$$=\left(\log_e\frac{5\cdot0\times6\cdot02}{6\cdot02\times6\cdot02}+j\sqrt{3}\log_e\frac{6\cdot02}{5\cdot0}\right)\times10^{-9}\times160934$$
$$=(-0\cdot1855+j\sqrt{3}\,0\cdot1855)\times10^{-9}\times160934\ \text{henrys per mile}$$
$$e_{qm}=j\times100\times314\cdot16\ (-0\cdot2985+j\sqrt{3}\,0\cdot2985)\times10^{-4}$$
$$=-1\cdot625-j\ 0\cdot9374$$
$$=1\cdot88/210\ \text{deg. }2',\ \text{volts per mile. (See Fig. 3.)}$$

LINE R.

VOLTAGE CONTROL OF LARGE ALTERNATORS.*

Problem of Maintaining Constant Voltage—Stability and Speed of Response—Grading of Rheostats—Alternator Instability—Trend of Alternator Design.

By H. W. TAYLOR, M.I.E.E.

THE problem of maintaining constant voltage on a generator, when large loads are frequently thrown on and off, is still met with in some mills and factories which still generate their own power.

With power supply from capital stations, incidental variations in legitimate load have become relatively small. But system faults constitute changes of load which require adjustment of the machine excitation.

When a severe fault occurs close to the generating machinery in one section, it is usually impracticable to maintain full

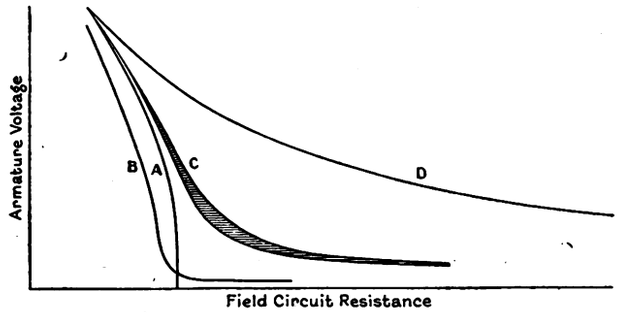

Fig. 1.—Curves illustrating grading of rheostats for different types of exciter.

voltage. When, however, a fault occurs at a distant point, or in an adjacent section, it is usually desired that the excitation on the generators be increased quickly to the limit of the exciter capacity, so as to maintain the supply voltage as near to normal as possible. Side by side with increase in size of system, there is a tendency to increase sizes of generating units. The magnet systems require larger stores of electro-

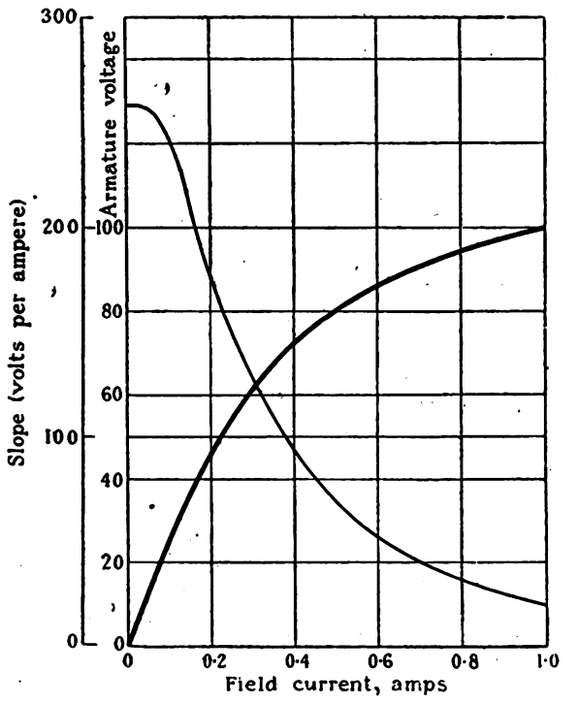

Fig. 2.—Typical exciter saturation curve.

magnetic energy, which tends to a longer time in responding to changes in the excitation.

The study of the machine voltage control requires consideration of " stability " and " speed of response," both separately and in combination. Stability determines whether the drop or rise in voltage becomes cumulative after certain load changes. Response determines the quickness with which voltage can be restored.

Voltage control is nowadays required to be automatic within a few per cent. of normal value. As direct manipulation of the alternator field circuit is not practicable, the control of the generator voltage is effected by changes in the exciter field circuit. It is convenient to consider firstly, the exciter alone, secondly, the generator alone, and finally the two in combination as a generating unit.

The author then proceeds to review in turn exciter stability, exciter response, alternator stability, alternator response, and the combined response of alternator and exciter.

Exciter load instability is caused by the load current in the armature overpowering the field excitation. In general, the exciter load current and voltage increase together, except for increases in resistance due to the temperature of the alternator field coils, which may attain 33 per cent. This feature, and the saturation, help to make the exciter stable at heavy loads. But the air gap should be such that at low exciter voltage the field ampere turns are greater than the corresponding armature reaction ; also equalising connections should be provided on the armatures where lap windings are used. Separate excitation of the exciter field is a preventive against complete reversal. By the aid of several diagrams, illustrating the relation between armature voltage and field current and the grading of rheostats (Fig. 1), the author next discusses the inherent instability of exciters. Various attempts to stabilise the shunt machine at lower voltages are mentioned, such as premature saturation in short lengths of the magnetic

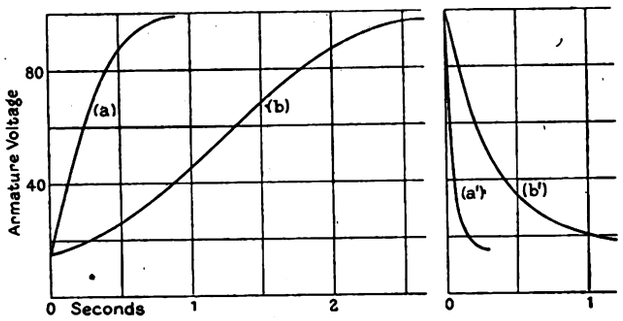

Fig. 3.—Growth and decay of voltage with shunt and separately excited exciters (exciter time constant = 1 sec.)

circuit, or the provision of an initial voltage independent of the shunt field circuit. Various methods of carrying out these two ideas are illustrated in the original paper. Exciter response, which is next discussed, may be defined as the rate at which its voltage increases per second when the resistance of its field circuit is changed. The response figure at any voltage is calculated by dividing the ultimate increase in exciter voltage by the time-constant of the exciter. The author presents a typical saturation curve, giving a maximum voltage of 100 with an excitation of one ampere (Fig. 2). The time-constant of a typical exciter when separately excited and unsaturated is taken at one second, and the growth of voltage of such a machine is illustrated in the original paper. Response curves for a separately excited exciter and of the same machine when shunt excited are compared (Fig. 3). The maximum available exciter voltage should be at least 15 per cent. greater than that required for maximum excitation of the generator. The use of curves for a particular exciter is next illustrated, and the effect of solid poles, etc., upon exciter time-constants is briefly discussed. A reference is also made to " super-excitation " by some special process other than conversion to separate excitation with the 15 per cent. margin in voltage mentioned above. The procedure may involve using a larger number section of conductor with a corresponding smaller number of turns for the field spools or the provision of a higher voltage for separate excitation. The time-constant of the exciter is not altered, but the possible voltage change is increased.

The next point considered is the inherent instability of the alternator. If an alternator is connected to a circuit which consists largely of capacity (e.g., unloaded long overhead lines or underground cables), it may be self-exciting owing to leading current in the stator windings acting as a magnetising current upon the magnetic circuit. The alternator will then be inherently unstable, and the voltage may rise to a

* Abstract of a paper read before the Institution of Electrical Engineers.

Digitized by Google

value limited only by saturation. The condition may arise in high potential testing when a smaller alternator is used to provide current for testing a large stator, and it has been noticed on some commercial circuits abroad. It is unlikely to arise in this country, but it is suggested that, in specifying power factors for machines, the capacity current required in distribution should be included, and that manufacturers should base the stator dimensions upon kW rather than kVA rating, longer air gaps being used when high-power factors are specified. It is possible to say at what value for the external capacitance the alternator will build up, and the author illustrates this process by the aid of diagrams, one of which is reproduced (Fig. 4).

When the capacity is absent or negligible, and with a constant excitation, load conditions may produce a drop in voltage and the alternator may become unstable. If there is a corresponding drop on load current (e.g., with a purely lighting load), a steady, but reduced voltage will result. But if the kVA demand remains the same with falling voltage (as with an induction-motor load), an additional load may not be sustained, and the alternator voltage may fall to zero unless the excitation is adjusted, preferably by automatic means. The usual condition of service is probably intermediate between these two conditions.

The foregoing considerations affect the trend of alternator design. The tendency in turbo-alternator design has been to design with higher armature reactions than those con-

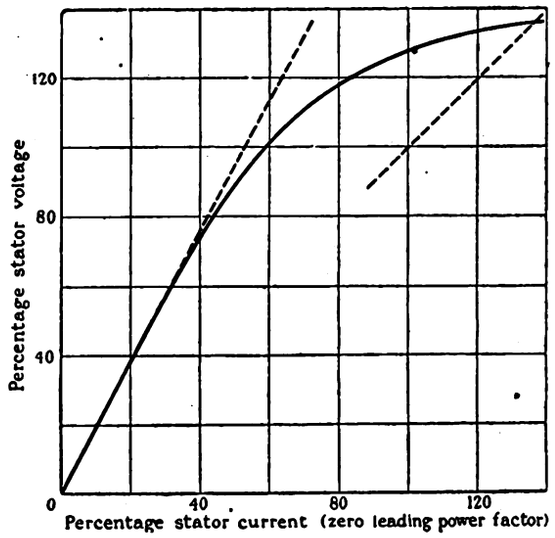

Fig. 4.—Building up of stator voltage with capacity load.

templated when turbines came into use about 25 years ago. Typical figures for modern machines are: reactance, 16 per cent.; armature reaction, 160 per cent., giving a synchronous reactance of 176 per cent. These characteristics apply to machines designed to work at 0·8 power factor. In American designs the armature reaction percentage is less, but even higher values have been adopted with success on large systems in England. The evolution is the result partly of the search for a design which will be cheaper per unit of rating and partly of keeping pace with turbine design. The turbo-alternator has become more of a "copper" machine and less of an "iron" machine. Performances of a typical modern turbo-alternator are illustrated (Fig. 5). In a case mentioned, the maximum load at 0·8 power factor requires 2·63 times the excitation for open circuit normal voltage, and assuming a temperature rise of 90 deg. C. on the rotor-winding copper, as measured by resistance between no load and full load, the exciter will need to be stable over a range of 1:3·5. With a margin of 15 per cent. between the maximum excitation voltage and the maximum exciter voltage available a shunt exciter must be stable at 24 per cent. of its maximum voltage. With the older type of machine the inherent voltage regulation of an alternator (i.e., the voltage rise when full load is thrown off, excitation remaining constant at full load value) was usually guaranteed not to exceed 22 per cent. with 0·8 power factor. With present day machines, the value may be about 45 per cent. The corresponding figures for voltage drop, when the full load circuit is suddenly connected to the alternator terminals, may be put at 30 per cent. for the older machines, and 60 per cent. for those of the present day. In the original paper, a family of load saturation curves at 0·8 lagging power factor for ¼c, ½, ¾ and ⅘, and full load at normal voltage are presented. From these corresponding volt-ampere curves may be derived. Such characteristic curves are useful in determining the change in voltage arising from a change in load, and illustrations of this procedure are given.

In the next section, devoted to alternator response, it is remarked that the voltage drop in the alternator voltage

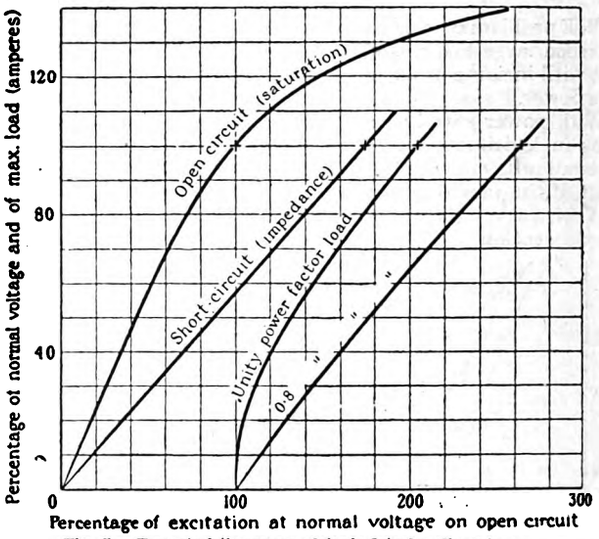

Fig. 5.—Characteristic curves of typical turbo-alternators.

when load is thrown on is calculated in two steps. The first involves the reactance of the stator winding, assuming that constant voltage is available, and the percentage voltage absorbed in the stator reactance before and after the load change is determined. A diagram is presented showing the reactance voltage change for changes of 0·8 power factor load for a machine with 16 per cent. reactance is shown. When a full load is thrown off, the voltage rise is 11 per cent., or if full load is thrown on when the machine is on open circuit, 9·8 per cent. In general the change in load current and voltage at the alternator terminals occur almost simultaneously with the change in the load circuit conditions. The second part of the calculation takes account of the magnetising effects of the opposing stator and rotor currents. Each change in load produces a change in the main flux and therefore in

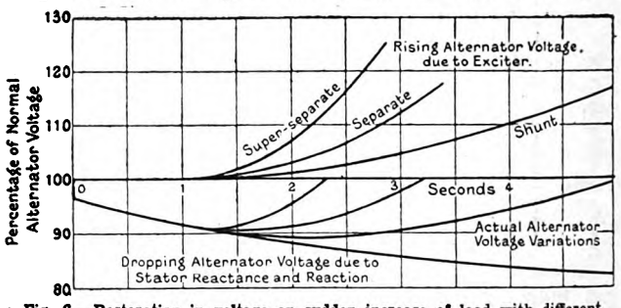

Fig. 6.—Restoration in voltage on sudden increase of load with different methods of exciter excitation.

the machine voltage. The time-constants of alternators on open circuit are briefly discussed. It is suggested that for large 50-cycle turbo-alternators the time-constant may be taken as 7·2 seconds for 3 000 r.p.m. machines and 8·4 seconds for 1 500 r.p.m. machines of the plate-rotor construction, and 8·4 seconds for 1 500 r.p.m. machines of the solid rotor-construction. Time-constants on load for various types of machines, working on 0·8 power factor, are also illustrated. In order to illustrate alternator response the author presents a curve showing the restoration in voltage after increasing the load suddenly from 40 to 80 per cent. (power factor 0·8) with different methods of exciter excitation (Fig. 6).

The final section explains how, by the aid of curves previously presented, it is possible to calculate (1) the drop in voltage due to armature reaction when the exciter does not respond, and (2) the rise in armature voltage due to the exciter if armature reaction were not effective. Average curves are drawn to show that a maximum drop of voltage-drop of 8 per cent., and a time of 3·8 seconds to restore the voltage completely to normal in the case of the shunt exciter, may be expected. For separate excitation, the corresponding figures are 5·5 per cent. voltage drop and 1·8 second for restoration, and for super-excitation, 4·5 per cent. drop and 1·0 second.

UNEMPLOYMENT AND WORK—V.

Official Unassistance.

By SIR ERNEST J. P. BENN.

"SOMETHING must be done." There is a satisfaction about this phrase which explains our habit of using it on all occasions, as a study of political speeches and newspaper articles will show. Whatever the subject of the speech, the regular method is to enlarge upon the troubles and the difficulties and then the whole audience applauds when the table is thumped and the orator declares that we will no longer brook delay and that "Something must be done." The next step is to set official machinery in motion, and years later we discover to our cost that the "doing" has been more in the nature of talk than action.

Those who have no practical experience of business methods find it hard to understand that official action is the slowest, most expensive, and generally most inefficient of all forms of action. This is necessarily so, even when the official method is obviously the best. For instance, education is accepted as a proper sphere for government activity, but that does not alter the fact that it costs a great deal more to educate a child in a government school than by the use of any other agency. This is as it should be and is quite proper. Public money must be spent with due delay and strict regard to forms and rules which have no bearing upon private disbursements. When, however, public opinion forces government action in the field of commerce or industry, a double damage is always done. The first effect is to drive off the field all the private individuals who would ordinarily be at work upon it. They can proceed with their activities so long as they are dealing with other private individuals, all subject to the same limitations and all possessing the same prospects. When, however, the government or the local authority enters the field and begins to make bargains without the healthy influence of the risk of personal loss, others who are subject to that influence have no alternative but to leave things alone.

The first effect, therefore, of deciding that "Something must be done" officially, is always to stop somebody else doing anything. Unemployment is created from the moment that officials first put in an appearance in any market. Then, if and when that appearance is followed by real action, the pace is slower, the price is higher and the loss almost inevitable. The question is too big to discuss in this connection, but it should be remembered that official action, if wise, is always a last resource; that the public authority method is the worst and not the best way of satisfying a practical economic need. Public action half empties the private purse and closes up the other half.

In the matter of unemployment, we know that discharges are made with far less compunction since insurance was introduced than before. An employing company, having paid perhaps thousands of pounds to the insurance funds, thinks itself fully justiffed in relying on the fund to relieve it of obligations which had previously been regarded as its own. The dole is commonly supposed to encourage the spirit of idleness among the workers. I doubt very much whether that aspect is nearly so serious as the tendency, inherent in its very nature, to encourage employers to leave to the State obligations which the State in its folly has been vain enough to assume.

The American Attitude.

America helps us to understand this very difficult dilemma. She resolutely declines to take any official notice of unemployment, and deliberately leaves the distress created by bad trade to the care of private charity. A talk between an average American citizen and an average Englishman on this matter always discloses very wide differences in outlook. The American does not think himself a hard-hearted materialist, but he regards us as innocent fools. I have had the advantage of long and earnest conversations with unemployed in America and have talked with the lowest of the down-and-outs in East Side New York, Pittsburg, Chicago and elsewhere. From the very bottom upwards, these men regard their difficulties as mere stepping stones to fortune. There is in America a total absence of that reliance on superior authority which is the characteristic and the curse of the post-war Englishmen. It is hard to blame the victims of our way of looking at things. The fault is with the public opinion, which seems to delight in creating and fostering a spirit of helplessness and hopelessness. But wherever the blame, the effect is the same—millions of people who desire to be up and doing are discouraged by the suggestion that the real responsibility is with others.

The Labour Exchange is a dangerous drug, undermining the vitality of both employers and employed. It has failed to promote employment; the theory of mobility upon which it was founded has disappeared; the principle of insurance has ceased to be regarded as serious; and it is rapidly assuming the character of a more expensive form of Poor Law relief. But the mere shutting up of the Ministry of Labour, desirable as I believe that course to be, would not of itself remove our difficulties. We have surrounded the individual man with obstacles to work. We not only tell him that it is somebody else's job to find him a job, but we add, in order to strengthen that unnatural proposition, all sorts of prohibitions and restraints which bar the way of the enterprising fellow who desires to be without official assistance.

Obstacles to Self-Help.

Nobody knows of the numerous hardships of this kind better than the genuine unemployed himself. If he tries to do a little natural buying and selling he may find himself in conflict with the police over a hawker's licence or, failing that, he will be up against some trade ring. To give only one example: if he thinks he might sell a few books, no publishers will give him supplies until the Federated Booksellers or Associated Publishers have decided that he is qualified to receive trade terms, a decision which they are not very likely to take. The same sort of difficulties crop up in almost any trade he may choose. If his inclinations are of a more simple character, and he approaches a building job or a printing office, he will find his prospects blocked by the absence of a ticket which some labour monopoly declines to issue to him. If he tries to emigrate he will find so many official organisations to help and examine and qualify him, that he will give up the attempt in despair. Whatever he decides to try, he is absolutely forbidden by popular modern economic heresy from getting into any job or market by the natural process of cutting the price. A trade board will get on his heels if he attempts any homework, and, above all, unless when he goes to draw his weekly dole he can swear that he has been completely idle, he loses the pittance on which he now relies. It is rather difficult in these circumstances to blame the unemployed; they are the product of our own plans for improving the condition of the world. They are part of the price we pay for social reform, and the more reforming we do, the greater will be the number of those who rank as unemployed.

If arrangements made by the State provide for the payment of benefits in given circumstances, it is natural, and even in some circumstances right and proper, for the citizen to arrange his affairs in such a way as to qualify for those benefits. Who, for instance, can quarrel with the girl who, on leaving her employment to get married, requests her employer to go through the formality of a dismissal in order that unemployment pay may be added to the new family budget? The thing is natural and inevitable. As time goes on, increasing numbers are always finding ways to get themselves within the range of these benefits, and they have every bit as much right to adopt this course as has the tradesman, who, faced with two ways of doing the same transaction, selects the one which will involve the lower taxation. If a motor manufacturer can regulate the length of the piston and the size of the bore to reduce the tax, the labourer is equally entitled to plan his work with a view to advantages offered and given by a badly run State.

These aspects of a difficult and complicated problem come into better perspective when we consider that practically none of all the talk and writing about employment makes any direct appeal to the employed or unemployed themselves. It appears to be agreed on all hands that they are the helpless victims of circumstances beyond their control and hardly a word is said of their own responsibility, or still less of their own potentialities. Human nature being what it is (a dangerous and forbidden phrase) the vast majority of the workers ignore our official folly and look after themselves, a simple little natural fact that saves us from complete disaster. But nobody seems to imagine that among the million-and-three quarter

Digitized by Google

recipients of State allowances there would be even a minority who would respond to any form of encouragement to self-endeavour. Our public policy is clear and definite; we appear to be determined to cultivate the spirit of dependence and to multiply the numbers of those whose conception of citizenship is the right to an income.

This abuse spreads far beyond the limits of the working class, as every day we add to the number and variety of the doles available for people who do not care to stand on their own. Indeed, nobody stands "on his own" in this rationalised world if he can help it. When a local authority makes a road, the cost is covered up in a Treasury grant and most of the things which we do in our corporate capacities are apparently paid for by somebody else. We have fooled ourselves into a condition of complete irresponsibility; the Chairman of the Finance Committee of a County Council boasted recently that 73 per cent. of the county budget was outside the jurisdiction of the Committee, the Council or the county. Wherever one turns, the fashionable tendency to depend upon the State is apparent. I would like to see a return showing the number of young people from the universities and secondary schools who are leading a life of irresponsible security in obedience to the new obsession for organised research. They are all on the dole. As we go on increasing the numbers of those whose conception of the State is as a payer of wages and decreasing the numbers of those who realise that the State can only derive its support from the citizens, so our position must get weaker.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Electrical Progress.

[To the Editor.]

Sir,—It is unfortunate that Colonel Crompton should have prefaced his interesting account of the progress of electricity supply with a disparagement of the knowledge of telegraph engineers at the beginning of the period of which he wrote, circa 1880.

Before that date the Committee of the British Association had formulated the definitions in C.G.S. dimensions of the ohm, the volt, the ampere, and the farad, and had provided material standards for practical use. That work was largely instigated for telegraphic purposes and was shared in by eminent telegraph engineers. The names of some of them—William Thomson, William Siemens, Latimer Clark, Fleeming Jenkin, Ayrton—should suffice to clear the profession of the aspersion of ignorance.

To my own knowledge, from at latest 1874, all P.O. telegraph instruments, rheostats, and condensers, had their resistances and capacities marked in ohms and micro-farads; received currents in line tests were measured in milli-amperes (an older name for the ampere was the weber), and battery values denominated in volts.

References to contemporary technical literature will confirm these statements. Some books in my possession which afford confirmation are:—

* "Culley's Handbook of Telegraphy, 1874, 6th edition.

"Fleeming Jenkin's Magnetism and Electricity, 1880. 5th edition.

Preece and Sievewright's "Telegraphy," 1884. 3rd edition.

Kempes "Handbook of Electrical Testing." 1884. 3rd edition.

The fact is that heavy electrical engineering came into a rich heritage from the telegraph engineers. A contemporary authority said with truth that there was more scientific knowledge and practice of electricity in the cable test rooms than in all the University classes. The heritage included:—a system of units on a scientific basis; material standards of the more important units of respectable accuracy; methods of electrical measurement for practical use in great variety and of high accuracy; instruments suitable for those measurements; knowledge of the electrical properties of some important materials (e.g., the importance of a high degree of purity in copper); all of which were, and are still, of incalculable value to the new art.

As to the views of those consulted by Colonel Crompton upon the relation between the resistances and voltages of dynamos, it is permissible to conjecture that there was a misunderstanding between questioner and questioned. The design of dynamos was as much a new problem for telegraph engineers as it was for Colonel Crompton himself.

I may add that I wrote a little note on the debt of heavy electrical engineering to telegraph engineering for the Jubliee number of the Journal of the I.E.E. which I hoped had laid to rest Colonel Crompton's imputation to telegraphic ignorance.—Yours faithfully,

Henry M. Sayers.

Streatham, S.W.16.
May 24.

* R. S. Culley, first Chief Engineer of P.O. Telegraphs.

Kaplan Turbines.

[To the Editor.]

Sir,—In your issue of May 16 last, Mr. J. J. C. Berkeley mentions the Kaplan turbines at Passau on the Danube, rated for 9 200 H.P. max. A similar station will be ready for use this year near Rheinfelden in Germany, containing two aggregates with Kaplan turbines, each for about 33 000 H.P. at 75 r.p.m. These two turbines are said to be the largest of their kind at present, but it is interesting to note that in 1925, i.e., five years earlier, an installation was erected for the Swedish Government at Lilla Edet on Göta älv, with turbines for a continuous output of 10 000 H.P. at 62·5 r.p.m., working on a head of only 6·5 metres and a water consumption of 150 cubic metres per second. One of these turbines was of the Kaplan type while the other two were of the Lawaczeck type. The efficiency of the Kaplan turbine reached the high values of 90 to 92% at test for loads from 4 800 to 10 000 H.P. and the same full load value was measured for the other turbines. The direct connected three-phase generators, rated for 10 000 kVA at 25 cycles, 10 000–11 000 volts and 7 p.f. were all of Asca manufacture and at this time the largest vertical generators in Europe.—Yours faithfully,

H. Wahlberg,
Civil Ingeniör.

Västeras, Sweden.
May 23.

I.E.E. Wiring Regulations.

[To the Editor.]

Sir,—I should be glad if you would draw attention to the revised Supplement to the Ninth Edition of the I.E.E. Regulations for the Electrical Equipment of Buildings. This supplement relates to radio receiving and valve amplifying apparatus connected to the supply mains, and is in substitution for the corresponding supplement issued in June, 1928, which is now withdrawn. Copies can be obtained, free of charge, on application to the Secretary of the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2.—Yours faithfully,

P. F. Rowell,
Secretary.

The Institution of Electrical Engineers,
Savoy Place, W.C.2.
May 23.

Benn Brothers' Jubilee.

[To the Editor.]

Sir,—May I congratulate you on your Publishers' Jubilee History, which is very interesting. I think the nation owes a great deal to Benn Brothers.—Yours faithfully,

C. Turnbull,
Borough Electrical Engineer.

North Shields,
May 23.

RAILWAY SIGNAL ENGINEERS.

The seventeenth annual report of the Institution of Railway Signal Engineers, contained in Part II of the Proceedings, 1929–30, just issued (price to non-members 7s. 6d.), gives the membership on January 1, 1930, as 756, an increase of 25 during the year.

The Council is considering the best means of administering the legacy of £1 000 bequeathed to the Institution by the late Mr. W. J. Thorrowgood, a Past President, for the purpose of founding a Thorrowgood Scholarship.

Increased use is being made of the Appointments Register by those having vacancies to fill in the signalling world.

The financial position of the Institution continues to improve.

BOOK REVIEWS.

The Practice of Electrical Wiring. (Third and revised edition.) By D. S. MUNRO, M.I.E.E. (London: Electrical Review. Pp. xi+293. 4s. 6d. net.)

Here is a book which will become the "Bible" of the electrical contractor. In it the author sorts out, classifies, explains and comments upon the details of the practice of electrical wiring. Every system of wiring, whether the author approves of it or not, is given its fair share of notice in an entirely unprejudiced manner.

What an excellent thing it would be if all architects could read this book; they might not care for the references to their own work, but they could not well take offence since the strength of the author's arguments can scarcely be contradicted. For one thing, the architect who reads this book will, perhaps, realise what an enormous responsibility he takes upon his shoulders if he relies on no outside expert opinion in designing the electrical installation. Some architects, it is true, are capable of taking this responsibility, but very, very few. The I.E.E. Regulations by no means cover the subject adequately, although they are the best which such a body can produce in view of the fact that they have no parliamentary authorisation to insist on such rules. It is good to hear Mr. Munro's views on craftsmanship, for this point is too often overlooked. Electrical installation work being a comparatively new science, one is apt to forget that science is not everything, and that it must be backed up with handicraft. There is also an impression among many laymen that public supply undertakings, where they carry out wiring work, are more to be trusted than electrical contractors. Listen to what Mr. Munro has to say on this subject:—

"Indoor wiring executed by the workman of a public supply company or corporation (so far as the experience of the writer goes) is commonly worse than that of the average contractor."

Dealing with the question of competitive tenders put out with no regard for anything but price, the author says:—

"The most desirable results are got, as a rule, by employing only skilled labour under the control of a responsible contractor working to the specification of an experienced consulting engineer. The proper registration of these various classes is necessary for their own protection and that of the public."

Hard on the heels of this particular evil of the "lowest tender" comes the evil of customers buying their own fittings and handing these to the contractor to erect. The author points out how absurd it is for a contractor to be expected to be held responsible for the electrical condition of an installation which he has put up where the fittings have been handed to him without consultation.

Architecture forms a chapter to itself, and shows, among other things, that electrical installation work is not the only craft of which the author is master. This chapter, which is, in some respects, the most important in the book from the point of view of propaganda, shows also the vitally important part which the electrical installation plays in any building, and it shows, too, the deplorable neglect of which it is the object at the hands of architects. Let me conclude with a quotation on this subject:—

The author is speaking of the installation in a certain hotel where the space occupied by piping of all kinds actually took up three feet of the basement corridor height, and the steel channel supports were fixed at short intervals right across the passage to form a framework for the pipes. "This particular corridor," says Mr. Munro, "was primarily designed for waiters to convey trays of food to numerous sumptuous dining-rooms, and it was not pleasant to think of the dust-laden upper recesses of the corridor where all the germs were comfortably breeding on the warm piping till destiny or an electric fan decided that they should fall into the soup. Such an important pipe run should have been provided for from the beginning."

D. W. T.

Electric System Handbook. By C. H. SANDERSON. (London: McGraw-Hill Publishing Co.) Pp. 1067. 25s. net.

This book, written in twelve sections, is by a number of American authors, each of whom is an expert at his own particular job. Mr. Sanderson is a capable editor-in-chief, and is responsible for some of the sections. The work may be described as a treatise on the generation and transmission of electrical energy for all purposes. The first section deals with electrical energy and its transmission in a general way: elementary principles of generation are given. Other sections deal with auxiliary electrical equipment and factors influencing choice of equipment. The section on switchboards is valuable, since it deals extensively with the selection of instruments and control and instrument wiring. Generating stations come in for adequate treatment; an interesting portion of this section discusses power station auxiliaries, an important subject from a central station engineer's point of view. The section on the transmission system is well written and deals with the subject from all angles, including the electrical characteristics of transmission. Sub-stations occupy a large proportion of the work; this is necessary since it deals with a.c. and d.c. sub-stations; railway sub-stations have a separate section, in which the characteristics of mercury arc rectifiers are discussed. The section on distribution includes all distribution methods, including street lighting, and installation practice in distribution systems. Details are given of the protection of electrical apparatus, circuits and systems, and inspection and maintenance. The work is well indexed, and as a general work is to be commended.

CYRIL SYLVESTER.

Outline of Costing. By WM. A. SMITH, A.C.W.A. (London: Moore's Modern Methods.) Pp. 110. 5s. net.

Manufacturers desiring to institute a simple and effective system of job costing will find in this book much useful data, both in connection with the allocation of the various charges and the general control of the accounts. Numerous examples and specimen rulings for the different books and forms have been included, and a separate chapter has been devoted to the need for reconciling the costing figures with those recorded in the books of account. The methods to be adopted when materials and stores are requisitioned and issued are dealt with in a manner that will enable the small manufacturer to appreciate the principles involved, while the entries necessary at the termination of the financial year or other accounting period are sufficiently illustrated for all practical purposes. It is true that many points of a more or less controversial nature have been disregarded, but by so doing, the practical daily requirements, as enunciated in the fifteen chapters, can be more readily grasped by the preoccupied employer established in a small way.

S. H. W.

Kraftverstärker. By DR. EUGEN NESPER. Pp. 96. (Leipzig: Hachmeister and Thal.) 4·80 rm.

This book is a reprint of a series of articles on radio amplifiers which appeared early this year in "Radio-Helios," a German export and trade journal. In consequence, the semi-technical, semi-descriptive vein to be expected from such a source is found in the book. A few simple notes on amplification theory are followed by a statement of the desiderata of a good amplifying valve, and the methods of coupling. The remainder of the book deals with details such as supply, assembly, parts, valves, etc., with a data sheet of certain thermionic valves for amplification purposes manufactured by various German firms. The book closes with descriptive notes on large industrial amplifiers and methods of measurement (e.g., of losses, distortion, etc.). The majority of the diagrams are of the line type, a few half-tones being included to illustrate apparatus, and the typography is good.

S. PARKER SMITH.

The Theory of Electrical Artificial Lines and Filters. By A. C. BARTLETT, B.A. (London: Chapman and Hall. Pp. 155. 13s. 6d. net.)

Mr. Bartlett, who is a member of the Research staff of the General Electric Company, has written a general introduction to the theory of artificial transmission lines, line balances, filters and phase shifters, a subject which is of increasing importance in modern telegraphy and telephony, both wired and wireless. Chapters 1, 2 and 3 deal with the general theory of artificial lines and repeated networks, and the remaining chapters, which are concerned with extensions or applications, include treatment of filters and phase shifters, terminal impedance circles and other geometrical aspects of the Homographic transformation, artificial lines related to the uniform line, thermionic valves and the general theory of the multi-stage amplifier. The book will be of considerable service to telegraph, telephone and radio engineers.

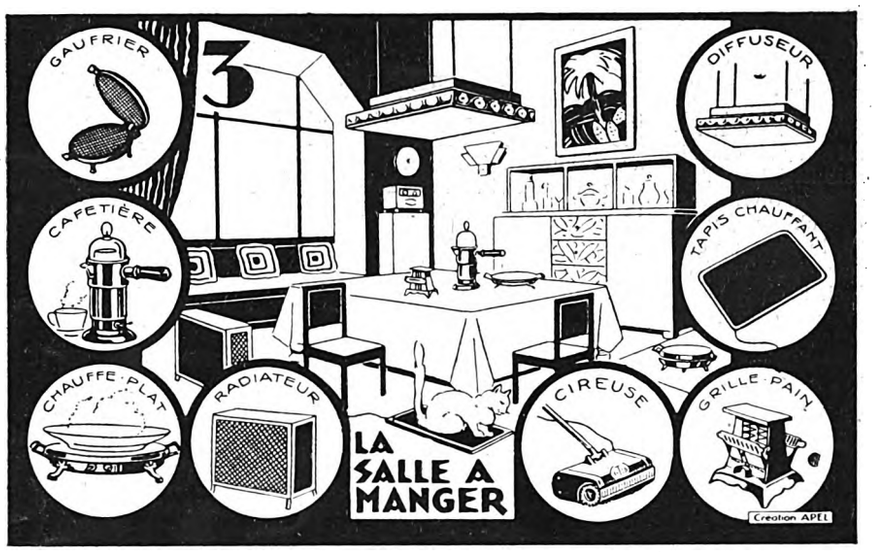
ELECTRICAL LOTTO.

Useful French Publicity Device for Children—A Suggestion for E.D.A.

IMPRESSIONS gained during childhood often have lasting effect, as many political and other propagandists realise. In France there is an organisation, the Société pour le Developpement des Applications de l'Electricité (known generally as the Société Ap-El), of 14, Rue de la Victorie, Paris, IX; it supplies pamphlets, films and utilisation data, and recently developed the ingenious idea of devising a game for children to show the uses of electricity in the home, the office and the farm.



Typical illustrations included in the Electrical Lotto of the Société Ap-El.

The game is in the form of picture Lotto. A number of large cards, 16 in all, are dealt round, each card having a general view showing appliances in place. The cards include the drawing-room, dining-room, kitchen, bedroom and bathroom, the office of "papa" and the laundry. Four cards cover the farm—the dairy with churns, and so on; the machinery shed with a thresher, winnowing machine and cyder press, farm tools, circular saw and grindstone; the cow shed, with milker, sheep shearer, and hen house with electric brooder and electric light, and what is humorously termed the kitchen for the animals, with chaff cutter, root cutter, and so forth. Each piece of apparatus, besides being shown in the main picture, is also shown in a circle which has to be covered by a cardboard counter with the name of the appliance on it. The cards are dealt round, the counters taken out of the bag, one by one, and called out. The sharp player spots the right picture, and the one who fills up all the circles first wins the game. The card illustrated shows the dining-room with coffee pot, plate warmer, radiator, floor polisher, toaster, diffuser and foot warmer.

The Ap-El society supplies these to power authorities which send them to school teachers for use in class or as prizes. Experience shows that the parents take quite an interest in the game.

Printed in a folder, giving the rules of the game, is a list of articles illustrated with a description of the appliance or its virtues in a few words; for example, of the "aspirateur" (suction cleaner) it is stated "the broom only displaces the dust, the suction cleaner puts it in a bag." The electric iron is "always ready for work and is clean," and so on. After playing the game two or three times a child will know the names of a score of electrical objects and will point them out with pride to parents and others when seen in a shop window.

It might be a happy idea for the E.D.A. to get out something of the same kind, but the game in French, as it stands, might become popular in high schools and private families as a valuable method of learning French, on the one hand, and useful to British supply authorities at the same time as an introduction to electricity in the home. Enterprising supply undertakings in this country might obtain some sets from the introducers and send them to secondary and high schools for use as an amusing form of French lesson.

MICA SUPPLIES.

Canadian and Madagascar Amber—The Largest Mica Firm in Europe.

IN connection with the article on "Varieties and Uses of Mica," by Mr. A. R. Dunton and Mr. A. W. Muir, which appeared in THE ELECTRICIAN of May 9, Messrs. Attwater and Sons, of Preston, ask us to state that over thirty years ago they were importing mica and supplying to the Brush Co. They add:—

"When the English Electric Co. started in Preston some thirty years ago we supplied all their mica for many years and the same with the British Westinghouse Co., from the moment they started, and the British Thomson Houston Co.; for many years we could truthfully say that one could not sit down in an electrically propelled vehicle in the United Kingdom that was not driven by a motor the copper bars of which were not insulated with Canadian Amber mica which we imported direct from Canada in the cob form or in thumb trimmed slab and trimmed—split and cut in our factory. The London County Council's first tramways, the Manchester, Birmingham, Liverpool, and Glasgow Tramways, the first L. and Y. electric train, the first North Eastern trains, were all insulated with such Canadian Amber mica. When the building of the Westinghouse works was begun Mr. Crumpton, the first purchase agent, gave us a three years' contract for Canadian Amber mica splittings and this was continued until Mr. Shroeder took charge, when, on the score of economy, he substituted India mica splittings.

"From 1902 up to 1914 we imported direct from Canada into Liverpool over 90% of the total sea-borne mica mined in Canada. We have also been importing mica direct from Madras and Calcutta for over 25 years, and we think that we can safely say that over 50% of the mica used by the Westinghouse Co., the British Thomson-Houston Co., The English Electric Co., during the past 25 or more years was imported direct and supplied direct to these firms by ourselves.

"We were, during the war, the only house in the United Kingdom with a permit to import mica, other than the Government agents. Further, we exported over 50% of the total of mica exported during 1914–1918. We were shipping on blank orders all the mica we could spare to France and to the United States. We were shipping five tons per month to the Italian Government aeroplane works alone. For three years we took the whole production of the Madagascar mines and we have at all times in our warehouses at Preston more Madagascar Amber mica than exists in the whole of the public and private warehouses in London

"We have one very choice and large supply of Madagascar Amber that gives a breakdown test nearly equal to the best Ruby. Tests made at the English Electric Co.'s works recently for the Russian Government on this mica supplied by us gave an average puncture test as follows:—

Film	·005" average breakdown	11 500 V.
	·007" " "	16 000 V.

"As we carry a stock at Preston at all times of £50 000 to £60 000 value of mica, we can claim to be the largest mica house in Europe."

WOMEN IN BUSINESS.

In the charming book "Good Manners and Bad," Mr. Hugh Scott refers to the "numerous class of women engaged nowadays in business and professions who, because they have found an intelligent occupation, or have been given a position of some small authority, apparently feel it necessary to put off all the most engaging attributes of their sex and to make themselves as hard, and generally unattractive as possible."

Mr. Scott seems to have been somewhat unfortunate in his experience of business women. He goes on to say that "women of this class are distinguished in a peculiar degree by that particular kind of bad manners which I am at present discussing. I refer to that kind of rudeness and incivility which proceeds, not from carelessness or ignorance or obliviousness, but is perpetuated deliberately, and has its roots in downright ugliness of disposition and lack of amiability."

NEWS IN BRIEF.

Electric Houses at Liverpool—Tasmanian Views of Australian Tariff—Foreign Cable for Dundee—Automatic Signals on Tramcars—Appointments Vacant.

BIRMINGHAM Corporation requires an assistant to the district mains engineer in the Corporation's rural electricity supply area.

It is stated that 3 000 telephones will be installed in Thames House, Westminster, on its completion in 1931. The building is to be equipped with public call boxes.

Liverpool Electric Power and Lighting Committee is having exhibition model houses in Church Road, Litherland, and at 292, Menlove Avenue, Liverpool, equipped with electrical apparatus.

A chief assistant electrical engineer is wanted in the Birmingham electricity supply department.

The position of power station superintendent at the Scarborough Municipal electricity works is vacant.

A limited wireless telephone service between Great Britain and Java, via Amsterdam, was commenced on May 23.

The number of hired electric cookers connected to the Manchester mains during March last was 95, making 6 114 on circuit.

The 57th meeting of the American Electrochemical Society is being held at St. Louis, Miss., from May 29 to 31, inclusive.

Warwickshire County Council is to obtain tenders for an electric light and power installation in the new county offices, Warwick.

On May 21 the Prince of Wales opened the new physics and chemistry laboratories of the University College of South Wales and Monmouthshire, Cardiff.

The Swansea and Merthyr Joint Mental Hospital Committee has decided that the hospital be heated and lighted by electricity obtained from Swansea Corporation.

The summer programme of the Electrical Association for Women includes a visit to Wimbledon electricity works and showroom on June 4, when Mr. A. E. McKenzie, engineer and manager, will deliver an address on "What Wimbledon is Doing to Introduce Electricity into the Home"; and a motor coach trip to the works of Electrolux, Ltd., at Luton, where Mr. A. H. Hunter will talk on "The Manufacture of Modern Household Electric Appliances," on July 3.

Mr. H. A. Curtis, chairman of the Tasmanian Government Hydro-Electric Commission, recently expressed his views to the Commonwealth Public Accounts Committee on the Australian Government's recent additions to the tariff imposts on electrical appliances. He said if Australian industries followed these tariffs, the remaining Tasmanian areas would never be reticulated, as they could not pay the charges. The capital expenditure on the hydro-electric scheme was £3 592 535, and hundreds of thousands of pounds had been added to the cost by the Customs duties on machinery which had to be obtained from Great Britain and America.

The International Illumination Congress will begin on September 2 and end on September 19, 1931. The Congress is held under the auspices of the International Commission on Illumination, of which Mr. Clifford C. Paterson is chairman, and is being organised by the National Illumination Committee of Great Britain and the Illuminating Engineering Society, London. During the period of the Congress the delegates will visit places of interest in London and afterwards proceed on a tour to Glasgow, Edinburgh, Sheffield, Birmingham and Cambridge, the last week of the Congress being spent at the last mentioned town. The papers and discussions will cover illumination for every purpose.

It is understood that negotiations are proceeding between the Indian Radio Co. and the Indian Government with a view to establishing a wireless telephony service between India and the United Kingdom.

Dundee Electricity Committee decided last week to accept the offer of a foreign firm for the supply of cable, and thus effect a saving of 23%. It is stated that the amount of the lowest British tender was about £500 in excess of the accepted tender.

The Council of the Overhead Lines Association has selected Friday, October 31, 1930, as the date for the Association's annual conversazione. In connection with this function there will be a supper-dance and a display of exhibits relating to the activities of the Association.

An illuminated tramcar was run over various routes during Newcastle-upon-Tyne's Cancer Campaign carnival last week.

A lady cooking demonstrator and showroom assistant is required in the showrooms of Harrogate electricity department.

There is a vacancy for a graduate assistant in electrical engineering in the Wolverhampton and Staffordshire Technical College.

An agreement for establishing a special wireless station for the use of the League of Nations in times of emergency has been signed. The station will be run in normal times by the Radio Suisse Co.

It is understood that Birmingham tramways department is considering the question of adopting automatic light signals to give warning to the drivers of following vehicles when tramcars are about to stop.

The wireless telephone service, which was opened between London and Sydney (N.S.W.) at the beginning of May, has now been extended, at the Australian end, to most parts of New South Wales, Victoria and Queensland and, at the European end, to the Irish Free State, Northern Ireland, France, Switzerland, Belgium, Holland, Germany and Denmark.

It is announced by the Imperial and International Communications Co., that savings to cable telegraph users to the approximate amount of £85 000 per annum are the results of reductions in cable and wireless telegraph rates effected by the company since its inception in April, 1928, as a joint cable and wireless organisation, incorporating all the British privately owned overseas telegraph services operated from Great Britain. In some instances charges have been reduced by as much as 50%.

The London Students' Section of the Institution of Electrical Engineers will hold a summer meeting in the Ruhr area and Switzerland during August of this year. The places to be visited will include Cologne, Essen, Basle, Zurich, and Interlaken. The tour will commence on August 2 and finish in London on August 13 and the cost will not exceed £15 per person. Further particulars can be obtained from the hon. secretary, Mr. L. S. Crutch, 15, Mundania Road, East Dulwich, London, S.E.22.

The last of the series of five lectures on electricity to teachers of domestic science, students of housecraft and others, by Mr. C. F. Partridge at the Girls' Central Secondary School, Sheffield, took place on Monday, the talk being on controlling and protective devices. Some essays were handed in for a competition in which electrical apparatus was offered as prizes. The lectures were organised by Captain A. W. Brown, of Leeds, in co-operation with the Sheffield educational and electricity departments.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of May* 29, 1880, *recorded what was described as the inauguration of the electric light in the City of London, when the new installation supplied by the Brush Electric Light Co. in the vaults of the Royal Exchange was set to work.*

At that time Chicago had 3 000 *telephones, St. Louis* 1 000 *and Milwaukee* 550. *The charge was £12 per annum in Milwaukee and £20 at Chicago and St. Louis.*

The s.s. "Columbia," just completed at the works of John Roach, Chester, Pennsylvania, for the Oregon Railway and Navigation Co., was fitted throughout with the Edison electric light, this vessel being the pioneer in this respect. The current was supplied by four Edison dynamos installed in the engine room.

Experiments with electric ploughing and threshing and with sugar machinery driven by electricity had just been carried out at Bar le Duc and elsewhere in France.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of May* 26, 1905, *correspondence was continuing on the subject of the desirability of larger generating units.*

The L.C.C. Bill for the construction of electric tramways across Blackfriars and Westminster bridges and along the Thames Embankment was before a House of Commons Committee.

PERSONAL.

CARLISLE Town Council has adopted a recommendation by the Electricity Committee to pay to the city electrical engineer, Mr. C. W. Salt, £1 075 for services rendered in connection with extensions at the new works.

Mr. H. G. W. Haslett who has joined Chesterton, Jones and Co.

Mr. H. G. W. Haslett has been appointed sales manager (electrical products) to Chesterton, Jones and Co., Ltd. Mr. Haslett has, for many years, been London sales engineer (heating and cooking section), for the Credenda Conduits Co., Ltd.

The happy and interested relationships which have existed between the Association of Supervising Electrical Engineers and its presidents are reflected in the statement that Mr. S. B. Donkin has accepted the invitation of the Board of Control of the A.S.E.E. to continue as president for a further year. It is expected that Mr. Donkin will deliver his presidential address at the opening meeting of the 1930–31 session, on October 21.

Falkirk T.C. has granted an increase of £100 a year in the salary of Mr. Thos. Climie, burgh electrical engineer.

Bedford Town Council has fixed the salary of Mr. R. W. L. Phillips, borough electrical engineer, at £1 195 per annum as from April 1 last.

Mr. G. C. Hadfield, manager of the showroom of the Southport electricity undertaking, has resigned on securing a similar appointment with Nottingham Corporation.

Sir William Henry Bragg received on May 22, the Franklin gold medal, the highest award of the Franklin Institute, Philadelphia. The gold medal is awarded for an outstanding career in physical science.

Mr. Lachlan Mackinnon, manager of Glasgow Corporation Tramways, has been elected president of the Scottish Tramways and Transport Association. Mr. F. A. Fitzpayne, Edinburgh, has been elected vice-president.

Mr. Walter Binns, who was general manager of the Reading Corporation Tramways 18 years ago and left to go to South America, visited Reading last week and addressed the local Rotary Club on the subject of Brazil.

Mr. M. I. Lipman, engineer representative for A.E.G. Insulation Materials Department, has relinquished his position to take a post with E. K. Cole, Ltd., as production engineer. His place is being taken by Mr. F. E. Chilton.

At the meeting of the Overhead Lines Association on May 21, the president, Mr. Theodore Stevens, announced that the Council had nominated Mr. W. C. Bexon, chief engineer and manager of the Ayrshire Electricity Board, as president for next year, and that this would come before the members next October.

Mr. John Christie, borough electrical engineer, Brighton, is relinquishing his appointment within the next few months, but his services will continue to be at the disposal of the corporation undertaking in a consultative capacity. He is being succeeded as borough electrical engineer by Mr. W. N. C. Clinch, operating engineer, North Metropolitan Electric Power Supply Co., and resident engineer Brimsdown power station.

Sir Ernest Benn, Bart., chairman of Benn Brothers, Ltd., and Lady Benn will be entertained at a luncheon at the Criterion Restaurant, London, on Tuesday, June 3, by the Trade, Technical and Scientific Branch of the London District of the Institute of Journalists, to mark the occasion of the jubilee of Benn Brothers, Ltd., proprietors and publishers of THE ELECTRICIAN and numerous other technical and trade journals.

Obituary.

MR. DAVID BAILLIE, for many years superintendent at Pinkston power station.

MR. ALEXANDER FAIRBAIRN DODDS, chief draughtsman of Edinburgh Electricity Department. Mr. Dodds has been in the department for 47 years, and was closely connected with the work of the Portobello power station extension.

IN PARLIAMENT.

House of Lords Select Committee Approves Tube Extension.

THE Bill promoted by the London Underground Railways Group for authority to extend the Piccadilly line northwards from Finsbury Park to Cockfosters, etc., has been under consideration by a House of Lords Select Committee during the past week. Sir Lynden Macassey, for the promoters, gave particulars of the scheme, and said the total expenditure under the Bill would be £12 385 000. Mr. Frank Pick, managing director of the London Electric Railway Co. and the London General Omnibus Co. and other witnesses gave evidence in support of the scheme. Sir Ralph Wedgwood, general manager of the L. & N.E. Railway Co., gave details of an alternative electrification and extension scheme which his company were prepared to carry out and which, he said, would cover a greater distance and cost £1 000 000 less than the proposed tube. The Committee decided that the preamble of the Underground Railways' Bill was proved, and also authorised proposed improvements at certain stations in Central London. The Bill had previously been passed by the House of Commons.

Manx Electricity Bill.

The Manx House of Keys on May 20 postponed the third reading of the Electricity Bill until October. The scheme, which was to cost £100 000, was being promoted by the Electric Securities Trust, a subsidiary company of the General Electric Co., Ltd. The Legislative Council passed the bill, but in the House of Keys some members expressed dissatisfaction at the financial proposals, which enabled the promoters to charge 8% on loan capital. This proposal was also objected to by the Electricity Commissioners of England, to whom the question was referred, and the House adjourned consideration of the Bill until further information is obtained.

Barnsley Tramways Abandonment.

The Bill promoted by the Yorkshire Traction Co. seeking powers to remove tramway rails and substitute motor omnibus services for the tramways in Barnsley and district came before the Unopposed Bills Committee of the House of Commons on May 15. The Bill, which had already passed through the other House, was passed for third reading.

Sidmouth Electricity Undertaking.

The Bill to authorise the transfer of the electricity undertaking of Sidmouth U.D.C. to the East Devon Electricity Co. came before the Unopposed Bills Committee of the House of Lords last week. The Bill, which was passed for third reading, authorises the company to supply electricity in the urban district of Sidmouth and parts of the parishes of Salcombe Regis and Sidbury, in the rural district of Honiton.

Fife Electric Power Co.'s Bill.

The Unopposed Bills Committee of the House of Lords last week passed for third reading the Bill promoted by the Fife Electric Power Co., seeking powers to increase the capital from £600 000 to £1 000 000, to increase the borrowing powers from £200 000 to £500 000, to sanction the raising of additional loans, etc.

Nottingham Trolley Omnibus Bill.

A Select Committee of the House of Commons decided on May 16 to grant authority to Nottingham Corporation to adopt trackless trolley traction on all its existing tramway routes, but refused power for extensions outside the city. Trolley vehicles are not to go into Beeston urban district, nor on certain Carlton routes.

Progress of Unopposed Bills.

The Unopposed Bill Committee of the House of Lords has passed the Bill promoted by the Metropolitan Railway Co. for power to construct a new railway from Wembley to Little Stanmore, and to raise money not exceeding £500 000.

The Committee has also passed the Bill promoted by the Brixham Gas Co. to change the name of the company to the Brixham and District Gas and Electricity Supply Co., to consolidate and convert existing capital, to raise additional capital, to increase company's area of electricity supply to include Broad Sands, the urban district of Paignton, etc.

The Hastings Tramways Co.'s Bill, seeking powers for additional trolley-car routes and the prevention of indiscriminate competition, has also been approved by the Committee.

LEGAL INTELLIGENCE.

Marconi Company's Action with Respect to Broadcast Receiver Royalties.

IN the King's Bench Division, on May 22, Mr. Justice Branson gave judgment in an action which had been brought by Marconi's Wireless Telegraph Company, Ltd., to recover £3 261 for royalties under a licence of May 6, 1928, from a number of defendants. These were Mr. E. H. Newman and Mr. Maudslay Baynes, a firm of Regent Street, W.; Mr. Wm. Henry Cork, an accountant of Eastcheap, E.C.; Mr. H. F. Gidden, 105, New Oxford Street; Mr. W. G. Adie, White Street, E.C.; Mr. A. W. White, Essex Street, W.C.; Mr. H. Bowyer, of Bailey Mews; Mr. P. S. Booth, Kimberley House, Holborn; Mr. W. A. J. Osbourne, Magnet House, Kingsway; and Mr. L. O. Terrett, Charing Cross Road. All the defendants denied liability.

Sir Walter Schwabe, K.C., for the plaintiff company, said the defendants were the inspector (Mr. Cork) and the inspection committee appointed under a deed of arrangement by the two other defendants, Newman and Baynes, who were in business together in the manufacture and sale of wireless sets and other apparatus under the style of the Langham Radio. Messrs. Newman and Baynes got into financial difficulties, and the deed of arrangement was drawn up between them and the other defendants under which Mr. Cork was appointed inspector and the remaining defendants became the committee of inspection, with a view to carrying on the business to a successful point.

Defendants' contention was that Newman and Baynes were still the licensees of the plaintiffs, and they were carrying on the business under the control of Mr. Cork and the committee. The licence to Newman and Baynes had not been revoked, and had not been transferred to the inspector and the committee.

Giving judgment, his Lordship said he had come to the conclusion that the business remained under the control of Messrs. Newman and Baynes after the deed of arrangement had been come to. The inspector and the inspection committee acted in strict accordance with the terms of the deed. His Lordship added that he was not satisfied that Mr. Cork and the committee knew the sets involved the use of the Marconi patent. The claim against him and the committee failed and must be dismissed with costs, but plaintiffs were entitled to judgment against Newman and Baynes with costs.

Reduction of Capital.

A petition by the English Electric Co., Ltd., for confirmation of a reduction of capital from £5 000 000 to £3 244 472 was on May 26 heard before Mr. Justice Eve, in the Chancery Division.

Mr. Gordon Brown, for the company, said the reduction formed part of a general scheme of arrangement between the company and its debenture holders. The reduction involved a reorganisation of capital on the basis of the Second debenture holders accepting preference and ordinary shares in satisfaction of 65% of their debenture stock holding. Messrs. Lazard Bros. and Co. were prepared to put up £750 000 cash for the company by subscribing for ordinary shares at par. The reduction was to be effected by cancelling 7s. 6d. per share on the issued preference shares. The remaining 12s. 6d. was to be converted into 10s. preference shares, non-cumulative until December 31, 1933, and cumulative thereafter. As to the ordinary shares, 16s. 8d. was to be written off and the remaining shares of 3s. 4d. consolidated into £1 shares.

The resolution showed that the reduction was not due to capital lost or unrepresented by available assets, but that the real reason for the reduction was the reorganisation of the capital. The debenture stockholders were prepared to take shares rather than enforce their security, and that was the best reason for saying that the capital was represented by available assets.

His Lordship confirmed the reduction.

BUSINESS ITEMS.

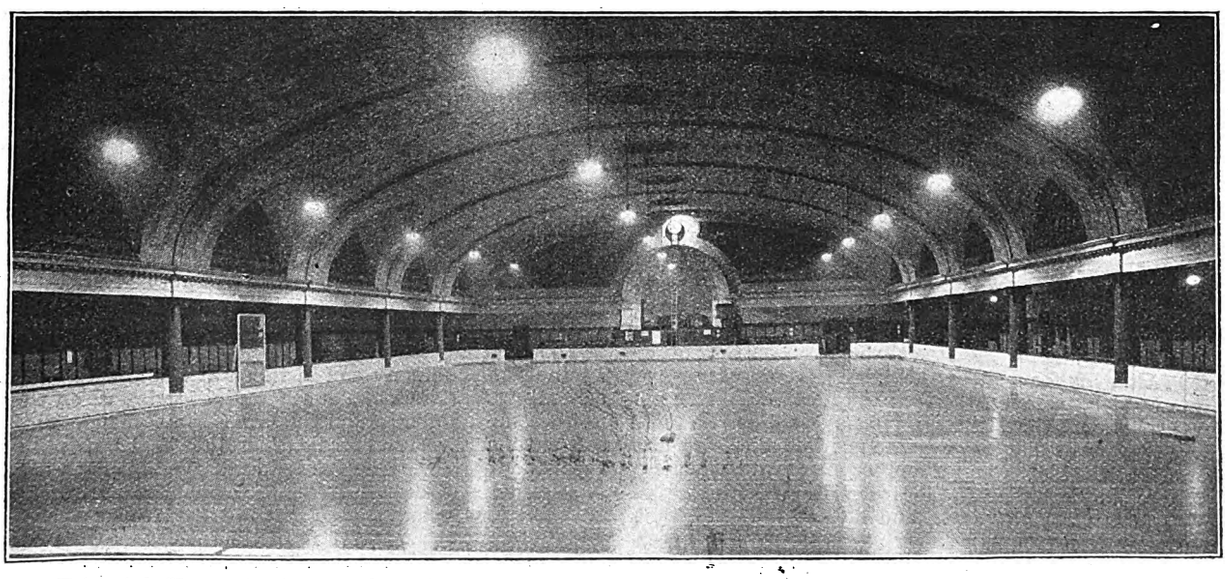
THE address of the SPRINGFIELD ELECTRICAL WORKS has been changed to River Road, Carmyle, Glasgow, E.2.

WILD-BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, North Road, London, N.7, announce that their licensees for France, Switzerland, and the Netherlands, La Compagnie Francaise "Wild-Barfield," have recently taken new premises at 110, Avenue du Général Michel Bizot, Paris.

The Department of Overseas Trade has prepared a statistical report on the world's trade in wireless apparatus. Copies of this report may be obtained by United Kingdom firms upon application to the Department at 35, Old Queen Street, London, S.W.1. Reference B.X. 6 399 should be quoted.

The ALTON BATTERY CO., LTD., Alton, Hants, has received a contract to completely renew the positive plates in one of the largest batteries in London, and considers this to be one of its greatest successes. The battery, which is not of Alton manufacture, is situated at the Metropolitan Electric Supply Co.'s sub-station, Fisher Street, London, W.C.

Contractors who are concerning themselves with the sale of ventilating fans will be interested to hear that the GENERAL ELECTRIC CO., LTD. is advertising Magnet fans at the moment, and will continue to do so for some time to come, in many of the most prominent business journals, as well as in a large number of high-class magazines. To supplement this journal and magazine advertising the company has devised a number of showcards, printed in colours, for the use of contractors, and the display of these, in windows and showrooms and on counters, will effectively link up with the advertising campaign. In addition, a tastefully-printed folder advocating the advantages of fans, and giving details and prices of the Magnet range, is available for distribution. This folder is designed to be overprinted with a dealer's name and address.



THE ice-rink, Haymarket, Edinburgh, fitted with "Geco" reflectors. The installation was carried out by Martins (Electricians), Ltd., of Kirkcaldy.

JOHN BENN HOSTEL.

Distinguished Speakers at the Annual Banquet.

OVER 300 guests assembled in the Mansion House, on Tuesday, for the annual banquet of the East End Hostels Association; Viscount Astor was the chairman. The banquet took place in the famous pillared dining-hall of the Mansion House, kindly placed at the disposal of Sir Ernest Benn, the President, and the Council of the East End Hostels Association, by the Lord Mayor (Sir William Waterlow, K.B.E.). At the end of the speeches Mr. A. Townshend, the Warden of the John Benn Hostel, announced that the Association would benefit by a record sum of about £2 200 as a result of the function.

The Prince's Message.

After the toast of "The King," the chairman read a message from the Prince of Wales, who inaugurated the John Benn Hostel and Milner Hall in 1927. His Royal Highness said:

"I was delighted to hear that the Lord Mayor had given permission for to-night's Banquet to be held in the Mansion House, and also that the Corporation of the City of London had subscribed to the funds of the John Benn Hostel, thus giving a mark of their approval to the work which I inaugurated by opening the Hostel in 1927.

"The high hopes expressed at the opening ceremony have not been falsified in the three intervening years, and from what I saw of the normal life of the Hostel on my second informal visit in 1928, I remained convinced of the vital need of work of this kind for boys in London.

"It is my intention to pay another visit to the Hostel before the close of the year, when I hope to hear that as a result of the Mansion House Banquet a record subscription will have been raised in 1930 for carrying on this fine constructive work. EDWARD P."

The toast of "The London Boy" was proposed by the Earl of Feversham, who asked whether any toast could be occupied with a more kaleidoscopic subject. The London boy, in school, was clean, alert and active. He took in the teacher's instruction with one eye and one ear, and with the other eye and the other ear he sought opportunities to place a pin for his classmate to sit upon. The work done at the Hostel was completely done, and every boy who went into the Hostel came out of it a new person. The boy of to-day would be the man of to-morrow, and to-morrow England would need every healthy and industrious man she possessed.

Miss E. S. Haldane, C.H., responded to the toast, and confessed that to her, in the boy full of fun and mischief, mischief was, perhaps, the most endearing quality. They knew how some people lived in the East End of London, and what chance had a boy there of growing up an honourable and healthy citizen? It was the business of those more fortunately situated to give them a chance, somehow or another, as, for example, they were given a chance in the John Benn Hostel.

Lord Astor Commends the Movement.

Viscount Astor gave the toast of "The John Benn Hostel." The fact that they were dining in the Mansion House was, as the Prince of Wales had pointed out, evidence that they were past the experimental stage and were a proved success. He joined with Miss Haldane in urging his hearers to go and see the Hostel for themselves. He had witnessed something of the work on its educational, recreational and social sides. He saw boys at work carpentering and others in the swimming bath. On a stage admirably equipped for theatricals he saw other boys acting a scene from Shakespeare, and showing real natural aptitude. The boys' characters were being trained; they had an old boys' association, and after they had left they nearly always retained for the Hostel the affection that other boys felt in after life for a good school.

Sir Ernest Benn, in reply, thanked the Lord Mayor for his kindness in lending the Mansion House for the banquet. There were two points that he wished to mention, one in regard to their work at the Hostel and the other in regard to finance. Three years ago, upon a visit to the Hostel, he found a group of fourteen or fifteen boys at work, and he was informed that they were a minstrel troupe. Never in his life had he seen such a complete absence of histrionic ability. To-day their minstrels were in great demand all over London, and from those efforts had sprung a dramatic club which was to appear at the Old Vic next week, having fought its way to the finals in the Stewart Headlam Shakespeare Competition. Turning to finance, Sir Ernest said that they spent something like £7 000 a year in running the Hostel and the community centre, and mentioned also the very striking fact that one-third of that sum was contributed by the boys themselves. It was a little difficult to divide the figures exactly, but it might roughly be said that one-third of the expenditure was upon the community centre, and if that were so the boys provided 50 per cent. of every 6d. spent upon the Hostel. That would help them to understand the motto of the Hostel, "No pains, no gains," chosen by the boys themselves and forming a striking illustration of the spirit of the institution. At the outset of the Hostel's career, the Carnegie Trustees gave £10 000, and looking upon the venture as an experiment, took a mortgage on the building. Since then, the Trustees had expressed satisfaction of the highest order with the conduct of the Association, and had suggested that if an endowment fund were set up, they would tear up the mortgage or return the deeds. This explained why the Association was anxious to see on the other side of the balance sheet the sum of £10 000 so that it could rely upon a regular income.

Mr. J. H. Thomas, M.P., spoke of the rise to power of the democracy, and emphasised the importance of early training in good citizenship, such as was provided for boys otherwise without help in an institution like the John Benn Hostel, if the democaracy were to use its preponderance with wisdom and credit to the Empire. He spoke also of his own association in other days with the late Sir John Benn and the late Lord Milner, in memory of whom the Hostel and the community centre had respectively been founded.

Mr. W. Clarke Hall, the well-known London magistrate, proposed "No pains, no gains," and spoke of some of the difficulties and perils that beset the path of the East End lad and which the work of the Hostel did so much to lessen. In a witty speech the Secretary of State for India (Mr. Wedgwood Benn, M.P.) replied.

The health of the Lord Mayor of London was honoured at the call of the Mayor of Stepney (Alderman H. Lazarus, J.P.), who proudly claimed to be a London boy himself, and the toast of the Chairman was given by the Earl of Elgin, who referred to the happy amalgam of East End boys, West End boys and all sorts of other boys (including himself as a boy from north of the Tweed), that had produced the good work of the Hostel and their gathering that evening.

LARGE TRANSFORMERS.

Some Big Units of American Design and Manufacture.

TWO transformers which for two seconds have a capacity of 1 250 000 kVA have been installed at the Schenectady works of the General Electric Co. of New York. This maximum capacity is more than twice as great as the installation of the Niagara Falls Power Co., which is rated at about 556 000 kVA. The transformers, which will be used with a 100 000 kVA generator, are normally rated at 33 333 kVA and are claimed to be the largest yet built in America for testing. They are to be used for testing switchgear of various types. The two transformers now installed are the nucleus of a bank of four. Each weighs nearly 200 tons, including 27 200 gallons or 100 tons of oil. The weight of the core and windings is 64 tons. The long diameter is 21 ft. 8 in., and the short diameter 12 ft. 2 in. There are thirteen high voltage bushings on the top of each, for ease in obtaining different voltage connections. The overall height is 28 ft. 1¼ in. In shipment from Pittsfield, Mass., the place of manufacture, to Schenectady the cores and windings were enclosed in steam-heated houses on standard transformer cars. A temperature of 90 deg. F. was maintained so that the cores arrived at Schenectady free from moisture.

Three other interesting units consist of 40 000 kVA, 220 000 V transformers of the non-resonating type, developed by the same company and installed at the Long Beach No. 3 generating station of the Southern California Edison Co. The non-resonating feature claims to permit higher factors of safety than have been reached heretofore. Electrical stresses throughout the winding are reduced. The insulation of these transformers is co-ordinated with that of the rest of the transmission system; that is, the transformers are designed to be electrically stronger than the insulators that carry the 220 000 V transmission line. Thus, if lightning should strike the line or very high voltage surges should be induced in the line by a nearby stroke, the line insulators will be the first to flash over and thus tend to relieve the abnormal voltage stress.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

FYLDE WATER BOARD.—Installation of impulse type water turbines and 40-50 kW generators. Specification, etc., from Mr. G. F. Atkinson, Head Office, Setton Street, Blackpool.

KIRK ELLA PARISH CHURCH.—Electric light installation. Particulars from the vicar, Canon James Foord, Kirk Ella, Yorks.

COMMISSIONERS OF H.M. WORKS, ETC., May 30.—Electric light shades, etc. Forms of tender from Controller of Supplies, King Charles Street, Westminster, S.W.1.

OGMORE AND GARW URBAN DISTRICT COUNCIL, May 30.—Supply, erection and connecting up of about 2 000 route yards of 11 000 V overhead service line, with short lengths of interconnecting cables. Specification, etc., from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £1 1s.

FARNWORTH URBAN DISTRICT COUNCIL, May 31.—Supply of 1l.t. cable. Specifications, etc., from Mr. A. J. Atkinson, Electricity Department, Albert Road, Farnworth, Lancs.

PORTADOWN URBAN DISTRICT COUNCIL, May 31.—Supply, erection, etc., of eight sets of electric motors and pumps and automatic switchgear at three pumping stations. Specifications can be seen and forms of tender obtained at the offices of Messrs. Taylor and Wallin, 1, Saville Place, Newcastle-on-Tyne; deposit 10s.

UPPER STOUR VALLEY MAIN SEWERAGE BOARD, May 31.—Treble ram pump (to deliver 15 000 gallons per hour), electric motor, automatic central gear and accessories. Particulars and tender form from Mr. G. P. Deeley, 13, Church Street, Stourbridge; deposit £1 1s.

ABERDEEN CORPORATION, June 2.—Electrical work in connection with new public conveniences, shelter and shop at the Bridge of Dee. Specifications, etc., from the Borough Surveyor.

BALLYMENA URBAN DISTRICT COUNCIL, June 2.—Provision of electricity supply equipment for the township. Specifications, etc., from Mr. James Scott, 358, Royal Liver Buildings, Liverpool; deposit £2 2s.

HULL CORPORATION, June 2.—Electric light and bell installation in new admission hospital at Willerby Mental Asylum. Specifications from the City Architect.

LIVERPOOL CORPORATION, June 2.—Supply of 41 motor-generator sets for cinema arc work, suitable for operation on 400 V, three-phase, 50 period supply, and to give d.c. output of 80A at 70 V. Tenders to Mr. Walter Moon, town clerk, Liverpool.

STOCKTON-ON-TEES CORPORATION, June 2.—Supply of paper insulated cables. Specifications from Mr. S. G. Marston, Electricity Works, Thompson Street, Stockton-on-Tees.

HULL CORPORATION, June 3.—Twelve months' supply of stores to the electricity department, including electric lamps and fittings (schedule No. 1); joint shells (No. 2); end connections (No. 3); fuse boxes (No. 4); fuse wire (No. 8); etc. Specifications, etc., from Mr. J. N. Waite, Electricity Works, Sculcoates, Hull.

BELFAST WATER COMMISSIONERS, June 4.—Electrically-operated pumping plant. Specification, etc., from the Secretary, Water Office, Belfast; deposit £1.

CLACTON URBAN DISTRICT COUNCIL, June 4.—Two transformers and e.h.t. and l.t. switchgear (all of British manufacture) for Great Clacton sub-station. Specification, etc., from the Electrical Engineer and Manager, 1, Arcade Buildings, Station Road, Clacton-on-Sea; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of storage battery equipment, comprising emergency stand-by lighting storage battery, 15 kW motor-generator set, battery trickle charger, milking booster, and spare parts. Specification (No. 10) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 4.—Supply and erection at Ironbridge generating station of works supply sub-station 3 300 V and 400 V metal clad switchgear. Specification (No. 9) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

LIVERPOOL CORPORATION, June 6.—Installation of automatic telephone exchange at Central Police Station, Dale Street, Liverpool. Specifications from Mr. Walter Moon, town clerk, Municipal Buildings, Dale Street, Liverpool.

A SPECIAL exhibition of G.E.C. products at the Imperial Hotel, Colwyn Bay, May 7–17.

HINDLEY EDUCATION COMMITTEE, June 7.—Electric light installations at Moss Lane and Argyle Street Schools. Specifications from Mr. O. P. Abbott, Council Offices; deposit £2 2s.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., June 9.—Supply of electrical accessories. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

GLASGOW CORPORATION, June 9.—One year's supply of l.t. and e.h.t. cables, small insulated cables and flexibles, electric cookers, meters and electric kettles. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

ATHERTON URBAN DISTRICT COUNCIL, June 10.—Supply of 2 600 yds. of 0·2 h.t., concentric, paper insulated, lead sheathed, served, steel tape armoured and compound cable, suitable for pressures up to 2 500 V, centre point earthed, and made in accordance with latest B.E.S.A. specification. Tenders to Mr. A. E. Hope, clerk to the Council.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., June 10.—Supply of fuse boards and switches. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

CENTRAL ELECTRICITY BOARD, June 11.—Construction of site works, foundation works and buildings in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.F.2) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 11.—Supply and erection of 33 kV transformers. Specification (No. S.E.E.-G.T. 1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.1; deposit £2 2s.

NOTTINGHAM CORPORATION, June 11.—Supply of 300 tons of steel tramway rails of British manufacture. Specification, etc., from Mr. T. Wallis Gordon, city engineer, Guildhall, Nottingham; deposit, £1.

OSWESTRY CORPORATION, June 14.—Supply, erection, etc., of 3 core, 11 000 V, paper insulated, underground cable; l.t. 3 core, 4 core and 2 core, 400 V, paper insulated cable service material, and link disconnecting boxes (specification No. 1A); e.h.t. 11 000 V, oil immersed, truck type switchgear, and 400V, ironclad, air break switchgear (specification No. 2A);

Digitized by Google

and one, two or three oil immersed, self-cooled, three phase, step down (11 000 V to 400V) transformers (specification No. 3A). Specifications from Mr. H. W. Edwards, borough electrical engineer, 28, Oswald Road, Oswestry; deposit £2 2s. for each. All apparatus and materials to be of British manufacture and cable to be C.M.A.

Leeds Corporation, June 16.—Supply of (1) 100 tramcar bodies; (2) 100 tramcar trucks, with wheels and axles; (3) 100 tramcar pneumatic brake equipments; (4) 100 tramcar electrical equipments. Specifications from Mr. R. L. Horsfield, general manager and engineer, Tramways and Transport Department, 1, Swinegate, Leeds; deposit £2 for each.

Nottingham Corporation, June 17.—Twelve months' supply of general stores to the electricity department. Forms of tender, etc., from the Engineer, Electricity Station, Talbot Street, Nottingham; deposit, 5s.

West Midlands Joint Electricity Authority, June 17.—Supply and erection of double circuit, 33 000 V, overhead transmission line, supported by steel towers. Specification (No. 33/T/2), etc., from Mr. E. F. Hetherington, chief engineer and manager, West Midlands Joint Electricity Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit, 10s. 6d.

Coventry Corporation, June 18.—Pumping plant in duplicate, for the Brownshill Green Water Scheme—contract No. 4, each set including centrifugal borehole and force pump, with vertical electric motor and all accessories. Specification, etc., from Dr. H. Lapworth, 25, Victoria Street, Westminster, S.W.1; deposit £3.

East Ham Education Committee, June 18.—Electric light installations at Monega and Sandringham Schools. Specifications, etc., from Mr. F. R. Thompson, Education Office, Town Hall, East Ham, London, E.6; deposit 10s.

Central Electricity Board, June 19.—Supply and laying of 33 kV and other cables in connection with Central England Electricity Scheme. Specification (C.E.-G.C.3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Metropolitan Water Board, June 20.—Twelve months' supply of electric lamps. Form of tender (No. 24) from the Chief Engineer (Room 155), 173, Rosebery Avenue, London, E.C.1. Stamped addressed envelope to be sent.

Oldham Public Assistance Committee, June 20.—Supply of electric lamps and fittings, for the Poor Law Institution. Tender forms from the Public Assistance Officer, Town Hall, Oldham.

Central Electricity Board, June 23.—Supply and erection of 66 000 V and other cables in connection with Mid-East England Electricity Scheme. Specification (M.E.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Central Electricity Board, June 30.—Supply and erection of metering equipment required in the area of the Central England Electricity Scheme. Specification (C.E.—G.M. 1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Dundee Corporation, July 12.—Supply of six 300 kVA outdoor type transformers. Specifications from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

Westmeath County Board of Health, June 2.—Electric wiring, etc., at County Home and Hospital, Mullingar, and at Dispensary, Mullingar. Specification from Mr. M. O'Lionnain, Runaidhe, Mullingar; deposit £5.

Cape Town Municipality, June 4.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

Indian Stores Department, June 9.—Supply and erection of oil engine and alternator set, with switch and protective gear and connecting cables, for Public Works Department's power station, Jaipur (order No. N. 11 096). (Reference B.X. 6 445.)

Auckland Harbour Board, June 10.—Supply of submarine cable (contract No. 902). (Reference B.X. 6 354.)

Hydro-Electric Power Commission of Ontario, June 10.—Supply and installation of transformers, for Chats Falls transformer station. (Reference B.X. 6 436.)

Melbourne City Council, June 11.—Supply of paper insulated, lead sheathed cables, suitable for use on three-phase, 50 cycle system at 6 600 and 420 V. (Reference B.X. 6 415.)

Copenhagen Lighting Department, June 12.—Two electrically driven gas compressors, with minimum hourly capacity of 20 000 cu. metres of gas at pressure of 1 metre water column. (Reference A.X. 9 598.)

South African Railways and Harbours, June 12.—Supply of 2 000 V switch units and l.t. switchboards (tender No. 1 649). (Reference B.X. 6 365.)

Generating Plant, etc., for Rhodesia.

Bulawayo Municipality, June 13.—One 5 000 kW turbo-alternator, condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321.)

South African Iron and Steel Industrial Corporation, Ltd., June 14.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

Madras Government, June 15.—Complete electrical equipment of three 66/110 kV outdoor sub-stations, in connection with Pykara hydro-electric scheme. Specification (No. E.26) (price 30s.) and general conditions of contract (price 3s. 6d.) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4, on payment of the respective fees (not returnable).

Postmaster-General's Department, Melbourne, June 17.—Supply of indicators (schedule No. C.588.) (Reference B.X. 6 333.)

Postmaster-General's Department, Melbourne, June 17.—Supply of multiple twin cable. (Reference B.X. 6 349.)

Postmaster-General's Department, Melbourne, June 17.—Supply of loading coil pots. (Reference B.X. 6 350.)

Melbourne City Council, June 18.—Supply and installation of automatic electric signals for traffic control (contract No. 2 787.) (Reference B.X. 6 421.)

South African Railways and Harbours, June 19.—Supply of metal-clad, 2 000 V switchboard, for Bloemfontein workshops sub-station (tender No. 1 657). (Reference B.X. 6 402.)

India Store Department, June 23.—Supply and erection of 11 000 and 400 V a.c., and 220 V d.c. switchgear, power and control cables, etc., at Shanan power house. Forms of tender (£3 15s., not returnable) from the Director General, Belvedere Road, London, S.E.1.

Johannesburg Municipality, June 26.—Electricity meters and time switches (contract No. 405). (Reference B.X. 6 449.)

New Zealand Public Works Department, July 1.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 63. (Reference B.X. 6 443.)

Cape Town Municipality, July 2.—Supply of paper insulated, lead covered, impregnated, lead sheathed and armoured cable. (Reference B.X. 6 426.)

New Zealand Public Works Department, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

New Zealand Government Railways, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

New Zealand Government Railways, July 17.—Supply of cable, switchgear and junction boxes. (Reference B.X. 6 385.)

South African Railways and Harbours, July 28.—Supply and erection of 23 electric lifts at new Railway Building, Johannesburg (tender No. 1 673). (Reference A.X. 9623.)

New Zealand Public Works Department, July 29.—Supply of auxiliary turbines and generating sets for Arapuni power scheme—section 305. (Reference B.X. 6 356.)

Victorian Railway Commissioners, July 30.—Supply and erection of turbo-alternators, condensing plant and control gear. (Reference B.X. 6 355.)

Victorian Railway Commission, July 30.—Supply of renewals for caustic soda primary cells (contract No. 43 701). (Reference B.X. 6 441.)

New Zealand Public Works Department, September 16—Supply of 110 kV switchgear, steelwork and controlling

Digitized by Google

e equipment, for Mangahao electric power scheme—(section 221). (Reference B.X. 6 453.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 110 kV and 50 kV switchgear and protective system, for Arapuni power scheme—(section 273). (Reference B.X. 6 450.)

Tenders Accepted.

BEXHILL CORPORATION.—Enfield Cable Works, Ltd., supply of l.t. cable for further six months. (Recommended.)

H.M. OFFICE OF WORKS.—T. Clarke and Co., laying main power and road lighting cables, Belfast Parliament Buildings.

BRADFORD CORPORATION.—English Electric Co., Ltd., supply of 12 double-deck, railless electric trolley vehicles, £27 000.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Metropolitan Electric Cable and Construction Co., Ltd., supply of cables, £3 026 5s. (Recommended.)

PORTSTEWART URBAN DISTRICT COUNCIL.—General Electric Co., Ltd., supply of generator, and Crossley Bros., Ltd., supply of 120 B.H.P. vertical engine, for the electricity works.

GENERAL POST OFFICE.—Telephone exchange equipment, Edgware, General Electric Co., Ltd. Telephone repeater equipment, Manchester, Standard Telephones and Cables, Ltd.

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Enfield Cable Works, Ltd., British Insulated Cables, Ltd., and Edison Swan Cables, Ltd., supply of cables for one year. (All recommended).

SOUTHEND-ON-SEA CORPORATION.—General Electric Co., Ltd., electrically-driven pump for fountains, £247 17s. 6d.; H. A. Lee, two fans for sterilising room and operating theatre, £36 7s. 6d.

CAPE TOWN CORPORATION.—Bruce Peebles and Co., Ltd., supply of self-synchronising equipment for two convertors, £218 10s.; Associated Engineers Co., Ltd., supply of 1 000 house service meters of "Measurement" type, £2 9s. 6d. each.

GENERAL POST OFFICE.—Telephone exchange equipment, Ipswich, Automatic Telephone Manufacturing Co., Ltd.; Ayr and Prestwick (Ayr area), Ericsson Telephones, Ltd.; terminating equipment, Seabrook (Kent), General Electric Co., Ltd.

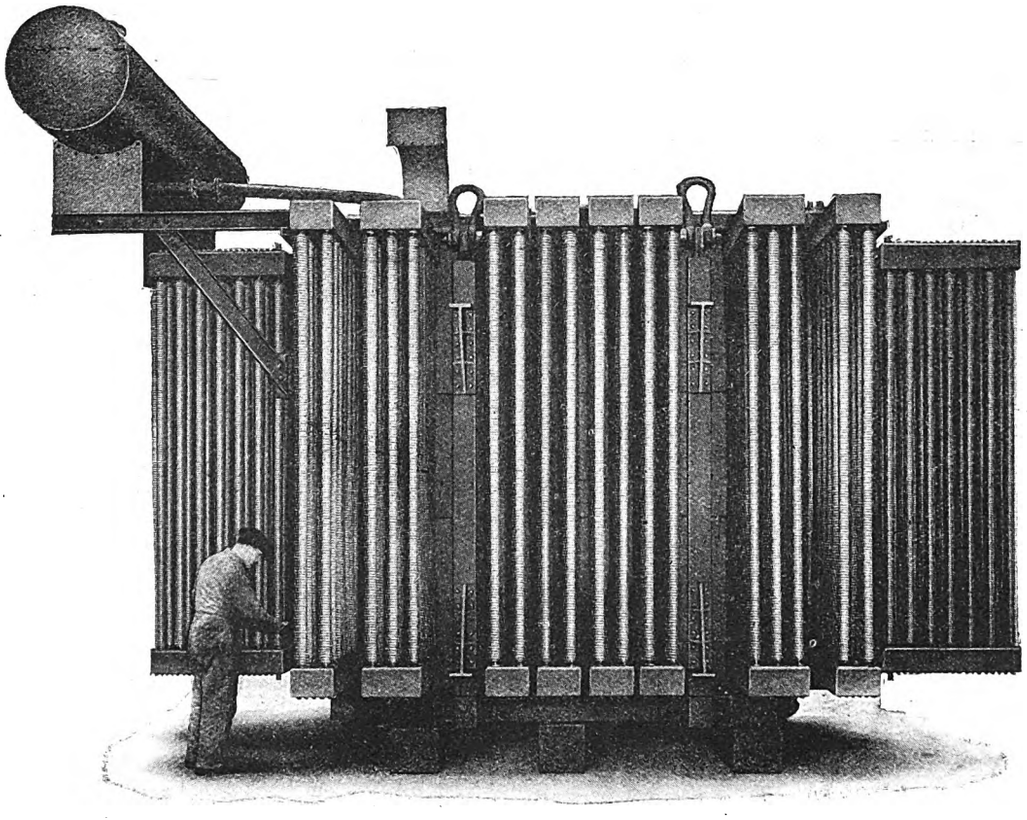
BEDFORD CORPORATION.—Robt. M. Russell, lines for use in connection with experimental scheme for provision of electricity supply in rural areas, £24 000. (Recommended.) Amount of tender is between £2 000 and £3 000 below estimated cost.

LONDON COUNTY COUNCIL.—Siemens Electric Lamps and Supplies, Ltd., all types of electric lamps (renewal order). This contract now covers supply of lamps to institutions formerly controlled by Metropolitan Asylums Board and boards of guardians.

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Edison Swan Cables, Ltd., supply of e.h.t. lead covered cable, £1 410; l.t, lead covered cable, £3 145; and twin and three core armoured cable, £974, subject to increase or decrease based on prices of copper and lead at date of order. (Recommended.)

LONDON COUNTY COUNCIL.—Berkeley Engineering Co.. Ltd., fire alarm and automatic telephone wiring and fittings at Queen's Hospital, Sidcup, £867. Also tendered: Automatic Telephone Manufacturing Co., Ltd., £1 008; Buchanan and Curwen, £1 056; J. Briggs, Ltd., £1 066; T. Clarke and Co., Ltd., £1 122; A. Dean and Co., £1 268; L. G. Tate and Co., Ltd., £1 485; H. J. Cash and Co., Ltd., £1 692.

LONDON COUNTY COUNCIL.—Standard Telephones and Cables, Ltd., supply of h.t. and l.t. electric cables of British manufacture, and building up of existing cables, etc., for the tramways department, original tender, £46 725 19s. (accepted subject to reduction of prices to conform with ruling price of copper at date of acceptance, the result being a reduction to £42 061 11s. 7d.) Also tendered: Johnson and Phillips, Ltd., £48 232 17s. 3d.; Callender's Cable and Construction Co., Ltd., £48 975 15s. 11d.; W. T. Henley's Telegraph Works Co., Ltd., £49 171 13s. 8d.; Pirelli-General Cable Works, Ltd., £50 528 8s. 6d.; British Insulated Cables Ltd., £51 715 11s. 2d.; Macintosh Cable Co., Ltd., £51 993 10s. 7d.; Metropolitan Cable and Construction Co., Ltd., (incomplete); Siemens Bros. and Co., Ltd., (tender not signed); W. T. Glover and Co., Ltd., (tender not signed); Estimate of General Manager of Tramways, £52 000.



THIS large electrical transformer tank was constructed by G. A. Harvey and Co. (London), Ltd., Woolwich Road, London, S.E.7, for the South-East England Electricity Scheme. This unit, the first of a number in hand, is fitted with "Harco" gilled tubes of mild steel. One of the tubes shown dissipates, it is claimed, as much heat as three plain tubes. These batteries of tubes can be detached without emptying the oil from the tank, owing to the fact that special valves are provided, which, when closed, isolate the radiator, when it can be drained of oil and removed. The chief object in having the radiators detachable, is, however, to make transport from the works to the site possible by their removal.

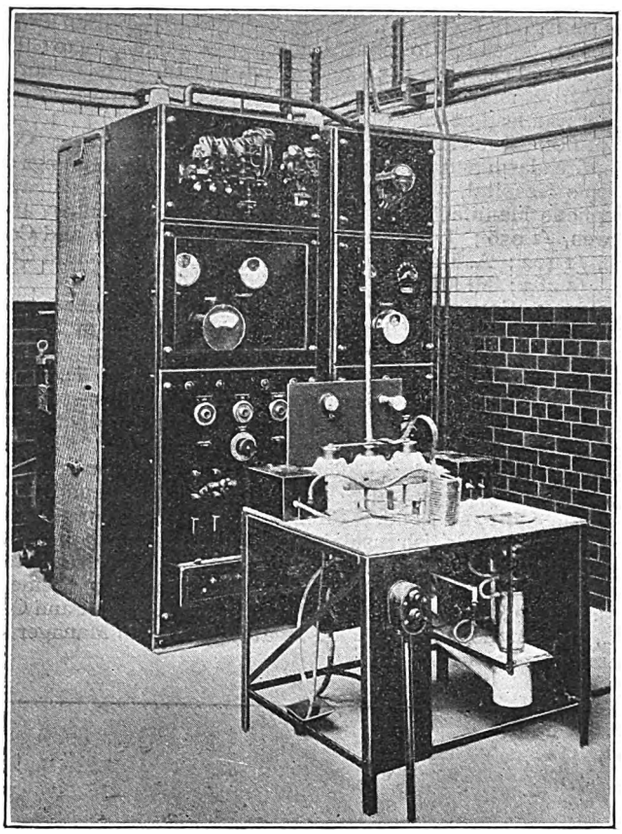
INDUCTION FURNACES.

Development of Small Equipments for Laboratory Use.

IN addition to the larger coreless induction furnaces developed by the METROPOLITAN-VICKERS ELECTRICAL CO., LTD. for melting iron and steel and non-ferrous metals in commercial service, this company has also developed small induction furnace equipments which are particularly suited



"Metrovick" induction furnace at Manchester University.

to laboratory work. The latter development was carried out originally to meet the needs of the company's own research work, but the design was later commercialised and equipments supplied to the Universities of Manchester and Sheffield have been in operation for some time. An equipment of similar type but somewhat larger size has now been ordered by Imperial Chemical Industries, Ltd., for use in the research laboratories of the works of Brunner Mond and Co., at Winnington, near Northwich. The furnaces of this type have been developed in a range of sizes. The equipment ordered by Imperial Chemical Industries, Ltd., is designed to melt a charge of 20 lb. of metal and is rated at 20 kW. The equipment supplied to the University of Manchester is designed for a charge of ½ to 2 lb. and is rated at 5 kW. Two equipments at Sheffield University are of rather smaller size and are used for melting charges of a few hundred grams of metal in vacuo. In all cases the supply of power at high frequency for operating the furnace is obtained by means of a water-cooled oscillator valve. The development has thus an additional interest as an example of the use of thermionic valves for industrial work. The use of an oscillator valve, which gives a frequency of about 500 000 cycles, enables the furnaces to melt very small charges. While it is possible to melt a ¼ ton charge of steel with power at 500 cycles, charges of a few grams require very much higher frequency. In laboratory furnaces, especially when working with rare or costly metals, it is very desirable to be independent of any size restrictions imposed by purely electrical considerations, and so it is essential to provide a frequency which will melt all charges from a few grams up to several pounds. The furnaces will melt charges of up to ½ lb. in 2 to 3 minutes. The normal full charge is melted in 20 to 30 minutes. All the furnaces will melt quantities up to about twice their normal charge, provided that a correspondingly longer time is allowed for the operation.

THE "BRITANNIC."

Telephonic Communication to be Effected During Trials.

THE new White Star liner "Britannic" is one of the first new ships to be affected by the regulations of the 1927 International Radiotelegraph Convention of Washington, and by one regulation in particular, which restricts the power of spark transmitters, fitted after January 1, 1930, to 300 W. The Marconi wireless installation is in a spacious room at the after end of the chart room, and includes a valve transmitter and receiver, an emergency transmitter, and a direction finder. Two motor lifeboats are also fitted with transmitters and receivers. The main transmitter is a valve installation for continuous and interrupted continuous wave signalling on 600 and 800 metres, and for continuous waves only on wavelengths between 1 887 and 2 725 metres. This transmitter will work with an aerial 335 ft. in length, the horizontal span of which is 265 ft. long and is 144 ft. above the water line. There is a two-valve receiver which is a new development in marine work, as it covers in one instrument the whole of the commercial waveband of from 15 metres to 20 000 metres, for which two receivers were formerly used. The direction finder will be used in conjunction with a gyro repeater, and the direction finder aerials are mounted on top of the chart room forward of the Marconi room. These aerials are 7 ft. high and are of the latest double loop type in which the actual aerial wires are totally enclosed in rigid metal tubes.

An interesting wireless experiment has been permitted by the Post Office in connection with the "Britannic" trials off the Clyde. Temporary wireless telephone installations have been fitted in Harland and Wolff's offices and on the ship, so that representatives of the owners and builders can be constantly in oral communication during the three days trials. This has never been attempted before, and will be watched with interest by all those who know the many questions which arise on these occasions and which usually can be settled by a few minutes' talk by telephone. It will be particularly useful on this occasion as the trials take place at some distance from the builders.

It is probable that at a later date a short wave telegraph installation will be added to the present Marconi equipment, and this will give the "Britannic" a wireless range practically world-wide.

BATTI-WALLAHS SOCIETY.

Luncheon to Sir Edward Crowe—Consuls and Trade.

MR. WILLIAM McCLELLAND, C.B., O.B.E., occupied the chair at a Batti-Wallahs Society luncheon at the Hotel Metropole, London, on May 22, when Sir Edward T. F. Crowe, C.M.G., Comptroller of the Department of Overseas Trade was the principal guest.

Sir Edward Crowe, who talked with humour and understanding of the Consular Service, in which he served with so much distinction before taking up his present position. He said that consuls had not been spoken of very highly and the criticism was directed against consuls of all nationalities. It was, however, not the fault of the consuls if they had not helped trade as much as they should have done. Consuls could not sell goods; all they could do in that direction was to supply information and to try to put two and two together and send intelligence home as quickly as possible. Foreigners often appeared to be more eager to secure British commercial reports than our own manufacturers. British manufacturers and merchants did not study these reports as much as they should. They seemed to be satisfied that they had done all that was necessary if they glanced at Press summaries of documents which might extend from 150 to 200 pages.

As far back as Lord Palmerston's time British consuls were in the habit of reporting on commercial matters; to-day the Consular Service had very definite instructions that it must go all out to help commerce, and if manufacturers would take advantage of the information that was gathered by consuls they would find it of some use to them.

Sir Edward Crowe drew attention to the advantages offered by the Consular Service to the boy with brains and some gift for languages. He said that he would be very pleased to give any information that might be required by parents who might be interested in the service as a possible career for their sons.

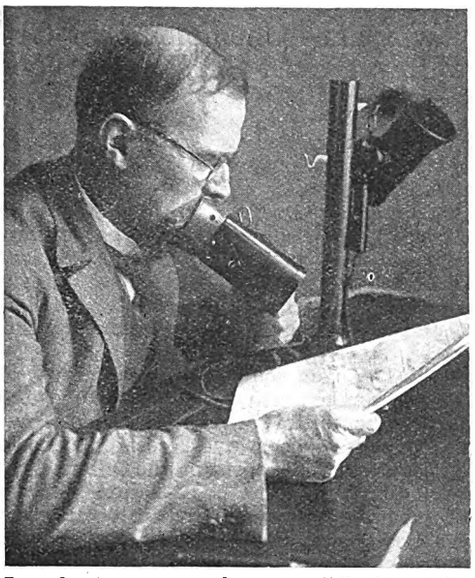
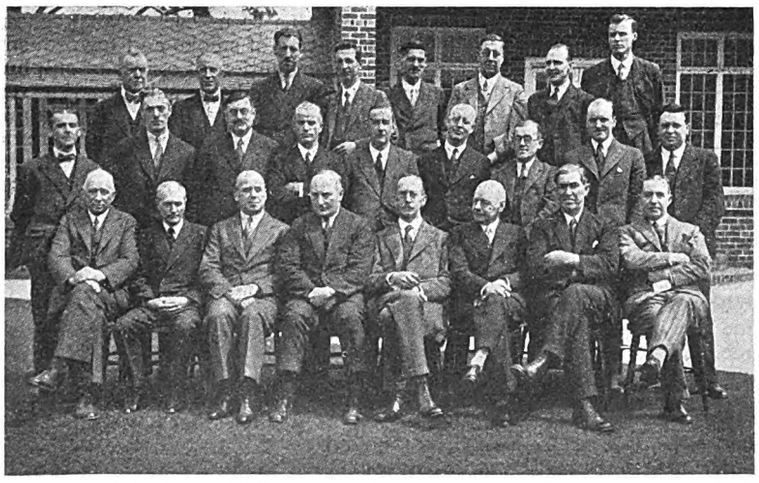
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



In order to overcome language difficulty at the World Power Conference, which opens at Berlin on June 16, special speech transmitting apparatus has been installed, which will enable members to listen to speeches in any one of the three official languages of the Conference—i.e., German, English, or French. Three sets of apparatus have been built and will be installed so as to provide for a total number of 1 000 members. Placed in front of each seat in the auditorium will be a pair of headphones, connected to a specially designed switch box by means of which the listener can switch in to the language he best understands. In addition, a volume control is included. The speakers and the interpreters, who will translate on the spot, will speak into microphones equipped with sound-proof mouthpieces.

Two E.D.A. window displays designed in connection with the Selling Campaign for June. The window on the left features cookers, kettles, etc., and maintains that atmosphere of simplicity which has so far characterised all E.D.A. windows. Refrigerators form the subject of the second display, and here, again, the design is strikingly attractive.



Members of the South Midland Area Committee of the E.D.A. photographed on the occasion of their May meeting at the headquarters of the Shropshire, Worcestershire and Staffordshire Electric Power Co., Ltd., Mucklows Hill, Halesowen, near Birmingham.

A new system of lighting has been installed in St. Paul's Cathedral, ready for the reopening next month. This view of the main transept shows the effect of the new fittings.

ELECTRICITY SUPPLY.

Official Returns of Electricity Generated—St. Helens' New Plant—Unemployment Grant for Hull—Progress of East Midlands Scheme—Lancashire Power Co's. Rural Extensions—Canadian Hydro-Electric Development.

BEDFORD Electricity Committee is to seek sanction for a loan of £20 000 for mains.

Battersea (London) Electricity Committee has obtained sanction to borrow £6 987 for mains and £13 320 for plant, switchgear, etc.

Whithorm Town Council has accepted the draft of an agreement with the Scottish Midlands Electricity Supply Co. for a supply of electricity.

Sanction to loans of £24 064 for mains, £5 900 for sub-station equipment, and £10 000 for services and apparatus in connection with the change-over is being sought by Halifax T.C.

Aberfeldy T.C. has received a letter from the Grampian Electric Supply Co. intimating that the company is including a supply to the burgh in its programme of extensions for the current year.

Sanction has been received by St. Helens T.C. to extend the generating station by the installation of a 12 500 kW turbo-alternator with cooling tower and other ancillary works, at a cost of £48 150.

On behalf of the owners of the Hinderton Electric Light Works, a letter has been addressed to Birkenhead Electricity Committee offering to sell the undertaking. The Committee is having a report prepared on the matter.

St. Pancras (London) Electricity Committee reports that it is necessary to provide 10 l.t. mains for distributing electricity from Arlington Road sub-station. The cost of the work will be £7 200, including the laying of the cables and reinstatement charges.

The Unemployment Grants Committee has given sanction to a scheme of Hull Corporation for laying electric service cables at an estimated cost of £100 000. The scheme will permit of cables being laid in any areas irrespective of immediate return on expenditure.

Shoreditch (London) Electricity Committee recommends seeking sanction for a further loan of £20 000 for free wiring. The Committee reports that 570 applications for supplies under the free wiring scheme are in hand, and applications are being received at the rate of 50 per week.

The extension of Clitheroe Corporation's cable to Chatburn has been held up through differences between the Corporation and the P.C. The latter put forward an objection to overhead wires, but the Electricity Committee has intimated that the underground system is too costly.

A loan of £1 548 for excess expenditure incurred in connection with the electricity scheme for Bradenham is being sought by Aylesbury T.C. The Electrical Engineer is to submit a further report with regard to a scheme for the supply of electricity to Cholesbury, Longwick, and Wotton.

The Electricity Commissioners have sanctioned the borrowing by Fulham (London) B.C. of £12 500 for consumers rental wiring installations, £7 500 for domestic apparatus for hire, and £10 000 for unspecified mains extensions. The Electricity Committee has authorised mains extensions at an estimated cost of £6 212.

A beginning was made last week with the construction of the Lincoln to Grimsby section of the Central Electricity Board's East Midlands scheme. From Lincoln a further line will proceed southward to join up with Peterborough. The line is being constructed by the Pirelli General Cable Works, Ltd., and it will carry current at 132 000 V.

Mr. M. G. E. Rhodes, on behalf of the Ministry of Health, held an inquiry last week into the application by South Shields T.C. for sanction to a loan of £50 057 for the conversion of the street lighting from gas to electric, at a cost of £42 865. Mr. C. B. Fenwick, for the Corporation, said had it not been for the purpose of relieving unemployment the scheme would not have been launched for at least another three years. Amongst the opponents was the South Shields Gas Co.

The official returns rendered to the Electricity Commissioners show that 837 000 000 kWh of electricity were generated by authorised undertakers in Great Britain during April, 1930, compared with 807 000 000 in April, 1929, an increase of 3·7 %. During the first quarter of 1930, the amount of electricity generated by authroised undertakers was 3 017 000 000 kWh, compared with 2 844 000 000 for the corresponding quarter of 1929, increase over 6%. The Commissioners propose to issue a similar statement each month.

Watford Electricity Committee seeks sanction for a loan of £20 000 for mains extensions under the unemployment scheme.—The Committee has received from the Electricity Commissioners a copy of a letter from the chairman of Chipperfield Village Council on the subject of the supply to certain premises in the village, and the Commissioners asked for the observations of the Corporation. The Committee is replying to the Commissioners that without an adequate contribution from the persons desiring the service the Corporation cannot give a supply.

Construction is to be begun shortly on a new power plant on the Abitibi River, 65 miles north of Cochrane, Ontario. The waters falling through the Abitibi Canyon and Rapids above are to be harnessed to develop 275 000 H.P., at a cost of $23 000 000. An additional $3 500 000 is to be spent by the Ontario Hydro-electric Power Commission on the construction of a transmission line to Sudbury. The new plant is to be constructed by the Hudson's Bay Power Co., and a contract has been entered into for the delivery of 100 000 H.P. for 40 years to the Power Commission.

The Electricity Commissioners have granted an Order to the Lancashire Electric Power Co. to supply in the urban districts of Lathom and Burscough, part of the rural district of Wigan (Parbold and Dalton), part of the rural district of West Lancashire (Bispham and part of Bickerstaffe) and the mining township of Skelmersdale. The company recently purchased the private undertaking at Ormskirk, and is converting this station to receive alternating current from two 10 000 V cables from Southport. It is proposed to spend £18 000 on h.t. mains, and £32 000 on distribution mains.

Tynemouth Electricity Committee has decided to enter into an agreement with the Electrical Manufacturers' Finance Co. in connection with the hire purchase of electrical apparatus. The Corporation is to receive a discount of 20%, with an additional 2½% for cash on all sales, and the company accepts all responsibility for the collection of moneys. The Committee has authorised the Electrical Engineer to enter into arrangements with other companies in connection with the hire-purchase of electrical apparatus on similar terms to that made with the Electrical Manufacturers' Finance Co.

Sanction has been received by Tunbridge Wells T.C. to a loan of £13 200 for mains. The Electricity Commissioners have had under consideration the Council's application regarding a supply of electricity to premises at Chiddingstone Causeway, and, in view of the comprehensive scheme which is being carried out by the Kent Electric Power Co., they suggest that the Corporation consider the question of affording a bulk supply to the Kent Co. for the purpose of the development of the area in question. The Lighting Committee is not prepared to recommend the Council to afford such a supply.

Prof. Wheeler, Dr. Ardern, Messrs. Kennedy and Donkin and Dr. J. S. Owens, who were appointed by Marylebone (London) Electricity Committee to advise as to precautions to be taken for the consumption of smoke and for preventing the emission of grit and the evolution of oxides of sulphur at the Council's generating station, have submitted a report which is being considered by the Committee. The Committee reports that the suitable plant is now available for the removal of dust from the boilers and economisers when they are undergoing periodical cleaning, and it proposes that such improved plan be installed at a cost of about £2 000, and is inviting tenders accordingly.

The Manitoba Power Commission contemplates the expenditure of $2 066 114 during the present year on rural transmission lines. A programme has been arranged for extension of the hydro-electric system into all of the important Manitoba municipalities within the next two or three years. The proposals for the coming year are for the construction of 540 miles of line in 18 schemes, the most important of which is a 82-mile high-voltage line connecting Portage le Prairie with Brandon, and branch lines of lower voltage to serve towns to the south and north of this main transmission line. The system will be extended into the area south-west of Brandon. Two smaller systems are being established in the north-western part of the Province, with local generating stations. North of Winnipeg the line is to be extended from Selkirk to serve Winnipeg Beach, Gimli and Toulon.

POWER PLANT.

New Equipment to Interest the Supply Engineer and Contractor.

IT is stated that the new Martindale super-blower, manufactured by the MARTINDALE ELECTRICAL CO., LTD., Aerial House, The Hyde, Hendon, London, N.W.9, is unusually powerful, while the common defect of allowing the air in the air-chamber to be churned has been overcome—providing greater pressure and giving cooler operation by reducing the load on the motor. The specification is given as follows: Oversize ⅓ H.P. motor, 32, 110, 220 or 250 V (universal); mounted on Norman precision ball-bearings; 20 ft. of cab-tyre flexible cord, with 2-pin bakelite plug; 11 in. semi-hard rubber nozzle; weight, 9 lb. The U tube water column pressure is stated to be 32·5 in. and the air velocity 312 ft. per sec. For those desiring a smaller blower, the Martindale "Blow-er Clean" is offered. It weighs only 7 lb., but gives an air velocity of 260 ft. per sec. and develops a pressure of 23·95 in. water column. It is fitted with a ¼ H.P. motor and has a polished aluminium case.

To fit either type of blower is offered a special attachment containing a heating element. It can be used—among other purposes—for supplying warm air for drying insulating varnish, for drying out magnet coils, small transformers and insulation on wiring, for thawing water pipes or valves and for melting ice on insulators. The warm air stream is also recommended for drying out a moisture "earth" in conduit, since heat alone cannot be used for this purpose on account of the moisture recondensing elsewhere in the conduit.

An interesting addition has lately been made to the standard range of counter e.m.f. starters manufactured by THE GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). The new starter has been developed to deal with relatively large motors, and the starter is specially suitable for all d.c. services where the machine starts up light, including such applications as machine tools, wood-working tools, small printing machines and small compressors and pumps. Two patterns are manufactured—a light duty pattern (type 1) and a heavy duty pattern (type 2) for the higher horse powers (up to 5 H.P.). The starter consists essentially of a line contactor and an accelerator contactor mounted with a resistance in a ventilated box. In the new type 2 starter, the line contactor is fitted with a magnetic blow-out and is electrically interlocked with the accelerator contactor. Since the coils of the line contactor are shunt-operated, the starter also functions as a no-volt release.

Blue-printing.

Supply engineers, whose duty it is sometimes to prepare drawings, blue prints, etc., for specifications, will be interested in the new "Peerless" equipment, for which unusual speed of production, high quality prints and low operating cost are claimed. The equipment is put on the market by the C. F. PEASE COMPANY, 813, North Franklin Street, Chicago, and the model 30, it is stated, is suitable for producing blue-prints, negative prints, blue line and brown line prints; although the operation is similar to that of the former "Peerless" model, the design differs in several respects.

The tracings are laid face up on a continuous roll of paper, feeding at the front of the machine, and are carried upward around a semi-circular, uniformly curved segment of French plate glass, past a glowing bank of arc lamps. These lamps are individually mounted in horizontal alignment in front of the glass and give an intense light rich in actinic value. After the exposure has been made, the tracings are automatically returned into the tray at the front of the machine, near the operator's hands, while the prints on the continuous roll of paper are carried through the machine. The operations of washing, potashing, and drying take place in succession. The paper is then automatically rolled up in loose cylinder form at the rear of the machine for convenient cutting and trimming. Throughout its travel the roll of paper is gear-driven without drag or possibility of strain. The machine is direct gear-driven throughout, has a speed range of from 4 inches to 12 feet per minute and is driven by a variable speed ¼ H.P. motor direct connected to a fully enclosed gear reduction unit running in oil. At the extreme left-hand side of the machine and mounted in the feed table is a four-point auto-type gear shift providing for two forward speeds, high and low, also neutral and reverse. The reverse gear is stated to be a new departure in blue-printing machine construction.

LIGHTING INDIA HOUSE.

Novel Fittings in New Kingsway Building.

AMONG the features of electrical interest at India House, Kingsway, London, which will, it is expected, be opened in July, those of most novelty are the lighting fittings, which have been carried out for the architect, Sir Herbert Baker, from his designs, by Higgins and Griffiths, Ltd., of 21, Orchard Street, London, W.1. The fittings have been definitely designed to harmonise with the architecture. The whole scheme has been treated as an entity; it centralises on the main octagon hall of the building, and, as one passes farther from this hall, the design gradually falls away—the fittings steadily dropping their ornamentation until at length they become merely service fittings. At all times the aim has been to have the illumination both ample and pleasant, and the question of efficiency has also been carefully studied. The most remarkable part of the lighting scheme is the large Jali lantern. This great central light extends through and above the first floor, and is so designed that, in addition to illuminating the hall, it throws a gentle diffused light through the Jali work forming the sides of its dome, giving a similar effect to daylight streaming through a series of openings. The Jali work is exquisitely carved and beautifully decorated, and the whole furnishes a superlative example of the combination of art with the science of electric lighting. The light is derived from an unusually large pendant, which consists not only of the large lamp, but also carries on the suspension a secondary lamp to light the Jali, while from the main lamp depend eight satellites in the form of small globular lamps resembling those used in other parts of the building.

In various details the pendants and wall brackets throughout the greater part of India House reproduce the octagonal characteristic that is the basis of the scheme. All the principal fittings have the same light touch combined with an appearance of strength; in some of the principal apartments fittings close to the ceiling are substituted for pendants. The corridors are lighted by Doric globes with a special type of domed gallery in harmony with the main scheme of design. On the High Commissioner's floor the lighting scheme has been carried out in polished silver plate.

COLLIERY MOTORS.

New Specifications for Motor Generators for Mines—Miners' Handlamp Bulbs.

IN continuance of the programme of work in their Colliery Section, the British Engineering Standards Association has just issued B.S.S. for electric motors and generators for mines and for miners' handlamp bulbs. The specification for electric motors and generators for use in mines applies to machines of one brake horse power and upwards per 1 000 r.p.m. having windings insulated with class A material, and wound for voltages not exceeding 7 000 V. The specification has been drawn up to comply with the General Electric Regulations made under the Coal Mines Act, and in its preparation due regard has been paid to the explanatory notes made in Mines and Quarries, Form No. 11. The specification does not apply to turbo-type machines, rotary converters, motors for traction purposes, *i.e.*, motors mounted on vehicles for their propulsion, nor does it apply to motors embedded in coal cutters, drills and conveyors, for which another specification will be prepared. Two classes of machines are provided for by the specification, those for use in locations where General Regulations 127 (v) and 132 of the Coal Mines Act are applicable.

The miners' handlamp bulbs specification provides for the ordinary class of 2 V bulb with a nominal rating of 2 W, used underground in collieries. The terms of this specification have been determined after a series of tests which are probably unique. Batches of lamps were manufactured under normal conditions, having filaments designed to operate at different efficiencies. All these lamps were carefully measured and a proportion of each design tested, in the manner defined in the specification, at several test stations, including those at the National Physical Laboratory, and the Mines Department, Sheffield. Lamps of each design were also sent to six coal mines, chosen to represent the widely varying conditions normal to the industry, and details of their performances were carefully logged. The data so obtained from both laboratory tests and experience in the mines, has been used in framing the specification, and its utility in defining a lamp satisfactory to the industry is thereby guaranteed.

(a) Including £21 287 (1·64%) from reserve. (b) Including other income, £58 385 (2·33%).

Capital invested in above 25 companies at end of 1929, £40 783 011. Summary of appropriation accounts :—

Brt. Fwd. from 1928	£692 018	Divs. Distributed ..	£2 651 904
Profits, 1929 ..	3 897 544	To Reserves, etc. ..	1 228 567
Other Income ..	79 672	Other Appropriations	68 313
		Carried Fwd. to 1930	720 450
	£4 669 234		£4 669 234

The average dividend *declared* on ordinary capital was 8·32% and the dividends actually distributed on ordinary and preference capital averaged 6·50% of the invested capital. The percentage of profit realised in relation to capital works out at 9·56%, and the percentage allocated to reserves, etc., was 3·01%. The sum brought forward from 1928 was 1·70% of the capital and the sum carried forward to 1930 is 1·77%. "Other Income" and "Other Appropriations" were 0·19% and 0·17%, respectively.

COMPANY NEWS.

Less Active Market in Electrical Shares—Chloride Co.'s Increased Profit—Birmingham Investment Trust's Share Bonus—Directors' Reports and Dividends.

BUSINESS in the electrical share markets has been less active during the past week. The principal feature shown by our usual contrast of prices is the marking down of the official quotation for Electric Construction ordinary shares from 16s. 3d. to 13s. 1½d.—we mention in each case the middle between buying and selling price. W. T. Henley's shares have shed a further half-crown to £6 5s.; Callender's and Enfields are unchanged at £3 12s. 6d. and £4 5s. respectively. Crompton Parkinson 8% preference have retained their higher level at 24s. 4½d., and Ever Ready ordinary shares have put on 3d. to 19s. The 10s. shares of the National Electric Construction Company, despite the larger dividend, are 7½d. down, to nearly 23s.

A scheme for re-arrangement of the capital of Ferranti, Ltd., has been sanctioned by the Court. It provides for increase of the company's capital to £900 000 by the creation of 300 000 new preference shares of £1 each and 600 000 ordinary shares of 10s. each. For some time the directors have realised that it is in the interests of the company that the capital should be increased to provide for present financial requirements, and extension and development of the business.

General Electric Company's ordinary shares are 1s. 3d. down at £2 10s. Of the other transatlantic leaders, Hydro-Electrics are slightly higher at nearly 48, while International Holdings have remained steady around 6⅜. Radio Corporation of America shares at 53¼ are nearly 5 points higher. Cables and Wireless stocks are a shade better; American Telephone and Telegraph stock has lost 15 points, to 240 dollars. Anglo-American Telegraph ordinary is up a point.

Bournemouth and Poole Supply shares are 57s. 6d., ex dividend. Central Electric Supply Co.'s debenture stock is a couple of points down at 93½, and Cornwall Power 7 per cent. preference shares are 9d. lower at 23s. On the other hand, County of London shares have recovered 1s. 3d., to 47s. 6d., and City of London and Electric Supply Corporation preference are each 6d. better at 23s. and 22s. respectively.

Directors' Reports, etc.

CARLISLE AND DISTRICT TRANSPORT CO., LTD.—Tradg. blce. for 1929, includg. £81 brt. fwd., £353. Loan int., £1 852. Debit blce., £1 499.

ELECTRIC CONSTRUCTION CO., LTD.—Pft. for year ended March 31, 1929, £14 874, agst. £8 739. Div. for year 5%, agst. total of 5½% for previous year.

RICHARD JOHNSON AND NEPHEW, LTD.—Net pft. for year ended March 31, 1929, £40 672. Div. on ord. shs., 8% p.a., less tax (same as last year). Fwd. £16 370, agst. £10 835.

FOOT'S CRAY ELECTRICITY SUPPLY CO., LTD.—Pft. for 1929, £4 042. To depreciatn. res. £800, res. for renewals, £455, res. agst cost of change over, £800. Div. 10%. Fwd. £1 147, agst. £1 351.

BOSTON AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Rpt. for 1929 shows amt. to credit of net rev. acct., £8 984. To res. for depreciatn., £2 200; res. for renewals, £2 690; div. 4%; fwd. £600, agst. £133.

NORTHWOOD ELECTRIC LIGHT AND POWER CO., LTD.—Pft. for 1929, £13 848; provisn. for tax, £800; depreciatn. res., £2 500; res. for renewals, £1 389; gen. res., £2 000. Div. 15% on ord.; fwd. £3 616, agast. £3 597.

LEWES AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Net rev. for 1929, £12 487, agst. £11 218. Addg. int. and deductg. expenses, income tax and deb. int. leaves £7 217, plus £2 735 brt. in. To gen. res. £4 500, div. on ord. shs. 8%. Fwd. £2 452.

COLNE VALLEY ELECTRIC SUPPLY CO., LTD.—Pft. for 1929, £29 211. Provisn. for income-tax, £3 000, to depreciatn. res., £2 500, res. for renewals, £1 773, res. agst. cost of changing pressure of supply, £5 000. Div. 12% (same). Fwd., £2 600, agst. £1 802.

LOTS ROAD POWER STATION.—Hldrs. of Metropolitan District and London Electric Railways joint power house rent charge stk., at a meeting on May 22, sanctioned issue of £675 000 additnl. cap. for purpose of extendg. Lots Road power station.

WESTON-SUPER-MARE AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Net rev. for 1929, £40 690, agst. £42 685. Available blce. £33 296. To gen. res., £15 000. After provisn. for div. on 6% pref. shs. for year, div. on ord. shs. of 10% for year is recommended. Fwd. £4 896.

DIRECT SPANISH TELEGRAPH CO., LTD.—Rev. for 1929, £90 130, plus income tax recovered, £600, and blce. brt. in, £1 990. After provisn. for all expenditure, blce. is £12 348. Divs., on pref. shs. 10% p.a., and on ord. shs. 8% p.a., tax free. To deb. redemptn. acct., £2 000. Fwd. £2 176.

CHLORIDE ELECTRICAL STORAGE CO., LTD.—Net pft. for year ended March 31, 1930, £287 183, agst. £216 936. After provisn. for pref. div., ord. div. of 30% (agst. 25%), plus capitalised bonus of 100%, is recommended. To res., £100 000, agst. £50 000. Fwd. £85 824, agst. £69 833.

DUDLEY, STOURBRIDGE AND DISTRICT ELECTRIC TRACTION CO., LTD.—Working loss on operatn. of tramways for 1929, £5 410. Debit blce. of £6 009 to be carried fwd. Arrears of div. on 5% cum. pref. shs., £35 000. Whole system of lines operated by company was discontinued on March 1, 1930.

ELECTRICAL ENTERPRISES-LUDWIG LOEWE CO. ("GESFUEREL").—The 6% debs., due 1953, of this German public utility holdg. company, have been introduced on the New York Curb Exchange. The debs. are part of a $5 000 000 (£1 000 000) issue made for the company in 1928 by Harris Forbes and Co.

MERTHYR ELECTRIC TRACTION AND LIGHTING CO., LTD.—Net. rev. for past year, £25 277, agst. £23 868 for 1928. After deducting administratn. and gen. exes., income tax and deb. int., blce. is £12 422, which, added to £3 653 brt. fwd., makes available blce. £16 076. To gen. res., £7 000, to div. on 5% pref. shs., £1 500; to div. on ord. shs. of 2½% for year, £1 625; fwd., £5 951.

ELECTRIC FURNACE CO., LTD.—Net pft. for year ended March 31, £13 520, agst. £16 047, plus £1 586 brt. in. Div. of 7% on ord. shs. is recommended. Fwd. £4 043. During the year a private company, known as Electric Resistance Furnace Co., Ltd., was formed with object of facilitg. organisatn. of this branch of business. The company has a cap. of £5 000, and all the shs. are owned by the Electric Furnace Co. Subsidiary company deals in furnaces for industrial heatg. by electl. resistance. It is proposed in future to pay dividends on Jan. 1 and July 1.

SOUTH STAFFORDSHIRE TRAMWAYS (LESSEE) CO., LTD.—Share of net traffic receipts under workg. agreemts. and other rev. for 1929, includg. div. received from South Staffordshire Tramways Co., £7 427. After deductg. paymts. to local authorities, interest, tax, etc., blce. was £2 429, plus £1 790 brt. fwd. To res., £2 500; fwd., £1 719. During year tramway from Great Bridge to Burnt Tree was sold to West Bromwich Corporation, and Dudley to Wednesbury tramway has been abandoned. Negotiatns. have been concluded for sale of remaining tramways operated by co.

CABLE TELEPHONE AND GENERAL TRUST.—In order to comply with Stock Exchange regulatns., particulars have bn. published of this company. The trust has undergone rapid expan., its capital havg. increased from £200 000 in 1926, to £698 737. It is a link in a chain of telephone companies in the U.S.A., Great Britain, and elsewhere, and is in associatn. with International Automatic Telephone Co., Automatic Telephone Mfg. Co., British Insulated Cables and Associated Telephone and Telegraph Co. of U.S.A. Valuatn. of company's assets made in April last showed present issue of 288 737 pref. shs. was covered 2½ times as to cap.

LANCASHIRE ELECTRIC LIGHT AND POWER CO., LTD.—Trading pft. of the Parliamentary company (Lancashire Electric Power Co.) for 1929, plus int. receivable, amts. to £257 525, and adding blce. brt. fwd., £3 186, makes available blce. £260 711, of which £19 792 has been appropriated for income tax, £35 000 for depreciatn. (making that acct. £465 000) and £4 562 is carried fwd., leavg. blce. £201 358, which has been paid to the Lancashire Electric Light and Power Co., Ltd., in respect of int. and div., less tax, for year to Dec. 31, 1929, and, with management fees and items accrued to March 31, 1930, makes a total of £209 892. Company acquired during year whole of sh. cap. of Ormskirk Electric Supply Co., Ltd., and has received from that company net div. and management fees amtg. to £1 282. Net blce. for year, after providg. for deb. int., £173 109. Amt. brt. fwd. from 1929 is £3 308, showg. available blce. £176 417, from wh. fall to be deducted fixed divs. on 6% 1st pref. and 7% participatg. pref. shs., less tax, £85 811, leavg. £90 606. Div. at rate of 7% p.a., less tax, on ord. shs. recommended. Fwd., £3 806.

Company Meetings.

ENNISKILLEN ELECTRIC LIGHT CO.—At the annual meeting on May 21, Dr. Leonard Kidd, presiding, a net profit for the past year of £1 142 8s. 11d. was reported. After paying a dividend of 7½% up to December 31, there was a credit to profit and loss account of £1 608 7s. 11d. Out of that sum, £500 has been transferred to reserve account, which now stands at £1 500. The dividend was approved and Dr. L. Kidd was re-elected chairman of the company.

YORKSHIRE TRACTION CO., LTD.—Presiding at the meeting on Monday, Mr. W. S. Wreathall, deputy chairman, said that they had again had a good year, total receipts amounting to £282 000, against £225 000. They had been able to place the same amount to reserve as in the previous year, and had been able to pay the same rate of dividend, 10%, on the increased ordinary share capital. They had also been able to increase the amount carried forward. During the year the L.M. and S. and the L. and N.E. Railway companies had acquired a joint interest in the company equal to that of the largest shareholder. The reports and accounts were adopted.

YORKSHIRE (WOOLLEN DISTRICT) ELECTRIC TRAMWAYS, LTD.—Mr. W. S. Wreathall, deputy chairman, presiding at the meeting on Monday, said that there had been a satisfactory increase in gross traffic receipts, which were £312 400, compared with £267 650. There were two reasons why the profit had not grown correspondingly with the increase in the traffic receipts. The receipts on the tramways were not as good as they had been in the previous year, and although the receipts on the omnibuses had gone up considerably, they had had to run more miles in order to take the same money. The L.M. and S. and the L. and N.E. Railway companies had acquired a joint interest in the company equal to that of the British Electric Traction Co., Ltd. The report and accounts were adopted.

KALGOORLIE ELECTRIC POWER AND LIGHTING CORPORATION, LTD.—Mr. G. C. Howard presiding at the meeting on May 22, said the net result of the year's operations was an increase in the profit of £1 846. That increase has been obtained notwithstanding that in October last their plant had been practically closed down for nine days owing to a lightning storm which had caused a fire at Dunlops Line Crossing, costing the company about £500 in repairs, in addition to loss of profits. They recommended the payment of a dividend of 6% on the ordinary shares. The financial position continued to be strong. They had a surplus of over £55 000, and of that £30 000 was at the close of the year invested in British

Digitized by Google

Government securities. The interests of the Corporation were bound up with the mining industry of the Kalgoorlie field. Whether the developments of that district would enable it to take a much larger quantity of power than at present, time would tell, but they were in a position to meet all reasonable requirements in the near future. The report and accounts were adopted.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST, LTD.—Mr. P. M. Rossdale, presiding at the meeting on Monday, said the outstanding event of the year had been the sale of their shares in the Shropshire, Worcestershire and Staffordshire Electric Power Co. They received 50s. for each £1 ordinary share. The proposed final dividend of 6% was, of course, equivalent to 12% on the original share capital, so that the shareholders would have received in respect of the year 1929 a dividend of 15% on their original holding, or 7½% on the doubled capital. Shareholders would have gathered from the report that the policy of disposing of the tramway assets of their subsidiary tramway companies was now reaching its final stage. The directors had decided to utilise the surplus derived from the sale of these shares, with certain other moneys available for distribution, for paying up in full 1 119 560 £1 6% cumulative redeemable preference shares. When the shares were thus fully paid they would be distributed to the shareholders in the proportion of one share for every share now held. The report was adopted and the resolutions authorising the increase of capital were passed.

POWER INVESTMENT CORPORATION, LTD.—Mr. R. O. Hambro, presiding at the meeting on May 21, said they were actually a new company; that was only the second meeting since they took over the shell of another company, and therefore they had not yet had time to build up reserves comparable to those shown by the older companies. In fact, 93% of the present issued capital had been subscribed in the last three years. Their investments were composed of 39·79% in high class bonds, 8·03% in preference shares, and 52·58% in ordinary shares. Although they were confident that in the long run the valuation of their investments would show an improvement, in view of the present depreciation they felt that the only wise policy to pursue to-day was to strengthen their position. They therefore proposed, out of the balance of £60 530 available after paying the preference dividend, to restrict the dividend on the ordinary stock to 5%, less tax, or the same as last year, and to carry forward the balance of £39 745. It would, no doubt, have been noticed that the item of £449 222 representing bank loans was considerably larger than at the corresponding period last year. But since that date the whole course of money rates had changed, and with the low rates now ruling they felt it was an opportunity of which the company should take advantage, and which was to-day paying them well. The report and dividends were approved.

URBAN ELECTRIC SUPPLY CO., LTD.—At the recent general meeting, Mr. P. D. Tuckett, chairman, said during the past year the company's business had continued to show healthy expansion. Including subsidiary companies, connections increased by 3 468 kW, a 7% increase on the previous total, whilst the output increased by over 4 000 000 kWh, or nearly 12%. They carried down to the net profit and loss account a balance of £154 274 9s. 2d., an increase of £2 392 over the corresponding figure a year ago. After providing for debenture interest and redemption, income tax, interim dividends, depreciation, general reserve, dividend on preference shares, final dividend of 4% on ordinary shares, making 7% for the year, and contribution to staff benevolent fund, £26 029 was left to be carried forward, an increase of £3 076. He mentioned last year that notices had been received from the Stamford and Twickenham Corporations of their intention to purchase the company's Stamford undertaking and part of the undertaking of the Twickenham company. They had since received notice from the Teddington and Hampton Councils of the exercise of their rights of purchase over other portions of the undertakings of the Twickenham company. So far as the undertakings of the Twickenham company were concerned, they expected that the purchase price would be settled by agreement, and negotiations were proceeding to determine the price and arrange for the transfer. The company would be paid the book value of the assets to be sold, less a small deduction for renewals, but unfortunately the purchase terms in the Provisional Orders and agreements prevented the company receiving any adequate compensation for the business it had built up. Hence the loss of this rapidly expanding area of supply would reduce the future earning power of the company. In the case of Stamford the Corporation had withdrawn their notice of purchase, and agreed to the company's tenure of the undertaking being extended for a further period of 40 years, in return for the concession of a tariff based on profits. Stamford was one of their least profitable undertakings, with only a limited scope for development, so that this new arrangement was unlikely to bring them any immediate benefit, but they thought that it should in due course prove beneficial in enabling them to earn a more adequate return.

SIEMENS BROTHERS AND CO., LTD.—Lord Queenborough presided at the meeting on May 22, and, after dealing with the accounts (abstracted in our issue of May 23), said the output of the works was in excess of the average for several preceding years. In order to be in a position to undertake contracts for the manufacture and laying of transoceanic submarine telephone cables, they had carried out a considerable amount of research and experimental work, so that when the time arrived for the establishment of a submarine telephone cable service with those countries which had hitherto been beyond the range of speech transmission by submarine cable, it was hoped to play as important a part as Siemens Brothers had hitherto taken in the domain of submarine telegraphy. Some important contracts were carried out in connection with that form of submarine telephone cable in which they had particularly specialised. The demand by the British Post Office for telephone subscribers' cable was maintained. The Post Office development programme on the trunk cable lines was, however, still further curtailed. The Treasury had now authorised an accelerated programme, and some substantial orders had been placed. They were successful in obtaining the largest contract for super-tension mains which had ever been placed in Australia. This consisted of 645 large drum lengths of three-phase 33 000 V. cable, the whole consignment weighing about 5 000 tons. Other important super-tension and high-tension cable contracts were carried out for various municipal authorities, notably Bristol and Hull. The chairman then gave particulars of contracts which the company had received for telephone exchange equipments in the United Kingdom, Canada, South Africa, Chili, Japan, Brazil, China, Italy, Portugal, etc., and he went on to say that their new type of telephone, the "Neophone," had, after exhaustive tests, been found to be a great advance in transmission efficiency and articulation, and had, in consequence, been adopted by H.M. Post Office as the standard instrument. New machinery had recently been installed at their works which should be of considerable assistance in cheapening production and in further improving the quality of their batteries. A new type of radio telegraph auto-alarm was developed at their works which, though proving a very great technical advance, was less costly to produce, enabling them to give shipowners a considerable reduction in price. Siemens Electric Lamps and Supplies, Ltd., a subsidiary which they fully owned and controlled, has for several years past made continued and satisfactory progress and was now an important factor in the company's business. The report and accounts were adopted and the dividends approved.

New Companies.

H. A. LAMB AND SONS, LTD.—Cap., £1 000. To acquire business of electrician now carried on by H. A. Lamb at 119, Fulham Road, Chelsea, London, as "H. A. Lamb and Sons."

PAINTER AND MADEW, LTD.—Cap., £2 000. Manufacturers and repairers of, and dealers in, dynamos, motors, armatures, magnetos, wireless apparatus and accessories, etc. Solicitors: Huntbach and Son, Hanley.

ROBSONS (LIVERPOOL) TRADING CO., LTD.—Cap., £500. Electrical engineers, boilermakers, manufacturers of, and dealers in, dynamos, motors, electric hammers, etc. Solicitors: Luya and Williams, 20, North John Street, Liverpool.

HERBERT SMITH (BRADFORD), LTD.—Cap., £3 000. Electrical and general engineers, manufacturers of, and dealers in, accumulator batteries, plates, motors, dynamos and electrical supplies. Solicitors: A. V. Hammond and Co., Bradford.

W. H. LAWTON, LTD.—Cap., £750. To acquire business of electrical engineer, manufacturer of, and dealer in, electric, magnetic, telegraphic and telephonic accumulators, etc., formerly carried on by W. H. Lawton at 121A, Liverpool Road, Stoke-on-Trent.

ELECTRO-GAS DEVELOPMENT CO., LTD.—Cap., £1 000. To acquire business of supplier of electrical, heating, cooking and other apparatus carried on by H. P. Barker at 100, Victoria Street, London, S.W., and elsewhere as "Electro-Gas Development Co." Reg. Office: 3, Arundel Street, Strand, London, W.C.2.

BARTON AND SONS (1930), LTD.—Cap., £10 000. To adopt agreement with Barton and Sons, Ltd., and W. J. Edwards, liquidator thereof, to acquire business of manufacturers of conduits, fittings and accessories for electric lighting and power transmission, etc., now carried on by old company at Green Street, Walsall.

DULVERTON ELECTRIC LIGHTING CO., LTD.—Satisfaction reg. May 6, £1 000 reg. June 16, 1927.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

FAIRFIELD, H. and R. W., trading as FAIRFIELD AND CO., 27, 38 and 42, London Road, Leicester, wireless dealers, etc. Creditors were called together recently, when a statement of affairs was submitted which showed ranking liabilities of £5 143, of which £4 895 was due to unsecured creditors, and assets estimated to realise £2 919, less preferential claims, or a deficiency of £2 796. It was reported that the business was originally commenced in 1914, when the joint capital was approximately £1 000. During the year to January 3, 1926, the turnover was £22 347, and in the following year it fell to £20 209, and in the succeeding 12 months was £19 708. During the year to January, 1929, the sales still further declined to £14 215, whilst for the 12 months to January 3 last, the turnover was £10 677. During the year to January, 1925, there was a profit earned of £1 049, and in the two following accounting periods the net profit was £135 and £283 respectively. During the last three years, there had been losses incurred ranging from £700 to £1 000 per annum. The deficiency was attributed to the losses on trading together with the depreciation written off the assets in the statement of affairs. The fully secured creditors were discount companies who had taken assignments of a large number of hire purchase agreements. No offer of a composition was submitted, and it was eventually decided that a committee should be appointed to consider the matter, and to make recommendations to the general body of creditors as to the way the estate should be dealt with.

SIMKINS, F. W., trading as BROADWAY RADIO SUPPLIES AND THE CORNER CABINET WORKS, Roxeth Corner, Harrow. In response to a circular letter issued by Mr. James Mortimer, accountant, of 12, Coleman Street, E.C., a meeting of the creditors of the above was held on May 26, when a statement of affairs presented disclosed liabilities of £250 (of which £175 was due to the trade and the balance to loan creditors) and net assets (including stock in trade valued at £140) of £163, or a deficiency of £87. Mr. Mortimer reported that the debtor started business in Middle Road, Harrow, in March, 1927, with a borrowed capital. He acquired his present premises in December, 1929, at a rental of 25s. per week. The net profits for the year ended March 31, 1930, amounted to £162, out of which the debtor had to pay interest on borrowed money. The drawings had averaged £2 10s. weekly. The debtor attributed his present position to losses incurred on the cabinet business, bad trade generally and lack of working capital. The creditors decided to confirm the deed of assignment already executed in favour of Mr. E. H. Hawkins as trustee and to accept the debtor's offer of 10s. in the £, payable by minimum payments of £8 monthly, the first payment to be made on June 1, 1930. The following are creditors:—Hobday Bros., Ltd., £58; Kolster Brandes, Ltd., £47e Cossors, Ltd., £20.

WEBB, R. N., trading as THE WEBB CONDENSER CO., 42, Hatton Garden, London, W.C.1. Creditors met recently at the offices of Jones and Peel, 109, Kingsway, London, W.C.2, when a statement of affairs was submitted showing liabilities of £3 069 (of which £1 069 was due to unsecured trade creditors, and the balance to an unsecured cash creditor), and net assets of £428, or a deficiency of £2 641. No offer was made, and creditors intimated that the matter should be dealt with in bankruptcy. Subsequently, however, the cash creditor, debtor's brother, agreed to stand aside in respect of his claim of £2 000 in favour of the trade creditors, and a resolution was passed requesting the debtor to execute a deed of assignment in favour of Mr. E. H. Hawkins, of Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C., as trustee, with a committee of inspection.

London Gazette, etc.

Company Winding-up Voluntarily.

HOUGH BROTHERS, LTD. By special resolution, May 22. W. L. Dominy, chartered accountant, Friary Chambers, Friar Lane, Nottingham, appointed as liquidator.

ville Road, and at Victoria Works, Victoria Road, Bexhill-on-Sea, by mutual consent as from September 22, 1928. Debts received and paid by F. A. Boggis, who continues the business.

Bankruptcy Proceedings.

BALL, Ernest, Old Hall Street, Middleton, Lancs, electrical contractor. The statement of affairs produced at the examination of the debtor showed ranking liabilities of £768, and a deficiency of £604. Debtor attributed his failure to loss on contracts, bad debts, legal costs on summonses, heavy wages bill, and domestic illness. It would seem that at one time he had a partner, and borrowed £100 with which to pay him out when the partnership was dissolved. In March, 1924, he had a debit balance, but throughout his business career he had been handicapped with regard to capital, as a result of the arrangement made with his former partner. Accounts had not been prepared since March, 1926. The debtor added that he had received £140 from his father's estate.

DOUDNEY, Edward, 93, East Street, and 40, South Street, Chichester, wireless and wholesale and retail salesman. The public examination was held on May 21 at Brighton. The statement of affairs showed liabilities £2 428, and assets of £350, thus leaving a deficiency of £2 078. The debtor started business May, 1919, as a wireless dealer. The business, however, was not successful, and he was allowed an overdraft from the bank. In February, 1928, he gave the guarantor a mortgage on the premises at Chichester, for £750. At that time he was responsible to the bank for an overdraft, and that liability had not been discharged. He did not think there was much value in the lease of the premises. In June, 1929, he found that the retail business was unsuccessful, and then commenced a wholesale business, borrowing £500 from his sister for the purpose. The debtor attributed his failure to bad trade, competition and ill-health.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

PHONIXION (sign). 510 439. Class 8. Electrical sound reproducing apparatus. Mildred Elsie Cox, trading as Connor and Co., 23, Charing Cross, Whitehall, London, S.W.1; supplier of electrical goods. February 17, 1930.

MAGIC NOTES.—510 817. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Columbia Graphophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers. February 28, 1930. To be associated with No. 367 102 (1 969) and others.

PORTOPED.—509 661. Class 8. Sound reproducing instruments. Charles Blankstone, "Chartrude," Nursery Road, Edgbaston, Birmingham; manufacturer. January 21, 1930.

510 957. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Silas Quaker, Ltd., 110, Park Street, Camden Town, London, N.W.1; manufacturers. March 6, 1930. To be associated with No. 510 958 (2 716) xiii.

ROX.—508 400. Class 13. Hollow-ware, electric conduits and terminals, electriclighting, heating and cooking fittings, incandescent electric lamps (ordinary), lamp reflectors, barbed wire, wire netting, bells, rivets, bolts and nuts, door bolts and locks, gas fittings, gas cylinders, gas tubing, hinges, nails, screws and staples, all being metal goods not included in other classes. Weiss, Biheller and Brooks, Ltd., 71, Chiswell Street, London, E.C.1; general merchants. December 3, 1929. To be associated with No. 319 334 (1 676) and others. (By consent.)

ROLLISTIC.—510 312. Class 50. Soap bowls, powder bowls, flower bowls, containers and container lids; knife and razor handles; bradawl handles; parts of shaving and hair brushes; finger plates and knobs for doors; ornaments (not being jewellery); napkin rings; fishing rod handles; butts of rifles, pistols and revolvers; panelling; electrical insulators and insulating parts of electrical apparatus; trays, drinking utensils and toilet sets; all being goods manufactured from synthetic resin and not included in other classes. Rolls Razor, Ltd., 255 to 289, Cricklewood Broadway, London, N.W.2; manufacturers. February 12, 1930.

VIKING.—510 826. Class 6. Domestic vacuum cleaning machines, domestic washing machines, electric fans for domestic use, and electrically driven sewing machines for domestic use. VIKING SALES, LTD., Harvesta House, 37, Peter Street, Manchester, merchants and manufacturers.—March 1, 1930. (By Consent.)

SINGER.—Advertised before acceptance, the Applicants alleging distinctiveness. 500 780. Class 8. Rheostats, electrical resistances and devices for controlling electric motors for sewing and like machines (and not forming parts of or accessories for motor vehicles and cycles). THE SINGER MANUFACTURING CO. (a Corporation organised under the laws of the State of New Jersey), 149, Broadway, New York, County and State of New York, United States of America; Sewing machine manufacturers and dealers.—March 8, 1929. To be Associated with No. 432 357 (2 347) and others.

LIVER. 508 132. Class 17. Goods for electrical purposes manufactured from mineral and other substances for building or decoration, but not including Portland cement and reinforced concrete, and not including any goods of a like kind to any of these excluded goods. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. November 23, 1929. To be associated with No. 505 075 (2 705) and others. (By consent.)

TIRON. 510 901. Class 8. Electric cables. St. Helens Cable and Rubber Co., Ltd., Trading Estate, Slough; manufacturers. March 4, 1930.

READI-RAD. 510 988. Class 8. Wireless telegraphic and telephonic instruments and apparatus and parts thereof. R. R., Ltd., 159, Borough High Street, London Bridge, London, S.E.1; merchants and manufacturers. March 7, 1930.

PRIMROSE. 511 087. Class 8. Dry electrical batteries and electrical cells, not for medical purposes. Norman Stanley, 8, Cranbrook Road, Ilford, Essex; merchant. March 12, 1930.

NUZ. 509 263. Class 13. Electric switches (ordinary), plug box covers of ordinary metal and electrical fusible cut-outs of ordinary metal. Siemens Schuckertwerke Aktien-Gesellschaft, 101 to 110, Nonnendamm-Allee, Berlin; manufacturers. January 4, 1930. (Date claimed under International Convention, July 13, 1929.)

LIVER. 508 131. Class 16. Goods for electrical purposes made of porcelain or earthenware. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool, manufacturers. November 23, 1929. To be associated with No. 474 578 (2 543) and others.

DEXIM. 511 774. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth, Middlesex; manufacturers. April 3, 1930.

COMING EVENTS.

Friday, May 30—Saturday, May 31.

I.M.E.A. CONVENTION.—Eastbourne.

Monday, June 2.

ROYAL INSTITUTION.—21, Albemarle Street, London. General meeting.

Monday, June 2—Saturday, June 7.

INSTITUTION OF ELECTRICAL ENGINEERS.—Summer meeting at Irish Centre.

Tuesday, June 3.

ELECTRICAL CONTRACTORS' ASSOCIATION (DERBY BRANCH).—Ordinary meeting. 5 *p.m.*

ILLUMINATING ENGINEERING SOCIETY.—32, Victoria Street, Westminster, S.W. Annual meeting. 7 *p.m.*

Wednesday, June 4.

PHYSICAL AND OPTICAL SOCIETIES.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington. Discussion on Photo-electric Cells, their History, Development and Manufacture, and their Various Applications. 3–5.30 *p.m.*, 5.30 to 7 *p.m.*, demonstrations.

FARADAY SOCIETY.—King's College, Strand, London. Papers by Prof. T. H. Laby on "Quantitative and Qualitative Analysis by X-Rays," and Mr. J. T. Calvert on "The Determination of Potassium in Soil Samples by the Application of an X-Ray Method." 5.30 *p.m.*

PHYSICAL AND OPTICAL SOCIETIES.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington. Discussion on Photo-Electric Cells, their History, Development and Manufacture, and their Various Applications. 10.30 *a.m.*–1 *p.m.*, and 3–5.30 *p.m.*

ELECTRICAL CONTRACTORS' ASSOCIATION (BATH SUB-BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (SOUTHERN SECTION).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (CARDIFF BRANCH).—Ordinary meeting. 2.30 *p.m.*

ELECTRICAL CONTRACTORS' ASSOCIATION (DUBLIN BRANCH).—Ordinary meeting. 2.30 *p.m.*

POLYTECHNIC ENGINEERING DEPARTMENT.—307-311, Regent Street, London. Lecture V. (Course of six lectures) by Mr. W. H. Date on "Thermionic Valves." 6.30 *p.m.*

Thursday, June 5.

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-WESTERN STUDENTS' SECTION).—Visit to the Parkington Steel and Iron Co. at Irlam.

ELECTRICAL CONTRACTORS' ASSOCIATION (NEWCASTLE BRANCH).—Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION (BRISTOL BRANCH).—Ordinary meeting. 3.15 *p.m.*

LONG DISTANCE TELEPHONY

The new short wave wireless telephone transmitter used by the Marchese Marconi when he carried on two-way telephone conversations with Australia from his yacht "Elettra" in the Mediterranean, a distance of 9,000 miles, was manufactured at the Marconi Works, Chelmsford. ¶ This telephone set has several new features and the success of the Australian tests indicates the great commercial possibilities of the apparatus. It is simple in operation and will provide an efficient wireless telephone service for ships at sea over almost any distance. Full details of this and other types of wireless telephone equipment can be obtained from the Marconi Company.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., MARCONI HOUSE, STRAND, LONDON, W.C.2

Where 1=3

A new type Standardised Plug that fits all Sockets.
Why bother to stock 5 amp., 10 amp., 15 amp. Plugs—where this one

ASHDOWN

Plug is adaptable to all amperages—fits all types of Sockets.
What a saving in stocks!
Note the simplicity—one turn of Knurled ring adjusts pins to exact position for Sockets—no risk of shocks from touching live metal.
Also the three types of pins supplied (5, 10, and 15 amps.) can be fitted in a jiffy—thus converting the plug to any amperage at will.
Don't bother to stock "various-sized" plugs—stock the Universal Ashdown—it fits every socket!

Last Week at Eastbourne.

IT was generally agreed that this year's I.M.E.A. Convention, with its record attendance, was a thoroughly successful affair. For this happy result the efficient organising work of Mr. CRAMB and Mr. SIMPSON, and the local efforts of Mr. and Mrs. BRYDGES and the civic authorities of Eastbourne deserve cordial thanks, but the Clerk of the Weather certainly supported them in a most efficient way. The change which came over the scene in the course of Monday afternoon proved to be the harbinger of three wonderful days of brilliant sunshine and warmth—the dancers could have wished that the evenings had been a trifle less tropical—and this must have contributed very largely to the general atmosphere of geniality and good fellowship. Friday was not so good, but it would be ungrateful to say too much about this lapse. Possibly the tutelary deity of the district was alarmed by the somewhat defiant incitation to the visitors, contained in the Mayor's speech at the annual dinner on the previous evening, to indulge in flood-lighted night bathing on the beach, and thought it desirable to damp the ardour of any who might contemplate taking Lieut.-Col. ROLAND GWYNNE too literally. He had been goaded into making this reckless suggestion by the sly fun poked at Eastbourne's recent attempt to pose as a censor of seaside manners by Sir HARRY HATT.

Turning to the serious side of the Convention, it may be said that the discussions on pulverised fuel firing and electric heating of buildings provoked by the papers read by Mr. LAKE and Mr. BURR and by Mr. MCKENZIE's remarks on domestic water heating resulted in a useful exchange of ideas on two very important current problems of supply undertakings. On the subject of pulverised fuel there is still a wide difference of opinion, but it would appear that there is fairly general agreement as to the necessity of adopting this method in the case of plants of the size now reached in the United States. Just where the dividing line is to be drawn above which stoker firing ceases to be able to hold its own is still uncertain. Dr. PEARCE puts it at about 400 000 lb. steam capacity. Mr. LAKE would certainly divide this figure by more than two, and other engineers favour a combination of both methods. Local conditions of coal supply and quality naturally exert a large influence on the decisions taken by station engineers as to which plan should be adopted. Mr. SELVEY rightly emphasised the promising value of Mr. LAKE's work at Derby, and Mr. CHATTOCK quite reasonably made the point that efficiency and capital cost comparisons between the still partly experimental pulverised fuel-fired plants and stoker-fired stations which were on a more permanent basis could not fairly be drawn.

Considerable diversity of view was also apparent on a number of points connected with the heating of large buildings, and the best method of securing and distributing the domestic water heating load. Mr. MCKENZIE advocates giving the consumer the choice of a variety of tariffs, and in his district he seems to be successfully working on these lines, but elsewhere greater simplicity in the system of charging for current regarded as essential. The women speakers were all is emphatic on this point. They strongly urged the desirability of having tariffs which could be readily understood by the average housewife. A certain liveliness characterised the encounter between Mr. MCKENZIE and Mr. SHARP on the question of the comparative costs and merits of time switches and synchronous motor switches, and Mr. SHARP would appear to have some ground for complaint at the lack of response by engineers to inquiries as to which type of apparatus they preferred. Clearly it is very necessary, in order to cheapen the manufacturing cost of the British article, that some indication of the character of the demand should be obtainable.

Current Topics.

Sussex and the Grid.

ONE or two aspects of the grid situation in Sussex, arising out of Mr. BRYDGES references to the subject in his presidential address and in his speech at the annual dinner, deserve attention. Eastbourne is to take its entire supply from the grid, according to programme, by October, 1931, and a partial supply has been promised by October 1 of the current year. Mr. BRYDGES appears to be a little dubious as to this promise being implemented, and is consequently, concerned as to what may happen during the coming winter in view of the veto on extensions to his own station. We gather that there is still a good deal of obstruction being encountered by the Central Electricity Board in the matter of obtaining way-leaves in this and other areas. It is a scandal that such a condition of affairs should exist, especially now that the erection of some of the overhead lines on the South Downs has shown how unobtrusive the pylons really are. If, as seems to be the case, the Board is getting seriously behind its time table the consequences in certain supply areas are likely to be awkward and the national scheme will receive some very undesirable publicity.

Standard Cookers.

VISITORS to the electrical exhibition held in conjunction with the I.M.E.A. Convention at Eastbourne, had an opportunity of inspecting the British Standard Electric Cookers which have been produced to the standard specification approved in September last by the Joint Committee of the I.M.E.A. and B.E.A.M.A. This attempt to cheapen and simplify electric cookers will, we hope, achieve the objects with which it has been designed, but it cannot be said that manufacturers are wildly enthusiastic about their co-operative progeny. Their preference for their more individual products may, perhaps, be compared to that of parents for their own offspring in comparison with other children of the same clan. The lagging of the standard cookers is exceptionally thick, but it is claimed by the designers that, although their appearance is certainly somewhat massive, this robustness has resulted in very efficient heat retention being obtained.

Getting Prices Down.

THE return to normality after the unheaval of the war is a long, painful and difficult process, of which such troubles as unemployment are only a part. A good deal of the difficulty is due to the fact that no one can say what normal will be. It is by no means to be assumed that we are going back to the pre-war price level, but it is quite certain that we must get sooner or later on to a natural price level. That process will not be complete until every little bit of inflation and all the other artificial price arrangements of the last fifteen years have been wiped out. Meanwhile the wholesale price level has reached the lowest figure since the war. "The Times" index, published on Monday, gave the level of wholesale prices at 116·3, or 2·2 per cent. lower than a month ago, 11·8 per cent. below a year ago, and 15·4 per cent. less than the corresponding figure at the beginning of 1929. In the meantime, however, retail prices have shown no such reduction, and the great big lag between wholesale and retail prices is one of the most disturbing factors in the economic situation. Commodity prices fall, wages fall or people go out of work, and then when they go shopping they are astonished to find that the stuff which was cheaper at the factory, remains at the inflated price in the shop. The most glaring examples of this difficulty are to be found in food. The present price of bread is about double pre-war price, while the price of wheat is close to the pre-war level. Coal is not quite, but nearly as bad. But the difficulty is spread more or less over the whole realm of retail trading, and presents a problem with which many of our readers are intimately concerned.

An Interesting Experiment.

THE head of the firm of John Lewis and Co. has been expounding some novel doctrines on the duty of the heirs of successful business men. Mr. LEWIS seems to assume that there are only two possible courses open to a man in his position, either to sell out of the family business and invest the proceeds in gilt-edged securities and take up a public career, or to do as he has done—keep his capital in the business, "stick to the shop," so arranging matters that he takes no profit of any kind. It will be interesting to see how the experiment works, for to the plain man there seems to be a third and much sounder course for everybody concerned; those employed in the business as well as those whose money is invested in it. That course is to keep every penny of capital in the business and to devote every scrap of energy to its development, with all the profits which may accrue from the enterprise and ambition of its head. Mr. LEWIS is, apparently, not unmindful of the flaw in his argument, for in his speech at the annual meeting of the company, after assuring the preference shareholders that none of them could lose a penny until he had lost the whole of his estate, he added that he could be trusted to part with the control of the company long before that point was reached. The moral is that there could be no playing with economic forces without the certain risk of the stopping of initiative and the loss of confidence.

High Speed Circuit Breakers.

AFTER extended tests last August on the 220 kV system of the Philadelphia Electric Company, a new design of high voltage high speed oil circuit breaker is now being manufactured by the Philadelphia works of the American General Electric Company on a commercial scale. These new circuit breakers have an interrupting rating of 2 500 000 kVA at 230 000 V. They are of the moulded non-metallic explosion chamber type, with stationary contacts. The operating mechanism is a double motor-operated centrifugal device. This closes the breaker contacts and at the same time stores energy in springs to accelerate the opening stroke. The complete breaker is 39 feet long and 12 feet wide, the height to the top of the bushing being 23 feet. The tanks have an inside diameter of 9 feet and contain 13 700 gallons of oil. Completely assembled the breakers and oil weigh 92 tons. At the three generating stations of the New England Power Company's new development —Fifteen Mile Falls, Andover and Tewksbury—17 of these new circuit breakers are being installed. The operating time of 8 cycles from the energising of the trip coil until extinction of the short circuit compares with 20 cycles for the ordinary explosion chamber design of similar size, and it is believed that developments now in progress will lead to the production of a still more rapidly acting type.

THE ENGINEERING BUDGET.

Analysis of Development Expenditure of an American Supply Undertaking—Method of Predicting Future Requirements by Extending Graphs.

By VERNON W. PALEN.

IT is the purpose of this paper briefly to outline the essential parts of the engineering budget as annually prepared by an electric company in the eastern United States, having in use upwards of 250 000 meters. The material is set out in such a way that the growth in the budget items of a similar company elsewhere may be compared with those described.

From figures 2, 3 and 4 some idea may be gained as to the very rapid growth in population and corresponding rapid growth in electric meter installation and load which have taken place in the territory under discussion. It is well to point out that in this community at present every meter serves an average of slightly less than four individuals, since there are very few locations which are not entirely electrified. In short, the growth in electric meter installations shown in Fig. 4 represents almost entirely new building installations.

Account must also be taken of the fact that the territory in question, due to its proximity to metropolitan districts, is populated by individuals who are used to or at least are familiar with the best in electric service. The annual expenditures for the various items to be described may, for the above reason, necessarily be somewhat higher than for a company serving the average suburban territory. Besides this, the city developments and improvements in a community such as is described here greatly influence the amounts expended annually for removal of overhead lines and for subway construction.

The company under discussion in this paper has as yet no generating station of its own. All energy is purchased from one of the large generating stations in the nearby metropolitan district.

In 1915 we find this company owned and operated six sub-stations indicated on Fig. 1 by the letters A, B, C, D, E and F. In 1917 sub-stations E and F were rebuilt and enlarged. Up to 1918 power was distributed two-phase almost entirely, but in 1918 extensive changes to three-phase were made, and this work was extended in the years following 1918, so that at the present time practically all power is distributed three-phase.

In 1925, 1926 and 1927 respectively automatic sub-stations G (controlled from D) and H (controlled from D) and I (controlled from A), as shown on Fig. 1, were added.

Very little construction of any kind was done during the war, and when the armistice was signed, this company found itself several years behind in its enlargement programme. With money becoming more easily available, 1919 saw considerable subway construction in the vicinity of sub-station A. A 15 000 V tie feeder was installed between sub-stations B and E as well as a 15 000 V distribution feeder in the vicinity of sub-station A.

In 1920 subway construction was done in the neighbourhood of sub-stations C, D and E, and a 15 000 V tie feeder was installed between stations D and E. A commercial office at D and a new sub-station at C were built in 1922, and additional subways were constructed at C.

In 1923 a new store-room and garage at A, additions to office building at A, a 15 000 V tie feeder between A and C, a 15 000 V tie feeder between A and D, subway construction in the vicinity of A, C and D, and installation of underground distribution systems at A, C, D and E, were among the improvements. Additional distribution subway was built in 1924 at A, D, C and I, and the underground distribution system at A, C, D and E were extended in this year. A 15 000 V transmission feeder from C to D, and a 15 000 V distribution feeder at A were also installed.

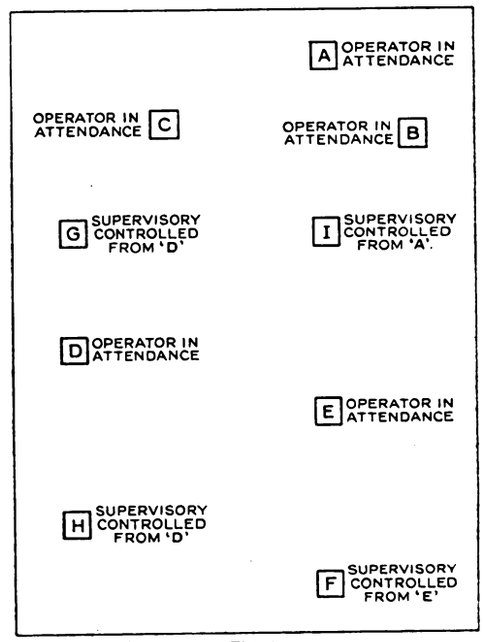

Fig. 1.

In 1925 a new garage and storeroom at D, considerable subway construction at A, C, D, E and G, a 15 000 V transmission feeder from C to G and another from D to G, and considerable additions to the underground distribution systems at A, C and D were on the programme.

Subway construction at A, C, D, E and H was carried out in 1926. A 15 000 V transmission cable from D to H, a 26 000 V transmission cable from A to D and added underground distribution systems at A, D and E were also among the improvements. In 1927 a 15 000 V transmission cable was installed between A and I and also between E and I.

The foregoing outline indicates work which was, for the most part, not affected by natural growth in load, but more par-

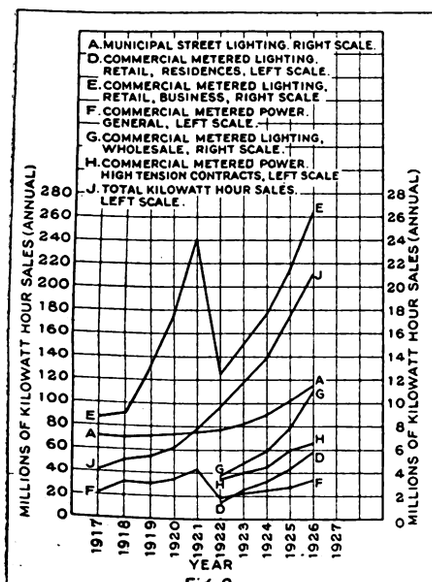

Fig. 2.

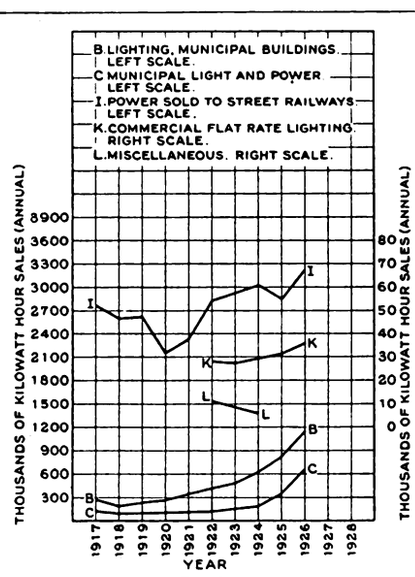

Fig. 3.

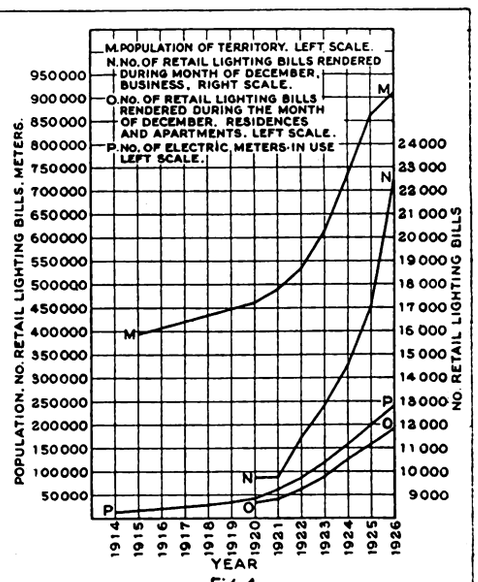

Fig. 4.

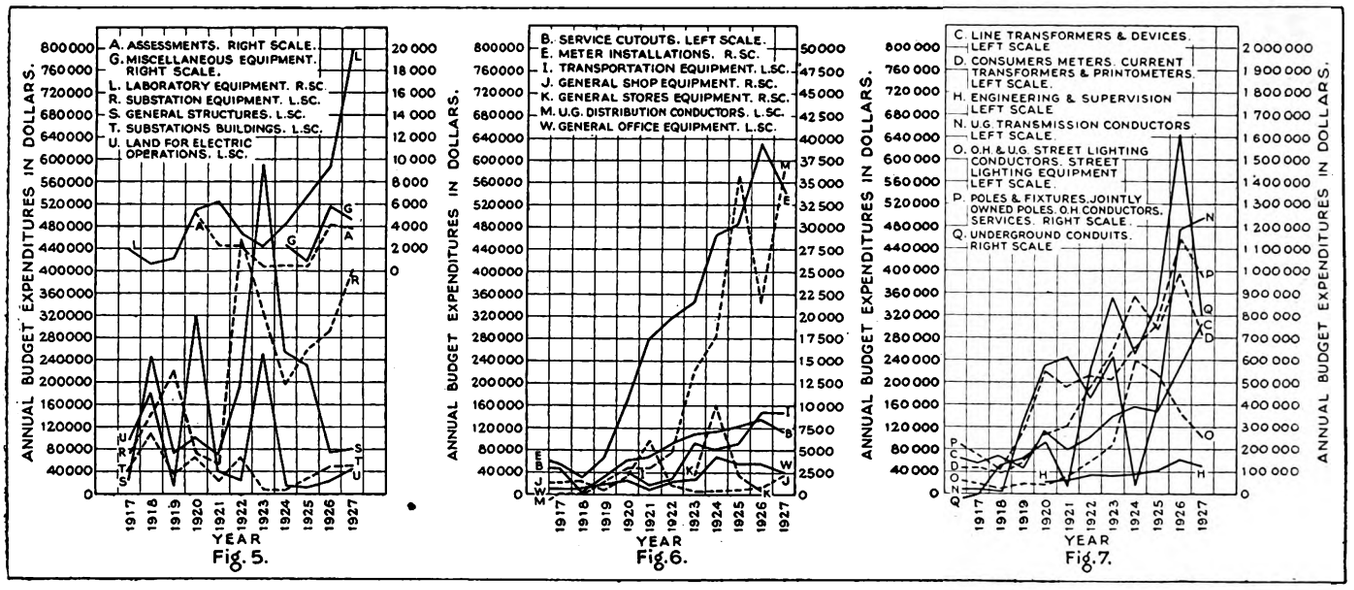
Digitized by Google



ticularly dependent upon local conditions. Practically all other budget accounts show a proportionate yearly increase with the load. The data given should aid the reader materially in comparing this company's annual budget expenditures and scope of improvements with similar items of another company. The annual expenditures for these various items will be found on Figs. 5, 6 and 7.

Project (*A*): Labelled "Assessments."—Covers the amount for the payment of assessments for local improvements.

Project (*B*): Labelled "Service Cutouts."—Covers the purchase and delivery of service cutouts to supply requirements for coming year.

Project (*C*): Labelled "Line Transformers and Devices."—Covers the purchase and delivery of line transformers to supply the requirements for the coming year.

Project (*D*): Labelled "Consumer's Meters, Printometers and Current Transformers."—Covers the purchase and delivery of said equipment to supply the requirements for the coming year.

Project (*E*): Labelled "Meter Installations."—Covers the cost of installing new meters.

Project (*G*): Labelled "Miscellaneous Equipment."—Covers the purchase and delivery of electric tools and implements to supply requirements of coming year.

Project (*H*): Labelled "Engineering and Supervision."—Covers the amount of such expense which is charged to capital.

Project (*I*): Labelled "Transportation Equipment."—Covers additional business and commercial vehicles required for new business and to replace vehicles removed from service.

Project (*J*): Labelled "General Shop Equipment."—Covers the cost of such material due to expansion of business.

Project (*K*): Labelled "General Stores Equipment."—Covers the cost of such material due to expansion of business.

Project (*L*): Labelled "Laboratory Equipment."—Covers cost of testing equipment due to expansion of business.

Project (*M*): Labelled "Underground Distribution Conductors."—Covers all new and existing commercial 4 000 V feeder requirements.

Project (*N*): Labelled "Underground Transmission Conductors."—Covers all new and existing transmission feeder requirements.

Project (*O*): Labelled "Overhead and Underground Street Lighting Conductors and Equipment."—Covers all new and existing street lighting requirements.

Project (*P*): Labelled "Poles and Fixtures, Overhead Conductors and Services."—Covers all new and existing commercial feeder requirements.

Project (*Q*): Labelled "Underground Conduits."—Covers all Subway Construction and depends greatly on local conditions.

Project (*R*): Labelled "Sub-station Equipment."—Covers all electrical equipment required by new and existing sub-stations.

Project (*S*): Labelled "General Structures."—Covers all construction on other than sub-station buildings.

Project (*T*): Labelled "Sub-station Buildings."—Covers the construction of new sub-station buildings and miscellaneous additions to existing sub-station buildings.

Project (*U*): Labelled "Land Devoted to Electric Operations."—Covers the amount necessary for the purchase of sites for sub-station buildings.

Project (*W*): Labelled "General Office Equipment."—Covers the cost of such material due to expansion of business.

In making up the annual budget this company estimates items A, B, C, D, E, G, H, I, J, K, L, Q, S, and W from expenditures of previous years. In other words, to find approximately what amount to include in the 1928 budget for any one of these items, it is only necessary to extend the graph for that particular item on the curve sheet.

On the other hand, items M, N. O, P, R, T and U, which depend primarily on load conditions, are all more or less involved together, and for this reason it is best to study load conditions over the entire territory at one time. This procedure will show what sub-stations and primary feeders must be relieved. New sub-stations and new feeders are laid out to meet the estimated future peak and suitable amounts to cover the cost of all work are incorporated in the budget.

WORKS WELFARE.

ALTHOUGH welfare work need not be a costly item of management, a considerable proportion of the activities covered by it being practically chargeless, or capable of being made self-supporting, there are some items which must be debited to the welfare account. This question is discussed in detail in a confidential memorandum on "The Introduction of a Works Welfare Scheme," which has been compiled by special request for the use of member firms of the Industrial Welfare Society. To a firm with 4 000 employees the allocation of a penny per per day per worker would mean a fund of over £5 000 per annum; this would be sufficient to cover the salaries of the welfare staff and groundsman and the firm's contributions to the various benevolent funds. The memorandum attempts a definition of the scope of works committees and suggests that executive functions should include such matters as determination of hours of work, control of mess rooms, heating, lighting and sanitary arrangements, collections, entertainments, works magazines and the organisation of the sports association. Advisory functions should deal with the engagement, discharge, dilution and transfer of labour (excluding disciplinary discharges), training and education of apprentices and suggestions for improvement in method, time-keeping and so on. Actually, in matters involving expense by the firm, a works committee is naturally advisory, in others, and certainly in all minor matters, it becomes executive in fact if not in name.

NATIONAL RADIO EXHIBITION.

The National Radio Exhibition, organised by the Radio Manufacturers' Association, will be held in the New Hall, Olympia, London, from September 19 to 27. The plan of the stands has been prepared and the allocation of space, as in past years, will be by ballot. There will be three ballots held consecutively on the same day, and all firms whose applications for space are received on or before June 14 will be then included.

MODERN BOILER HOUSE PRACTICE—III (b).

Water and Air Cooling of Furnace Walls—Corner Firing—Pulverised Fuel Firing—Boiler Efficiencies.

By F. JOHNSTONE TAYLOR.

WHILE water cooled walls are now to be regarded as prevalent practice the air cooled furnace can in many instances be justified on account of its lower cost. The M.A. Detrick Co. of New York, who are specialists in this type of furnace (shown in Fig. 6), lay stress on the important matter of the bonding of the key tile, which as shown in detail consists of a small casting which fits into a recess in the bottom face of this tile eliminating any possibility of its working out into the furnace. Shortening of the height of the vertical sections, too, is claimed to facilitate erection and to make possible a more equitable distribution of the steel supporting members. Nine inch tiles are adopted as standard, while the supporting steel is so arranged that the outer wall may be of red brick laid up between and supported by the steel members, thus giving lanes for air cooling. The tile supporting castings are made with horizontal arms of various lengths. The air passages can, therefore, be made to suit the particular conditions of each installation. That is to say, if all the combustion air is to be taken through the walls, these arms can be made long with large air spaces, while if only the primary air for a unit mill is required a thinner air space can be provided. In addition the design permits of baffling vertically or horizontally, as desired, with equal facility. Obviously there is a limit to the rate of combustion which is possible with such furnaces, but for moderate rates they are satisfactory if properly designed and constructed, and as already stated their cost is relatively low.

Another development is that due to the Combustion Engineering Co. of New York, which takes the form of tangential or corner firing. This arrangement has proved of value at high ratings in the form of reduced carbon loss and good furnace distribution. By means of a special type of mixing burner all the air necessary for combustion is admitted through the burner either as primary air entering with the coal stream or as secondary air entering around the fuel inlet nozzle. Baffles and deflectors are so arranged that an intimate mixture exists when the fuel and air enter the combustion chamber. It is claimed that corner firing entirely eliminates smoke at any rating, the minimum excess air being determined by the fusing temperature of the ash.

Typical of a large boiler unit is that installed by Simon Carves at the Birmingham, Nechells station, which is an interesting study in itself. This installation is on the "central" system of pulverised coal firing with four rotary driers and four mills of the ball type, while the four boilers are

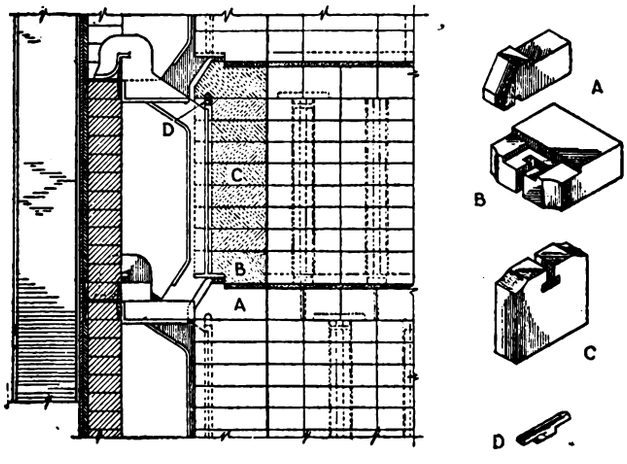

Fig. 6.—Air cooled Detrick furnace.

rated at 150 000 to 180 000 lbs./hour at 350 lb. and 700 deg. F. On a 54 hours official test at an average rating of 140 600 lb./hour the overall efficiency after deducting all coal used for drying and power purposes was 81·18% on the gross and 84·76% on the net lower calorific value, while that of the boiler alone was 84·69% and 88·46% respectively. Later tests at a higher rating and after certain modifications to the plant showed a maximum boiler efficiency of no less than 91·10% on the net lower value. The fuel used was an inferior grade with 20% moisture content and 25% ash.

The foregoing may be compared with the general system applicable to Babcock boilers as shown in Fig. 7, and that of Messrs. Clarke, Chapmans' Woodeson boiler in Fig. 8, which may be taken as representative of British practice at the

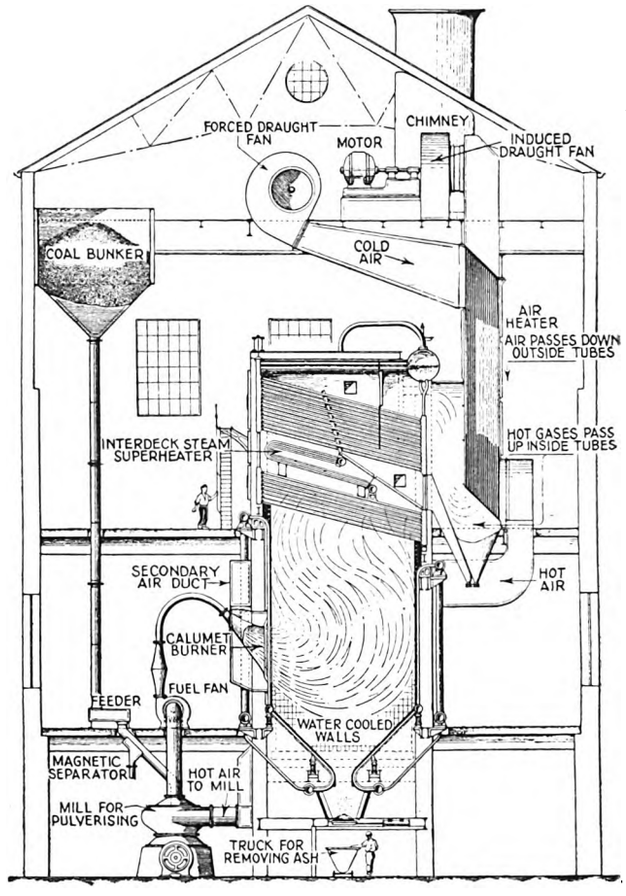

Fig. 7.—Babcock boiler.

present day, while Fig. 9 shows the principal features of a Foster Wheeler boiler at the Rockway, N.Y., station of the Queensboro' Gas and Electric Co., which could be regarded as good average American practice. These units have a maximum capacity of 280 000 lb./hour, with an evaporation of 13·5 lb./sq. ft. of heating surface (450% rating).

Of plants in this country the previously described Nechells boilers and those recently installed at Hams Hall, Birmingham, may be taken as representative of large installations, the latter described in "Engineering" of November 22, 1929, comprising five boilers with a normal rating of 190 000 lb./hour at 375 lb. and 710 deg. F. They are of the B. and W. cross drum type, and are fitted with Usco air heaters.

The sets at Wallasey ("Engineering," April 26, 1929), and Peterborough ("The Engineer," May 24, 1929) are indicative of what can be done in the case of relatively small stations. The boilers at Wallasey already shown in Fig. 3 have a rating of 53 500 lb./hour at 300 lb. pressure and 600 deg. F., though they are only at present being operated at 200 lb. They are of Simon Carves' semi-vertical tube tri-drum type, the previously mentioned cooling tubes in the walls forming part of the circulating system.

The Peterborough station is claimed to be unique so far as this country is concerned in its being entirely operated by pulverised fuel and also in its having the boilers and turbines in the same room, while the coal is dealt with and stored in an entirely separate building. Here, as opposed to Wallasey, however, the central in place of the unit system is employed incorporating a pulverised fuel fired raw coal

Digitized by Google

dryer, ball type mills, screw conveyors and steel plate bunkers with a capacity of 240 tons together with the necessary feeders and subsidiary equipment.

The builders point to some pertinent facts relating to this very interesting plant.

At the present time the coal cost per unit generated is 0·157d. per unit. A striking point about this figure is that rail freightage and wagon hire together account for no less than 65 per cent. of the total. That is to say, of 14s. per ton paid for coal delivered on the station siding, the foregoing

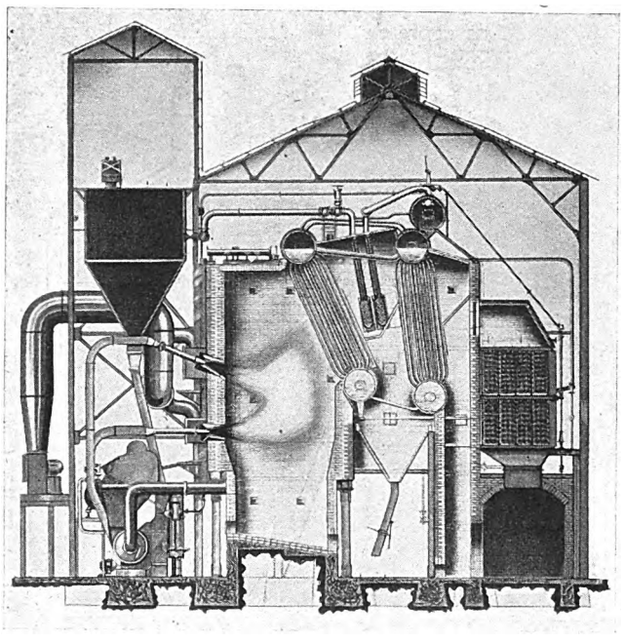

Fig. 8.—Clarke, Chapmans' Woodeson boiler.

items are responsible for 9s. 2d. The plain figures speak for themselves and need no comment.

Energy absorbed in drying and pulverising with different systems of pulverised fuel firing have been the subject of considerable discussion from time to time. At Peterborough the overall consumption in coal handling, drying and pulverising, including boilers, fans and auxiliaries, averages 27 units per ton. Labour cost of coal drying and pulverising is 2·8d. per ton of raw coal.

Experience in the storage of pulverised coal is always interesting. At Peterborough coal has been stored for over six months in unlagged bunkers without deterioration. and has subsequently fed freely to the boilers when used. This successful result is attributed to some extent to the practice of filling up the bunkers to the top when the plant is shut down, and at week-ends, and keeping all openings to the bunkers down to a minimum size. The object is to eliminate condensation of moisture by excluding air from the bunkers as far as possible. It is moisture in the coal, of course, that is largely responsible for caking and spontaneous combustion in the bunkers. Dryness factor of the coal in the bunker is about 2½%. The foregoing practice is diametrically opposite to that followed in some power stations, where the bunkers are emptied during any appreciable interruption in the operation of the plant. The nature of the coal is, of course, another factor of importance. An average analysis of the coal at present being burned is as follows :—

Volatile matter	27·26%
Coke	54·28%
Ash	16·40%
Fixed carbon	37·88%
Free moisture	8·02%
Hygroscopic moisture	10·44%

Calorific value :—Gross, 8 852 B.Th.U.
Net, 8 351 B.Th.U.

Coal with 20% of moisture has been handled over long periods.

While a comparison of recent tests is apt to be misleading unless local conditions are carefully taken into account, the results appended in respect of the Calumet (Chicago) station as given in " Engineering " serve as a general guide as to the conditions which lead up to boiler efficiencies approaching 90% in the case of large units.

Duration of test	30 min.	20 min.
Total steam generated, lb. per hour	243 000	285 000
Pressure in drum, lb. per sq. in.	348	363
Steam temperature, deg. F.	741	739·5
Superheat, deg. F.	314	300·2
Air pressure in primary duct, inches of water	9·5	9·3
Air pressure in secondary duct (fan), inches of water	4·5	5·05
Air pressure in secondary, below burner damper, inches of water	1·1	1·3
Gas temperature at boiler, deg. F.	1 290·5	1 294·5
Gas temperature at economiser outlet, deg. F.	580·8	576·0
Gas temperature at preheater discharge, deg. F.	315	308·6
Gas temperature at washer discharge, deg. F.	164	154·6
Air temperature at preheater discharge, deg. F.	358·0	358·0
Air temperature at preheater inlet, deg. F.	95·0	96·0
Water temperature at economiser discharge, deg. F.	475·8	479·2
Water temperature at economiser inlet, deg. F.	172·0	172·5
Water pressure at feed pump delivery, lb. per sq. in.	495·0	485
Coal consumption, lb. per hour	32 000	—
Boiler efficiency, per cent.	89·4	—
Power consumption—		
Forced draught motor, No. 1, kW per hour	55·68	59·52
Forced draught motor, No. 2, kW per hour	64·64	62·08
Exhaust fan motor, kW per hour	26·40	26·00
Pulveriser, kW per hour	156·00	149·00
Primary air fan, kW per hour	23·48	22·76
Fuel pump, kW per hour	8·24	8·14
Gas washer, kW per hour	43·64	42·76
Induced draught fan, kW per hour	372·00	370·80
Total A.C. kW per hour	750·08	741·66

The following figures are given by Messrs. Clarke, Chapman in respect of a relatively small moderate pressure Woodeson boiler, fired with powdered fuel by a " Resolutor " pulveriser, and can be taken as representative of good average practice :—

Duration	4 hours.
H.S. of boiler	5 200 sq. ft.
Method of firing	Powdered fuel.
Calorific value of fuel as fired	10 670 B.Th.U's.
Steam pressure by gauge	201 lb.
Temperature deg. F. saturated steam at above pressure	388 deg. F.
Final temperature of Superheated Steam	517 deg. F.
Degrees of superheat	129 deg. F.
Temperature of gases leaving economiser	380 deg. F.
Temperature of feed water to economiser	112 deg. F.
Factor of evaporation over plant	1·23
Total amount of water evaporated (actual)	123 341 lb.
Water evaporated per hour (actual)	30 835 lb.
Total amount of fuel burnt during test	16 380 lb.
Fuel burnt per hour	4 095 lb.
Amount of water (actual) evaporated per lb. of fuel	7·53 lb.
Amount of water (F. and at 212 deg.) evaporated per lb. of fuel	9·27 lb.
Draft of economiser outlet	0·27 W.G.
Average percentages of CO_2 in flue gases	16%
Efficiency of boiler, superheater and economiser	84%

Particulars relating to the operation of the Thompson boilers at Cadeby Colliery are given in " Power Engineer " of June, 1929, from which it would appear that this plant, showed 84·68% efficiency on an average rating of 40 000 lb./hr. on fuel of an average calorific value of 10 348 B.Th.U. per lb.

Large Observation Doors.

While pulverised fuel firing is a distinct problem in itself and one concerning which there is no doubt much to be yet learned through practical experience, probably the most important criterion of good results is to so design the furnace and the burners and to so adjust the air and fuel that while the two latter are in the correct ratio the flames do not strike the boiler tubes and to maintain this condition the operator should have large observation doors, one on each side, about three feet below the tubes and two small observation doors on each side, about one foot below the tubes. In the case of installations provided with storage bins the primary air should be fed at the rate of about 60 cu. ft. per lb. of fuel fed per minute. It is improper adjustment of the air supply that causes a general deficiency of air in the furnace and leads to

Digitized by Google

incomplete combustion and this is indicated by the flames licking the tubes over the entire width of the furnace. The result is an excessively high furnace temperature causing molten ash to trickle down the walls and the accumulations of ash to soften and slide down to the bottom of the furnace, while dark grey smoke will be visible at the stack. The remedy is to increase the furnace draught or, if this is not possible, to reduce the rate of coal feed.

When the rate of steaming has to be increased, the speed of all the feeders should be increased in the same proportion, the point being to ensure that all parts of the furnace burn equal amounts of coal. The draught must always be increased in a greater proportion than the rate of coal feeding owing to the rate of air flow into the furnace varying as the square root of the draught.

Flames may impinge on the tubes by reason of their turning up before descending low enough into the furnace. The path of the coal being thus shortened it leaves the furnace in a partly unburned condition which can be remedied by reducing the draught and increasing the air pressure on the feeders. The latter has the effect of forcing the flame down into the furnace so as to practically complete combustion before the flame reaches the tubes; at the same time the flames must not be driven against the bottom of the furnace where they will melt the ash and cause considerable trouble.

Those who are interested in the practical results and operating conditions of pulverised fuel in large power stations will do well to consult the very comprehensive report thereon issued by N.E.L.A. and referred to as publication No. 06/1929. This

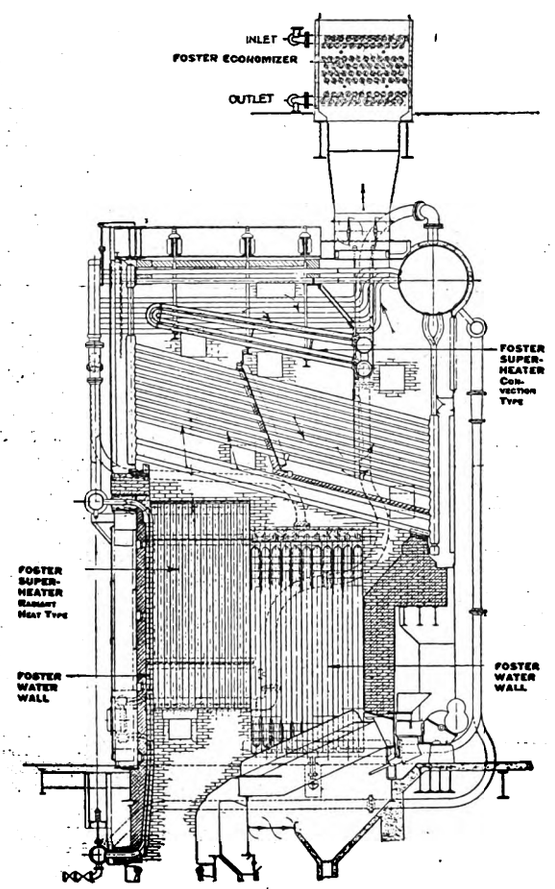

Fig. 9.—Foster-Wheeler boiler.

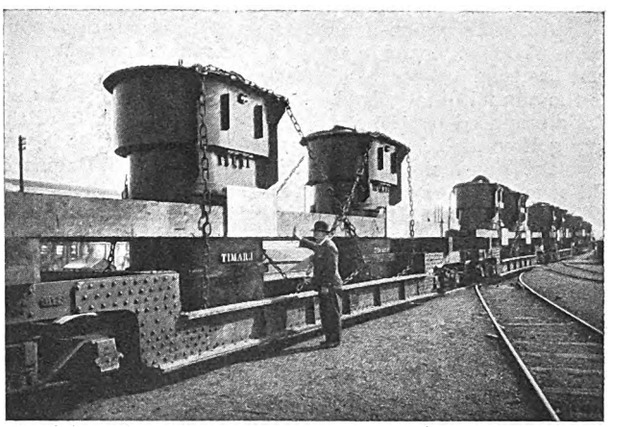
contains in condensed form the reports of those responsible for the operation of a number of large stations, some interesting statements by manufacturers of pulverised fuel equipment and a very comprehensive index of the current literature on the subject.

The general manager of the Oldham tramways has reported on the representations which had been made with reference to interference with wireless broadcast reception alleged to arise in connection with the running of tramcars. The Committee does not see its way to take any action at the present time.

LARGE TRANSFORMERS.

Special Units Designed and Made for Power Scheme at Waitaki.

AMONG recent important developments overseas is the electric power scheme at Waitaki, being carried out to the plans of the Public Works Department, New Zealand. Part



Part of a train prior to leaving Rugby with seven transformers destined for New Zealand.

of the plants for installation in connection with this scheme are seven 5 500 kVA single-phase transformers of special design, manufactured by the British Thomson-Houston Co., Ltd., Rugby. In the accompanying illustration is seen part of a train prior to its departure from Rugby with the seven units in question, the shipment having a net load of over 90 tons, the weight of each transformer amounting to about 13 tons. The transformers, which are of the oil-immersed, water-cooled outdoor type, will form the initial installation of two 16 500 kVA three-phase banks, with one spare, at the Waitaki power station, where ultimately the transformer installation will consist of five banks of the same capacity. Current from the alternators will be taken to the transformers and stepped up from 11 000 V to 110 000 V, three-phase, 50 cycles, for feeding the transmission lines. All the transformers will be delta-connected on the primary, or 11 000 V, side, and star-connected on the secondary, or 110 000 V, side, with the neutral point solidly earthed. An interesting feature in connection with the plants supplied for the Waitaki power station is that the 110 000 V transformer bushings are interchangeable with those on the oil-immersed circuit breakers. These breakers are of similar construction to the 132 000 V. oil-immersed circuit breakers which this company has supplied for various sub-stations on the Scottish grid scheme. In addition to oil-immersed circuit breakers, the B.T.H. switchgear for the Waitaki scheme includes a metering desk and an indoor control board, with voltage regulators and engine-room telegraphs.

ELECTRO-FARMING.

Visit of Electrical Engineering Society of the Borough Polytechnic Institute.

MEMBERS of the Electrical Engineering Society of the Borough Polytechnic Institute recently visited the all-electric farm of Mr. R. Borlase Matthews. The visitors were particularly interested in the Law "Bloc" Utility Farm Machine which has been installed on the farm during the past few weeks, and is the only one of these machines in this country. This machine was first shown at the Paris Agriculture Show in January of this year. In the design of this machine the principal of the disintegrator has been adopted, but instead of mounting the plates on a horizontal shaft, the vertical axle of a 0·9 horse-power squirrel-cage pipe-ventilated motor is employed. The machine can be employed for four main purposes: (*a*) for crushing and grinding cereals; (*b*) for crushing or grating cider apples and potatoes; (*c*) for breaking up chalk, artificial manures, oyster shells, etc.,; and (*d*) for cutting and slicing roots. In fact, all the usual food preparing operations for livestock, with the exception of tumbling and cleaning of roots and the chaffing of hay and straw, can be carried out by this machine.

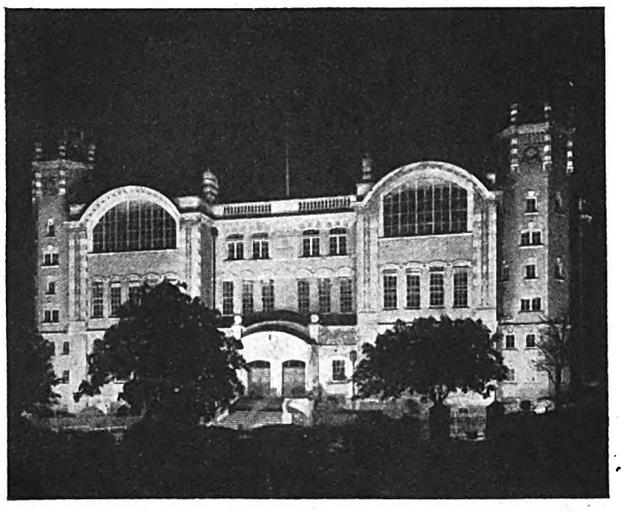
THE I.M.E.A. CONVENTION.

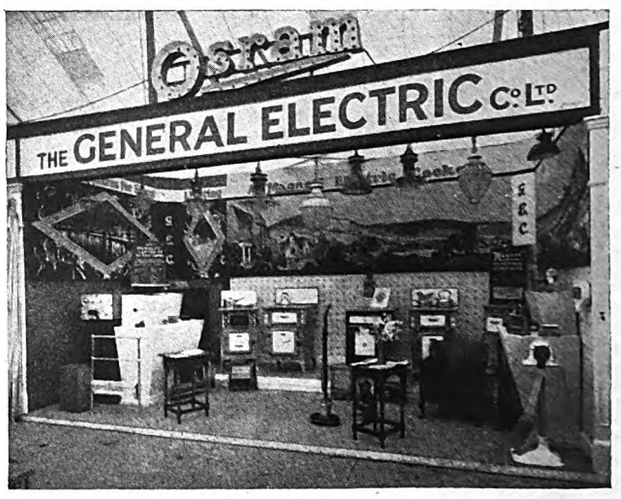
Municipalities and the Post Office—Supporting the Electrical Association for Women—New List of Officers—Next Year's Meeting.

ALTHOUGH our special illustrated report of the 35th annual convention of the Incorporated Municipal Electrical Association at Eastbourne last week occupied no less than twenty-four pages, and included reports of all the papers and of all the discussions, time and space considerations compelled us to hold over the report of the annual dinner and of the annual meeting.

At the annual dinner, held in the Grand Hotel on May 29, it was announced by the President that as the result of the annual golf contest for the cup presented by Mr. Dennis, the Benevolent Fund of the Institution of Electrical Engineers would benefit to the extent of £5 10s. The winner of the contest was Capt. Kennard. It was added that the first prize in the sweepstake held in connection with the contest had been won by Capt. Kennard, and the second prize by Mr. J. H. Rothwell.

Proposing "The Incorporated Municipal Electrical Association," Col. Sir Thomas Purves (President of the Institution of Electrical Engineers) referred to the close working between the Institution and the I.M.E.A., inasmuch as the latter was represented upon many of the Standing Committees of the Institution, and he assured them that the Institution of Electrical Engineers appreciated the help it received in this and many other ways, which he believed was mutually beneficial. Continuing, Sir Thomas said he not only represented the Institution of Electrical Engineers on this occasion, but presumed he would also be regarded as representing a very much more questionable organisation, the Engineering Department of the Post Office! The work of that Department involved negotiations with municipalities throughout the country, but he claimed that the Post Office plant never gave any trouble to anybody. It never looked for trouble, and it never started trouble, but he had to confess that it had a wonderful faculty for blundering into other people's troubles and getting mixed up with them in such a way that it was blamed for being an offender. It really, however, was only a victim. That, perhaps, was the penalty the Post Office had to pay for keeping bad company in the streets! He did not think, however, they would be very far wrong in regarding the Post Office as a very well meaning and human old institution, and that if it made mistakes it should be given the benefit of the doubt. Really, however, the relations between the Post Office and the municipalities were of the most cordial and friendly kind. Moreover, these friendly relations he always endeavoured to preserve because the telephone service, for instance, was not so much embarrassed by its friends that it could afford to overlook any of them. As to the relations between the I.M.E.A. and the Post Office, he did not remember any really acrimonious discussions between them. The I.M.E.A. might, at times, have taken part in some concerted action against the Post Office, but he did not remember that it had ever played the part of a spear-head, and the Engineering Department had always got along well with municipal electrical engineers. When there was any difficulty in regard to Post Office regulations on such things as clearances between telephone wires and lighting and power circuits, it would always be a good thing if the engineers concerned would go to the Post Office and let them know about it quietly, so that it could be discussed as between man to man. It was not a very easy matter to devise safety regulations which could be applied under all kinds of local conditions, and they would always find the Post Office ready to take account of special local conditions. He was certain that a great deal of trouble was often caused by trying to apply regulations to conditions which it was never intended they should be applied to when they were framed, and therefore he asked electric supply





THE left-hand picture shows one of the two multiple spray-design G.E.C. illuminated fountains installed at Eastbourne in connection with the I.M.E.A. Convention. The fountains emitted three different forms of spray, the jets being controlled by a special form of valve distribution gear, permitting of pyramid, cylindrical and floral sprays. The change from one form to another was timed at one minute intervals, while a colour wheel gave continuously changing effects, the wheel making some three revolutions per minute. Within each of the fountains was installed a 1 h.p. electrically-driven centrifugal pump, the main lighting source being provided by a 1 000 W projector fitted within the fountain, and surrounded by 17-40 W amber sprayed lamps. The whole of the lamps, together with the projector, the pumping arrangements and the distribution gear, were enclosed in a watertight compartment, over which the rotating colour wheel operated, this being driven by a fractional h.p. motor. The first of the bottom pictures shows the School of Art at Eastbourne floodlighted by G.E.C. projectors and Osram lamps. In all there were 14 projectors, two being mounted on pedestals, and the remaining floodlights being installed at ground level. The types employed were G.E.C. FB2 505 and IE2/96. The second picture is of the company's main stand in the Winter Garden Exhibition.

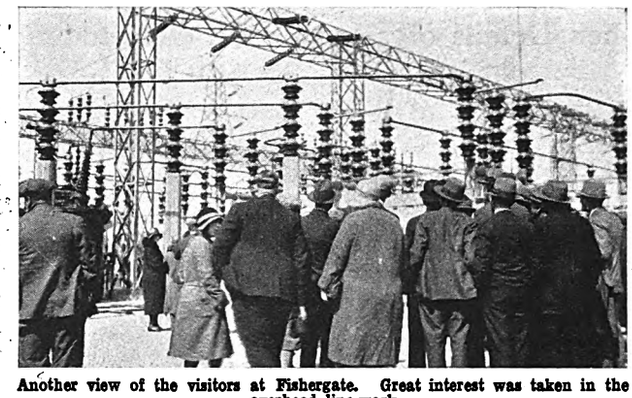
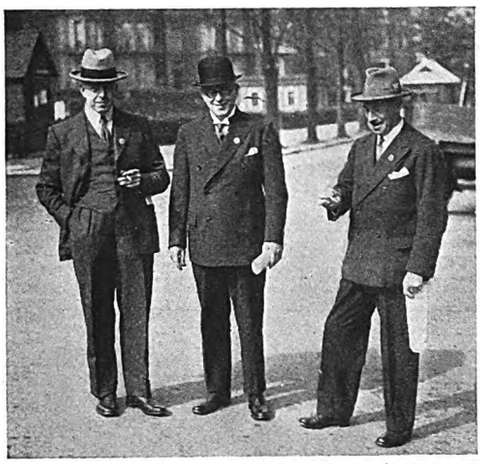
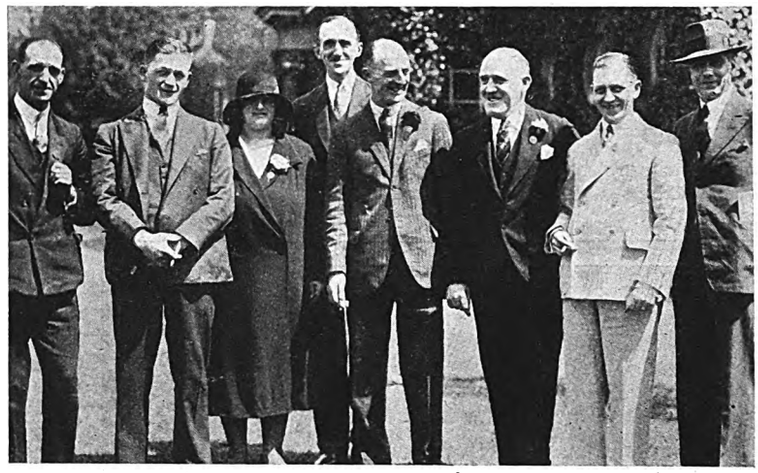
Alderman W. Walker "takes one" on his own at Fishergate sub-station, Kemp Town.



Another view of the visitors at Fishergate. Great interest was taken in the overhead line work.



Mr. A. W. Barham; the newly-elected President; and Mr. J. Bell.



Some well known "Magnet" personalities posing for "The Electrician" camera.

engineers to bear in mind that the Post Office was always pleased to discuss matters with them from this point of view. A great deal of misunderstanding would be avoided if both sides got together in this spirit.

The President, responding to the toast, spoke of the growing importance of the I.M.E.A., and how it is now consulted by all important Government departments upon any matter relating to electricity supply. In the matter of supply from the grid, he said Eastbourne had been promised a supply by October 1, and he hoped that the anticipations of the Central Board on that matter would be fulfilled, otherwise he feared Eastbourne would be in a rather difficult position during the coming winter, because the Commissioners had refused the Corporation permission to extend its generating plant. Referring to the Convention, he commented on the fact that the attendance of over 1 100 constituted the largest of any Convention, and he thanked the Mayor and Corporation on behalf of the members and visitors for all that had been done for them. Reference was made to the exhibition held in conjunction with the Convention, and on the same matter the President called attention to the showroom of the Eastbourne Corporation as well as the well-arranged showrooms of the electrical contractors in Eastbourne. Bearing also on the same subject of propaganda, he referred to the work of the British Electrical Development Association, and made a strong plea that every municipal electricity committee should subscribe on the full scale. Again, all possible support should be given to the Electrical Association for Women, which now had a membership of 4 000, and was doing valuable propaganda work among the women of the country, who were such an important factor in developing the use of electricity in the home. The hope was further expressed that all educational authorities would equip their schools with electrical cooking.

"The County Borough of Eastbourne" was proposed by Sir Harry Hatt (chairman of the Bath Electricity Committee), and was responded to by His Worship the Mayor of Eastbourne (Councillor Lt.-Col. Roland Gwynne, D.S.O.).

Mr. A. J. Fuller (Vice-president) proposed "Our Guests and Ladies."

Mr. W. W. Lackie (Electricity Commissioner), who responded, spoke of the loss sustained by the death of Dr. Ferranti, who had been such a familiar figure at I.M.E.A. Conventions for so many years. It was, he continued, reassuring that the I.M.E.A. continued to invite a member of the Electricity Commission to their annual conventions. Many people, he believed, thought the Commissioners were a Parliamentary nuisance, but he assured them that the Commissioners aimed to do everything within their power to promote the interests of the electrical industry. The Commissioners had suffered a loss in the retirement of Sir Harry Haward and Col. Ekin, but they had obtained a very able colleague in Sir John Brook. It might be felt that as the Commissioners had prepared eight schemes under the Electricity Act of 1926, their work was finished, but in his opinion their work was only beginning, and probably many supply authorities would think the same if the Central Board fixed the price of their supply at 0·4d. per unit when they thought it ought to be 0·39d.! Finally, Mr. Lackie drew attention to the extent to which the Central Board had drawn upon municipal electrical engineers for their staff, and he particularly mentioned the appointments of Mr. Allen, Mr. Fedden, and Mr. Watson.

The Annual Meeting.

The annual meeting, which was held on Friday, May 30, was, as usual, private. We give below the new president and officers, together with new members of Council :—

President.—A. J. Fuller (Fulham, London).
Vice-president.—C. G. Morley New (Cardiff).
Hon. Treasurer.—A. Nichols Moore (Newport, Mon).
Hon. Solicitor.—J. H. Rothwell (Town Clerk, Brighton).
Hon. Secretary.—A. C. Cramb (Croydon).
Members of Council, to fill vacancies :—
Large undertakings—
E. E. Hoadley (Maidstone).
G. Porter (Worthing).
R. W. L. Phillips (Bedford).
Small undertakings—
F. Newey (Long Eaton).
Local Authority representatives—
Alderman R. S. Chatfield (Eastbourne).
Councillor R. Richardson (Hull).

An invitation has been received from Douglas (Isle of Man) to hold next year's Convention there.

The DOWSING RADIANT HEAT CO., LTD., of the Electrical Works, Bollo Lane, London, W.3, dressed their stand with cordless electric ironing outfits for tailors and dress-making workrooms, public wash-houses, training schools, etc.; a few samples of various sized laundry irons, a new large pattern 35 lb. machine iron, and a new special bench iron, in which the material is moved on the polished surface as distinct from the usual method of ironing; one or two samples of special appliances showing the application of electrically heated elements, namely: a collar roller (part of a laundry machine), one 35 lb. drag iron for laundry work, and automatic sealing wax heater. An electrically heated instrument steriliser with the company's new float system protective device; this latter is arranged so that a circuit breaker is operated when some predetermined level of the water is reached, say, the last ½ in., was exhibited, as were also electrically heated branding machines; electrically heated clothing (waistcoat, gloves, and soles) particularly applying to airmen's clothing; a new folding pattern "Solarium" electric light cabinet bath for home use, new milliners' hat steamer with wide rose spreader and small spreader of the latest pattern for millinery workrooms.

The ELECTRICAL CONTRACTORS' ASSOCIATION (Eastbourne Branch). The members of the Eastbourne Branch of the Electrical Contractors' Association, which is a sub-branch of the Sussex Branch, organised a good co-operative display, consisting mainly of electrical fittings and apparatus for use in the home. Members of the E.C.A. in Eastbourne realise the pressing need for publicity and educational work, and it is their policy to co-operate wholeheartedly with the supply undertakings in promoting all electrical development activities.

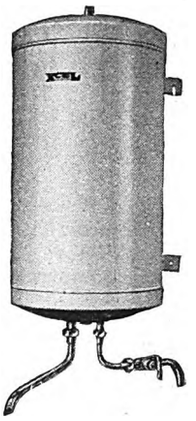
METROPOLITAN VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, included in their exhibits a number of boiling plates of the cast-in type, for which is claimed a higher permissible loading than any other boiling plate. A special feature is the small thickness of the plates—9/16 in. The principle of construction is as originally introduced and depends on the conversion of magnesium into magnesium hydroxide by the aid of very high pressure steam. The magnesium expands in the process of conversion to the hydroxide resulting in the iron or nickel enclosing tube being tightly packed. The method of manufacture is such that the heating spiral is definitely centralised and located in the magnesium oxide which, as well known, is not only an excellent conductor of heat but also has very high insulating qualities. The elements are bent by jigs into shapes depending on the type of boiling plate required and then completely embedded in a cast metal plate, the casting being then machined to a thickness of 9/16 in. The boiling plate is finally completed by sealing up the ends of the heating element with a cemented cap, which also serves to shield completely the brazed joint to the lead out wire. The design of the terminals assures that they run cool.

The use of these Met-Vick heating elements is not restricted to boiling plates, they are used with advantage for grills (nickel tube), immersion heaters (copper tube), and another interesting application is for car and room heating. Other items of interest included types of modern electric lighting fittings, cookers, automatic and self-regulating kettles, two and three kW fires, various electric domestic appliances, both for the table and for house cleaning and a full display of ultra-violet ray equipment and high frequency and vibrator apparatus.

Oil Heaters.

A. REYROLLE AND CO., LTD., Hebburn-on-Tyne, showed a wide range of apparatus for heating water and other liquids, comprising a domestic water-heater, a steam-raiser, and immersion heaters, including two special arrangements of the latter, one being a bank of nine heaters for heavy-duty water-heating in factories, and the other a heater for raising the temperature of oil in oil-purifying equipments.

The domestic water-heater shown was one of their smaller sizes, holding 2½ gallons. The 500 W heating element is controlled by a thermostat. The steam-raiser has a total capacity of 18 kW, and will raise steam in 10 to 15 minutes, the pressure being 80 lb. per square inch. The heating elements are built up of three 6 kW units, and the required selection is made by means of standard Reyrolle earthed plugs. Three sockets are provided, so arranged that either one, two, or three units can be in circuit, giving 6, 12, or 18 kW respectively. The fittings are nickel-plated, and the whole equipment is finished in white enamel. The immersion heaters are of the tubular pattern, and are manufactured in units ranging from 0·75 to 6 kW capacity for use on circuits up to 500 V a.c. or 250 V d.c. The heating elements comprise spirals of high-grade, high-temperature-resistant wire, and are wound on special bobbin-shaped formers of refractory material, which are themselves supported on a central metal rod. Each element is enclosed in a strong copper casing, which is provided either with a 2 in. B.S.P. thread for screwing into the tank, or with a bolted flange when the heater is to be used for high-pressure heating or for heating chemicals. The oil heater shown was a 9 kW unit for use in an oil-purifying equipment. It is in the form of an oil-tight box containing six 1½ kW immersion heaters each fitted with a three-pin plug and socket for three-heat control. The use of multiple heaters provides a simple and efficient means of adjusting the temperature of the oil with varying loads.



One of the water heaters shown by Siemens Electric Lamps and Supplies Ltd.

A collection of small metal-clad air-break switches, for domestic and other purposes, was also exhibited. The domestic apparatus included a cooker control-board with an indicating lamp and a red lens to show when the switch is on. The control boards can be fitted with change-over switches, with or without a neutral position, for those users who contemplate water-heating as well as cooking by electricity. On the same stand, Messrs. Reyrolle's associated company, J. H. HOLMES AND CO., LTD., exhibited a controller designed to give automatic push-button control of a.c. commutator motors, such as those used for driving rotary-web newspaper printing presses. The pilot motor on the top of the controller is operated by means of push-buttons, which effect the operations of "inching," "speeding up," "slowing down," and "stopping." A small reduction gear box is fitted to the pilot motor, and four spindles protruding from this box transmit the energy from the motor for the required operations. The use of this controller makes it possible to alter the speed of an a.c. commutator motor of the brush-moving type from standstill to full speed, and in addition any desirable interlocks or safety features can be provided.

BELLING AND CO., Bridge Works, Southbury Road, Enfield, Middlesex, made a special feature of the new No. 34 cooker, this being the first time that the unit has been exhibited. The oven has a clear cooking space of 12 in. wide by 13 in. high by 12 in. deep and a loading of 2 000 W. It is made in one piece with rounded corners and finished in vitreous enamel inside and outside. Lagging is 1½ in. thick. Runners, shelves and heating elements are all removable. A thermometer is fitted as standard and a special type of ventilator is fitted at the back of the oven, allowing steam to escape without loss of heat. The oven attains a temperature of 400° in 20 minutes. The oven elements are of a new plug-in type, fitted top and bottom. The hob is 22 in by 17 in. and is finished in mottled blue and white vitreous enamel. The inside of the hob is free from all electrical connections, and the simplicity of the method of wiring used in the contruction of this cooker is one of its most commendable features. The new boiling plate is 7½ in. in diameter and loaded to 1 200 W. It is totally enclosed and made of a special alloy. It is a particularly fast and efficient boiler and has proved exceedingly reliable over a series of prolonged life tests. The boiler-griller is 8½ in. square and has a loading of 1 800 W. This is similar in construction to the boiling plate, except that a special nickel alloy sheet is fitted underneath, which becoming red hot, provides an excellent griller and toaster. A new method of indicating the heat control has been adopted with a view to simplifying this subject and the wording used on the switch panel is familiar to every housewife. A large warming cupboard is provided, and amongst the standard equipment which is included in the price of the cooker is a thermometer, ventilator, enamelled back plate, grill pan and grid, baking tin, three oven shelves, etc. Side extensions can be fitted to the hob at small extra cost. The standard finish is blue and white mottled enamel, with white enamel door panels, but the cooker can also be supplied in a de luxe all-enamel finish at small extra cost. The vertical model is easily converted into a horizontal model. The oven door is easily reversible and the switch panel can be fitted on either side of the splash plate or on the wall as a separate unit. The cooker is suitable

Digitized by Google

for families of 4-6 persons. This firm also made a special display of pipe heaters giving practical demonstrations of the Parmotor relay and thermostat, controlling both air and water temperature. A new series of three-heat enclosed type boiling rings was also shown.

MARCO REFRIGERATORS (1929), LTD., Manor Works, Streatham Vale, London, S.W.16. The most interesting feature on this stand was the 1930 range of "all-steel" refrigerators. These cabinets are constructed with a white cellulose enamel exterior and the linings are of one-piece steel, porcelain enamelled, with all corners rounded. The refrigerators are made in four sizes. The comprehensive range of Marco equipment was illustrated by a 75 c. ft. sectional cold room. This is operated by automatic electrical refrigerating equipment and is fitted with a new type cooling unit.

Time Switch Control.

VENNER TIME SWITCHES, LTD., 45, Horseferry Road, London, S.W.1, this year made a special point of apparatus for the control of electric water heating during off-peak periods of the day. The exhibit included a "W" relay, capacity 10 A a.c., designed to control electric water heating in conjunction with street lighting. When the street lights come on, the water heaters in adjoining houses are switched off. The heating supply is resumed from one to four hours later, after the evening load peak is over. The "ewNZX" switch, capacity 10 A a.c., is fitted with a standard electrically wound clock and has three pairs of hands, this giving three switchings on and off per day. Venners also exhibited a range of thermostats for controlling electric water heaters. Four sizes were shown, of 6, 10, 15 and 20 A capacity, fitted with specially high grade mercury tubes. Another exhibit was the OZM switch for two-rate tariff and maximum demand indicator purposes. It is designed to operate the resetting coils of Merz type demand-indicators.

The REVO ELECTRIC CO., LTD., Britannia Works, Tividale, Tipton, had a comprehensive display consisting of cookers, fires, washboilers, water heaters, etc. The cooker has been considerably improved since last year, a special feature being the enclosed heating elements used in the oven. These are of the plug-in type, with a new patented plug and socket so arranged that perfect contact is given, and at the same time they are so easy to fit that a smooth action is obtained. Some of the new vitreous enamelled finishes, as shown on the fires, were very attractive, especially the rainbow finish. The "Matchless" fire, one of the latest designs, has a new element, which illuminates the reflector evenly, even when switched on to "low." The new chromium-plated iron was also exhibited, together with washboilers, water heaters, and various other domestic appliances.

RADIOVISOR PARENT, LTD., 26, Coventry Street, London, W.1. In addition to displaying their lighting unit automatically controlling a street lamp, the company gave a separate demonstration of the a.c. lighting unit working in conjunction with a contactor switch, breaking a current of 15 A. They also gave an acoustic demonstration, specially arranged to show the response of the Radiovisor light-sensitive bridge to variations of light at sound frequencies, and demonstrated the quality of reproduction obtained by talking-picture equipment employing the Radiovisor bridge. For the demonstration the Radiovisor bridge was connected, according to ordinary talking-picture practice, to an amplifier and loud speaker, but instead of being operated by a sound film record, as it normally would be, it was, for the sake of simplicity, operated by a fluctuating beam of light from a Neon lamp, which was controlled by a gramophone pick-up.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C., was represented at two stands, one of which was devoted to water heating equipment. A model was shown of an installation incorporating a general hot water supply to a home by means of a Magnet electric storage water heater; and a range of standard Magnet water heaters from 1½ to 30 gallons all thermostatically controlled, was staged in close juxtaposition—some of them in actual operation. Electric low temperature radiators, both of the tubular and convector types, were also shown, in conjunction with thermostatic control equipment. The second stand was aligned with the E.L.M.A. stand, and was adjacent to the stand of the Eastbourne Corporation. It was subdivided, one section being devoted to illuminating engineering, and street lighting in particular, and the other to household electric appliances. It is interesting to note that the Illuminating Engineering Department, of the G.E.C. was responsible for the floodlighting of the Institute and the interior lighting of Devonshire Park Hall during the week of the Convention.

ELECTROLUX, LTD., 153-155, Regent Street, London, W.1, again showed suction cleaners and refrigerators, together with floor polishers, all of which have been previously described.

The BRITISH ELECTRIC TRANSFORMER CO., LTD., Wellington House, Strand, London, W.C., had two stands, one devoted to cookers, fires, electric irons, Kye electric lamps, etc., while the second stand was a "Sunray" lounge. At the cooker stand were introduced two new cookers, comprising a "baby" size cooker called the "Tricity Tot" and an intermediate size (i.e., a little larger than the baby size, a little smaller than the standard domestic size), called the "Tricity Tweeny." The company also exhibited a new design of an average domestic size cooker with a third boiling plate and other modifications. There were also exhibited several attractive models of coal and reflector type fires, together with other domestic appliances, including the new "Sunray Tricity" iron, etc. Both stands were lighted with Kye electric lamps. The second stand, the "Sunray Lounge," included the well-known Tricity Sunrays, and several new models were exhibited to the trade for the first time.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., Upper Thames Street, London, E.C., included in their exhibit a representative range of "Xcel" cookers, "Cosyglo" fires, etc. Among the fires not of the imitation coal type is the new series of "Homely" fires. Water heating was represented by samples of the new Xcel hot water storage tanks, fitted with strong copper water cylinders, the inside surfaces of which are well tinned. All internal units, i.e., the immersion heater, thermostat, inlet and outlet pipes, are mounted on a strong, easily removable gun-metal baseplate. Xcel immersion heaters were also shown, together with tube heaters and a range of domestic appliances.

The HOTPOINT ELECTRIC APPLIANCE CO., LTD., 24, Newman Street, London, W.1, showed the well-known "Falco" cookers, "Maytag" washers, "Premier-Duplex" cleaners, in addition to a complete range of domestic electric appliance of the smaller type.

The SLOAN ELECTRICAL CO., LTD., 8/12, Golden Lane, London, E.C.1, showed, among other things, an electric hot and cold water tap. An advantage of this apparatus is that no special pipes need be fixed, as it is screwed direct on to the cold water pipe. Hot water is obtained by turning the handle to "hot," and when sufficient hot water has been supplied for immediate use, the handle is turned back and the current is automatically cut off. Exclusive features are: (*a*) A valve which can easily be adjusted to any pressure of water; (*b*) No possibility of lime deposits, the current being cut off before the water stops running, consequently the following flow of cold water immediately disintegrates any deposit; (*c*) The inside of the tap is specially nickelled, which, it is claimed, keeps it clean.

SIGG, LTD., 469, Holloway Road, London, N., exhibited their well known range of specially constructed cooking utensils for electric cookers, descriptions of which were given in these columns recently.

J. H. CONNOR AND SON, LTD., Fenton House, Fenchurch Street, London, E.C.3, made a special display of their well known model 21 thermo-electric washer and wringer, suitable demonstrations being given.

S.W. ENGLAND AND S. WALES ELECTRICITY SCHEME.

Scheme now Adopted by the Board—New 240 000 kW Stations.

THE Central Electricity Board adopted, on May 23, the South West England and South Wales Electricity Scheme submitted by the Commissioners on January 15 last, and explained in THE ELECTRICIAN for January 17. The scheme in its adopted form is substantially the same as that submitted by the Commissioners, except that the number of selected stations has been increased from eight to nine, the addition being the Lydney station of the West Gloucestershire Power Co., Ltd. The sites for the two new selected stations suggested by the Commissioners have been determined at Fawley, on Southampton Water (Wessex Electricity Co.) and Tir John North, Swansea (Swansea Corporation). Both these units will comprise installations of 60 000 kW and will be so designed as to be subsequently extended to 240 000 kW.

MARINE ELECTRICITY.

Important New P. & O. Orders Rumoured—Electrical Equipment of the White Star Motorliner "Britannic"—A Complete Cooking Outfit.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types." etc.)

WHILE one of the outstanding events of the month as regards the application of electricity to ships is, unfortunately, only a rumour, if this rumour materialises, it will place electric ships in a position of paramount importance as far as large passenger liner types of ships are concerned. It is rumoured that several shipbuilding firms have been invited by the P. & O. Co. to submit tenders for a total of five twin screw turbo-electric vessels. These are, it is rumoured also, to have a power of 50 000 shaft horse power, and their turbo-alternators will take steam from Yarrow water tube boilers at 400 lb. pressure. A length of about 550 ft. and a beam of about 66 ft. is mentioned in this connection. The P. & O. Co. has already pioneered the electric passenger liner in this country with its "Viceroy of India," and in the new larger ships which it has under construction for Australian service. Here again advantage has been taken of high pressure water tube boilers and by a clever arrangement of side firing, the total space required for the machinery has been reduced to a minimum. Once more we may therefore reiterate the fact that the "come-back" of steam for marine purposes seems more and more to be a matter of electric propulsion and less and less a matter of direct drive. There are, of course, one or two notable exceptions to this, particularly in the highest powers for transatlantic mammoths and in the 10 to 27 000 H.P. passenger liner group, the electric ship has as its most dangerous stone in the path of progress, the motor-driven liner whose chief claim to merit is a big and undoubted fuel economy which at the moment does not appear to have been reached by any electric ship. The advantages and economy of the electric ship in fact lie in different directions and the economies are not so apparent on grounds of fuel consumption alone, but rather upon grounds of machinery flexibility. No electric ship has yet been long enough in service for the total life of the machinery to be judged, but it does not seem unreasonable to suggest that this, if not at least as long as that of existing types of machinery, may probably be longer. As a result of the operation of such ships as the "Viceroy of India" it has been found, too, that for an entirely new type of marine machinery, the upkeep and repair bill have been gratifyingly low. It has been mentioned that in the 10 to 27 000 H.P. group of tonnage, the motorliner is the chief rival of the electric ship at the present moment, and yet such a rivalry should not be taken too seriously, because the motorliner in itself as a modern propelling unit provides a deal of work for the electrical industries.

The "Britannic."

The eyes of the shipping world are this month turned upon the completion of the new White Star motorliner "Britannic" which with a total power output of some 20 000 H.P. is at once the largest British motorliner and one of the largest motorliners in transatlantic service. As might be imagined, a ship which has a gross tonnage of 26 840 and accommodation for 1 550 passengers has very high electrical loads, not only for the "hotel" part of the ship but also for the many auxiliary services for which electricity is required on a modern vessel. The power station part of the machinery is arranged in a special compartment and comprises four Diesel-driven generators with a combined capacity of 2 000 kW. Each of these generators is driven by a 6-cylinder 4-cycle single-acting trunk piston unit and these generators supply in normal operation, current for lighting, heating, cooking, refrigeration, operation of water-tight doors, driving of pumps, steering gear, winches, capstans and windlass, and, in addition to all this work, there is, of course, the usual low voltage circuit for auxiliary hotel purposes. In case of emergency, either due to a complete breakdown of the main electric generating sets or to a flooding of the engine room, there is situated above the waterline a deck generator set of 75 kW output driven by a 4-cycle Diesel engine. The engine room auxiliaries, which are driven by electric motors, amount to over 60 in number, the individual horse-power ranging all the way from 100 of the larger units down to 2½ H.P. The refrigeration installation is also electrically driven. It is arranged to operate on the CO_2 system and the machinery consists of two horizontal twin compressors each coupled direct to an electric motor. There are the usual condensers and evaporators and all the brine and water pumps are electrically driven. An ice-making tank is provided with rocking gear, also driven by an electric motor. The deck machinery includes 38 electrically-driven winches, four large capstans and two large warping winches. Ventilation takes about 79 electric motors driving fans ranging in size from 10 in. to 55 in. diameter. Over 40 of these fans are fitted with heating elements by means of which the "Britannic" can be kept comfortably warm in the coldest weather which may be experienced on her transatlantic run. These air heating fan units are supplemented by electric heaters distributed throughout the accommodation and this is an important point because it is believed that it represents one of the first, if not the first, transatlantic ship in which electricity has been used for heating. It is supplemented, of course, to a certain extent by steam, as would only be natural on a route like the North Atlantic, where very severe cold is encountered in winter, but it is rather a compliment to electrical heating and an indication of the confidence which shipowners now place in the use of electricity for such matters, that the "Britannic" should use so much electricity for matters of this sort. For ships trading to the tropics, the electric heater is a very useful asset because it can be switched on and off so easily, but for work in the North Atlantic, where in winter the heater must be going "full bore" for the whole passage, there has been a current feeling among shipowners that it is asking too much of the heater. It would appear that many of these objections have now been overcome.

Electric Cooking Facilities.

Particular interest centres around the cooking appliances of the "Britannic." These have been supplied by Henry Wilson and Co., of Liverpool, and are of ample capacity to deal with the large number of passengers carried on the ship. As a matter of fact, it represents one of the largest marine electrical cooking installations that has yet been fitted. For the cabin class passengers there are two island type ranges, each with a length of 8 ft. and a breadth of 6 ft. 6 in. They have three ovens on each side and total loading of 145 kW for each range, thus giving a total loading of 290 kW for the galley. Tourist and third class passengers are also carried on this ship and here again the galley which is common to both these classes is equipped with an island type range, this time with a total length of 15 ft. 6 in. and a width of 5 ft. 6 in. There are five ovens on each side with a total loading of 22 kW. There is also a special Hebrew galley and this contains a single-fronted range with a loading of 22 kW, whilst the crews' galley has a similar range with a total loading of 72 kW. In the bakers' shop the ovens are electrically heated and the principal bake oven has two chambers, each 6 ft. by 4 ft. with a 24 kW loading, while the confectioners' oven has two chambers, each 4 ft. square with a loading of 16 kW. A great number of the hot presses distributed throughout the ship are also electrically heated, while it is of somewhat novel interest to note that a special electric roaster for poultry and game is provided. This has a loading of 18 kW and is both driven and heated electrically. Whisking machines, dough mixing machines, potato peelers, dish washers, choppers and slicers, etc., are also electrically driven. Finally, it should be noted that the "Britannic" has a length between perpendiculars of 680 ft., a moulded breadth of 82 ft. and a moulded depth of 43 ft. 9 in.

One of the most recent electric liners to be completed on the other side is the turbo-electric "Santa Clara" built for Grace Lines, Ltd., at Camden, New Jersey, for service between New York and the West Coast of South America. Additional interest is lent to this ship because she will be running alongside two very similar motor-driven vessels completed in this country a year or so ago. The "Santa Clara" has a displacement of 16 000 tons on a 25 ft. load draft. She has two propelling motors of synchronous induction type, each rated 6 300 shaft H.P., 50-pole, 3-phase, 3 000 V and 120 revolutions. These take their current from two turbo alternators rated 4 800 kW 3-phase, 3 000 V and 3 000 revolutions. It is interesting to note that the turbines are of downward exhaust type mounted directly above their respective condensers. The generators are directly connected to their turbines and are provided with a closed system of ventilation which both makes for noiseless operation and prevents a deposit of dust on the windings.

UNEMPLOYMENT AND WORK—VI.

Political Poison.

By SIR ERNEST J. P. BENN.

WHEN the intelligent person reads an advertisement he generally brings all his critical faculties to play upon it. If the advertiser is at pains to explain the merits of, say, some brand of whiskey, the reader will not usually take the statement at its face value, but will ask himself what else the advertiser might say, what are his limitations, and what is there to be said that he cannot say? For instance, the whiskey advertiser would not be expected to discourse upon the dangers of over-indulgence in spirits; he is not likely to mention the health-giving qualities of cocoa or meat extract, neither will he be found explaining that there are better whiskies to be had at higher prices. The man is simply obliged to say that his particular whiskey will suit you better than any other. All of which is understood, right and proper, as applied to advertising.

But when we listen to a political advertisement it seems as if we give our critical faculties a rest. We are told that there is an unemployment trouble and we must, therefore, alter the Empire, or adopt a big scheme of road repairs or double the dole. We choose between these various suggestions, take the advertiser at his word, squander our money upon him and preserve him immune from the healthy benefits of the sort of intellectual analysis that we always bestow upon the commercial advertiser. The difference is the more stupid and striking when we remember that the tradesman who falls below the quality of his own words loses his business and pays a natural penalty, while the politician runs no such risks.

The Political Market.

When we hear a politician say "I can conquer unemployment," we ought, merely as a matter of self-protection, to ask what else can the fellow say. We should remember that he has previously talked about Ireland, disestablishment, non-provided schools, the House of Lords, land values and quite a number of other things, and would gladly go on talking about any of them but for the fact that political fashions have changed. We should also have in the back of our minds our politician's personal point of view. He cannot very well say "I want to be Prime Minister"; indeed, he will generally pretend that he is reluctant to assume the burdens of office. Neither can he say "£400 a year in Westminster will suit me better than a minor trade union job in the country." He is equally debarred from explaining that having made a success of business he would like to become a public figure and perhaps get a knighthood, or that business at the Bar being slack and barristers being unable to advertise, the letters "M.P." would be helpful in getting briefs. The would-be politician must take the political market as he finds it, and talk the stuff that leaders have put upon the programme. No other course is open to him. To-day it must be unemployment, to-morrow it will be India, and after that probably Russia, and in a couple of years' time, when there are three million dole-drawers, we shall hear no more about unemployment than we do to-day about housing or temperance reform. One day he must explain that the Coal Bill is the work of the devil, and a week later from the same platform he must tell us that he has changed his mind in the interests of peace.

Such is politics. Imagine the plight of all three parties if unemployment disappeared. In the meantime, however, the effect of the activities of our politicians upon the psychology of a newly enfranchised proletariat is something more than merely dangerous, it is highly demoralising. Every party in the political field is explaining to people on whose personal efforts the continuance of civilisation depends that they need do nothing, that as individuals they are the helpless victims of somebody else's mistakes, and that the State and the Government will put matters right. All the details of unemployment and insurance fade into insignificance beside this one great big political lie, repeated with varying emphasis by every party. Instead of making our citizens to feel that each of them has his share of responsibility for the State, we have developed a whole generation of pauper-minded people; for a millionaire after a tariff or a subsidy is as much of a pauper as the servant girl who finds it easier to call for the dole at eleven than to light the kitchen fire at seven-thirty.

Unemployment will never be cured by politics. It is a disease which is only susceptible to the purge of personal endeavour. Most of the other nations of the world understand this; we are alone in our marked preference for politics to the facts of life. America provides the most striking contrast with ourselves, a contrast which can be emphasised by summarising the public opinion of the two countries. On this question the public opinions of England and America are exact opposites. John Bull is, day by day, chanting to his children some such story as this:—

"You are a good fellow; do the best you can. Don't kill yourself at it. You were not made to work. A happy life is what you came here for. If you find things too hard for you, there is an insurance fund and a dole and an old age pension at your service. If at all times our arrangements for your well-being and comfort do not in every way meet with your approval, you can rely upon the Government or the Universities or the Trade Unions, or some other highly intellectual bodies or persons, to devise new ministries or new legislation for your perfect comfort."

While Uncle Sam may be heard through every responsible utterance in America to be preaching the opposite theories. Here are his words:—

"You are a man. You are as good as any other man. Anything which any other man can do, you can do, if you will try. Life is not a bed of roses; it's a struggle with the forces of Nature. The world depends upon work, effort, endeavour on your part and on the part of everybody else. If you succeed, you help to lift others up; if you fail, you help to push others down. So get out and get on and be quick about it. Above all, remember that America is destined to lead mankind and that you are an American citizen."

While we in this country seem determined to encourage our people to lean, America is concerned to maintain in the breast of each of her citizen the spirit of push, and the difference is very serious—for us.

If there is even an element of truth behind this general sketch, it would appear to be hardly worth while to discuss the details of the present-day situation. With a heart and mind which are all wrong other things are of no account. It becomes easier to understand the monstrosity of a Conservative Party which is Socialist to the core. Some people seem to imagine that Socialism means giving something to the workers, and they call themselves anti-Socialists because they are in favour of robbing the State in the supposed interests of other classes. They have not the brains to see that Socialism is a principle which embodies two deadly errors—the first, that producers should be considered before consumers; and secondly, that the State is more important than the citizen. Any man who is guilty of the suggestion that political action can take the place of constructive individual work is a Socialist, and when he calls himsslf a Conservative he is a much greater danger than when he speaks under the shadow of the Red Flag.

Parliamentary Auctioneers.

We have drifted into a degraded political auction simply because we have all become infected with the malaria of the State idea. All parties tell us that a few more Acts of Parliament and a few more forms and officials will do the trick.

When I walk down the Strand and see a big notice on a derelict shop "Sale now proceeding: PREMISES COMING DOWN," I get, or so it seems to me, a perfect picture of our political situation. The auctioneer is appealing to the ignorant with worthless, gaudy imitations, but not quite so worthless as the benefits displayed a little further on at Westminster. He does at least deliver some sort of a clock, even if the gilt is spurious and the works unreliable, while at Westminster all one gets is a form of dope which does exactly the opposite of what the label claims. Some reader may perchance regard this statement as too sweeping, and the sincere believer in some new kind of social legislation may look upon it as unkind and cynical. But I am relieved of the necessity of arguing the matter by the fact that, whatever the particular economic blessing offered by one party, two other parties full of experts will expose its dangers for me.

Wealth cannot be made from votes, and it is wealth we want. Wealth requires producers, and politics multiplies the non-producers. We must separate our politics and our economics; they are getting into a disastrous muddle. All our politicians talk about economics without, for the most part, the faintest conception of what the word means; and, on the other hand, some of our economists are becoming politicians, hoping thereby to be able to leave the secluded quiet

Digitized by Google

and poverty of a scientific life for the delights of big business and bank directorships.

Meantime, all of them are multiplying the non-producers and building up the burdens upon genuine industry. We have suffered in the past from landlords and profiteers, but none of these parasites ever secured for himself so large a share of the products of real work as our new masters. They get in between a man and his job and erect such barriers as to make the job itself easy by comparison with the work of getting at it. Money is their medium—other people's money. It will not be long, however, before even the poor understand that we cannot cure poverty with money. The distribution of the pieces of paper that we call money, whether by taxation, pensions, doles, fiscal arrangements or other allowances and devices may move wealth about, but it cannot make wealth, it adds nothing to the possessions of society considered as a whole. It is some years since Professor Bowley exposed the folly of the dividing-up idea, and yet our politicians continue to pretend that there is something in it. The best that we can hope is that another subject may some day soon attract their attention, and then men and women whose personal force and qualities are the only real assets we possess will quickly resume the beneficent processes of improving the standard of life for all of us.

BOOK REVIEWS.

Die Fernsprechanlagen mit Wählerbetrieb. (Automatische Telephonie). By Dr. F. LUBBERGER. Fourth Edition. (Munich: R. Oldenbourg.) Pp. 316. Price, bound, 15 marks.

The author of this specialist's treatise on automatic telephony is a chief engineer at Messrs. Siemens and Halske and an Extraordinary Professor at the Technische Hochschule, Berlin. The work has now reached its fourth edition, and the mode of treatment used in the earlier editions has been retained. The fundamental principles of automatic telephony are first dealt with, and then the construction of the apparatus. Then follow all the other problems concerning selector currents, circuit connections, tariffs, traffic peaks, description of representative systems, etc. There are 191 figures, and these are reproduced in a separate booklet—a sensible, if not essential, arrangement for a treatise of this kind.

For anyone not conversant with the subject, the reading of this book will be found rather tough; for the expert and the student of automatic telephone systems the treatise will probably be indispensable. The preparation of text and diagrams is excellent—indeed, the interested reader could not ask for more.

S. PARKER SMITH.

Eiserne Gittermaste für Starkstrom-Freileitungen. By W. TAENZER. (Berlin: J. Springer). Pp. 65. 13·5 marks.

With giant steel towers springing up all around, there is no need to dwell on the importance of their design. The author gets to work at once with his subject, which he divides into two parts—the first, the general principles of design; the second, examples.

To begin the section on design, an excerpt of the German regulations on the construction of overhead lines is given. This is followed by the necessary data on span, sag, foundations, etc. The second section, occupying three-fourths of the book, comprises four worked examples. These designs deal almost exclusively with mechanical details and appear to include all details from the foundations upwards. The first two designs refer to a 50 kV line, the one with rigid, the other with non-rigid arms. The third design is a 220 kV line and occupies nearly one-third of the book; and lastly, two lattice poles are worked out.

The book has only 65 pages, but the size of page—about 12 in. by 8 in.—has been chosen to suit the purpose. There are 209 figures, mostly line diagrams. Nearly every page is taken up with calculations and diagrams. For anyone concerned with the design and construction of steel towers for transmission lines, the book is invaluable—we had almost said indispensable.

It is the most complete treatise on the mechanical design of transmission-line towers we have seen, every part of the structure receiving proper consideration.

S. PARKER SMITH.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Safety in Domestic Electrification.

[TO THE EDITOR.]

SIR,—The writer is very much interested in the articles which have appeared in THE ELECTRICIAN from time to time covering the "earthing" question. I have just read page 363 of your March 21 issue.

Some four years ago I wrote a letter to the "Electrical News," Toronto, along the same lines, under the nom-de-plume of "Grounding Crank." My letter was such a drastic change from the orthodox way of looking at this matter that a shower of criticism followed in a subsequent edition.

I do not believe "earthing" or "grounding" as it is termed in North America is by any means all it is cracked up to be, even if it could be practically effected as required by a complicated and well ignored set of rules.

By all means thrash this question out to a "knock-out." I am glad I am not such a crank as I received credit for being and am undoubtedly in good company with some of your correspondents—Yours faithfully,

"GROUNDING CRANK."

Toronto.
May 15.

Rural Electrification.

[TO THE EDITOR.]

SIR,—When I wrote my article on "Safety in Rural Electrification," I hoped to persuade technical men carefully to study this rather difficult problem; so that if "Shocked" believes that I wish to add rules and regulations additional to those already existing, he has entirely misread and misunderstood my article.

My desire is, really, that certain of the somewhat severe regulations of the I.E.E., in regard to earthing, might be dispensed with, and that it should be left to the responsible engineers in charge of rural electric undertakings thoroughly to recognise the electrical risks to persons and to cattle, and to take such simple precautions as suggest themselves.

"Shocked" gives a very good example in his letter of the necessity of such precautions. He proposes as a precaution against such dangers to use linoleum mats in front of cookers, etc., whenever these are installed on stone floors. I do not consider that such precaution would be satisfactory as, in such a kitchen, there may be an electric cooker connected between one phase and the earthed neutral, and, quite near to it, an electric iron connected to another phase and the earthed neutral. Should both get voltage due to leakage this may not be discovered when these appliances are operated separately, that is to say, if fairly good insulating linoleum is used; but instead of the dangerous voltage of 230 one of 400 may be reached if the cooker and the iron be touched simultaneously. Further, if the floor be damp a linoleum mat would not give sufficient insulation.

I agree that education is of great importance and I admire the way in which "Shocked" has been able to train his dog to look right and left when crossing a road, but I do not see how this applies to the use of electricity. I think your readers would thoroughly enjoy watching "Shocked" educating a row of cows to look to their right and left before drinking water slightly activated by leakage of say $\sqrt{-y}$ voltage before they can drink with perfect safety. Or what would he teach a child, having a bath, when the water pipe has, through leakage, obtained a voltage making it dangerous to touch the water tap?

The purpose of my article, as well as that of a pamphlet which Mr. Vidar Ekstrom and I are about to publish, is certainly not to make the users of electricity nervous, but to show to those who are technically educated how best to face the dangers which may arise, especially in rural areas, where great electrical development is about to take place. I believe that the dangers from electricity supply could be reduced to a low point and at small cost, and I think that in such cases it is desirable to study all such dangers as may possibly occur and not be satisfied with the pious hope that they may not occur at all.—Yours faithfully,

ALFRED EKSTROM, D.Sc., M.I.E.E.

London.

NEWS IN BRIEF.

Sixth Annual Convention of the Advertising Association—Electrical Trading at Guildford—Wrexham and Electric Boilers—The "Exide" Convention.

A 120 000 V X-ray set has recently been installed in the Victoria Memorial Jewish Hospital, Manchester.

Bangor Lighting Committee has appointed a sub-committee to submit proposals for a publicity campaign to promote development of the electricity undertaking.

A public telephone service between Great Britain and Estonia was commenced on Monday, June 2. The service is limited, for the present, to calls between the London telephone district and Tallinn (Reval).

The Board of Trade announces that it has made a direction to the effect that electric incandescent lamps of ornamental design which, on account of their uneven surface, cannot be marked on the bulb, may bear an indication of origin indelibly stamped, embossed, incised or impressed on the cap.

Croydon Electricity Committee recommends the acceptance of a tender amounting to £634 for the erection of a chemical laboratory at the power station.

The Isle of Ely County Surveyor is to obtain estimates on the installation of electric lighting at the County Hall, March.

Alterations to the front of Aberdeen Corporation's electricity showrooms in Union Street are to be carried out at a cost of £1 487.

Ald. Tweedale recently suggested to Oldham Lighting Committee that one department should purchase the whole of the lamps required by the Corporation.

Doncaster T.C. has decided to apply to the Ministry of Transport for powers to convert the Balby and Warmsworth tram routes to the trackless trolley system.

The Dawson Turner memorial tablet was placed in the radiological department of the Edinburgh Royal Infirmary on June 2. Dr. Dawson Turner was medical electrician, and subsequently head of the radium department at the Infirmary, and he suffered for many years with dermatitis, until his death in 1928.

The Institution of Mechanical Engineers is to visit the works of Messrs. R. A. Lister and Co., Ltd., Dursley, Glos, during its annual summer meeting, which is being held in Bristol during the first week of July. The visit takes place on July 3. The visitors will be shown the new cold-starting Diesel engines, both small and large, which Messrs. Lister are now making on mass production lines.

The "Telegraph and Telephone Journal" announces that the number of telephone stations on the Post Office system at the end of February last was 1 867 500. Inland trunk calls during 1929 numbered 116 488 568, an increase of 8·3% over the previous year. Outgoing international calls in 1929 were 752 896, increase 25·1%, and incoming international calls 570 085, increase 25·2%.

"The Cold Shoulder" was the title of a talk on refrigeration which Mr. J. W. H. Penrose gave to the members of the Plymouth and district branch of the Electrical Association for Women at the May meeting. Mr. Penrose pointed out that food could be bought when it was inexpensive and kept until it was required. He also reminded his audience that flowers could be kept much longer if they were placed in the refrigerator every night.

Lord Lamington will preside at the last of the Individualist Luncheons for this session, which will take place at the King Edward VII Rooms, Hotel Victoria, Northumberland Avenue, London, on June 18, when the Bishop of Durham will speak on "The British Lazzaroni—A Present-day Phenomenon." A vote of thanks will be proposed by Lady Benn, and seconded by Sir Hugh Bell. Tickets (5s. each) can be obtained from the Individualist Bookshop, 53, Victoria Street, S.W.1.

Dover Corporation is buying tramway rolling stock which has previously been used at Birmingham.

Croydon Electricity Committee recommends the purchase of apparatus for hire up to the amount of £15 000.

An electrically operated and illuminated clock, with two 3 ft. dials and a solid bronze case, has been erected in the portico of the Wesleyan and General Assurance Society's premises in Steelhouse Lane, Birmingham.

Remarkable results have been achieved in the culture of plants by the aid of ultra violet ray lamps in an underground garden at Cumberland Lodge, Windsor Great Park. It is stated that strawberries have been ripened there by March 12, and that hardy plants can be grown from vegetable marrow seeds in 36 hours.

LOOKING BACKWARD.

FIFTY years ago, in THE ELECTRICIAN *of June 5, 1880, the electrocution of a workman at Lyons was recorded.*

Mr. J. C. Cuff, of Singapore, suggested that the name of the Society of Telegraph Engineers should be changed to the "Electrical Society."

A polo match was played at Ranelagh with the aid of electric light thrown on to the players by means of reflectors.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of June 2, 1905, printed an abstract of a paper by Mr. W. B. Esson, discussing the merits of aluminium as a rival to copper for overhead line construction, in which Mr. Esson expressed the opinion that "the case for the employment of aluminium wire for overhead power lines was extremely weak."*

The first of the original ten 50-ton electric locomotives for the Metropolitan Railway had just been supplied by the British Westinghouse Co.

The stream in York Gardens, Dawlish, is to be illuminated electrically, on the initiative of the Dawlish Chamber of Trade.

On May 29, telephonic conversation was carried on over a distance of 7 500 miles, between Berlin and an aeroplane flying over Los Angeles.

Trading at Guildford Corporation's electricity showroom for the year ended March 31, 1930, shows a gross profit of £584, and a net profit of £143.

Wrexham T.C. is building 57 houses, each of which will have an electric boiler. Tenants will pay 1s. weekly on account of electricity consumption.

Plymouth Electricity Committee seeks sanction to borrow £20 000 for the purpose of the Council's scheme for free and assisted wiring and hire purchase of cookers and other domestic appliances.

The Glasgow police authorities are preparing plans for a new system of road traffic signals showing three lights in each direction of the traffic flow, and an experimental installation will be erected shortly at the junction of George Square and Vincent Place.

The tenth Exide Battery Service Agents' Convention was held at Edinburgh on May 27 to 29. The number of persons present exceeded the attendance at any of the preceding Conventions, and comprised battery experts from all over the country, and from Europe, Africa, India, Australia and the Far East. Several interesting papers were read and discussed and motor coach drives and a number of social functions, were included in the programme.

The second birthday number of "Distribution," issued by W. T. Henley's Telegraph Works Co., Ltd., is a very attractive publication, containing many excellent illustrations and much interesting reading matter. Amongst its features are articles by Mr. P. Dunsheath, Mr. W. H. Nichols, Mr. J. F. H. Colyer, Mr. J. Stapen Hill, Mr. W. A. Moore, Mr. E. Bawtree and Mr. C. Grover, portraits of prominent members of the staff, snapshots taken at the recent I.M.E.A. Convention, and coloured pictures of the Antrim company's transmission lines and towers. Copies of the issue can be obtained for 6d., post free.

Lord Riddell will preside over the Sixth Annual Convention of the Advertising Association which will be held at Hastings on June 23 and 24. Over a thousand delegates and members will attend the 15 sessions, at which more than 50 speakers will take part. Following his presidential address, Lord Riddell will inaugurate a discussion on "Increasing Trade by Advertising." Lord Luke of Pavenham, Lt.-Col. Sir Stanley Reed, and Sir Ernest Benn will also speak. "Selling British Goods" will be the subject for the Trade Press Session presided over by Mr. E. A. Gatehouse. Addresses will also be given by Mr. C. Pinkham, publicity manager of the General Electric Co., on "The Service Expected from a Trade Journal."

PERSONAL.

THE Postmaster-General announced on Tuesday that the Prime Minister had nominated Mr. J. H. Whitley to be the new Chairman of the British Broadcasting Corporation in succession to Lord Clarendon, who recently resigned.

Mr. T. H. U. Aldridge wishes it to be known that, having resigned from the position of vice-president and general manager of the Shanghai Power Company, he expects to be permanently resident in this country, with headquarters in London. He arrived in England a few weeks ago.

The Electricity Commissioners have suggested that Mr. W. C. P. Tapper, consulting engineer and manager of the Stepney (London) electricity department, should serve on the committee which is being appointed to consider measures for obviating the risk of nuisances which may be caused by electricity generating stations. The General Purposes Committee of Stepney Council recommends that Mr. Tapper be permitted to carry out the suggestion.

Mr. H. Brotchie, who for 14½ years has been on the staff of the Battersea Borough Council Electricity Department, has severed his connection with that undertaking, having secured the appointment of power station superintendent at Letchworth Garden City, Herts. As a mark of esteem and appreciation the staff and employees of the Department presented Mr. Brotchie on May 28 with a handsome gold wrist watch, suitably inscribed, and a wireless battery eliminator.

Mr. W. J. Medlyn was gazetted O.B.E. on Tuesday, on his retirement from his position with the Post Office as superintending engineer of the South Lancashire District, after a period of service extending over more than forty years. The South Lancashire District includes both Manchester and Liverpool, and for the past 17 years Mr. Medlyn has been in control of the provision, development and execution of the works involved in the continuous extension of telegraph and telephone services. In 1926-27, Mr. Medlyn was chairman of the North Western Centre of the Institution of Electrical Engineers. In consequence of his official position, he has also served as Chairman of the Institution of Post Office Electrical Engineers. The staff of the district assembled to the number of over 400, at the Manchester Limited, on the evening of May 31, which was the last day of Mr. Medlyn's service, in order to make presentations as tokens of personal appreciation. It is announced that Mr. Medlyn will be succeeded by his assistant, Mr. T. E. Herbert, who is also the present chairman of the North Western Centre of the I.E.E.

Obituary.

MR. JAMES WM. SPEIGHT, on May 27, aged 64 years. He had been managing director and consulting engineer of the Ormskirk Electric Supply Co. for 18 years and retired at the end of last year. He had been concerned with important undertakings in Lancashire, Westmorland and Yorkshire, and before coming to Ormskirk was managing director and consulting engineer to the Penrith Electric Supply Co.

BIRTHDAY HONOURS.

THERE are few electrical recipients of Honours conferred by the King on the occasion of his 65th birthday. Amongst the names which may have some interest for our readers are the following :—

BARONETS.—Mr. Basil Mott, consulting engineer, past-president of the Institution of Civil Engineers; Mr. F. H. Royce, M.I.E.E., consulting managing director of Royce, Ltd.

KNIGHT.—Mr. Herbert Wright, chairman of the Executive Committee of the Governing Body, Imperial College of Science and Technology, South Kensington.

MEMBER OF THE ORDER OF THE BRITISH EMPIRE.—Mr. P. H. Burns, superintendent of telegraphs, Bahamas.

OFFICERS OF THE ORDER OF THE BRITISH EMPIRE.—Major W. S. Mulvey, T.D., 108th (Essex) Electrical and Mechanical Company, R.E. Supplementary Reserve; Mr. J. A. B. Horsley, M.I.E.E., electrical inspector of mines, Mines Department, Board of Trade; Mr. W. J. Medlyn, M.I.E.E., late superintending engineer, Manchester Engineering District, General Post Office; Mr. Walter Meakin, professor of mathematics, Royal Artillery Academy, Woolwich; Mr. F. B. Young, D.Sc., principal scientific officer, Admiralty Research Laboratory.

MEMBER OF THE ORDER OF THE BRITISH EMPIRE.—Mr. Wm. Davis, superintendent (telegraphs), London Postal Service, General Post Office.

COMPANION OF THE ORDER OF THE INDIAN EMPIRE.—Mr. George Rutherford, M.C., manager, Calcutta Tramways Co.

BUSINESS ITEMS.

ON April 15, members of the ELECTRIC LIGHT FITTINGS ASSOCIATION advanced their prices by 5% owing to the rise in the costs of copper and other raw materials. We

Dealers' assistants at work in the "H.M.V." mechanics' training school at Hayes, Middlesex..

are informed that this advance has now been withdrawn in consequence of the fall in the costs of raw material.

The BELGRAVE ELECTRIC CO., 24, Belgrave Road, London, S.W.1, would be glad to receive manufacturers' catalogues and publicity matter, relative to lamps, domestic and industrial heating and lighting supplies and neon signs.

HOLOPHANE, LTD., Elverton Street, London, S.W.1, have secured the contract for the street lighting at Sao Paulo. This is claimed to be one of the largest contracts yet placed, and about 16 000 street lighting units will be used. Other street lighting installations secured by Holophane, Ltd., in South America include Buenos Ayres, where more than 30 000 units are installed, and Santiago, Chile, where over 11 000 units are used.

The EDISON SWAN ELECTRIC CO., LTD., 123/5, Queen Victoria Street, London, E.C.4, announces that arrangements have now been made whereby the wiring supplies, lighting engineering and radio business of METRO-VICK SUPPLIES will be taken over and carried on by them at the address given. Cosmos lamps will not be included in this arrangement but will be marketed by the lamp sales department of METROPOLITAN VICKERS ELECTRICAL CO., LTD., of Trafford Park, Manchester.

THE SOCIAL SIDE.

THE annual excursion of the electrical trades in Belfast, comprising contractors, manufacturers, factors and agents, took place on May 21. A party of about 60 travelled by special railway coach to Portstewart, and the series of golf competitions arranged were thoroughly enjoyed.

For the "Dr. Wright" Golf Prize, the first of the annual competitions held by the staff of Siemens lamp works, Preston, the prize winners were Messrs. J. N. Aldington, L. W. Smith and W. G. Creasy. The competition took the form of 18 holes medal play, and was played on the links of the Dick Kerr Club at Ashton Park.

The Liverpool and District Electro-Harmonic Society held its fourth annual golf tournament last week at the West Derby Golf Clubs' course. There was keen competition for the premier award, the Allied Electrical Trades Golf Challenge Cup and replica, which was carried off by Mr. J. Mc Kenzie of Birkenhead, with a net score of 80. Amongst the other prize winners, was Mr. T. W. Whyte (British Insulated Cables, Ltd.), who received a golf bag. Mr. E. G. Pulford, junr., secretary of the society, intimates that the annual bowls competition will be held at the Half Way House, Woolton Road, Liverpool, on June 17. The chief award will probably be a challenge cup, which will be open for competition amongst members of the society only. Non-members of the society who are engaged in the Merseyside electrical and allied trades will be able to enter the competitions for the other prizes.

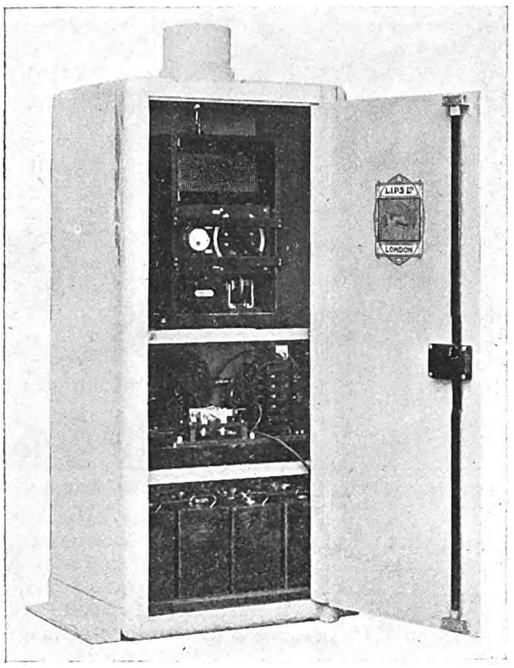
WIRELESS AND PIRACY.

Ingenious Arrangement for Outwitting the Pirates of Bias Bay.

THE danger of an attack by pirates on ships is one which has to be ever in the mind of those responsible for ships sailing in Chinese waters, as many experiences during the last few years have shown. Armed guards have for some time



The "Marconi" ¼ kW transmitter with automatic key, fitted in fireproof safe for use in ships subject to attack by pirates.

been carried on ships likely to be raided and the presence of this guard is, undoubtedly, a deterrent to pirates concealed among the passengers, but nevertheless piracy still occurs. To obtain further assistance when an attack takes place, reliance must be placed on wireless communication, and, in order to do this, adequate protection must be forthcoming for the operator and the wireless installation. An effective and practical solution to this problem has been supplied by the Marconi International Marine Communication Co., Ltd., by the development of an automatic transmitter fitted in a fireproof safe and equipped with the necessary power supply for immediate use. By the mere closing of a switch the transmitter is set in operation and the safe is then locked, leaving the apparatus secure from attack, while it radiates automatically the ship's call sign and the request for assistance. This transmission continues uninterruptedly until either the necessary assistance arrives or until, after some hours of continuous working, the batteries lose their charge.

It has been found in practice that pirates only attack the coastal and river steamers and not deep sea ships, and as the position of these ships is known practically from hour to hour it is unnecessary to transmit the position of the ship in any wireless message sent out when the vessel is attacked. The simple transmission of the ship's call sign and the distress call is sufficient information for the local coast stations, and a telephone call to the owners will soon determine the position of the ship. The installation only requires the safe to house a standard ¼ kW quenched spark transmitter fitted with an automatic key in place of the ordinary hand key, and no elaborate safety devices are necessary to protect it.

A NOTABLE BI-CENTENARY.

Extensive preparations are being made to celebrate the bicentenary of W. and T. Avery, Ltd., the Birmingham manufacturers of weighing and testing appliances. The full programme of events has not yet been completed, but the commemoration will extend over several days at the beginning of July, and many people prominent in industrial, commercial, professional and political circles have already promised to attend. The business was opened in a small steel-yard maker's shop at No. 11, Digbeth, Birmingham, in 1730 by a Mr. Ford, and has grown steadily until it has reached its present dimensions.

IN PARLIAMENT.

Torquay Railway Trolley Vehicles Scheme Approved by House of Lords Committee.

A SELECT Committee of the House of Lords had under consideration last week the Torquay and Paignton Tramway Co.'s Bill for authority to abandon its existing tramways and substitute railless trolley car services; to carry out extensions; and to secure protection from indiscriminate competition on the existing routes. Torquay Corporation supported the Bill. After hearing evidence, the Committee passed the Bill for third reading, and decided that it be left to the licensing authority to determine what was unfair competition and how it should be prevented, with an appeal to the Minister of Transport by either party. The Committee declined to instruct the licensing authority to impose a condition that competing vehicles must charge higher fares.

London United Tramways.

Opposition to the Bill of London United Tramways, Ltd., seeking power to convert its routes from trams to trolley cars, was withdrawn, and the House of Lords Select Committee which had the Bill under consideration found the preamble proved, and ordered the Bill to be reported to the House. The Bill authorises the abandonment of certain tramways and the substitution of railless trolley traction on 20 miles of routes in Twickenham, Teddington, Hampton, Kingston, Surbiton, Malden and Wimbledon.

Replies to Questions in House of Commons.

A scheme in reference to the electrification of the London and North Eastern Railway at Liverpool Street has been submitted to the Government authorities and is now being examined.

The electricity schemes for Palestine are not Government schemes, and, therefore, it is not possible for the Government to take steps to ensure that the water turbines and dynamos used are ordered in this country.

In reference to a request by Mr. H. T. Muggeridge for a return showing the names of electricity supply companies which have capitalised reserves or issued shares to shareholders at less than market price, or "adopted any other method of rendering abortive the statutory limitation of dividends," the Minister of Transport says there is no general statutory limitation of dividends, but he has power to revise from time to time the maximum prices which the companies are authorised to charge. He is keeping under observation the whole question of the procedure for controlling prices.

Rural party telephone lines are provided for not less than three and not more than 12 subscribers. At exchanges with fewer than eight subscribers the rentals are assessed on the costs involved. The Postmaster-General is unable to give preferential treatment to any particular locality.

Telephone subscribers may have their accounts for trunk and toll calls and phonograms rendered monthly on payment of a charge of 1s. a quarter.

The scheme for electrification of the Wirral Railway is being reconsidered by the L.M. & S. Railway Co.

The gross revenue received from wireless licences during the 12 months ended April 30, 1930, was about £1 550 000, against about £1 370 000 for the previous year.

THE "JOHN BENN" FERRY-BOAT.

Thames Ferry Service Increased by Addition of Boat named after "Benn's" Founder.

THE London County Council's new ferry-boat, "John Benn," made her maiden trip across the River Thames from the South Pontoon, Woolwich Free Ferry, on May 30. Many of the relatives of Sir John Benn, including the present baronet, Sir Ernest Benn, were present, and a party of boys from the John Benn Hostel in Stepney also made the journey. The vessel has been named after the late Sir John Benn, Bt., the former Chairman of the London County Council. Mr. F. Bertram Galer (Chairman of the L.C.C. Highways Committee, spoke on board on the inauguration of the increased service and welcomed Sir Ernest Benn and Sir Henry Maybury, G.B.E. (Chairman of the London and Home Counties Traffic Advisory Committee), who briefly replied. Those present included grandchildren of Sir John, and Mrs. Wedgwood Benn (wife of the Secretary of State for India) and Mrs. C. E. Hughes.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

ISLE OF THANET JOINT HOSPITAL BOARD.—Electric light installation at Thanet Isolation Hospital, Haine, near Ramsgate. Specification from Mr. Sidney Shea, solicitor and clerk, 19, Cecil Square, Margate; deposit £2 2s.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL, June 6.—Supply of l.t., paper insulated cables, cab tyre sheathed cable and v.i.r. cables, during period ending March 31, 1931. Specifications, etc., from the Engineer and Manager, Electricity Offices, 11, Staines Road, Hounslow.

Automatic Telephone Equipment.

LIVERPOOL CORPORATION, June 6.—Installation of automatic telephone exchange at Central Police Station, Dale Street, Liverpool. Specifications from Mr. Walter Moon, town clerk, Municipal Buildings, Dale Street, Liverpool.

CLYDE NAVIGATION TRUST, June 7.—Six or 12 months' supply of electrical stores. Form of tender (list No. 8) from the Stores Superintendent, 1, Graving Dock, Govan.

HINDLEY EDUCATION COMMITTEE, June 7.—Electric light installations at Moss Lane and Argyle Street Schools. Specifications from Mr. O. P. Abbott, Council Offices; deposit £2 2s.

WEST RIDING EDUCATION COMMITTEE, June 7.—Electric light installations in Scholes, Holme and Holmfirth Council Schools. Specifications from Mr. W. Heeley, 4, Macaulay Street, Huddersfield.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., June 9.—Supply of electrical accessories. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

GLASGOW CORPORATION, June 9.—One year's supply of l.t. and e.h.t. cables, small insulated cables and flexibles, electric cookers, meters and electric kettles. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

ATHERTON URBAN DISTRICT COUNCIL, June 10.—Supply of 2 600 yards of 0·2 h.t., concentric, paper insulated, lead sheathed, served, steel tape armoured and compound cable, suitable for pressures up to 2 500 V, centre point earthed, and made in accordance with the latest B.E.S.A. specification. Tenders to Mr. A. E. Hope, clerk to the Council.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., June 10.—Supply of fuse boards and switches. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, S.W.1.

ERITH URBAN DISTRICT COUNCIL, June 10.—Electric light installation at Belvedere Boys' School. Particulars from the Surveyor; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, June 11.—Construction of site works, foundation works and buildings in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.F.2) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 11.—Supply and erection of 33 000 V and other cables, in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-G.C.2), etc., from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 11.—Supply and erection of 33 kV transformers. Specification (No. S.E.E.-G.T. 1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.1; deposit £2 2s.

NOTTINGHAM CORPORATION, June 11.—Supply of 300 tons of steel tramway rails of British manufacture. Specification, etc., from Mr. T. Wallis Gordon, city engineer, Guildhall, Nottingham; deposit £1.

SLEAFORD URBAN DISTRICT COUNCIL, June 11.—Supply and laying of about 500 yards run of l.t., double steel tape armoured, lead covered cable, with necessary boxes, for new housing site off Grantham Road, Sleaford. Specification, etc., from Mr. W. H. Wilson, electrical engineer, West Banks, Sleaford.

DUNDEE CORPORATION, June 12.—Supply of e.h.t. and l.t., paper insulated, lead covered and double steel tape armoured cable, to B.E.S.A. specification for working pressures up to 6 600 V and 660 V respectively. Specifications, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

LEYTON CORPORATION.—June 13.—Re-wiring electric light installation at Farmer Road school. Particulars from the architect, Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.; deposit, £1.

STONE URBAN DISTRICT COUNCIL, June 13.—Re-wiring sewerage works. Specifications from the surveyor, Mr. W. R. Harlow, Stone, Staffs.

OSWESTRY CORPORATION, June 14.—Supply, erection, etc., of 3 core, 11 000 V, paper insulated, underground cable; l.t. 3 core, 4 core and 2 core, 400 V, paper insulated cable, service material, and link disconnecting boxes (specification No. 1A); e.h.t. 11 000 V, oil immersed, truck type switchgear, and 400 V, ironclad, air break switchgear (specification No. 2A); and one, two or three oil immersed, self-cooled, three phase, step down (11 000 V to 400 V) transformers (specification No. 3A). Specifications from Mr. H. W. Edwards, borough electrical engineer, 28, Oswald Road, Oswestry; deposit £2 2s. for each. All apparatus and materials to be of British manufacture and cable to be C.M.A.

WALLASEY CORPORATION, June 14.—Electric lighting work at New Brighton Ferry, including supply of switches, lamps, etc. Specification from the Ferries General Manager, Seacombe Ferry.

IRVINE CORPORATION, June 16.—Electric lighting work in connection with erection of (1) four blocks, each of four houses, and (2) 16 blocks, each of four houses, on Springbank Farm, Irvine. Specifications from Mr. A. R. Wilson, town clerk, Council Chambers, Irvine; deposit, £1 1s. for each.

EAST HAM EDUCATION COMMITTEE, June 18.—Electric light installations at Monega and Sandringham Schools. Specifications, etc., from Mr. F. R. Thompson, Education Office, Town Hall, East Ham, London, E.6; deposit 10s.

MANCHESTER CORPORATION, June 18.—Heavy a.c. equipment, cables and lighting at new Children's Sanatorium, Abergele, North Wales. Specification from the City Architect, Town Hall, Manchester; deposit £1 1s.

RICHMOND (SURREY) CORPORATION, June 18.—Borehole pump, with 35 B.H.P. electric motor; two horizontal pumps, with 80 B.H.P. electric motors; two ditto, with 65 B.H.P. electric motors; and two ditto, with 10 B.H.P. electric motors. Specification, etc., from the Water Engineer, Hotham House, Heron Road, Richmond; deposit £5 5s.

SCUNTHORPE AND FRODINGHAM URBAN DISTRICT COUNCIL, June 18.—Wiring for electric lighting and power at Public Baths to be erected at Doncaster Road, Scunthorpe. Specification (D) from Mr. W. Farrar, engineer, Council Offices, Scunthorpe; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 19.—Supply and laying of 33 kV and other cables in connection with Central England Electricity Scheme. Specification (C.E.-G.C.3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

OLDHAM PUBLIC ASSISTANCE COMMITTEE, June 20.—Supply of electric lamps and fittings, for the Poor Law Institution. Tender forms from the Public Assistance Officer, Town Hall, Oldham.

BENFLEET URBAN DISTRICT COUNCIL, June 23.—Three vertical spindle centrifugal pumps, with electric motors and automatic control, etc. Specification from Mr. W. E. Blezard, 9, Victoria Street, Westminster, S.W.1; deposit £2 2s.

E.H.T. and Pilot Cables.

CENTRAL ELECTRICITY BOARD, June 23.—Supply and erection of 66 000 V and other cables in connection with Mid-East England Electricity Scheme. Specification (M.E.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, June 27.—Supply and laying of pilot cables in connection with the Central England Electricity Scheme. Specification (C.E.-S.C.1), etc., from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Digitized by Google

CENTRAL ELECTRICITY BOARD, June 30.—Supply and erection of metering equipment required in the area of the Central England Electricity Scheme. Specification (C.E.-G.M.1) from Mr. R. H. FOX, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

METROPOLITAN WATER BOARD, June 30.—Twelve months' supply of electric lamps. Form of tender (No. 24) from the Chief Engineer (Room 155), 173, Rosebery Avenue, London, E.C.1. Stamped, addressed envelope to be sent.

CARDIFF CORPORATION, July 1.—Supply of h.t. switchboard (Contract No. IV); h.t. switchboard (No. V); transformers (No. VI); and battery and charging plant (No. XV), for the Llandough Hospital, now in course of erection. Specifications from Messrs. Plevin and Jenkins, 4, Working Street, Cardiff; deposit £2 2s. for each. Only manufacturers on the King's National Roll are invited to tender.

SUNDERLAND CORPORATION, July 7.—Manufacture and supply of (1) paper insulated, lead sheathed cable for general main-laying requirements; (2) rubber insulated wire; (3) consumers' meters; and (4) gasfilled and vacuum lamps, for 12 months. Specifications, etc., from the General Manager, Electricity Department, Dunning Street, Sunderland; deposit 10s. for each.

DUNDEE CORPORATION, July 12.—Supply of six 300 kVA outdoor type transformers. Specification from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIAN STORES DEPARTMENT, June 9.—Supply and erection of oil engine and alternator set, with switch and protective gear and connecting cables, for Public Works Department's power station, Jaipur (order No. N. 11 096). (Reference B.X. 6 445.)

AUCKLAND HARBOUR BOARD, June 10.—Supply of submarine cable (contract No. 902). (Reference B.X. 6 354.)

HYDRO-ELECTRIC POWER COMMISSION OF ONTARIO, June 10.—Supply and installation of transformers, for Chats Falls transformer station. (Reference B.X. 6 436.)

MELBOURNE CITY COUNCIL, June 11.—Supply of paper insulated, lead sheathed cables, suitable for use on three-phase, 50 cycle system at 6 600 and 420 V. (Reference B.X. 6 415.)

COPENHAGEN LIGHTING DEPARTMENT, June 12.—Two electrically driven gas compressors, with minimum hourly capacity of 20 000 cu. metres of gas at pressure of 1 metre water column. (Reference A.X. 9 598.)

MADRAS GOVERNMENT, June 15.—Complete electrical equipment of three 66/110 kV outdoor sub-stations, in connection with Pykara hydro-electric scheme. Specification (No. E.26) (price 30s.) and general conditions of contract (price 3s. 6d.) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4, on payment of the respective fees (not returnable).

CAPE TOWN MUNICIPALITY, June 18.—Supply of 1 000, steel tubular poles (specification No. 500/1930). (Reference A.X. 9 622.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, June 30.—Supply and maintenance of an electric generating unit, with motors, transmission lines, etc., at Tor Quarantine, on the Gulf of Suez. (Reference B.X. 6 466.)

POWER SECURITIES CORPORATION, LTD., July 1.—Supply of (*a*) 4—3 000 kVA transformers (specification E.28, price 15s.); (*b*) indoor 11 kV switchgear (E.23, price 22s. 6d.), for Pykara, Madras, hydro-electric scheme. Specifications (on payment of above fees and 3s. 6d. for general conditions of contract) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

EGYPTIAN MINISTRY OF THE INTERIOR, July 26th.—Supply and erection of cooling tower, construction of concrete well and basin and supply of electrically-driven and centrifugal pumps, electric motors, switchgear, etc., at Assiout electric power station. (Reference A.X. 9 627.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 12.—Supply of 11 000 V metal-clad switchgear and accessories, for Manghao power scheme—section 239. (Reference B.X6 455.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 2—. Supply of 110 kV switchgear, steelwork and controlling equipment, for Mangahao power scheme. (Reference B.X. 6 452.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 9.—Supply of 110 kV switchgear and controlling equipment, for Mangahao power scheme—section 217. (Reference B.X. 6 454.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 50 kV switchgear and steelwork, for Arapuni power scheme—section 276. (Reference B.X. 6 451.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 110 kV and 50 kV switchgear and protective system, for Arapuni power scheme (section 273). (Reference B.X. 6 450.)

Tenders Accepted.

CENTRAL ELECTRICITY BOARD.—Contracts placed in connection with North-West England and North Wales and Mid-East England schemes: British Thomson-Houston Co., Ltd., Brush Electrical Engineering Co., Ltd., English Electric Co., Ltd., Ferranti, Ltd., and C. A. Parsons and Co., Ltd., 66 kV 33 kV, and lower voltage transformers. Super-Centrifugal Engineers, Ltd., oil filtering and storage equipment for outdoor transforming stations in area of Central England scheme. Total amount of contracts approximately £326 000.

LONDON COUNTY COUNCIL.—W. H. Gaze and Sons, electric fittings and wiring in connection with erection of new elementary school at Henwick Road. Also tendered: T. Clarke and Co., Ltd., £803; A. Hawkins and Sons, £829; Woolwich Metropolitan Borough Council, £835; L. G. Tate and Co., Ltd., £845; Electrical Installations, Ltd., £851; Eastern Armature Winding Co., £862; J. Briggs (Electrical Contractors), Ltd., £920; A. Dean and Co., Ltd., £929; Burdette and Co., Ltd. £1 050; Malcolm and Allan (London), Ltd., £1 236

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY.—Mitchell Conveyor and Transporter Co., Ltd., coal handling plant for new Ironbridge power station, consisting of Mitchell patent side-discharge weighing type tipplers for unloading colliery wagons up to 20 tons capacity; Mitchell ball bearing type belt conveyors for placing coal into boiler house bunkers or into store; and a travelling store bridge, spanning coal store, fitted with two special type elevators for reclaiming coal from store. Ultimate capacity of store yard will be over 80 000 tons.

TRADE JOURNALISM.

Memories of the "Good Old Days."

SIR ERNEST BENN, chairman of Benn Brothers, Ltd. (publishers of THE ELECTRICIAN), and Miss Betty Benn were entertained to luncheon at the Criterion Restaurant, London, on Tuesday, by the Trade, Technical and Scientific Branch of the London District of the Institute of Journalists, in order to mark the jubilee of Benn Brothers. Lady Benn was to have been present, but her unavoidable absence abroad prevented her from attending, and Miss Benn deputised for her. Mr. Hugh B. Philpott, the chairman of the Branch, who presided, proposed the health of the guests.

Sir Ernest Benn, in reply, said that he could go back 40 years into those days when the firm possessed one letter book and a copying press. It was his duty to write the letters and do the copying. They were days before the arrival of the accountant and cost accountancy. Business accounts then, some of which were preserved to-day, showed nothing which would be recognised as accounts in these times. Estimates were "guesstimates," and the only costing system was the other man's catalogue. Those were days before the arrival of all those extravagantics so strangely called economics. His father's first election circular in 1889 set it out that: "He has had a thorough business training fully fitting him to deal with those economical interests which are most important to business men, who, like himself, have to pay heavy rates." He had searched and failed to find the figure, but he had the profit and loss account of 1881, in which they would find the staggering item of "rates: £3 10s.," and, "if you please," said Sir Ernest, "he went into public life to get rid of that intolerable burden!" Could they wonder that he sang with fervour the line in the old hymn, "Change and decay in all around I see"? There was no net sales stunt in those days. Journalism was a serious occupation, even outside the trade and technical Press. Indeed, he thought that the trade and technical section ought to recognise more definitely than they did the responsibilities that they carried, for they were almost the sole remaining depository of the old and best traditions of journalism.

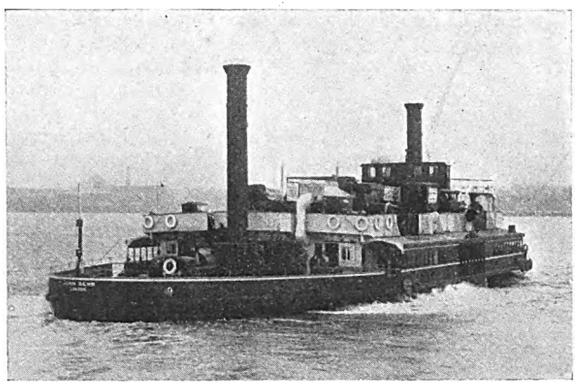
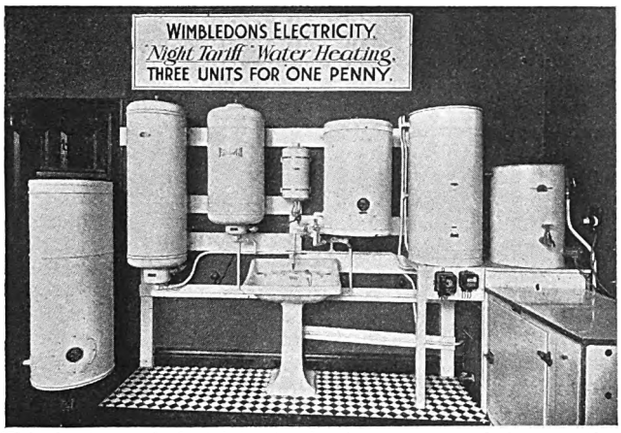
ELECTRICAL PICTURES OF THE WEEK.

Mr. W. N. C. Clinch, superintendent of power stations to the North Metropolitan Electric Power Supply Co., who has been appointed to succeed Mr. John Christie as borough electrical engineer, Brighton.

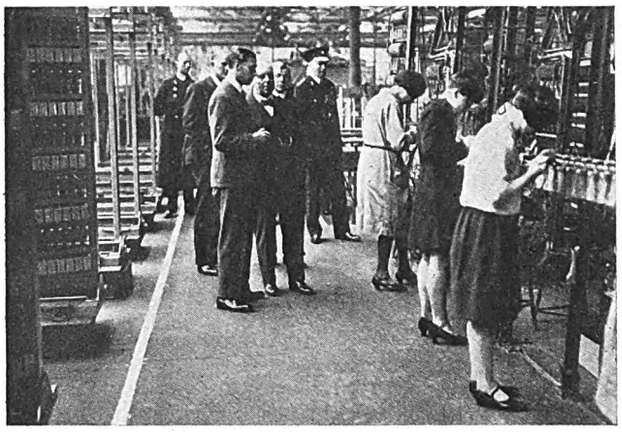


The new London ferry-boat, "John Benn," which was put into service on May 30. She was given her name by the L.C.C. as a tribute to the late Sir John Benn, the founder of Benn Brothers, Ltd., publishers of THE ELECTRICIAN. See page 740.

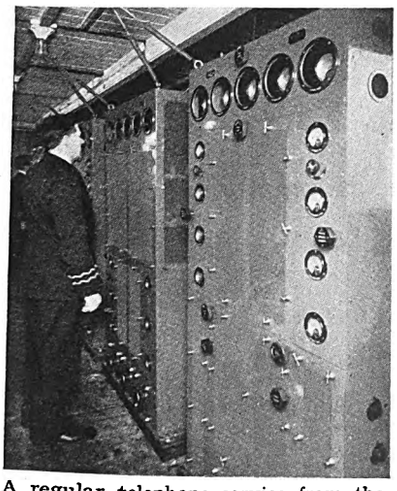
Mr. A. J. Fuller, borough electrical and consulting engineer, Fulham, who was elected President of the I.M.E.A. for the ensuing year, at the annual meeting held at Eastbourne on Friday, May 30. See page 730.



This battery of electric water heaters, connected for practical demonstration purposes in the showrooms of the Wimbledon Corporation Electricity Department, is of special interest in view of Mr. A. E. McKenzie's remarks at Eastbourne last week.



The Duke of York at the Strowger Works of the Automatic Telephone Co., Ltd., Liverpool, where, under the ægis of the Industrial Welfare Society, on May 20, he made a thorough tour of inspection of all the departments.



A regular telephone service from the "Homeric" to the United States and Great Britain was announced by the Post Office last week. This is the first vessel of the Mercantile Marine to be fitted with the new short wave gear similar to that used by Marchese Marconi when he spoke to Australia from the Mediterranean some few weeks ago.

The past few weeks have seen the conclusion of an intensive indoor propaganda campaign amongst rural areas by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. This has included exhibitions and demonstrations in halls at Kinver, Moreton-in-the-Marsh, Redditch, Craven Arms, Bidford-on-Avon, Evesham, Ludlow, Hereford, Kidderminster, Banbury, Weobley, Whitchurch, and Wellington. An exhibition has also been held at Dudley. The company has now commenced its outdoor propaganda campaign, which will continue until the autumn, with the same object in view, namely, convincing the rural areas of the advantages of electricity. For these exhibitions a large marquee is used and demonstrations are given. A start was made at the Oxford Agricultural Show, held at Banbury on May 20 and 21.

ELECTRICITY SUPPLY.

Biggar Street Lighting Contract—Lighting on Bury Housing Sites—Rothesay Rural Supply—Wimbledon's Electricity Propaganda—Diesels at Southend.

GLASGOW electricity department is to extend mains at a cost of £6 000.

Shipley Electricity Committee has received sanction to borrow £9 969 for mains.

Sanction has been received by Bexhill T.C. to a loan of £3 959 for sub-station equipment, etc.

Coventry Electricity Committee recommends application for a loan of £10 168 for mains and switchgear.

The Edinburgh Collieries Co. has under consideration a scheme to erect electric light standards in Wallyford streets.

Ilford Electricity Committee has obtained permission to supply electricity to additional premises in the rural district of Epping.

Plymouth Electricity Committee has sanctioned extensions of cable in 18 streets in Plymouth and Devonport, at a cost of about £1 200.

Biggar T.C. has accepted an offer by the Clyde Valley Electric Power Co. to supply all fittings and light the streets at a cost of £1 500.

Barking Electricity Committee has authorised the Electrical Engineer to proceed with the laying of a main in Longbridge Road at a cost of £1 482 5s.

The Borough Electrical Engineer of Bury (Lancs) has been instructed to arrange for house and street lighting by electricity on the Woolfold and Walmersley housing sites.

An inquiry which was to have been held at Rothesay by the Ministry of Transport has been cancelled, the Bute Estate having withdrawn objections to an application by the Burgh of Rothesay for powers to erect an overhead line to farmhouses.

The chairman of Wimbledon Electricity Committee and the Borough Electrical Engineer were making arrangements for the use of a shop window for advertising the advantages of water heating by electricity, and also for the erection of an illuminated sign on land belonging to the Corporation abutting upon the Southern Railway, for the same purpose.

Maidstone T.C. is to carry out the public lighting by electricity at East Malling at £4 7s. 6d. per lamp per annum, at Ditton at £3 2s. 6d. per lamp, and at Linton at £4 7s. 6d. per lamp. It has also been arranged to supply electricity for lighting Malling Rural District Council's Isolation Hospital for a minimum revenue of £43 per annum for seven years.

The Shawinigan Water and Power Co., Ltd., is seeking the approval of the Minister of Lands and Forests of Quebec for the plans of the proposed Rapide Blanc station, the first of six new developments along the Upper St. Maurice river contemplated by the company for execution during the next few years. The plans contemplate the installation of 160 000 H.P. at a cost of $13 000 000.

Poplar (London) electricity department is to extend mains, at a cost of £3 914, in connection with the h.t. supply to the Blackwall Tunnel, considerable extensions to the electrical installation of Messrs. J. Kidd and Co., Old Ford Road, and the additional supply of 100 H.P. to Messrs. W. Lusty and Sons, Ltd., Bromley. The Electricity Committee has sold land in Weston Street, Bromley, to the Central Electricity Board for the erection of a transformer sub-station.

At a meeting of Portishead U.D.C. last week an alleged nuisance from fumes and smoke emitted by the Portishead generating station was discussed at the instance of the Portishead Ratepayers' Association. The chairman, Mr. Hedley Stevens, said the Surveyor had written to the County Medical Officer of Health with regard to the ill-effects of the coal dust and fumes from the works. It was stated that Bristol Corporation was taking this matter seriously and was searching for a remedy.

In reply to requests by residents in Cark, Flookburgh, and Ravenstown, for a revision of the maximum charge by the Cark and District Electricity Supply Co., the Minister of Transport states that he understands that the company is now prepared to make an offer to reduce the flat rate for lighting to 9d. per kWh, and to offer consumers an alternative two-part tariff, under which the average price per unit will be considerably lower. The Minister has therefore deferred further consideration of the matter for the time being.

Consent has been given by Abergavenny T.C. to the application of the Shropshire, Worcestershire and Staffordshire Electric Power Co. for a Special Order to supply electricity to the town. The company proposes an agreement for 21 years, and undertakes to reduce the flat rate for lighting from 6½d. to 6d. within a year of the commencement of the supply. Alternative tariffs include one for residential premises for lighting, heating and cooking at 1d. per kWh, in addition to 2s. 6d. per room per quarter for six months of the year, and 3s. 6d. per quarter for the other six months.

Manchester Electricity Committee has been asked by the Minister of Transport and the Electricity Commissioners to carry out electrical developments in such a manner as to preserve the beauty and character of the countryside. Mr. H. C. Lamb, engineer and manager of the electricity department, states in his monthly report that before any sub-station is erected in the area, consideration is given to the amenities of the district. Alterations are introduced, if desirable, to keep the building in conformity with the surrounding architecture. Evergreen shrubs are also planted in many cases round sub-stations.

The West Kootenay Power and Light Co., which was recently conceded authority for the development of hydro-electric power from the waters of the Pend d'Oreille river in southern British Columbia, is amending its application to the Provincial Water Board. The company's revised application proposes the construction of a 165-ft. dam at Sevenmile Creek and a 150-ft. dam at Cedar Creek. The dam of over 350 ft. at the mouth of the river, planned by the company some months ago, is not mentioned in the application. From this it is presumed that the company has come to the conclusion that the water powers of the river can be best harnessed by two separate developments, rather than by a single dam and power house. The output planned is 350 000 H.P. at a cost of about $18 000 000.

Newbury Corporation has recently had under consideration a suggestion that it should appoint an electrical inspector for the borough for the purpose of testing doubtful meters. In regard to this subject, the Urban Electric Supply Co. has informed the Corporation that when a meter is suspected of being wrong, the consumer is given notice that it is to be removed for testing. If he objects to the meter being removed the company fixes another new certified meter alongside, and take frequent check readings. If the consumer still refuses to have the meter changed, it is dispatched to one of the recognised meter testing institutions. It is only in very few cases that it is necessary to send a meter away. The Committee has decided to take no action in reference to the suggested appointment of an inspector.

After an interview with an official of the Electricity Commissioners, the chairman of Ripon Electricity Committee reports that there is no possibility of the Government carrying out the suggested line from Boroughbridge for some time. It is suggested that Harrogate Corporation put up an alternative line in the direction of Boroughbridge and that Ripon Corporation connect thereto. An assurance has been given that if the Government or Harrogate Corporation devises a scheme for a duplicate line on an alternative route, Ripon Corporation will be consulted in the matter.—The Committee has agreed to the principle of assisted wiring, and inquiries are being made as to the extent to which local electrical contractors will co-operate in working it. A loan of £2 000 for assisted wiring and £1 000 for showroom appliances is being applied for.

In reference to the decision of Southend T.C. to apply to the Electricity Commissioners for permission to purchase a new 3 000 kW Diesel engine set for £28 000, Coun. J. Le Masurier, chairman of the Electricity Committee, said, in a recent interview, it had now been possible to reduce the capital cost to about £9 per kW, and it was idle to argue that the proposal for peak loads was better served by bulk than by Diesel generation. He had always felt that local authorities would some day throw over the yoke of all bulk supply by long distance transmission. The advent of the high-powered oil engine must of necessity call for a revision of the original grid scheme of 1925 as regards local load stations. Even at the unusual, if not entirely unknown, load factor for bulk supply of 60%, it would be noted that cost per unit for the nine months was 0·58d. The combined costs were: Local generation and bulk, 0·80d. for 1930, against 0·84d. for 1929. London Road Diesels had generated at 0·73d., against bulk at 0·58d., with the advantage of the high load factor.

FINANCIAL INTELLIGENCE.

Profits of Electricity Supply Companies for Last Financial Year—Dividends and Other Appropriations, and Percentages of Same to Capital.

By "AUDITOR."

THE following table gives the balance of profit realised by 20 electricity supply undertakings during the last financial year or accounting period; together with the sums distributed in the form of dividends; the amounts allocated to reserves, etc.; and other appropriations, where applicable. The percentage which each total in the final appropriation of profit account bears to the total capital invested in the undertaking, is also shown, with recent prices of the different stock and share issues, and the yield in each case :—

TABLE SHOWING PROFITS REALISED BY CERTAIN ELECTRICITY SUPPLY COMPANIES DURING LAST FINANCIAL YEAR; DIVIDENDS, RESERVES, &c. (WITH PERCENTAGES IN RELATION TO INVESTED CAPITAL), AND RECENT PRICES AND YIELDS.

	Capital Invested.	Brought Forward.		Profit.		Total.		Dividends Distributed.		Reserves, etc., Allocated.		Other Appropriations.		Carried Forward.		Total.		Ann. Div.	Par. Value.	Recent Price.	Yield.

*Including £1 973 (0·56%) Interest.

SUMMARY OF APPROPRIATION ACCOUNTS OF 45 SUPPLY UNDERTAKINGS.

The capital invested in the above companies, and upon which dividends were declared, aggregates £20 060 994, while the totals of the different items on the debit and credit sides of the appropriation are as summarised below :—

Brought Forward ..	£727 199	Dividends Distributed ..	£1 319 321
Profits	2 690 007	Reserves, etc. Allocated ..	1 160 321
Other Income	1 973	Other Appropriations ..	54 169
		Carried Forward	885 368
	£3 419 179		£3 419 179

The amount of dividend actually distributed on ordinary and preference capital averages 0·58% of the total invested capital, while the percentage of profit in relation to capital is 13·41%. On the same basis the percentage allocated to reserves, etc., was 5·78% and other appropriations accounted for 0·27%. The total amount brought forward from the previous appropriation is 3·62% of invested capital, and the sum carried forward to the next appropriation is 4·41%. "Other Income" was 0·01% of capital.

Below is reproduced the summary of the two sides of the appropriation accounts relating to 25 supply companies whose final figures were analysed last week :—

Brought Forward ..	£692 018	Dividends Distributed ..	£2 651 904
Profits	3 897 544	Reserves, etc., Allocated	1 228 567
Other Income	79 672	Other Appropriations ..	68 313
		Carried Forward ..	720 450
	£4 669 234		£4 669 234

The capital invested in the 45 undertakings aggregates £60 844 005, and the combined summary of results, with the percentage of each item in relation to total capital, is shown below :—

	£	%		£	%
Brought Forward ..	1 419 217	2·33	Dividends Distributed	3 971 225	5·52
Profits	5 587 551	10·83	Reserves, &c., allocated	2 388 888	3·93
Other Income ..	81 645	0·13	Other Appropriations	122 482	0·20
			Carried Forward	1 605 818	1·64
	£8 088 413	13·29		£8 088 413	13·29

COMPANY NEWS.

Depreciation of Cables and Wireless Stocks—Chloride Electrical Storage Co.'s Continued Development—Ever Ready Co.'s Increased Sales—Directors' Reports.

DIVIDEND fears have caused persistent selling of Cables and Wireless stocks during the past week, the 7½% "A" ordinary stock changing hands at nearly 40 and the "B" ordinary stock at 17½. The legal action being taken in America, under the Anti-Trust Act, against the Radio Corporation of America and its associated undertakings is thought likely to be prolonged and at present is having little effect upon prices. The shares of the Radio Corporation have retained the higher level of just over 53 reached last week, American Telephone and Telegraph capital stock remains steady at $240, and General Electric ordinary shares at 50s.

The ordinary shares of the Underground Electric Railways Company of London have dropped from 23s. 6d. to 23s., the explanation being that the holders of the some four millions worth of six per cent. income bonds have the right until the middle of this year to convert into the ordinary shares at 21s. This, of course, will materially add to the amount of the ordinary share capital, but not enough to interfere with dividend prospects.

The ordinary shares of the Urban Electric Supply Company have risen this week to 32s. 6d., ex dividend. The company supplies, either directly or through its controlled companies, electricity in a number of districts as far apart as Cornwall and Scotland. Kensington and Knightsbridge shares are 1s. up, from 26s. to 27s., as also are St. James' and Pall Mall at 28s. 6d. Charing Cross shares have also been bought, the ordinary improving from 27s. 6d. to 28s., and the 4½ per cent. cumulative preference from 17s. to 18s. Both Newcastle companies' shares have been weak, Newcastle and District Electric Lighting ordinary falling 1s. 3d., from 26s. 3d. to 25s., and Newcastle-upon-Tyne Electric Supply shares to a less extent from just over 23s. 1½d. to 22s. 6d. Calcutta issues are unchanged. Victoria Falls are down 1s. 3d., to just under 62s.

Manufacturing shares have been unusually quiet. Telegraph Construction £12 shares at 19½ are a couple of points lower.

Directors' Reports, etc.

ROYCE, LTD.—Net pft. for past year, £293. No. div. proposed on ord. or pref.

HYDRO-ELECTRIC SECURITIES CORPORATION. Qrtrly. div. on common stk. of 50 cents p. sh. will be payable on June 14.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.—Fin. div. of 10%, less tax, recommended, again makg. 15% for year.

PENNSYLVANIA WATER AND POWER CO.—Div. of $\$\frac{3}{4}$ p. sh. on common stk. for qrtr. ending June 30, 1930, will be payable on July 1.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Div. on new common shs. 38 cents p. sh. for qrtr. ending June 30, 1930, is announced.

SHEERNESS AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Credit blce. £14 626, plus £3 490 brt. in. To res., £7 500. Ord. div., 10% for year. Fwd., £3 115.

DUNDEE, BROUGHTY FERRY AND DISTRICT TRAMWAYS CO., LTD.—Pft. for 1929, £2 504, agst. £2 780 for 17 months. Deb. stk. int. £1 116, agst. £1 611. Fwd., £1 388.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—The common shs. are to be split into two for one, and from now on the common stk will consist of 5 000 000 shs. of no par value.

MANSFIELD AND DISTRICT TRAMWAYS, LTD.—Pft. for 1929, £8 283, includg. £3 366 brt. in. Deb. int., less tax, and loan int. required £3 986, and deb. stk. redemptn., £3 108. Fwd., £1 189.

GREAT NORTHERN TELEGRAPH CO., LTD.—Fin. div. and bonus for 1929, £1 10s. per £10 sh., less tax, are now payable by Messrs. Hambros Bank, Ltd., 41, Bishopsgate, London, E.C.2.

RANGOON ELECTRIC TRAMWAYS AND SUPPLY CO., LTD.—Gross pft. for 1929, £181 139, agst. £180 019; net pft. £62 828, agst. £58 058. Div. for year R.1$\frac{3}{4}$ p. sh. Fwd. £25 817 agst. £20 942.

CANADIAN GENERAL ELECTRIC CO., LTD.—Qrtrly div. on common stk. of 75 cents p.sh., being at rate of 6% p.a. and qrtrly. div. of 1$\frac{3}{4}$% on pref. shs., being at rate of 7% p.a., will be payable on July 1.

ALTRINCHAM ELECTRIC SUPPLY, LTD.—Pft. for 1929, £28 120, agst. £31 757, plus £2 000 brt. in. Fin. divs. 2% on ord., and 14% on dfd. Fwd., £2 236. Assessmt. for local rates increased from £3 500 to £10 000.

PENARTH ELECTRIC LIGHTING CO., LTD.—Net. rev. for 1929, £12 065, agst. £11 341. After provisn. for exes., income tax, and int., blce. is £5 520, plus £3 022 brt. in. To res., £4 000; div. on ord., 7$\frac{1}{2}$%; fwd., £2 317.

WEMYSS AND DISTRICT TRAMWAYS CO., LTD.—Pft. for 1929, after provisn. for administratn. exes., taxatn., etc., and includg. £56 brt. in and £2 000 transferred from res., £7 283. Int., £7 061; to deb. stk. redemptn., £200. Fwd. £22.

POWER INVESTMENT CORPORATION.—Net pft. for year ended March 31, 1929, £85 169, agst. £75 787. Pref. div. requires £26 819, agst. £25 909, and ord. div. of 5%, £20 786, agst. £25 910. Fwd. £39 746. Investmts. and participatns. shown in blce. sheet as £1 573 872, agst. £1 424 570.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON, LTD.—Hldrs. of 6% income bonds are reminded that offer of company to convert bonds into fully-paid ord. shs. expires on June 30, 1930. Conversion is at rate of one ord. sh. for every £1 1s. of total principal amt. in sterling of all the income bonds exchanged.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Qrtly. div. of 50 cents p. sh. on issued common shs. of no par value will be payable on June 14 by Finance Trust and Agency, Ltd., 4, Crosby Square, London, E.C., or by the Corporation's representatives in Brussels.

GENERAL GAS AND ELECTRIC CORPORATION.—Consolidated net income for 1929 $6 086 052, an increase of more than 60% over 1928 consolidated income, amtg. to $3 791 150. Blce. sheet as at Dec. 31 last showed total assets $209 822 069, and total surplus $61 168 820. Corporation owns or controls public utility concerns supplying over 44 000 customers in South Carolina and Florida and has made large investmts. in Associated Gas and Electric Co. and other public utility enterprises.

L. M. ERICSSON TELEPHONE CO.—Directors propose to ncrease cap. from £3 360 000 to £5 600 000 by issuing 806 650 new B shs. at 110% on par, or 55 kronor. Of this sum £2 240 000 will be added to sh. cap., and remaing. £230 000 to res. Subscriptn. began on May 19. Hldrs. of old shs. are entitled to take up to two new "B" shs. for every three old ones. New shs. will be entitled to div. from Jan. 1, 1931, but int. at 6% will be paid on amt. paid in from date of payment up to Dec. 31, this year.

AEONIC RADIO, LTD.—Accts. for 15 months ended Jan. 31, 1930, state that net pft. was £2 370, after carrying to develop-mt. acct. advertising and wages and materials totalling £30 000, and providg. debtors' reserve of £10 000. Directors now propose to reconstruct company, and shhldrs. will be given right to take up three shs. of 2s. 6d. ea. in the new company, credited with 2s. p. sh. paid up, in respect of every five 2s. shs. held, blce. of 6d. per share being payable as to 1d. p. sh. on applicatn., 2d. on allotmt. and 3d. one month after allotmt.

ELECTRAMONIC CO., LTD.—For period from March 26, 1928, to Oct. 31, 1929, loss on tradg. was £67 679. Loss on sale of plant, motors and a lease amtd. to £9 878; deficiency owing to transfer from the company of shs. in Electramonic (Foreign Rights), Ltd., was £33 413; and directors' fees absorbed £2 402, makg. total of £113 389. After takg. credit for transfer fees, £250, and underwritg. commission, £730, there remained a debit of £112 389. A scheme of reconstructn., under which the company will be liquidated and the assets sold to a new company to be called Electramonic (1930), Ltd., will be submitted at the annual gen. mtg. on June 11.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Gross earngs. for 1929, $49 351 215, agst. $42 774 813; net earngs., $28 052 961, agst. $24 869 330; miscellaneous rev., $281 998, agst. $145 933; total charges of subsidiaries, $11 150 325, agst. $10 631 269; blce., being rev. to Brazilian Traction Co., $17 184 634, agst. $14 383 994; gross rev. Brazilian Traction Co., $17 605 179, agst. $14 762 619; total charges Brazilian Traction Co., $744 083, agst. $641 015; net rev. Brazilian Traction Co., $16 861 096, agst. $14 121 604. Total assets, $368 956 552; total reserves, $125 529 728. Liabilities include cap. stk. $170 563 338 and funded debt $60 184 200.

BRITISH ELECTRIC TRACTION CO., LTD.—Gross pft. for year ended Mar. 31, 1930, £396 261, agst. £330 822. After deductg. £63 701 for gen. exes., directors' fees, income tax and staff endowment fund, and £79 479 for deb. stk. int., blce. is £253 081. Divs. recommended: pref., 6%, pfd. ord., 8%, and def. ord., 5%. Surplus, £95 832. Directors recommend that £16 768 (equal to 10% on def. ord.) be capitalised and distributed to def. ord. stkhldrs. in fully paid def. ord. shs. of £1 each, to be converted subsequently into def. ord. stk. Subject to this being approved, pref. stkhldrs. are entitled to further div. of 1·89%, (makg. 7·89% for year), leavg. blce. £65 547 to be added to undivided pfts. acct., makg. that acct. £251 798. Amt. to credit of res. acct. remains at £520 000.

INTERNATIONAL HYDRO-ELECTRIC SYSTEM.—For first year of operatn. ended March 31, 1930, net income was $21 550 801, after deeductn. of depreciatn., taxes, etc. Int. on funded debt and div. on stk. of subsidiaries $18 606 183, leavg. $2 944 617 as blce. added to surplus. This amt. was equal to 1·9 times div. requiremts. on class A stk. After additn. of paid-in surplus and surplus adjustmts. amtg. to $12 360 238, total gross surplus was $15 304 856, from which div. on class A stk., aggregatg. $1 246 317, were deducted, leaving net surplus $14 058 539. Blce. added to surplus during first qrtr. of 1930, $1 107 076, was at substantially better rate than average for whole year, due principally to increased deliveries by subsidiaries of Canadian Hydro-Electric Corporation and to normal growth of New England Power Association.

Company Meetings.

LISKEARD GAS AND ELECTRICITY CO., LTD.—At the half-yearly meeting, May 26, a resolution was passed assenting to the disposal of the undertaking to Edmundson's Electricity Corporation, Ltd. It was stated that the offer was to purchase the £1 ordinary shares at 35s. each and the 7% preference shares at 27s. each, the Corporation also accepting responsibility for debentures amounting to £8 000 and agreeing to pay off loans of £2 450.

SHANGHAI ELECTRIC CONSTRUCTION CO., LTD.—Mr. J. S. Haskell, presiding at the meeting of May 28, said the accounts showed a satisfactory financial position, inasmuch as they had been able to increase the reserve for renewals to £96 000 and the general reserve to £62 000. They held £75 000 of 5% War Loan and they had also a reserve of £7 000 made up of guarantee premiums received from the Singapore Traction Co. The true test of the vitality of the business was the number of passengers carried, which had risen from 123 000 000 to 137 000 000. The effective receipts, expressed in Mexican dollars, showed an increase of almost exactly 10%, compared with the preceding year. The report and accounts were adopted, and a final dividend of 7$\frac{1}{2}$%, making 12$\frac{1}{2}$% for the year, was declared.

RICHARD JOHNSON AND NEPHEW, LTD.—At the meeting on May 29, Lt.-Gen. Sir Walter Campbell, chairman, said he was glad to announce that they had been successful in obtaining a share of the work initiated by the Central Electricity Board for the electrification of Great Britain. The high cost of copper throughout the past year had no doubt stayed the hand of many consumers. It was an artificial price, maintained by the American Exporters' Association, who, they believed, controlled approximately 90% of the world's supply. Since the close of the financial year the price had broken, and it remained to be seen whether this "ring" had not done itself more harm than good by driving potential consumers to use some other material where possible. On the subject of safeguarding, he said 72 000 tons of steel wire and 6 500 tons of copper wire were imported into this country last year, and it could easily be realised what a help it would be to the wire industry of this country if they could share this tonnage between them. He was satisfied that safeguarding would not raise prices against the consumer, as standing expenses would be spread over a larger output, and so reduce costs of production. The report was adopted.

South American Progress.

COMPANIA HISPANO AMERICANA DE ELECTRICIDAD S.A., BARCELONA (C.H.A.D.E.).—At the meeting on May 28, Señor Don Juan Ventesa, vice president, said the increase in consumption of electricity in the city of Buenos Aires and the favourable development of the province of the same name induced the board some time ago to endeavour to concentrate in this zone the activities of the various undertakings controlled by the company. In 1923 and 1924 they purchased the businesses of the concerns supplying electricity to the districts of General Sarmiento, Moreno, and La Plata. Later they took over the business of the Magdalena district, and finally, in 1929, attained direct control of the production and supply of power in Buenos Aires and in a zone of 100 km. around the Federal capital. Besides acquiring the power companies of General Rodriguez, Las Heras, Pilar, Coronel Brandzen, San Vicente, Canuelas, Echeverria, Marcos Paz, and Escobar, they had obtained control of the Compania de Electricidad de la Provincia de Buenos Aires. During the past year they also acquired an interest in the Primitiva Gas Co. of Buenos Aires. The increase in the consumption of power produced by the power stations of Buenos Aires had been 15·2%. The total current consumed had reached 625 559 198 kW. During the months of 1930 that had already passed the increase in consumption had been maintained at a higher level (17%). As announced in October, the directors decided to purchase immediately a new turbine of 52 500 kW, which would be installed in the super-power station of Buenos Aires. The balance of net profits available for distribution was 52 718 514 gold pesetas, against 50 884 560 pesetas, equivalent to 42 993 752 gold pesetas, for last year. This enabled the board to propose the payment of a total dividend of 17% gold, free of Spanish taxes, against 15% gold last year.

EVER READY CO. (GREAT BRITAIN), LTD.—Mr. Magnus Goodfellow, presiding at the meeting on June 2, said the sales for the past year showed an increase of 22½% over those for the previous year, and the increase in profit, £34 388, would have been at least proportionate to the increase in sales but for the fall in the values of materials and commodities during February and March, which necessitated their writing down stocks to the lower market values, but they had been enabled to effect reductions in price to the consumer of a number of their productions which would, he thought, still further stimulate the popularity and sale of their products. The reserves had been increased by £30 000. The balance on profit and loss account to be carried forward after payment of the dividend amounted to £34 000—roughly £3 300 more than it was a year ago. The increase of approximately £10 000 in the item "subsidiary companies" was due to the acquisition of a controlling interest in the capital of two small companies. It would be seen from the directors' report that no subsidiary company had made a loss. Every subsidiary company had made a profit, and the aggregate of profits exceeded the dividends they had received from these companies during the year. It appeared to be generally accepted that the present world-wide trade depression might continue during the coming year and might even grow worse than at present. The cause of the depression appeared to be excessive production and lower consumption, due to the fall in spending power in a number of countries. The report was adopted and final dividends of 5% on the preference shares (making 10% for the year) and 25% on the ordinary shares (making 35% for the year) were declared. At an extraordinary meeting which followed, resolutions were passed authorising the increase of the capital to £1 000 000 by the creation of 1 000 000 ordinary shares of 5s. each to rank *pari passu* with the existing ordinary shares.

LANCASHIRE ELECTRIC LIGHT AND POWER CO., LTD.—Mr. Alfred Shepherd, presiding at the meeting on June 2, said the trading profits of the parliamentary company, which was generally referred to as the power company and from which the Lancashire Electric Light and Power Co. derived practically the whole of its revenue, showed an increase of nearly £20 000 over those of the previous year, and, after deducting amounts for income tax and depreciation, there was a net balance of £201 357. This sum had been paid to the Lancashire Electric Light and Power Co. by way of dividends and interest, and, with the management fee, enabled the board to bring into the profit and loss account £209 892, an increase of approximately £22 000. Referring to the developments in the Power company's business, the principal event of the year had been the bringing into commission of the Kearsley station in October. During the year the units delivered to feeders were from Radcliffe 103 742 000, from Padiham 67 325 000, and from Kearsley 27 308 000, and 54 221 887 were purchased in bulk. The generating plant in the three stations had a maximum continuous rating of 162 000 kW. Units sold were 226 618 000, against 206 608 000, an increase of 9·7%, and the average price per unit sold was 0·655d., against 0·677d. Mains were being laid this year to deal with a large area between Preston and Chorley. The Commissioners had approved their application for a Special Order covering the districts round about Ormskirk. As regards the revenue account of the Lancashire Electric Light and Power Co., there was a balance, after payment of directors' fees, management expenses, and debenture interest, of £173 108, compared with £150 885. After payment of preference fixed dividends there was a balance of £90 605. It was proposed to pay a dividend at the rate of 7%, less income tax, on the ordinary shares, and to carry forward £3 805, against £3 308 brought in. The report was adopted and the dividends were approved.

Accumulators and The Grid.

CHLORIDE ELECTRICAL STORAGE CO., LTD.—At the meeting on May 30, Mr. W. S. Naylor, chairman, said they were in the gratifying position of being able to report a continuance of development and prosperity, and that, as a consequence of additional business, the profits for the year showed a satisfactory increase. They had the largest storage battery factory in the British Empire. They had sales depots in London, Bristol, Birmingham, Manchester, Glasgow, Dublin, and Belfast. These supplied the requirements of the trade and that large organisation of 500 to 600 Exide service agents, whose distinguishing "Exide" sign could be seen in all parts of the United Kingdom. They were also obtaining important business in the highly protected Continental countries. The "Keepalite" system, which they had designed and patented, automatically switched on emergency lamps if for any reason the regular lighting was interrupted. It was already in use in hospitals all over the country. In the cinema the "Keepalite" system ensured light in an emergency, and by so doing might avert a panic. Their principal raw materials were lead and oxides of lead, and there was the ever-present danger of lead poisoning to the workpeople. In the past the accumulator industry had figured far too prominently in the Home Office records of cases of lead poisoning. Some three years ago the directors decided to appoint a fully qualified doctor to devote his whole time to the study of the problem and take charge of its prevention in their works. The appointment, made in the autumn of 1927, had met with such gratifying success that they had had no case of lead poisoning during the years 1928, 1929, and so far in 1930. A resolution which was to be shortly submitted dealing with the disposal of profit referred to an appropriation of £11 500 for the benefit of employees. He was sure this item would receive hearty approval. In recent times it looked as if the stationary battery business were doomed by reason of the spread of the use of alternating current, and the proposed electrical transmission to every remote village. This development, by the complicated nature of its arrangement and the newness of the engineering problems involved, introduced new risks of interruption of the supply, and it was obvious that they opened out a new field for the standby or emergency battery on the premises of the user of electricity. They were proposing to double their ordinary capital by the issue of a 100% share bonus. The report and accounts were unanimously adopted.

Receivership.

LEADING LIGHT SYNDICATE, LTD. W. B. Hall, C.A., of National Provincial Chambers, Silver Street, Hull, was appointed Receiver on May 23, 1930, under powers contained in debenture dated June 22, 1923.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

ALPHA MANUFACTURING AND ELECTRICAL CO., LTD., London, S.W. Registered May 13, mortgage to Bank; charged on 26, High Road, Balham, etc. *£1 000. July 30, 1929.

FOSTER (W. D.) AND CO., LTD., London, N.W., manufacturers of magnetos, etc. Registered May 13, £1 600 deb. to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; charged on land in London, also general charge.

NEWFIELDS, LTD., London, S.E., radio engineers. Registered April 16, £1 000 debentures; general charge.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

COCHRANE, S. K. Y., trading as POPULAR WIRELESS STORES, 26, Moorfields, Liverpool, and 267A, Wallasey Village, Wallasey. A meeting of the creditors was held on May 27, at the offices of Mr. Parkin S. Booth, accountant and auditor, Exchange Chambers, Bixteth Street, Liverpool. The statement of affairs showed liabilities of £227. The assets comprised stock £150, estimated to realise £70; and fixtures, etc. £70, valued at £35; making a total of £105, which was the amount of the preferential claims. Mr. Booth reported that the debtor commenced business in April, 1929, when he purchased the stock and fixtures at No. 26, Moorfields, from the trustee of the estate. The money was advanced by friends. The turnover at Moorfields had averaged £33 a week, whilst the expenses included £180 rent and £105 rates a year. Last November, the debtor opened a further business at Wallasey. Mr. Booth added that it was obvious that the business had not been carried on at a profit owing to the heavy overhead expenses. A resolution was passed confirming the deed of assignment already executed to Mr. Booth, and the debtor was requested to obtain the assistance of friends with a view to making an offer of at least 2s. in the £.

A. AND C. EDELMAN, LTD.—Cap., £400. Electrical suppliers, engineers and lighting and heating contractors, etc. Reg. Office: 76, Stockwell Street, Glasgow.

HEADLEY AND EDWARDS (CAMBRIDGE), LTD.—Cap., £10 000. Ironfounders, electrical engineers, etc. Reg. Office: 11 and 12, Corn Exchange Street, Cambridge.

PRECISION TOOL AND INSTRUMENT CO., LTD.—Cap., £3 000. Electrical consulting and scientific engineers, etc. Reg. Office: 72, Newington Butts, London, S.E.11.

SILVEX SIGNS, LTD.—Cap., £2 000. Manufacturers of, and dealers in, apparatus for publicity, electricians, etc. A director: R. Pulford, 4, Pattison Road, Finchley Road, London, N.W.

THOMAS A. ROSE AND SON, LTD.—Cap., £3 000. To acquire business of electrical engineer and dealer in electrical novelties now carried on by T. A. Rose at 25, Milton Street, London, E.C.

STROMBO ELECTRIC CO., LTD.—Cap., £500. Manufacturers of, and dealers in, electric lighting apparatus, wireless apparatus, etc. Reg. Office: 8, Compton Passage, Clerkenwell, London, E.C.

TONEX, LTD.—Cap., £500. Factors, vendors and manufacturers of, and dealers in, electrical instruments, apparatus, machines, accessories and goods, etc. Reg. Office: Walmer House, Regent Street, London, W.1.

SPENCER RADIO, LTD.—Cap., £2 000. **To acquire from K. S. S. Spencer working models of mechanical and scientific inventions appertaining to wireless receiving sets, etc. Reg. Office: 136 to 142, Clerkenwell Road, London, E.C.**

NORTHAMPTON RADIO, LTD.—Cap., £100. Importers, exporters and manufacturers of, and dealers in, electrical and wireless goods, electric light and electrical engineering tools, etc. Reg. Office: 28, St. Giles' Street, Northampton.

LONDON DISPLAY GUILD, LTD.—Cap., £400. Manufacturers and factors of shop window display fitments, advertising signs, electric lamps and fittings, electrical engineers, etc. Reg. Office: 7, Juxon Street, Lambeth Walk, London, S.E.11.

MUTTER, SANDERS AND CO., LTD.—Cap., £1 500. To acquire business of electrical and mechanical engineers, etc., heretofore carried on by T. D. Mutter and C. E. Sanders at Royal Stuart Works, East Canal Side, Cardiff, as "Mutter, Sanders and Co."

ZENITH AUTO ELECTRICAL SERVICES, LTD.—Cap., £300. To acquire the business of Leonard A. Wicks Davis, trading as Zenith Auto Electrical Services, of 31A, St. Jude Street, Dalston, London, N. 16, and to carry on business of electrical and motor engineers, etc.

RADIO BY-WIRE (BEVERLEY), LTD.—Cap., £2 000. To construct, work and maintain wireless signal and receiving stations, to carry on the business of electricians, wireless, radio, electrical, and general engineers, etc. Reg. Office: Exchange Court, Bowlalley Lane, Hull.

IBEX MANUFACTURING CO., LTD.—Cap., £500. To acquire goodwill of business carried on by C. E. Stacey and L. G. Floyd, together with trade mark "Ibex," and to carry on the business of manufacturers and importers of and dealers in lamp shades. Reg. Office:—Ibex Works, Radcliffe Road, Winchmore Hill, London, N.

TUBE TURNS, LTD.—Cap., £100. To carry on exploitation of chemical or electro-chemical processes, to acquire interests in patents relating to the production, treatment, storage, application, distribution and use of electricity, electro-chemicals and other electric products, to carry on business of manufacturers of electric and mechanically operated plant, etc. Reg. office: 34, Victoria Street, London, S.W.1.

BARBIERI ORGANS (GREAT BRITAIN), LTD.—Cap., £15 000. To adopt an agreement with D. A. Barbieri, Corvi and Semeraro Societa Accomandita and N. Hall, G. Palmer, J. W. White and F. R. Ward (for the company), and to acquire patents granted to said D. A. Barbieri in the British Empire and the U.S.A., for invention relating to improvements in the manufacture of electrically controlled organs and piano players, etc. Reg. Office: 14, Queen Victoria Street, London, E.C.4.

W. E. CHAPPELL, LTD.—Cap., £1 000. To acquire business of dealer in electrical and wireless equipment and accessories carried on by W. E. Chappell at 160 and 167, Young Street, Sheffield.

POWER CONTRACTS (BATWIN), LTD.—Cap., £10 000. To acquire undertaking, or part thereof, of Power Contracts, Ltd., to carry on business of electricians, electrical and mechanical engineers, importers and suppliers of electric motors, dynamos, etc. Reg. Office: 138, Southwark Street, London, S.E.1.

THE LEAD MARKET.

A quiet tone prevailed in the market last week, and, according to James Forster and Co., though the opening was a little firmer, prices have since eased and closed a little lower on the week. Closing prices on May 20 were: £17 16s 3d. for June, £17 18s. 9d. for July, £18 for August and £18 1s. 3d. for September, about 2s. 6d. per ton lower on the week.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

WAC.—509 729. Class 8. Battery charging apparatus. Charles Edgar Dansie, 90, Berners Street, Ipswich, Suffolk; merchant. January 23, 1930.

SUMMIT.—511 600. Class 18. Electric fires. H. Frost and Co., Ltd., 35, Fieldgate, Walsall; manufacturers. March 28, 1930. (By consent.)

HELECO.—501 440. Class 8. High tension batteries, dry batteries, aerials, low frequency transformers, variable condensers, and high frequency chokes, all being apparatus for use in wireless telephony and telegraphy. Michael James Wass, trading as Heleco Radio Co., 19–20, High Street, Shoreditch, London, E.1; manufacturer.—April 3, 1929.

AEROFICIENT.—505692. Class 8. Wireless telephonic and telegraphic instruments and parts thereof. Graham Farish, Ltd., 153, Mason's Hill, Bromley, Kent; manufacturers.—August 30, 1929. To be associated with No. 500 220 (2 663) and another.

ELECTROFICIENT.—505693. Class 8. Wireless telephonic and telegraphic instruments and parts thereof. Graham Farish, Ltd., 153, Mason's Hill, Bromley, Kent; manufacturers.—August 30, 1929. To be associated with No. 500 220 (2 663) and another.

LYRIC.—508 868. Class 8. Radio and television receiving sets and component parts thereof, namely—loud speakers and fixed and variable condensers. All-American Mohawk Corporation, 4 201, Belmont Avenue, Chicago; manufacturers.—December 17, 1929. (By Consent.)

VOICE OF THE AIR.—508 892. Class 8. Sound amplifying apparatus and parts thereof, amplifying and rectifying tubes or valves, wireless telephonic apparatus and parts thereof, phonograph records and wireless telephonic apparatus in combination with phonographs. Grigsby-Grunow Co., 5 801, Dickins Avenue, Chicago; manufacturers and dealers in radio, phonographs and accessories.—December 17, 1929.

AGILE. 510 324.—Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Otto Simonis, 16, Upper Hamilton Terrace, St. John's Wood, London, N.W.8; engineer. —February 12, 1930. To be associated with No. 510 325 (2722) xiii.

STERNET.—511 247. Class 8. Wireless telephonic apparatus, gramophones and parts thereof and gramophone records. The British Homophone Co., Ltd., 67–69, City Road, London, E.C.1; manufacturers.—March 18, 1930. To be associated with No. 506 570 (not yet advertised).

LISSEN.—512 103. Class 8. Electrical accumulators and batteries, not for medical purposes. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth, Middlesex: manufacturers.—April 15, 1930. To be associated with No. 493 682 (2 651) and others.

PILOT (sign).—511 281. Class 8. Batteries for use in small flash lamps. William Twist and Sons, 19 to 27, Market Street, St. Helens, Lancashire; merchants.—March 19, 1930.

METAL AND CHEMICAL PRICES.

TUESDAY, June 3.

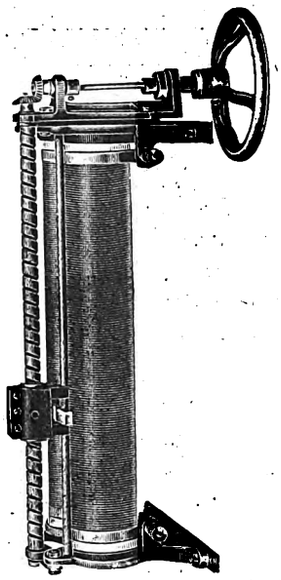
ZENITH

REGISTERED TRADE MARK

REGULATING RESISTANCES



Back of Board Type for Field Regulation, etc.

Simple construction

Ample rating

All mechanical parts entirely insulated

Reliable and easy to fix

Enable extremely fine regulation to be obtained

Single and Double Tubular types are manufactured in 10 sizes

Front of Board Indicators showing position of slider at any point can be supplied

Wherever Resistances of any type are required, always insist on ZENITH productions

—IT WILL PAY YOU

CATALOGUE OF ALL TYPES POST FREE

THE ZENITH ELECTRIC CO. LTD.

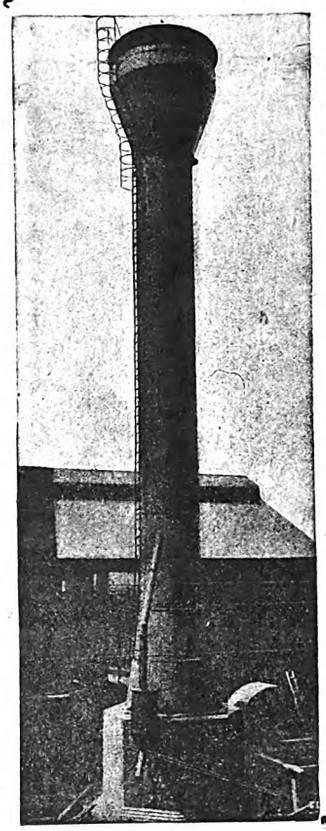
Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to the Admiralty, War Office, Air Ministry, G.P.O., L.C.C., &c.

ZENITH WORKS, Villiers Road, Willesden Green, LONDON, N.W.2

PARKER'S PATENT

"CENTRIFLOVANE" GRIT CATCHER



Automatic in its action.

Best scientific principles incorporated in design.

Durability and Efficiency combined.

No working parts.

No water used.

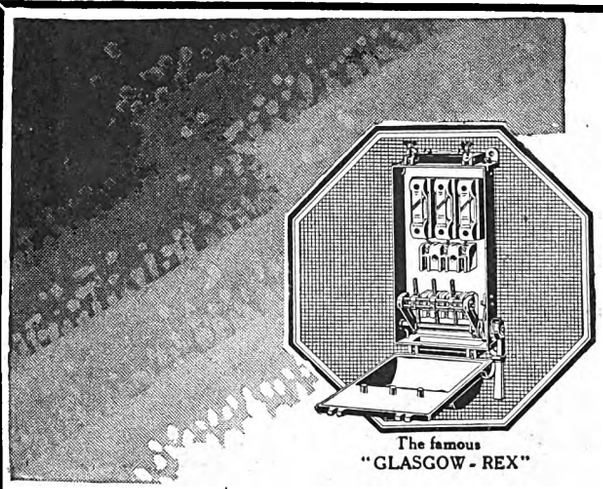
Is working satisfactorily on chain grate stoker and pulverised fuel plants.

Electricity and Gas Works have ordered over 200.

TIPTON TUB & TUBE CO., LTD.

TIPTON, STAFFS. ENGLAND

Phone: Tipton 11.



The famous "GLASGOW-REX"

The M.E.M. "Glasgow" was the first switch to be sold at commercial prices to comply with the exacting demands of the City of Glasgow.

The new "Glasgow-Rex" pattern embodies every recent improvement.

There is no better switch for important installations.

Send for List No. 155.

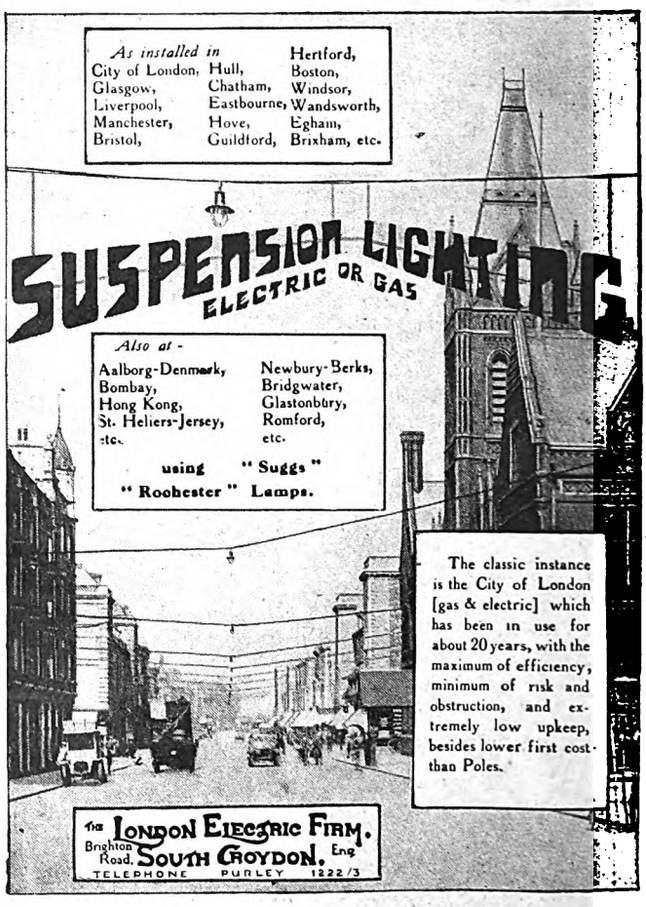
MIDLAND ELECTRIC MFG. CO. LIMITED,

BARFORD ST., BIRMINGHAM.

—And all Electrical Wholesalers—

As installed in

City of London, Glasgow, Liverpool, Manchester, Bristol, Hull, Chatham, Eastbourne, Hove, Guildford, Hertford, Boston, Windsor, Wandsworth, Egham, Brixham, etc.



Also at -

Aalborg-Denmark, Bombay, Hong Kong, St. Heliers-Jersey, etc. Newbury-Berks, Bridgwater, Glastonbury, Romford, etc.

using "Suggs" "Roohester" Lamps.

The classic instance is the City of London [gas & electric] which has been in use for about 20 years, with the maximum of efficiency, minimum of risk and obstruction, and extremely low upkeep, besides lower first cost than Poles.

An Eye to the Future.

FOR any kind of public utility undertaking which sells its service to householders, the task of forcing the initial entry into the consumers' premises is very much more than half the battle. Persuade Mr. and Mrs. Everyman to allow a lighting cable or a telephone circuit to pierce the wall of their dwelling and you have not only secured a customer but, in most cases, a customer whose quarterly payments will tend to rise (subject to seasonal variations) slowly but inexorably. Efforts at economising will be made, but few there will be who can maintain the unequal struggle for very long. The increased bill is paid with grumbles, sometimes after an acrimonious argument between the treasurer and the manager of the home. Threats are uttered to have the service cut off if the bills continue to mount up, but they are seldom carried out. More often some new current consuming appliance is added, either because the domestic labour situation is acting as a powerful form of propaganda for house service mechanism, or because of the deadly struggle to "keep up with the Jones's," which keeps Mr. Brown's and Mr. Robinson's hands forever dipping into their pockets.

This is a very pleasant state of affairs for electricity and gas undertakings, and also for the Post Office. For, unlike most manufacturers, who find that it costs more to sell goods than to make them and that it is necessary to beat the drum loudly and at heavy expense in order to keep their wares prominently before the public, the utility services benefit from a gradual increase of income which is independent of any efforts of their own. The result has been a disinclination to look ahead and to take risks which would seem to be gambling on certainty to the average business man. This is an almost inevitable consequence of the possession of a monopoly. In the circumstances which have hitherto prevailed and will continue to exist for some time to come, more than ordinary vision and courage are required to ensure the pursuit of an aggressive policy which involves the use of part of a sure and apparently certain income that is increasing by a steady annual percentage, in order to secure future advantages that appear in the slightest degree problematical.

Those undertakings which have recognised the importance of doing something more than wait for the unearned annual increment to fall into their laps are the more deserving of commendation in that they are often the most sure of continuous growth with little present effort on their part. It is not merely a matter of contributing on the appropriate scale to E.D.A. and supporting the Research Association. Individualist action to build up an efficient sales department, equipped with up-to-date showrooms and the initiation or extension of assisted wiring schemes are even more necessary now that future progress in the attraction of fresh consumers must depend very largely on the success with which people of small means can be induced to take a supply of electricity. In the case of new dwellings builders, eager to add to the saleability of their houses, are giving electric supply undertakings a large amount of gratuitous assistance. There remains a much larger reservoir of older houses, for the most part lighted by gas or oil, which is open to attack. Even so, the reservoir is not limitless, and with the population tending to become stationary—a condition that is likely to be reached in ten, fifteen or twenty years—it is advisable to look ahead to the time when all possible consumers will have been connected. Further development will then depend on a cheapening of both current and appliances, which will encourage those who begin by using electric light to add irons, vacuum cleaners, fires, cookers, water heaters and washing machines to their electrical equipment. The supply industry will then be compelled to adopt a much more vigorous publicity and sales policy than general to-day and those undertakings which make thorough preparations for the new conditions well in advance of their arrival, will reap the reward of the wise virgins.

Current Topics.

Hiding their Light.

THE Postmaster-General, Mr. H. B. LEES SMITH, in the course of his outline of the overseas and Imperial services carried on by the Post Office, at the first technical session of the Imperial Press Conference last week, remarked that "it was an example of the exceeding modesty of this country in general and the British Post Office in particular, and its aversion from self-advertisement, that there was very little knowledge of the fact that the country possessed at Rugby the largest and most powerful wireless station in the world." Mr. LEES SMITH might well have omitted the word "self" for the commercial side of the Post Office does very little to advertise what it has to offer in the way of communication facilities. It might well take to heart the wisdom contained in a few lines of doggerel which we saw in an American newspaper some years ago:

"The man who whispers down a well
About the goods he has to sell
Won't swell his bank account with dollars
Like he who climbs a tree and hollers."

Newspaper Possibilities.

SIR BASIL BLACKETT, who followed Mr. LEES SMITH, characterised the attempt to separate overseas telegraph and telephone services as "entirely irrational and economically and scientifically wasteful," a view with which we have previously expressed agreement. The chairman of the I. and I.C. Co. foreshadowed a reduction of cable rates to the same level as wireless telegraphy rates as soon as negotiations now in progress with India, Australia and South Africa for amalgamating cables and wireless in those countries had been completed. He also made an interesting reference to facsimile transmissions, and said that a whole page of "The Times" had been experimentally transmitted across the Atlantic in half an hour; full-page American newspaper advertisements had also been transmitted commercially for publication in European newspapers simultaneously with their appearance in America. Developments in this direction may radically affect the technique of newspaper production in the near future, especially in the case of newspapers which publish editions in several different cities.

Space and Time.

ACCORDING to Dr. E. F. ALEXANDERSON, consulting engineer to the General Electric Co. of America, television combined with wireless will one day enable an unoccupied bombing aeroplane to be safely steered until it is right on the top of its target. There is nothing new in this idea, for visionaries have for a long time pictured such events, but Dr. ALEXANDERSON'S other prophecy is noteworthy. He suggests that theatre audiences will be enabled to see and hear "news" as it is happening, by the simple expedient of having a corps of reporters equipped with aeroplanes, wireless and television. Certainly there is nothing impossible about these forecasts for though the progress of television may be slow, it will also be sure. Dr. ALEXANDERSON himself is now using a screen 6 feet square in place of the 14 in. screen which he employed last autumn. One wonders sometimes where the ultimate limits of electrical achievements lie. Distances are continually becoming shorter, and one day, perhaps, they will be almost annihilated—from Mankind's relative viewpoint. As a direct consequence more and more time is being saved. Sooner or later there may appear a super-civilised being who never needs to leave his home—his world-wide business will be transacted and his amusements will be supplied at the domestic hearth. Or will human nature recoil from the prospect and deliberately reject a line of development which could only lead to structural modifications that might eventually transform him into a creature resembling the Martians as imagined by H. G. WELLS?

Electric Incubators.

PARTICULARS are given in "Electrical News and Engineering" of the results of operating six electric incubators each of 15 000 eggs capacity on a poultry farm in Ontario. The electric incubators are said to give no trouble and to produce large, vigorous and fluffy chicks with an average hatch of 80 per cent. The cost of operation is given as about $9.00 (£1 17s. 2d) a month for each incubator. Heat is supplied by four coil elements, each with its own thermostat control. Air and moisture are distributed by a four-bladed reel rotating slowly round the egg drum and driven by a $\frac{1}{4}$ H.P. motor with a loading of 500 W. Current consumption is 15 to 20 units per 24 hours for each incubator. A ten hour stoppage of current has been experienced without serious effect. Electric brooders for 50 to 1 000 chicks are also giving satisfaction.

Muscle Shoals.

A BILL has now been approved by the American House of Representatives Committee on Military Affairs dealing with the future of the great Muscle Shoals power development. This bill rejects the idea of government ownership and provides for private leasing though, in order to satisfy those who fear "power trusts," power companies are not to be permitted to bid. It empowers the President to appoint a board of three, one of whom is to be identified with agriculture, which is to appraise the property and then lease it on the best terms obtainable for fertilisers, ferro-alloys, and other electro-chemical production. Whether this Bill will be passed, and if so, whether it will lead to definite exploitation of the plant, remains to be seen, but a certain amount of scepticism is permissible in view of the past history of the enterprise.

Large Storage Dams in Brazil.

SOME large water storage works are in hand in Southern Brazil in connection with the Brazilian Traction, Light and Power Company's installations. There are now in the Serra reservoirs 150 000 000 kWh reserve storage capacity, and the completion of the Rio Grande reservoir, as planned, in the next two or three years, will provide a further 1 500 000 000 kWh of reserve storage. In addition to the two generating units of 40 000 H.P. each at the Serra (São Paulo) development, a third of 60 000 H.P. is on order and should be in service early in 1932. A third 40 000 H.P. unit was ready for service at the end of last year at Ilha dos Pombos (Parahyba development—Rio de Janeiro). Operation of the 132 kV transmission line to Cascadura was begun early in February last. Transmission line circuits were increased by 143 miles in 1929. Including the business of the City of Santos Improvements Company there was an increase in the sale of current of 95 121 385 kWh, or 13 per cent., over the sales in 1928.

WITH THE I.E.E. IN IRELAND.

Memorable Summer Meeting—Superb Weather—Excellent Organisation by the Irish Centre and Well Planned Tours—The Shannon at Work.

(By THE EDITOR.)

SMILED upon by weather that put into the shade even the glorious three days with which the I.M.E.A. Convention at Eastbourne was favoured, the summer meeting of the I.E.E. in Ireland last week will long be remembered by those who had the good fortune to take part in it. We left London on the Monday morning in gloomy conditions and with none too optimistic expectations as to climatic conditions in the other island. But by the time the train reached the coast in North Wales the sun was beginning to disperse the mists and the "Cambria" left Holyhead in bright sunshine for a millpond crossing to Dun Laoghaire—better known on this side of the Irish Sea as Kingstown. Very efficient transport arrangements for people and baggage had been made by the committee of the Irish Centre, and throughout the tours of the succeeding days the smooth working of the programme, coupled with the wonderful sunshine and soft air, added very greatly to the enjoyment of the party.

On the Monday evening there was an informal gathering at the Gresham to allow us to get together and to meet the members of the Irish Centre. Tuesday began with a reception at the Mansion House by the City Commissioners of Dublin. The chairman, Mr. Seamus Murphy, who was supported by Mr. Hernon, welcomed the party, specially mentioning the President, Col. Sir Thomas Purves, whose achievements as chief engineer of the British Post Office he described as sometimes seeming to border on the miraculous. He had heard of nothing more striking and more indicative of recent progress than the joint meeting of the British Institution and the American Institution through the medium of the Atlantic telephone. He looked forward to the Irish chairman, Mr. Monaghan, emulating Sir Thomas's achievements in the Irish Free State. Mr. Murphy said that he also wished to welcome in a special way Sir Archibald Page, who, on his visit as President of the Institution, endeared himself to all who met him. Dublin had also had the honour of visits in recent times from Col. Edgcumbe and the great de Ferranti, whose death they deplored as a personal loss. He also extended a special word of welcome to Mr. Rowell, the Secretary of the Institution.

Mr. Murphy pointed out that Dublin was well in the forefront in the matter of electrical supply. It was the first city in the world to instal the system of generation and distribution which had now become the standard for the whole world. This was done on the advice of a former Treasurer of the Institution, Mr. Robert Hammond. The Dublin electricity supply had been a great credit and asset to the city under the management of the past chairman of the Irish Centre, Mr. L. J. Kettle. It had now become merged in the national scheme, and he was glad to say that the work done in Dublin would contribute very substantially to the success of that scheme. In Ireland they had not yet achieved electrification on any large scale, but now that the national scheme was spreading its network all over the country they looked forward to great things in the future. He was sure that Sir Archibald Page, who had so many difficult problems to deal with, must envy them the simplicity of their problem, and the degree of electrical unification which had been so easily secured. After expressing the hope that we should enjoy every moment of our stay—a hope that was abundantly fulfilled—Mr. Murphy asked the President to convey Dublin's greetings and good wishes to the Lord Mayor and City of Belfast.

Sir Thomas Purves's Silver Tongue

Sir Thomas Purves, who has the great gift of always being able to say the right thing in the right way, in a silver-tongued speech which delighted all who heard it, said that we had not expected that we should receive the signal honour of a civic welcome. We looked forward with keen anticipation to our visit to the hydro-electric scheme on the Shannon, which was a remarkable example of progressive enterprise, and also anticipated with keen pleasure renewing acquaintance with the beauty and glory of Ireland in early June. After a happily phrased reference to the deep affection for their motherland felt by Irishmen who had penetrated throughout the world, Sir Thomas Purves said that if this visit could do anything, however small, to increase and cement the friendship between these little islands between the Atlantic and the North Sea all the other results of the visit would be relegated to the background.

Then followed a drive, to which no adjectives could do justice, through the southern suburbs of Dublin to beautiful Wicklow mountains, flaming in old gold with gorse and broom. The outward route lay past the Sugar Loaf mountain and the Roundwood reservoir, which supplies Dublin with water, to the fairyland of Glendalough. On the way a number of overhead h.t. transmission and l.t. distribution routes were to be seen, giving quite a Continental or American appearance to the otherwise very English looking countryside. After lunch at Glendalough the party was conducted round the antiquities of the "City of the Seven Churches," whose existence as an ecclesiastical centre terminated more than five centuries ago. Mr. E. M. Stevens proved a charming guide, and his short but entirely adequate talks brought the dead past of this lovely glen vividly before us. We returned to Dublin by a different route, following the Avonmore river seawards for a time and passing the outskirts of Bray.

Tuesday ended with a reception and dance at the Gresham Hotel, and although the temperature was a trifle elevated, nearly everyone seemed to be taking part in the dances.

Mr. L. J. Kettle and Mr. P. F. Rowell at Glendalough.

Motor coaches took us to Kingsbridge station early on Wednesday. We left at 9 o'clock by special train for Limerick, passing Kildare, Maryborough and Thurles on the way, with glimpses of the great peat bogs of the central plain. The hedgerows were white rows of hawthorn blossom, and the distant mountains on the horizon formed a hazy background to the small towns and pastures of a lush countryside that was at the height of its early summer glory. It was Derby Day, and the occasion could not be allowed to pass without a sweepstake. The Irish halfcrown has a horse on the obverse, so that coin naturally became the basis of the sweep. Another fleet of motor coaches took us from Limerick to Ardnacrusha, where we sat down to lunch, as the guests of the Irish Free State Electricity Supply Board, in the imposing turbine hall of the great hydro-electric station that is now supplying light and power to the greater part of Southern Ireland. Dr. T. A. McLaughlin, managing director of the Electricity Supply Board, to whose efforts the inception and realisation of this impressive undertaking are mainly due, sat down with Sir Thomas and Lady Purves. He said half a sentence of welcome, but the generator was constitutionally "agin" public speaking and he gave up the attempt with a gesture. Sir Thomas Purves, by making a megaphone of his hands, succeeded in shouting "Thanks" loudly enough to be heard, and that ended two of the shortest speeches on record.

We were then taken through the power house, with its three Francis type turbines of 30 000 H.P. each, and inspected the gigantic penstocks, dam and the canal locks, which raise or lower barges in two lifts of 50 ft. each between the head and tail races. At the foot of the dam millions of tiny

(*Continued on page* 756.)

Digitized by Google

Digitized by Google

Digitized by Google

elvers were endeavouring to climb the footwall, where a small trickle of water was pouring down from the dam face.

Another journey of seven or eight miles by motor coach brought us to within walking distance of the weir at the upper end of the head race. This head race resembles a ship canal in width and depth. At the weir there is a fish pass, which is said to have proved quite successful, but as it is not the season for salmon to run, we were unable to confirm this statement by observation. Some technical details of the Shannon undertaking and the transmission and distribution systems must be reserved for a subsequent issue.

There was tea at Limerick, where great demonstrations of affection between some of the party and the hotel proprietor and his wife were witnessed. Then we rejoined our special train and travelled back to Dublin, having dinner on the way. So ended a most enjoyable and interesting experience.

For Thursday morning alternative arrangements had been made. The majority elected to visit the Guinness brewery, where they were royally entertained to lunch by the company. A smaller contingent, whose thirst for technical information outweighed the temptations of the rival attraction, inspected the Dublin sub-station of the Shannon transmission system at Inchicore, where the 110 kV line from Limerick and several 38 kV secondary lines terminate. Returning to Dublin, we were taken through Phœnix Park before visiting the new Fleet Street station, where Metropolitan Vickers isolating switches and panels and British Thomson-Houston transformers and tappings are installed in contrast to the completely German equipment at Ardnacrusha and Inchicore. After lunch at the Gresham Hotel the smaller party rejoined the "stout" contingent, and then left by special train for Belfast. Two of us, to our great regret, had to return direct from Dublin to London that evening, and were consequently unable to visit Northern Ireland.

G. H. L.

* * *

The concluding part of the meeting began with a reception, dinner and dance at the Grand Hotel, Belfast, where the visitors were the guests of the Irish branches of the electrical manufacturing companies. On Friday morning the programme began with a tour of the harbour on the s.s. "Musgrave." Two groups were then formed, one of which inspected the harbour power station and the Harland and Wolff shipyard, while the other remained on the steamer for a trip down the Lough. In the afternoon one group visited the York Street mills, and a second party went to the Sirocco engineering works of Davidson and Co., Ltd., where ventilating plant is made, the visitors being given tea by the two companies. A third group enjoyed a motor coach excursion through Antrim and Ballymena to Glenariffe and back by the coast road, taking tea at Larne.

The meeting ended with a reception by the Lord Mayor, Councillor Sir William Frederick Coates, Bt., at the City Hall, followed by dancing. During the dance Sir Thomas Purves presented pieces of plate to Mrs Monaghan, Mrs. Whysall and Mrs. Eaton, and took the opportunity of conveying the message from the City Commissioners of Dublin. This was warmly reciprocated by the Lord Mayor of Belfast.

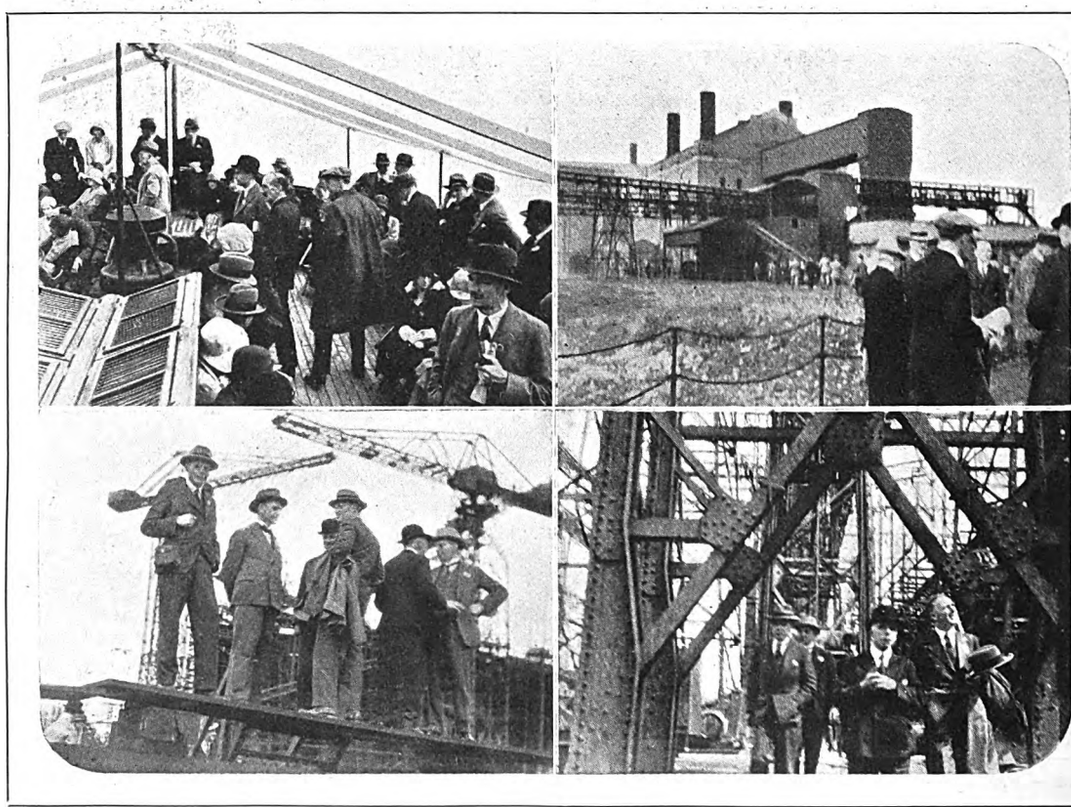
* * *

A correspondent who accompanied the visitors to Belfast writes:—

"The railway to Belfast traverses more varied scenery than the line from Dublin to Limerick—pastoral country alternated with glimpses of coastal towns, such as Drogheda at the mouth of the Boyne. A pleasant surprise awaited us at the terminus, where about 40 private motor cars were waiting to take the party for a drive round the shores of Belfast Lough, before leaving us at our hotels. In the evening, with Mr. A. E. McConnell occupying the chair, the President made another of his inimitable speeches in response to the toast of "The Institution and Visitors," proposed by the chairman. Mr. Monaghan also replied with a good speech. Sir Archibald Page, who described himself as an "extinct volcano," being a past-president, in a witty speech, returned the thanks of the gathering. During the dinner, a charming feminine incursion took place in the form of a group of Irish girls, in the national costume, bearing a present of Belfast linen handkerchiefs for each lady.

"Friday was cooler, and not so sunny, but formed rather a welcome change from the brilliance of the previous days. The Harland and Wolff yards seemed fully occupied with ships of many varieties and sizes, and we were shown the construction of vessels ranging from ships' lifeboats to the new 35 000 motorship, the largest yet begun, of which the keel plate has been laid. The York Street mills were a telling example of Belfast enterprise. The success of this undertaking, the largest of its kind in the world, is obviously due to the employment of constantly improved methods of preparing, spinning and weaving the yarn, most of the machinery being the product of Belfast designers and manufacturers."

By the courtesy of the Dublin United Tramways Co., Ltd., all those taking part in the meeting were carried free of charge on all the trams of the company's system while staying in the capital, and this privilege was very much appreciated.



IN NORTHERN IRELAND.

On board the s.s. "Musgrave," cruising in Belfast Harbour.

VARIETIES AND USES OF MICA—II.

Hand-built and Tower-built Micanite—A New Synthetic Bond—Flexible Micanite—Mica Fabrics—Mica Tubes—A New Vitreous Product.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

THE first part of this article reviewed the different varieties of mica used for insulation, their properties and applications, chiefly with regard to the material in its block form and in splittings. With regard to some brief historical notes given in the introduction, it may be of interest to quote some particulars which have since been received from Messrs. Attwater and Sons, of Preston. It is pointed out that as long as thirty years or more ago mica was supplied in large quantities for the early work of the Brush Company, the English Electric Company, the British Westinghouse Company and the British Thomson-Houston Company, the mica referred to being principally Canadian amber mica, imported in cob form or in thumb-trimmed slab, and being split and cut at Preston. The first electric tramcars of London, Manchester, Birmingham, Liverpool and Glasgow and the electric trains of the L. and Y. Railway and the North Eastern Railway had their motors insulated with such mica. It may be noted that in this early work the mica was mainly used bonded to paper with black plastic varnish forming flexible cells and not in the present forms of micafolium and micanite. Soon afterwards large imports of Indian and Madagascar mica were developed and are still maintained. One variety of Madagascar amber mica is stated to have exceptionally good electric strength, tests made recently at works of the English Electric Company giving an average breakdown value of 11 500 V on 0·005 in. thickness and 16 700 V on 0·007 in. thickness.

Passing now to the consideration of mica as used bonded with adhesives, one of the most important applications is that of micanite for the segment insulation between commutator bars and for commutator V rings. This service involves not only electrical stresses but also very severe compression as the copper assembly is clamped up, and developments which have taken place in this work are of great importance.

Bonding with Shellac and Resins.

It was at one time considered essential that the insulation between commutator bars should consist of pure mica, amber block mica being preferred because of its softness allowing the insulation to wear down with the copper. The high prices caused by growing demand, and the necessity for larger sizes, drove electrical machinery manufacturers to seek cheaper alternatives, and, fortunately for the industry, it was found possible to bond mica with shellac to form sheets which could be used as commutator segment insulation. Two difficulties were found—first, the hardness of the material; and, second, a tendency of the mica splittings to creep, causing the insulation to grow above the copper level. The hardness difficulty is overcome by undercutting the insulation to a depth of about $\frac{1}{16}$ in. below the copper surface. The creepage troubles have been overcome by scientific control of process, involving the use of higher baking temperatures.

For many reasons synthetic resins of the phenol-formaldehyde class are not suitable for micanite manufacture, but an important development of distinct merit has recently been made by the use of a new bonder known as glyptal, a complex synthetic resin which is formed by the reaction of glycerol and phthalic anhydride. The commercial development of this resin was carried out by the General Electric Company of America and by the British Thomson-Houston Company in this country. Glyptal resins and varnishes are now manufactured and sold exclusively in this country by Imperial Chemical Industries, Ltd., and glyptanite, a micanite bonded with glyptal resin is made and sold exclusively in this country by the Micanite and Insulators Company, Ltd. Normal glyptal is described as an almost water-white transparent resin which, like bakelite resins, changes from the fusible and soluble state into a relatively infusible and insoluble condition on heating. A temperature of at least 210 deg. C. is required to produce this change. Glyptal resins are not at present offered as a substitute for bakelite resins, partly because they do not mould quickly enough and partly because they do not compete in price. Their use is for purposes for which bakelite is not suitable, and their characteristics are claimed to open up a field of entirely new uses. So far as micanite is concerned, it has properties of particular importance. It is mechanically strong, and adheres to smooth surfaces; it is flexible and does not become brittle at elevated temperatures; it gives an electric strength which is quite as good as that of shellac bonding, and it is equally as good as shellac in not "tracking" under the influence of an electric arc; its abrasiveness and rate of wear are comparable with the corresponding characteristics of copper.

The ordinary process of manufacturing micanite commences with sheets of brown paper, which are laid upon benches and covered with mica splittings bedded in an adhesive, usually varnish applied with a brush.. The plate is built up in successive layers to its prescribed thickness, after which it is placed between metal plates and transferred to steam heated ovens for drying out the solvent. In large scale manufacture the removal of solvent is helped by vacuum pumping, and the solvent is recovered in water-cooled condensers. From the ovens the sheets are transferred to powerful hydraulic presses and pressed at high temperature. Accuracy in thickness, which is very important for commutator insulation, is obtained by passing the pressed sheets between high-speed sand-paper rollers, which are adjustable to fine limits and give sheets consistent to within 2 or 3 mils.

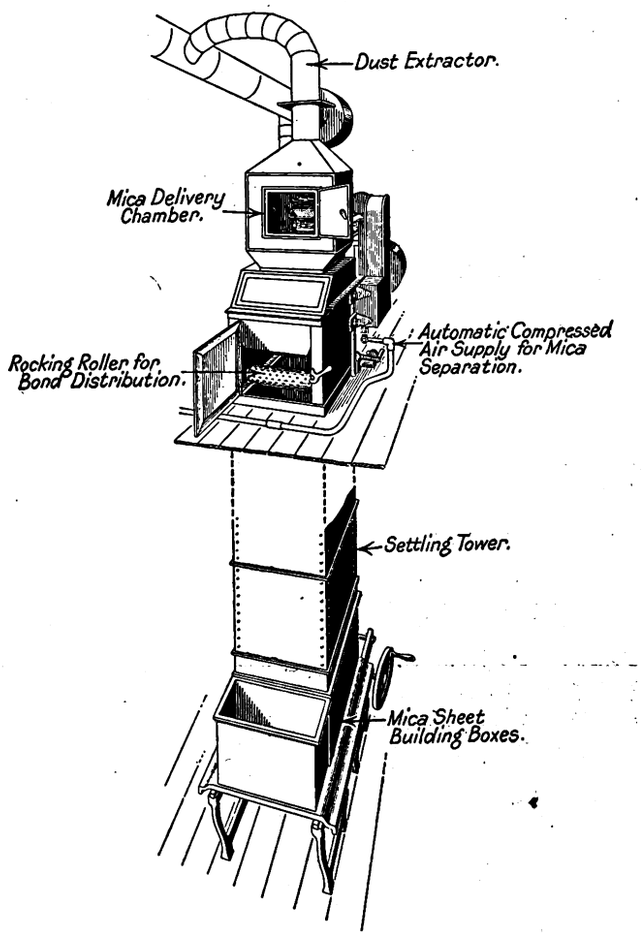

Fig. 6.—Mica tower for micanite building.

The work of building up the material is usually performed by girls, and one of the chief difficulties is that of obtaining uniformity of mica distribution and of bonder content, owing to differences and variation in the personal judgment of the workers. It is important to employ reliable skilled workers. A typical process of ten years ago for segment micanite shows initial materials consisting of 47 lb. of liquid shellac to 100 lb. of mica, with a loss of 20% in drying out the solvent and a further 25% loss in grinding to exact thickness, the total loss of material, even apart from trimming, thus approaching 50%. Similar wastage was allowed for in the manufacture of V ring micanite.

Experimental research work directed to the elimination of such wastage and to the production of a more uniform product

Digitized by Google

resulted in the development of the process of tower-building. This method of manufacture, which is used in this country by the Metropolitan-Vickers Electrical Company and the Micanite and Insulators Company, consists of discharging weighed quantities of selected mica and dry powdered bond in alternate blasts down a tall tower chamber, in which the falling material is scurried into very uniform distribution. Fig. 6 is a drawing of a typical equipment, reproduced from "Electrical Insulating Materials," by Allan Monkhouse. At the top of the tower is an arrangement of baffles and air jets. The base of the tower is arranged to accommodate traversing box containers in which the micanite mixture is deposited. The sheets in their dry form are carefully removed to ovens, where the adhesion of the flakes is ensured by melting the bond before it can become disturbed. The finishing heat treatment is carried out in heavy presses, as for hand-built material. A typical press in the Metropolitan-Vickers works is shown in Fig. 7. As has been indicated in the first instalment of this article, it is possible to manufacture equal quality of micanite by the tower process, using a smaller and therefore cheaper grade of mica than by the hand building process.

A process somewhat similar in principle to tower building but involving simpler equipment is described in an American patent specification of 1906, the method in this case being to pick up the splittings from a bin by means of a suction box with a wire mesh bottom and to deposit each uniform layer so obtained by breaking the partial vacuum in the box.

Composition of Micanite.

With regard to composition of micanite it has been recognised in recent years that the proportion of mica should be as high as is compatible with secure bonding and the degree of flexibility which may be required for hot moulding. It is generally considered that micanite for flat use as for commutator segments should contain not less than 95 per cent. by weight of mica. Micanite for V rings and similar service must contain 10 to 15 per cent. by weight of varnish bond in order to allow the splittings to slip a little in the hot moulding process, during which the percentage of varnish undergoes some reduction.

With the minimum quantities of bond now used in micanite manufacture there is sometimes a tendency, especially in hand-built material, for dry spots to be formed where thick patches of mica have caused practically all the bond to be squeezed away. This trouble can be obviated to a large extent by cushion pressing, in which layers of fabric are introduced between the micanite and the steel platens of the press. This gives resilient pressing and tends to even out the bond. It is not regarded as good practice to use excess of bond and squeeze it out either in the pressing process or in tightening up the commutators.

Mica V rings up to diameters of 12 or 14 in. are usually built up in complete ring form. Above this size segmental construction is usually adopted with the object of eliminating expensive moulds. The segments are cut to template, assembled in layers with staggered joints and hot pressed in moulds such as are illustrated in Figs. 8 and 9. These illustrations actually show a special process in use by the Micanite and Insulators Company for building large V rings of practically solid construction. In this process the rings are built up of carefully prepared mica or micanite strips laid on a suitable template and bonded with a slight overlap. The work involves very careful manipulation and requires highly skilled labour.

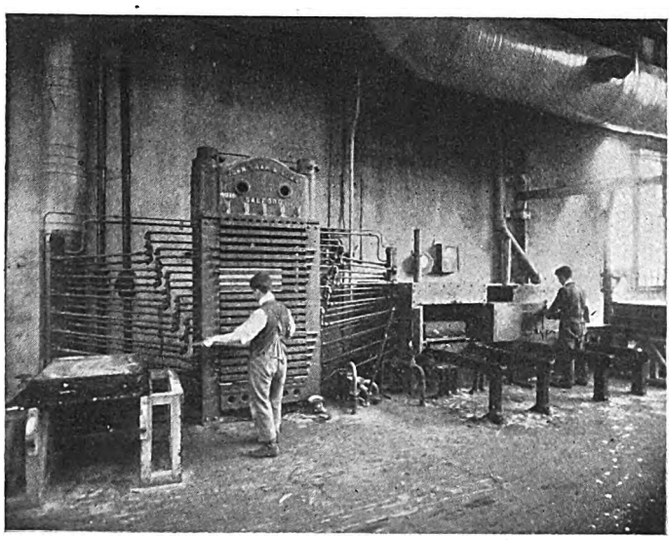

Fig. 7—Steam-heated hydraulic press for micanite.

Flexible micanite is produced by bonding mica splittings with special mixtures of resins, gums and oils, usually including a non-drying oil such as castor oil. Such micanite retains its flexibility for a number of years and is a convenient form of insulation, since it can be formed and bent without the application of heat. Its applications include slot linings and the insulation of cross-over wires in coils. Sheets built of large mica splittings rigidly anchored to each other are used for the almost pure mica slot insulation specified for armatures and stators to Admiralty requirements. The flexibility of such material is due to the thinness of the sheets used.

Heat-resisting micanite, used for domestic and other heating appliances, demands careful selection of the mica to be used.

Fig. 8.—Building a commutator "V" ring—setting the mould.

For service in which the maximum temperature does not exceed about 500 deg. C. either muscovite or amber mica may be used satisfactorily. For higher temperatures amber mica is essential and even this is limited to about 850 deg. C. for reliable service. Above this temperature it is advisable to use amber mica in block form. Special bonders are used for heat-resisting micanite but even the best of those commonly used up to the present time lose their adhesive properties after a short period of service.

Typical electric strength values for the different kinds of micanite are shown in Table I:—

TABLE I.—ELECTRIC STRENGTH OF MICA PRODUCTS.

Variety.	Electric Strength, Volts/mil.
Hard micanite—	
Muscovite	800–900
Phlogopite	700–850
Hot moulding micanite	800–900
Flexible micanite	600
Heat-resisting micanite	700–850
Micafolium	400–500
Mica Cambric	600
Mica Silk	700

Micafolium, another important mica product, consists of selected mica splittings carefully arranged by hand on a selected paper backing. The splittings are laid with an overlap on adjacent splittings, built up to two or three layers, and bonded with liquid adhesive. As the building process proceeds the paper travels slowly forward and finally passes through heated tunnels in which the solvent is driven off. The finished material is collected in rolls. The material is extensively used for the insulation of the slot portions of turbo-stator bars and other high voltage machine windings. In this work the micafolium is first tightly wrapped on the bar by hand and afterwards tightened up in a Haefely machine such as is illustrated in Fig. 10. This machine, called after its inventor, has an arrangement of heated bars which slowly rotate with an ironing action round the bar, pulling the wrap very tight and producing a wrap which is very hard and has a very high mica content. Although hard the cell has a certain amount of flexibility, sufficient to allow for slight displacement

Digitized by Google

or bending of the slot portion without fracture of the insulation. In most cases, and practically always when the slot length is great as in turbo-alternators, it is desirable and usual to subject the bars from the Haefely machine to a steam pressing. The effect of this process is to pack the insulation still more closely, driving off any moisture which may still be contained by the paper and any remaining solvent and closing up any pockets in the cell. Incidentally the pressing greatly improves the space factor in the slot. Very careful manipulation is required in the pressing process in order to avoid trapping gases in the material by prematurely closing up the ends of the wrap. Bars effectively wrapped and pressed in this way can be made to withstand very much higher voltages than are at present required in alternator manufacture, the limiting feature being the insulation of other portions of the windings.

Mica fabrics are built up in a manner somewhat similar to micafolium but using cambric or silk instead of paper and preparing usually in sheet rather than roll form. These materials are usually required to be very flexible in order to bed closely to the conductors on which they are wrapped and for this reason the splittings should be fairly large and overlapped after the manner of roof tiles. To prevent the splittings from lifting, the final mica surface is covered by a layer of thin tissue paper, forming a cambric-mica-paper sandwich. In most cases the finished material is cut into strips or tapes which are used for insulating the individual conductors and the end connectors of machine windings. Where economy of space is of prime importance fine Japanese silk of approximately 1·25 mils. thickness is used for the backing. The cambric or silk fabric permits of the use of this material under considerable tension. In cases where tensile strength is not important a tape of similar construction but with paper backing is often used.

Mica tubes are of different kinds and vary greatly in their mica content. One form of true mica tube, used in automobile sparking plugs and for the spacing tubes of resistance frames, consists of piles of pure mica washers assembled with a bonder under considerable pressure at high temperature. For work in which puncture value is of great importance tubes are made by wrapping sheets of bonded splittings round steel mandrels of the desired diameter and baked hard. Good tubes made in this way should ring like metal when struck. Such tubes are used for the insulating of shafts or bars of brushgear and other equipment on which clamped insulated fixtures have to be mounted.

Extensive use is made of mica tubes made by winding paper with mica sheet fed in between the layers. A refinement of this process is a winding of micafolium such as is used for the Haefely wrapped cells already described.

The use of mica tubes is governed chiefly by considerations of the stress voltage and temperature conditions of service. For high voltage stresses and high temperatures a high percentage of mica should be used. A pure mica tube of $\frac{1}{8}$ in. wall thickness tested at 20 deg. C. should easily withstand

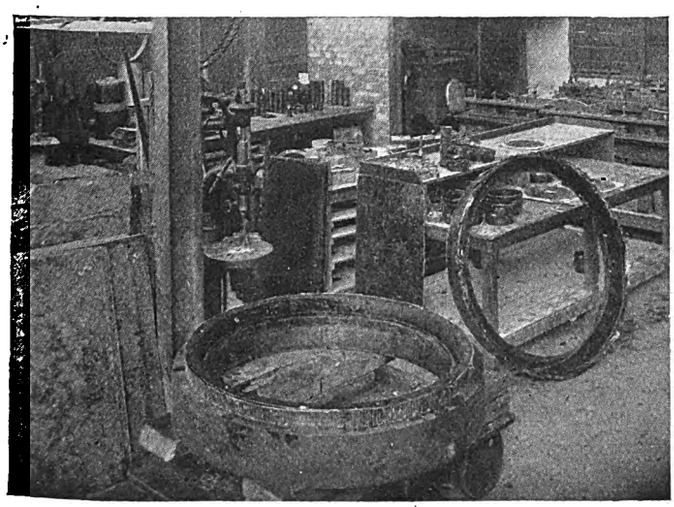

Fig. 9.—Building a commutator "V" ring—the ring moulded.

50 kV for 1 minute, corresponding to an electric strength exceeding 400 V per mil. As the percentage of paper increases the electric strength rapidly falls. With a mica content of about 25 per cent. by weight it is about 250 V per mil. A paper tube without mica may have a strength as low as 150 V per mil but the value then depends on the class of paper.

Even pure mica tubes, *i.e.* without paper, vary in electric strength according to the mica used. In connection with this and other uses it is therefore of interest to note the following typical electric strength values obtained on various mica splittings. (Table II.)

TABLE II.

Variety.	Electric Strength (Volts/Mil.)
Heavy spotted green mica	1 100
Medium spotted green mica	1 200
Medium spotted brown mica	2 000
Clear ruby mica	2 250
Clear brown mica	3 500
Canadian amber mica	3 800
Clear white Muscovite	3 000

A notable recent innovation in the use of mica is a new material known as Mycalex, a British invention, manufactured by the Mycalex Co. at Harlesden, Middlesex. The material is

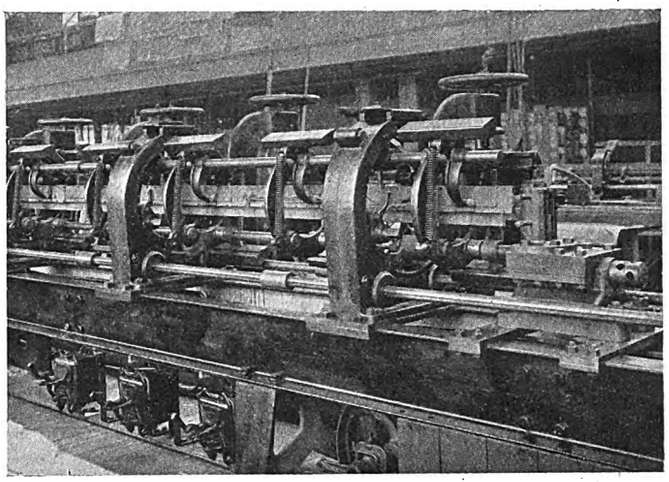

Fig. 10.—Haefely machine for ironing micafolium wrap of turbo-alternator stator bars.

a vitreous product made from block mica ground down to an almost colloidal state and fused with lead borate. The process of manufacture is interesting as it involves temperatures far exceeding those usually occurring in the insulation work to which the material is being adapted. The mixture of finely divided mica and lead borate is first moistened to a putty-like mixture, which is roughly formed or briquetted to the desired shape. The formed pieces are passed through a tunnel oven where they reach a temperature of about 750 deg. C., just below the critical temperature of mica, and are then compressed in a hydraulic press capable of a pressure of 550 tons, causing intimate fusion of the ingredients. Manufacture is at present concentrated on boards and rods but is eventually to include tubes and mouldings. The characteristics of the material are shown in Table III.

TABLE III.—CHARACTERISTIC PROPERTIES OF STANDARD MYCALEX.

Specific Gravity	3·0 to 3·2
Dielectric Strength at 90 deg. C. on 18 in. thickness	300 V/mil
Dielectric Strength at 180 deg. C. on 18 in. thickness	200 V/mil
Surface Flashover—distance 1 in.	17 to 18 kV
Carbon Arc Penetration	Rather rapid. Local fusion.
Fuse Wire Test	Surface disintegrated but no carbonisation
Water absorption—Specimen $\frac{1}{8}$ in. thick, 24 hours	·016 to 0·20%
Permittivity ("K")	5 to 8
Thermal Conductivity	23 W per cm. cube per deg. C.
Linear Expansion	·0000088 from 25 deg. to 50 deg. C.
Linear Expansion	·0000114 from 150 deg. to 175 deg. C.
Plastic Yield (Martens Test)	450 deg. C.
Hardness—Schleroscope	40
Hardness—Brinell	40 to 50
Tensile strength	5 300 to 12 800 lb./sq. in.
Bending strength	18 000 to 25 000 lb./sq. in.
Crushing test	48 000 lb./sq. In.
Impact test	6 to 7 kg. cm/sq. cm.

The most outstanding feature is probably the low power factor and power loss values. For this reason the Mycalex has found favour for high frequency work and is already

Digitized by Google

employed in the manufacture of low wave-length transmission sets. Another interesting feature is the fact that the insulation resistance measurements only show a rapid decrease at about 400 deg. C. whereas porcelain shows a rapid decrease at 250 to 300 deg. C. The material is made in various grades ranging from the " ordinary " which is refractory at 540 deg. C. up to a special arc-resisting grade of an alternative base composition.

The author's acknowledgments are made to the various manufacturers mentioned for some of the information here given and for the use of photographs, to Sir Isaac Pitman and Sons, Ltd., for Fig. 7, and to the Metropolitan-Vickers Electrical Co. for permission to publish information gained in research work.

ANGLO-AMERICAN CO-OPERATION.

Important Agreement Between English Electric and Westinghouse Companies.

THE English Electric Co., Ltd., of Queen's House, Kingsway, whose works are situated at Preston, Stafford, Rugby, Bradford and Coventry, announce that they have entered into a comprehensive arrangement with the Westinghouse Electric International Company, of New York, and Westinghouse Electric and Manufacturing Company, of East Pittsburgh, Pennsylvania, U.S.A., whereby there will be an exchange of technical information between the two organisations on steam turbines and electrical apparatus.

The arrangement includes the granting of licences for the use of patents and for the manufacture and sale of various products. These licences will, of course, be subject to the existing commitments of the two companies in various parts of the world. Under this arrangement, the English Electric Company, Ltd., will have the benefit of the results of the extensive research work carried on by the Westinghouse Electric and Manufacturing Company.

The English Electric Company, in making the above announcement, wish to make it clear that the technical and manufacturing link thus established does not carry with it any control from America.

The British interests in control of the English Electric Company, Ltd., believing that a moderate financial interest on the part of the American Westinghouse Companies would be highly desirable, have offered a participation in the ordinary shares of the company at par, but this participation will, in any case, be under 10% of the total. If accepted, this will increase the new money provided under the scheme of reorganisation by a corresponding amount.

"MOONSHINE."

Electricity from the Air.

ELECTRICAL development in Italy is progressing beyond all possibilities in this country for, according to the daily Press which has again shown its lack of discrimination between facts and fancy, Naples has produced a new Edison. Saverio Natella, a boy of seventeen years of age, has discovered an entirely new method of producing electricity, which, it appears, he is able to extract from the ether. His invention consists of an apparatus, rather resembling a wireless set, and an aerial. We have no particulars as to the actual apparatus contained in the box as Natella is applying for a patent and will not disclose any particulars until this has been granted. His invention has nothing to do with Hertzian waves but after making a thorough study of electro-mechanics, mathematics, magnetism and finally, astronomy, he has discovered, and he claims that positive electric waves exist at a height of 62 326 metres above sea level, while negative waves exist about 1 500 metres higher. These waves are the result of the revolutions of the stars as well as those of the earth, and they can be extracted from the atmosphere by means of his aerial. The only cost of this invention is the capital outlay, for, once in possession of the apparatus, one can continue to extract electricity from the ether for all time. He calculates that the total cost of a station for 100 000 V would amount to £700 and there would be no running expenses.

Natella gave a demonstration of his invention in a small town in Italy which has no electricity supply. He guaranteed to light an electric lamp at a given hour, and succeeded in doing so—unfortunately although he had taken every possible precaution he was not sufficiently protected against the current to which he was exposed, for his apparatus gave 550 V, and Natella only regained consciousness two hours later.

MUNICIPAL SHOWROOMS.

Cape Town Makes Full Use of Suburban Sub-stations.

By A. B. DENT.

ALTHOUGH South African municipalities engage in the business of generating and selling electricity to consumers, their charters forbid allied appliance merchandising activities.

Civic control of light, heat, and power is not conspicuous by advertising, display, and salesmanship enterprise. The attitude in too many cases is that of " We have something that you badly want; come and get it." A municipality may enjoy a monopoly of electricity supply, but obviously it cannot increase consumption without effective promotion work.

Outstanding among the South African municipal electricity departments is that of Cape Town. Often the city engineer, who is the man directing the entire project, is a professional man first and foremost. A clever technician is frequently burdened with a one-track brain—one given to thinking in the department's technical production problems, but oblivious to the increased consumption possibilities. It is rather like the factory which turns out mammoth quantities of a certain product, without making prior arrangements to market it.

Cape Town's electrical engineer is a man of vision—one who combines professional skill with business ability to an ideal degree. He is Mr. G. H. Swingler. As recently as 1924 Cape Town was jogging along in a serene manner with its electricity supply, when the department launched an advertising campaign to stimulate increased consumption, and with it the prospect of a lower rate. The scheme had limitations; housewives interested in lightening their domestic burdens expressed a desire to have appliances demonstrated to them under impartial conditions, so that they would not be placed under any obligation.

Mr. Swingler sensed the pressing need, and his electrical appliance showroom recommendations were accepted by his governing board as a legitimate supplementary service.

The department's headquarters, situated in the town hall, could not be utilised for demonstration purposes. Fortunately the department had two suburban sub-stations, each with its own offices. It was therefore decided to remodel these structures to provide for a separate showroom equipped with a show window frontage.

Sea Point and Wynberg Showrooms.

The Sea Point showroom is situated three miles from the city hall; while the Wynberg showroom is eight miles from the down-town section. A third showroom is now being planned in another residential area.

As stated in Mr. Swingler's own words, " The principal function of both of these buildings is that of a sub-station for the distribution of electricity. Since they are both located in residential areas it was necessary to camouflage the true industrial and commercial purposes of the sub-stations in order to conform with the architectural appearance of each neighbourhood."

The object of the showrooms is to enable housewives at their leisure to inspect the latest introductions in electrical appliances. Emphasis is laid on the fact that there is no obligation to buy, which is the direct opposite of the attitude experienced in a contractor's showroom. Importance is also attached to the facilities for obtaining from the experienced man in charge of the showroom unbiassed and accurate information relative to the operation, utility, and economic value of such appliances.

The merchandise displayed in the showrooms is not purchased by the Department, but is loaned by the various Cape Town electrical contractors and wholesalers. The Department maintains the right to accept or reject such wares for display purposes, and to demonstrate them in what it considers the most efficient manner. As a result of these necessary reservations it is felt that the public is able to choose through the showroom displays and demonstrations only the most reliable equipment. Consumers are also protected from the numerous inferior appliances on the local market. No display advertising signs are used, since the aim of the showrooms is to preserve a refined home environment, to which end the appliances are displayed with suitable furniture and furnishings.

Appliances are not sold from the showrooms, although the Department receives the usual trade discounts from sales introduced by them. Such discounts meet part of the showroom operating costs.

UNEMPLOYMENT AND WORK—VII.

Trade Union Policy, Good and Bad

By SIR ERNEST J. P. BENN.

PUBLIC opinion has travelled a very long road since the days when a combination of workmen was an illegal conspiracy, and we should be more than human had we been able to make so complete a change in our views without at least some errors and mistakes. To-day the notion that working men should be banded together in trade unions is almost universally accepted, and for that reason is hardly discussed amongst us. The trade unions are thus able to get along with what they conceive to be their business with a minimum of criticism and interference, and as in the nature of things they are bound to take a one-sided view of industrial problems, it is also natural that they should be doing a great deal of harm.

The Whitley Councils.

The war brought about many revolutions, but none so drastic or complete as the alteration which took place in the relations between trade unions and employers' organisations. The Whitley Report, and the joint councils which arose out of it, were welcomed on all hands as opening a new era of industrial peace and harmony, but, unfortunately, this excellent arrangement has produced in many trades what is in fact a conspiracy between capital and labour to rob the consumer.

I have never been a believer in low wages. I have never been able to see any economy in paying a man less than the maximum that can be got out of the job. I do not sympathise with much of the talk one hears about the need for reducing wages. In most cases I fail to see any such need. Rather am I convinced that it would be easy to increase the rates of many wage schedules. The difficulty about wages is of quite another kind: it is the work that is given for the wage. The elaborate systems of restriction and restraint chiefly arising out of demarcation; the awful waste of valuable time involved in most of these arrangements; the total lack of elasticity which we have introduced into our working arrangements—most of these things are to me merely stupid. The labour cost per hour of most jobs is far higher than the wage rate per hour. The consumer does not get this difference; the labourer does not get it; it is sheer waste.

In most cases the arrangement simply means the serious limitation of the demand, and less employment for everybody. Now the Whitley Report, the most useful document which was ever printed upon Government paper, has, strangely enough, tended to perpetuate and strengthen all these abuses. The employers in a trade which is full of trade union restriction will band themselves together on trade union lines, will agree upon costing systems and price lists, and fix the price of the article sufficiently high to cover up these abuses. The effect is to create a capital and labour trust, striving to obtain wealth from scarcity.

Most of the talk about over-production requires to be examined from this point of view. A trade which is riddled with extravagance will, through its unions, federations and joint councils, agree upon prices for its products which the market cannot stand. It will then be troubled with over-production, not because there is not a big demand for its products, but because people will not pay the price put upon them. In so far as that difficulty is due to the waste of labour arising from trade union restrictions, it is a trouble which the trade itself can and should remove.

Obstruction by Rules.

There is an even more serious side to this question of trade union abuses. I refer to the way in which rules and regulations are used to keep people out of work. I recently endeavoured, in a trade in which I am supposed to possess some influence, to get a boy of seventeen started on the career that he had chosen for himself. I failed entirely, notwithstanding a really strenuous endeavour. Trade unionists have yet to learn that every piece of work done leads directly and immediately to another piece of work. They are as a body afflicted with the notion that work is a limited thing, and that such work as exists must be shared out and spread over. It is only another variation of the Socialist fallacy that wealth is limited and must be divided up. These people fail to realise that economic endeavour is a continual process of creation. There is no more limit to the amount of work available than there is to the amount of wealth available, and to start upon the assumption that these things are fixed or limited in any way, and must therefore be regulated or rationed is simply foolish.

I always feel that one can appeal to trade unionists, and even to Socialists, with much more hope than to employers or capitalists, if only a small proportion of what the former classes claim as their aims may be allowed. The trade unions are loud in their protestations about service to the public, whereas employers and capitalists, whatever may be their real motive, do not as a class make much in the way of a public claim to be social servants. I can see a very sincere welcome for the idea that a particular trade is a service to the community, and that the trade union which governs it exists to render that service more perfect and more plentiful. If, however, we examine the actions of most of the trade unions from this point of view, they fall a long way short of this ideal. The difficulty, and it is a natural difficulty, is that each trade will think of itself and not of the rest. It persists in the fallacious notion that it can make arrangements for its own benefit and can impose them upon society as a whole. Thus it comes about that when some good trade unionist, owing to negotiations inside his own trade, succeeds in doubling his wages, he finds that other people have also had the same pleasant idea, and that the things he wants to buy are two-and-a-half or three times as expensive as they were before. His doubled wages leave him, therefore, rather worse off than he was. We have reached the stage in which it is almost true to say that every trade is organised in such a way as to get as much as possible for a minimum output. Very little thought is required to show that in these circumstances we can only expect to go on paying more and more for less and less. We are all following the same road, and it is due to our own intellectual self-respect that we should at least understand what we are doing.

Eclipse of the Consumer.

If we could get back to the notion that trade is a service, things would bear a very different complexion. It was certainly a service in the old days of free and open competition, and a very hard service. We did not then, perhaps, sufficiently recognise it as service. The buyer settled the price with a vengeance, the standard of living went up by leaps and bounds, and all sorts of incidental troubles came bubbling up to the surface. Now we have gone to the other extreme. The buyer has ceased to be a serious consideration with us. He must buy our goods on our terms, and if he fails to do so, then the trouble is not with us; it is with somebody else. We go in deputation to the Government, and seek for our particular form of dole. It may be a derating scheme or a subsidy or a tariff, but, whatever it may be called, it is a device to save us from the consequences of our own inability to accommodate ourselves to the market. Similarly with the worker. We must take his labour on his terms, and if that is not agreeable, we must provide for his needs. The trade union idea has established itself so firmly in the mind of the nation that we are all thinking of the convenience of the producer and forgetting that the consumer has any opinions at all.

The argument can be reduced to the very simplest terms, if we enquire as to the mentality of the trader or the worker, it matters not which, when doing and handing over a piece of work. Does the average workman say to himself:

"Here is a job which somebody wants. If I do it well, cheaply, and efficiently, the customer will want some more, and if he himself does not want more, he will go round to his friends, tell them how cheap and efficient I am, and they will then come into the market."

If that were our attitude of mind as a people, we should hear nothing about unemployment. But so long as most of us take another line, and say: "Here is a piece of work. I do not know when I shall get another. The man who wants it may as well pay me as much as I can screw out of him, and keep me at work on the job as long as I can make him," then, in so far as that is our attitude, or anything like it, the wonder is not that we are afflicted with a proportion of unemployment, but rather that there is any employment at all.

This unemployment disease is not amenable to Acts of Parliament and official arrangements. It needs a different outlook, a change of heart, another frame of mind on the part of most of us.

BETTER STREET LIGHTING.

Obsolete Methods which Cause Accidents—Advantages of Mid-Street Suspension—Making the Most of Our Streets.

By CYRIL SYLVESTER, A.M.I.E.E.

BEING interested in lighting problems in general, I cannot but remark upon the progress being made by our competitors—the gas engineers. One has only to look round the gas lighting showrooms of any municipality to see lighting units which compare very favourably, in appearance and utility, with modern electric lighting units. There is no doubt that we have set them an excellent example. They are taking lessons from us; they are learning more from us than we did in the days when we followed in their footsteps.

These observations relate more particularly to the development of street lighting systems. In the early days of gas, when darkness brought an end to vehicular street traffic, the chief consideration was the illumination of footways. The conventional method of lighting was a gas jet accommodated in a lantern fitted on the top of a standard. The object of the lantern was merely to protect the jet from wind and rain. The art of light control was not understood; the inside of a lantern, which should have acted more or less as a reflector, was often painted the colour of the standards, a dark red or green. The illumination was in the form of a ring of light immediately under the standard; one could see, but very dimly, objects situated between standards.

When we began to think about the use of electricity for street lighting, we merely removed the gas jet and replaced it with an electric bulb. It was accommodated in the same lantern which served as a protector for the gas jet. It is true that, after a time, the inside of the housing was painted white so that a certain amount of light was reflected in a downward direction instead of being absorbed, as before, but with very little efficiency. One could hardly expect a lantern with a top designed as a water-shed to have scientific reflection features.

Many of these lighting units are still to be seen in London and the provinces. This is not because well designed lighting units are not available; the reason is that, in many cases, the cost of new lighting units, when compared with the higher efficiencies obtained, is not considered worth while. Yet this is a brake on the progress which should be made in connection with better street lighting. Part of the enormous increase in the number of street accidents can be traced to bad lighting, which is worse for motor drivers than no lighting at all.

Even in districts where new lanterns have been fitted, they are not installed under the best conditions. This is no fault of the illuminating engineer or the designer of the units. The facts are that two or three firms are asked to quote for the supply of lighting units which "must be fitted on the existing standards." The firms have no option; they know it is useless to point out that the height of the standards relative to their spacing is not satisfactory. All they are concerned about is securing the order.

For a street to be well illuminated it is necessary for the intensity to be high and to be even. This is impossible through the medium of lighting units with concentric illumination fitted on standards which once accommodated units intended solely for footway illumination. The gas people realise this—a fact that I will substantiate later.

A lighting unit with concentric illumination, no matter how efficient it may be, when tested at the photometer, must be inefficient if the whole of the light is not projected on the road. As the matter stands, such a unit illuminates the front of buildings, or projects undesirable light into bedroom windows. When fitted in country districts, a large proportion of the light emitted serves to illuminate Brown's meadow or Jones' cabbage patch.

If the illuminating engineer had his way, he would suspend all street lighting units by a system of mid-street suspension. This projects practically the whole of the light on to the road. With suitable refractors, in which the prisms have been designed in conjunction with considerations of height and spacing, there is no reason why the resultant illumination should not be even and of high intensity.

[*Photo by courtesy of the General Electric Co*

The new lighting of the Victoria Embankment, London—an example of street lighting as it ought to be.

In many of the large cities on the Continent, mid-street suspension is general. It is true that the units are equipped with opal glass globes, but they are fitted so close together that directional illumination through the medium of refractors is not necessary; the light is well diffused with just that amount of directional quality to create the correct effect of light and shade.

What can be done in England by suspending lighting units over the centre of a roadway is manifest by the excellent results to be seen on the Thames Embankment. Here two lighting units are fitted on each span; the spacing of the spans is equi-distant, and was determined after due consideration had been given to the height at which the units were fitted. The intensity is high and the illumination is even. Another installation on the same system is to be seen in Maidstone. The street in which it is fitted is narrow, but practically no light is wasted and it is very even.

Even illumination is impossible with the use of units situated on the edge of footways, unless arrangements are made to make the light directional through mediums other than those which are embodied in the design of lanterns. The colours of buildings vary considerably—from dark red to white. In the first case, the majority of light incident upon the face of buildings is absorbed; in the second, a large proportion would be reflected into the street at angles governed by the positions of the reflecting surfaces. This makes for uneven and patchy illumination.

Interesting developments are being carried out by the gas people in the Streatham district of London. They are making the best they can of their lighting units by adding what may be termed "reflection or directional accessories" to ordinary street lanterns. In the first place, the lanterns are equipped

Digitized by Google

with an enamelled steel reflector of high reflection factor. On one side of the lantern (the side nearest to the buildings) a V-shaped reflector of mirror glass is fitted. High pressure gas burners are fitted in the top of the lantern and at the bottom, which is open, is fitted a square pyramid of mirror glass. The V-shaped reflector effectively prevents the light falling upon the face of the buildings adjacent to the unit, and it redirects it in the direction where it is required—on the roadway. The pyramid reflector prevents the concentration of light at the base of the standard and it is directed into the roadway and on to the footways. I have tested the illumination before, and after these accessories were fitted and, although I hold no brief for gas, the improvement is remarkable.

The subject of street lighting is very important from a national point of view. One of the most difficult matters to be dealt with at the present moment is the traffic problem. This can be solved by good street lighting. I was talking recently to the manager of a well-known carrier company. He complained of the slowness of transport through daytime traffic congestion. He said: "If only the roads were well lit I could do practically the whole of my work during the night, and my company would save money."

This is only one company. As one moves about London, it can be seen that vans and lorries are blocking the roads and preventing traffic progress. Practically the whole of this work could be done out of daylight hours if the roads were sufficiently well illuminated. It is done in an industrial interior; work after daylight ends is possible in well illuminated workshops. Why not on roadways? A road way is made to facilitate traffic; it should be made to work the whole of the twenty-four hours in each day. If only the Ministry of Transport and illuminating engineers could get together on the subject of better street lighting there would be a saving of life and limb, traffic congestion would be reduced, and the general public would greatly benefit.

AUSTRALIA AND THE BRITISH ELECTRICAL MANUFACTURER.

Factors Underlying the Possibility of Co-operation—Our Largest Market for Electrical Products—Australian Electrification Well Advanced—Tariff Aspect.

(FROM A CORRESPONDENT.)

At a time when intra-imperial industrial co-operation is a subject much discussed in both political and industrial circles, but a subject which, in general, has scarcely progressed beyond the form of the reiteration of principles, the results of an examination into the factors underlying the possibility of co-operation between the electrical industry in Australia and Great Britain should be of interest. The examination has been made in the purely impartial light of economic research, the relevant statistics being taken from the official Australian Year Book and from the official Trade Returns from both countries. Any suggestions, moreover, which may be expressed or implied for the bringing about of some degree of rationalisation in the conduct of this intra-imperial policy in respect of electrical development, have nothing to do with political considerations, and must stand purely as deductions from the observed facts.

The importance of this investigation must be realised at the outset by the fact that Australia is today the largest market for the export of British electrical products. It is, moreover, a market in which the potential expansion in the future is very great indeed, greater probably, both from the point of view of absolute volume and rate of development, than most of the new countries, so that a consideration of a policy to be adopted can, with every confidence, be based upon a long-term view.

In face of this fact it would not be sufficient merely to advocate a greater concentration of the British exporter upon the Australian markets. Such action would lead to wasteful price-cutting as, in the past, it has been accompanied by a maldistribution of productive resources. For an arrangement which is to be beneficial both to the Australian and British manufacturers a more reasoned examination of the facts will be necessary, and in doing so an estimate must be made of the balance of present concession as against future advantages.

An examination of the figures relating to the public supply of electricity shows that the capacity of all generating plant installed in Australia has risen from 238 349 H.P. in 1919 to 803 706 H.P. in 1928, while an estimate for 1929 would put the figure at about 1 000 000 H.P. Thus over the period of ten years the generating capacity has been more than quadrupled. It is important to note, moreover, that the above figures relate only to public supply undertakings and do not include private industrial generating plant or installations in power stations owned by the States. Including the latter, the total generating capacity in Australia, in 1928, was about 1 340 000 H.P.

In order that some estimate can be obtained of the degree of electrification in industry, the figures for the total capacity of generating plant installed are expressed as a percentage of the total prime-mover capacity in industry. The result is, of course, an indication of the amount of prime-mover machinery which is engaged in driving electrical generating plant. In 1919 this figure was 50·7%, while it had risen to 76·5% in 1928. The increase in generating plant capacity between 1919 and 1928 of 565 357 H.P. has been accompanied by an increase in prime-mover capacity of 578 572 H.P. This seems to indicate that almost the entire expansion in prime-movers has been due to expansion in electrical generation, or, in other words. that electrical supply development is keeping full pace with the development in general industry. This being the case, one would expect a corresponding increase in the electric motors installed in industry driven by purchased energy. In 1919 this figure was 159 372 H.P., while by 1928 it had risen to just over 500 000 H.P. Thus the public supply system is obtaining a steadily increasing proportion of its demand from industrial power purposes.

The operation of the supply industry is economical. This is shown by the fact that the average price obtained per unit sold has fallen from 1·7d. in 1922 to 1·32d. in 1928, at which figure it compares very favourably with that quoted in the United States or in Great Britain. In reaching this figure advantage has been taken of the steadily declining overhead charges represented by expenditure on land, buildings, plant machinery. The total expenditure under these heads per H.P. of generating capacity installed was £42 in 1922 and has fallen steadily to £33 in 1928, a figure which, although not as low, is comparable with that obtaining in Great Britain. The output of electricity has risen from 835 000 000 units in 1922 to 2 194 486 000 in 1928, an increase of roughly two and a half times, giving at the latter date an annual output per head of population of about 340 units, as against an output of about 180 units in this country.

Thus, both on the basis of consumption per head of population and of the degree of electrification in industry, Australia is already far advanced. The economic operation and design of the generating stations has enabled current to be supplied at an exceedingly low cost, and indicates that the Australian engineers have taken advantage of the most modern developments in supply technique. The problem of electrification in Australia, therefore, does not include the difficulty of overcoming prejudice, nor is it necessarily one of education. At the same time, as has been indicated, it is not primarily one which has to deal with the intensification in the use of electric current, but is rather one of extensive development, a development, that is to say, which will move *pari passu* with the development in general industry.

Local Manufacturing Possibilities.

This point is one of extreme importance when a consideration is made of what branches of the electrical industry shall be developed within Australia itself. It would be practically useless to attempt the foundation, by the imposition of tariffs or by means of government subsidies, of industries for the manufacture of heavy generating machinery in the country at the present time. The immediate demand for such products, while growing, would not constitute a sufficient turnover for the profitable operation of that branch of the electrical industry in which experience in this country has shown that the profit margins are at a minimum. Nor is the immediate future development of such a demand likely. The degree of industrialisation which would be necessary to justify the

Digitized by Google

installation of heavy manufacturing plant, although one assumes it to be accompanied by the fullest use of electrical power, is by no means yet reached.

The part which the British manufacturer has played in the development of the use of electricity in Australia can be estimated from an examination of the import returns over a number of years and also from a census of the equipment in the supply industry at the present time.

The total imports of electrical machinery and apparatus have increased steadily from £4 720 534 in 1923 to £7 166 008 in 1928, with a recession to £6 127 000 in 1929. If we add to these totals the imports of allied machinery such as steam turbines, water tube boilers, etc., for which the latest figures obtainable are for 1928, the import totals are raised to £4 866 491 in 1923, while for the latter date they are £7 454 928. Of these totals, that is to say, those which include the allied machinery, Great Britain has supplied about 67% over the period in question. In the category of allied machinery the percentage supplied by Great Britain is about 95%, or practically the entire market, the same figure pertaining to the imports of wire and cables. In the case of dynamo-electric machines, transformers, control and switchgear, the British percentage has been in the neighbourhood of 65% while in the lighter apparatus it has ranged between 25% and 50%.

Some of the largest stations in the Empire at Yallourn, belonging to the Electricity Commission of Victoria with 150 000 kW, Bunnerong in the Sydney municipality with 150 000 kW and White Bay belonging to the New South Wales Government with 147 750 kW, are being equipped either entirely with British machinery or to British specifications. The fact that this preponderance in the installation of British equipment has justified itself has been shown above by the economic operations in the supply industry of Australia. With those factors in mind we can touch on the broad question of co-operation between British and Australian industry.

One point of immediate importance arises out of the consideration of the tariff adjustments which would be best calculated to bring about this policy of rationalisation. The aims of such a tariff should be the protection of those branches of the electrical manufacturing industry which could be established on a true economic basis in Australia at the present time. On the other hand, those goods which cannot yet be supplied by the home market should, at least on the British Preferential basis, be admitted duty free. For this purpose one can divide the electrical imports into three broad categories. Firstly, those goods which in the main constitute the capital equipment of other industries. The manufacture of these requires very heavy capital outlay, which in view of the present degree of development in Australian industry generally, would not be justified. The necessity for importing such equipment from abroad at the present time means that the cost of the import duties on these goods must be borne by the importers, and thus constitutes a very serious burden on municipal and industrial enterprise. The second category is composed of goods which could still be included in the category of capital goods, but in which there is a fairly high rate of turnover. Thus the ratio between capital equipment necessary and gross output is not so large as in the first case. The third category includes goods which, in the main, could be produced in Australia at the present moment. They are of the nature of light apparatus (consumers' apparatus) and constituting as they do, a very small proportion of an individual consumer's expenditure, their price may be raised temporarily in order that the initial stages of manufacture be undertaken without loss.

The doctrine of *laisser-faire* is no longer one which can be relied upon to secure an equitable balance of trade between two countries. The conception of a vacuum in which such an economic equilibrium was supposed to be achieved has been found to be no longer valid, and the *ceteris paribus* which was such an important function in the principle has been disturbed by both financial and political agencies. To assume then, that because conditions of trade have been favourable in the past, they will remain so in the future, is to adopt an all too optimistic view, and when it is agreed that the potentialities in the trade relations between Great Britain and Australia can only be developed to the fullest extent by a conscious guidance, this is not to advocate a change in policy; it is rather the inculcation of a policy where no policy has existed before. The accumulation of considerable adverse balances of trade with nations which have no other interests than that of commercial exploitation; this has been the difficulty in the recent commercial development of Australia. It is a difficulty which, however, will be overcome when the phrase Intra-imperial Co-operation is converted from being a mere catchword of the newspapers to an accepted industrial policy.

BOOK REVIEW.

Transmission Networks and Wave Filters. By T. E. SHEA, M.S. (London: Chapman and Hall. 470 pp. 32s. net.)

Mr. Shea, of the Technical staff of the Bell Telephone Laboratories, deals very completely with the mathematical and electrical theory of the performance of transmission networks, balanced and unbalanced, and the general characteristics and formulæ of various types of networks and network arms are fully discussed. Characteristics and properties of wave filters are also examined, and the book includes an analysis of recurrent signals by the Fourier series and application of Fourier integral analysis to the solution of purely transient waves.

Supply Authorities and Radio Apparatus.

[To the Editor.]

Sir,—I should like to draw attention to what appears to me to be a very misguided attitude on the part of many supply authorities—their lack of interest in electrically operated mains apparatus, which in many cases amounts practically to discouraging its use. The reasons put forward for this attitude are usually that the energy consumed by mains receivers and supply units is so small as to be negligible and to be so small that the meter does not measure it.

The average type of mains receiver seldom consumes less than 30 W, and it is a very poor kind of electricity meter that will not measure this consumption. Further, radio apparatus is most commonly operated in the evenings when the lighting is in use, and, in consequence, the consumption of the radio receiver or supply unit is added to the general consumption and properly measured.

The very important point, however, which seems generally to be overlooked, is that great numbers of people install electricity in their houses in the first case for the facility of operating radio receivers and associated apparatus from the mains and the removal of the bugbear of batteries. Radio mains apparatus is therefore a direct incentive to the spread of the use of electricity, as when once installed for radio purposes it is obviously used in many other ways.—Yours faithfully,

J. Baggs.

Unemployment and Work.

[To the Editor.]

Sir,—Only three weeks ago you were good enough to print a letter from me in connection with Sir Ernest Benn's second article on Unemployment and Work, and therefore I feel some diffidence about trespassing on your space again. Also I am anxious not to lead your readers to imagine that I am in any way connected with the writer of these excellent articles, a sort of little Benn, for nothing is further from the truth. When I hear the thunder of the gods, and am moved to join in with my tin whistle, it should be readily understood that there is no connection between the sources of the sounds.

There may be many reasons for the decay of individual responsibility. Recent legislation, the decline of public worship, the trend of modern thought, but the obligation remains and the failure to realise it has been bewailed by no less a person than Mr. Snowden. The short-sightedness of politicans, however, is notorious, and political astigmatism is extremely contagious. We are all inclined to denounce the dole for others whilst demanding it for ourselves. Safeguarding, export credits, State guaranteed loans, relief works, exchequer grants, public assistance are among its various forms, so that it is almost impossible to foresee where the process of trying to live by taking in one another's washing is likely to end.

In a miasma of despair, apparently, and it is only by each and all of us remembering our responsibilities that any light can be seen.

In my small workshop I have unfortunately had to discharge many people for laziness, incompetence and insubordination, but for over six years no one has been discharged for reasons beyond his control. By hook or by crook everyone in my employ has worked full time except during holiday periods. I do not, however, pretend that such a system could immediately become universal, but I think much could be done in that direction. As I have pointed out previously, the trouble often starts in the home, so that boys and girls set out to obtain work with a very big handicap. If they and their parents really felt that failure to become efficient would lead to starvation, much greater trouble would be taken to attain this end. Employers would be assured of much better material on which to work, that is to say, if boys and girls entered employment feeling that their lives depended on them doing their best and of losing no opportunity of learning, the trouble would be much simplified.

It must be obvious to any thinking person that State insurance against unemployment has miserably failed. Quite recently Mr. Noel-Buxton stated that his department was considering a sound scheme of unemployment insurance for agricultural workers. Surely a moment's reflection by any sane person would convince him that any form of compulsory insurance might be unsound. I have always felt that fire and life insurance, as administered by insurance companies in this country, are wonderfully cheap, and yet these companies make good profits. Compare this with State insurance. The deduction of contributions is resented by the workers, the employers' contribution is a serious burden, those who receive its benefits are thoroughly dissatisfied with it, and its liability on the State is a staggering one, and yet we have a Minister of the Crown actually advocating its extension. Changes may take place by sudden or gradual means, but those which follow the latter course are usually the more effective. I advocate the abolition of State unemployment insurance, but by gradual means, so as to minimise the incidence of personal hardship. Under my scheme the State would cease to insure all workers below the age of 30, continuing benefit for another six months after cessation, but I would compel employers to pay three-quarter wages for six months to those whom they put off and do not discharge for misconduct. This compensation would be paid by employers whether or not the recipient obtained other employment, but it might be commuted by agreement with the worker on payment in a lump sum of 75% of the outstanding liability. For test purposes an employer might engage a man or woman for two months without incurring this obligation, but at the end of two months the employee must either be discharged or come under the scheme, and could not be re-engaged without immediately entering it. On the other hand, for those employers who are normally in the habit of engaging and throwing off labour intermittently, there would still remain in the beginning the men and women in industry over 30, which is the age after which it becomes increasingly difficult for anyone to get fresh employment. My scheme would in fact ensure rather better chances of employment for those over 30 than they have to-day, but each year the age limit would be raised. In other words, no one would enter State unemployment insurance. I would, however, raise the insurance contributions of both employer and employee, but entirely abolish the Treasury contribution, in return for which the loan now owing to the Treasury by the Insurance Fund would cease to become a liability on it, and would be added to the national debt. Any man or woman over 30 who desired to enter the scheme and relinquish State insurance would have the opportunity of doing so within six months, and would cease to be insured.

I do not pretend that my scheme, as outlined above, is free from blemishes, but it would, at any rate, have the advantage of making both employers and employees realise their dependence on one another and not on outside influences. Employers must realise their obligations to those whom they employ, employees must likewise recognise their obligations to their employers and themselves by becoming efficient, and politicians must realise that the best way to accumulate material wealth is by the freest possible production and interchange of the goods on which our welfare and comfort depend.—Yours faithfully,

D. G. Ryder.

London, S.E.14.
June 2.

ELECTRICAL TRADES ASSOCIATION.

Advantages of Membership.

Readers are reminded that the above-named association has been formed with the following objects: (1) To regulate credit; (2) to provide a means of debt collection without legal process; (3) to provide members with credit information; (4) to represent members at meetings of creditors and in matters where the opinion of the trades may be important; (5) to provide a special organisation for these trades, and (6) to protect the interests of members. The annual subscription to the association is £2 2s., payable on January 1 in each year. No charge is made for supplying credit information up to 25 inquiries a year; more than this number on special terms to be agreed. A fee of 10% of the amount collected is charged on all debts given over to the Association for collection. No other charge is made, and if no part of the debt is collected there is no fee. In cases where legal proceedings are necessary, whether as regards debt collection or otherwise, the Association's solicitors will act for members at reduced fees. The secretary is Mr. David Pollock, and the address Mitre Chambers, Mitre Street, London, E.C.3.

NEWS IN BRIEF.

Plays by Television—Floating Power Station—E.D.A. for South Africa—Large Canadian Hydro-electric Plant Begun.

A PUBLIC telephone service between this country and Latvia was opened on May 5.

Work has commenced on the new electric signalling system at St. Enoch Station, Glasgow.

Edinburgh Corporation has decided to seek powers from Parliament to make electrification of the railways within the city compulsory.

A total of 640 000 000 incandescent electric lamps were sold in the United States during 1929, an increase of 76 000 000 over 1928.

The number of telephones working with the Post Office system at March 31 was 1 882 110, an increase of 127 469 when compared with the total at the same date last year.

East Retford Corporation is advertising for a manager of the Corporation's electricity department. The salary offered is £350 per annum.

In connection with the electric power installation at the Barming Mental Hospital, Kent County Council has decided to instal hot cupboards and hot carving tables at a cost of £350.

A successful television demonstration is reported to have taken place in the laboratory of the General Electric Co., of New York, when a play was audible and visible in a theatre at Schenectady a mile away.

Mr. W. S. Wyman, president of the New England Public Service Company, recently described to the members of the New England Division of the N.E.L.A. an enterprise which will enable the company to supply energy to places where it may be needed in an emergency. A floating power-plant will be installed on a 4 500-ton ship which has been bought from the Government Shipping Board.

Colchester Corporation is inviting tenders for the installation of electric light in Canterbury Road School.—The Borough Surveyor has been asked to proceed with working drawings for new offices for the electricity department.

A sub-committee has reported to Guildford Electricity Committee that it had been decided that the cookers manufactured by the General Electric Co., Ltd., and Revo Electric, Ltd., and water heaters manufactured by the General Electric Co., Ltd., and Sadia, Ltd., be let on hire.

At the end of 1929 there were 676 electric railway transportation companies in the United States. On April 1 of this year, 380 electric railways were operating 12 819 motor 'buses over approximately 23 900 miles of route. These include 66 companies with 647 motor 'buses operating over 2 262 miles of route that have substituted 'buses for entire railway property.

The National Federated Electrical Association and the Electrical Trades Union announce that under the National wages agreements dated August 7, 1920, and September 22, 1921, the variation in cost of living justifies a 30% reduction in the basic rates of wages (April, 1921) and that the net hourly rates of pay applicable to the respective grades as from the second pay day in June are as follows:—A, 1s. 10d. (decrease 1d.); B, 1s. 7d. (decrease ¾d.); C, 1s. 5½d. (decrease ¾d.); D, 1s. 4d. (decrease ¾d.).

It is proposed to form an association to be known as the Electrical Development Association of Southern Africa. This proposal is the outcome of a paper submitted by the chairman of the Electricity Supply Commission, Dr. H. J. van der Bijl, to the Association of Municipal Electrical Engineers. The Cape Town Electricity Committee has given the matter careful consideration, and recommends that the T.C. support the Association, the subscription to be a minimum of £100 per annum with a maximum of £250, provided other municipalities support the proposal.

The International Hydro-Electric System, a division o International Paper and Power Co., produced 347 174 000 kWh in April, an increase of 13% over the output of the present plants of the system in April, 1929, and 60% over their output in April, 1928.

Chester Corporation has accepted a tender, amounting to £3 980, for alterations at the electricity showrooms, Northgate Street, and application is to be made to the Electricity Commissioners for sanction to borrow £5 000 to meet the cost of the alterations and incidental expenses.

In 1918 the average household in the United States was using 272 kWh of electricity a year for which it paid an average price of 8·3 cents per kWh. In 1924 the average use had increased to 378 kWh but the rate had decreased to 6·55 cents per kWh. In 1929 the average home was using more than 500 kWh at an average price of 6·2 cents per kWh.

Clitheroe Corporation has decided, as an experiment, to instal in six Corporation houses, an electric washboiler, cooker and kettle. Tenants are to pay 1s. 3d. a week in addition to the charge for energy.

Mr. H. B. Lees Smith, Postmaster-General, speaking at Sutton, Yorks, on May 30, said unemployment could not be cured under the present "anarchical individualistic system." There must be some central regulating authority in each industry to adjust output to potential demand. He cited the progress made by the Post Office telephone department, and added that international as well as national regularisation would be needed before unemployment could be gripped completely by the throat.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of June 12, 1880, stated that 1 716 Jablochkoff candles were then in use in France.*

The application of electricity to railway traction was suggested by Dr. Siemens in a paper read before the Society of Telegraph Engineers.

* * *

TWENTY-FIVE years ago, it was recorded in THE ELECTRICIAN *of June 9, 1905, that the Governments of Switzerland and Baden had granted a concession for the development of 50 000 h.p. of electrical energy from the Rhine falls at Laufenburg.*

The "Electrical World" of New York was quoted as reporting the installation of a 1 000 000 V transformer in Purdue University, under the supervision of Prof. J. W. Esterline.

Mr. S. E. Fedden, general manager of the Sheffield electric light department, complained in his annual report that progress had not been as rapid as anticipated, "owing chiefly to trade depression."

The National Federated Electrical Association announces that in view of the revised rates of wages for journeymen which came into operation on the second pay day in June for the pay period covered by that pay day, the corresponding rate for mates under the London agreement is 1s. 5½d. per hour.

Electric labour-saving appliances, having a retail value of nearly $1 000 000 000, were sold in the United States last year, establishing a new high record and a material advance over 1928. The 1929 total was $925 000 000, as compared with $813 000 000 in 1928. A notable feature of the year was the advance made by electric refrigerators, of which 630 000 were sold, with a retail value of $181 175 000. The 1928 total was 468 000. In each case the figures cover only domestic units. The demand for electric exercisers reached a total of 70 500, as compared with 15 000 the year before. Health lamps also registered a big increase, with a record total of 250 000, valued at nearly $10 000 000. Electric irons continued to hold their lead in the greatest number sold, more than three million having gone into the country's homes.

Work has now commenced on the construction of the new Chats Falls power plant on the Ottawa River. This project is one of the largest hydro-electric power developments at present under construction in Canada. It is a joint undertaking of the Ontario Hydro-Electric Power Commission and the Chats Falls Power Co. The fact that the Ottawa River is an interprovincial stream, forming the boundary between the Provinces of Ontario and Quebec, accounts for the division of interests. The Ontario Concession is entitled to the power developed from the Ontario half of the river, while the Chats Falls Power Co. has the privilege of developing the Quebec section. The joint power house will contain eight turbines, each rated at 28 000 H.P., or a total of 224 000 H.P. Provision will also be made for the later installation of two more similar units, so that eventually the development will have a capacity of 280 000 H.P.

PERSONAL.

SIR William Bragg has been elected a corresponding member of the Vienna Academy of Sciences.

Mr. H. B. Sharpe, late transport manager to Rotherham Corporation, has been appointed to Morecambe.

Mr. R. Borlase Matthews has been appointed one of the judges of the implements entered for the Silver Medal of the Royal Agricultural Society of England at the forthcoming Manchester Show.

Mr. C. G. Morley New, borough electrical engineer, Cardiff, is on the short list for a similar appointment under Nottingham Corporation, at a commencing salary of £1 750. Mr. New's present salary is £1 300.

At the business meeting of the Electrical Contractors' Association of Scotland last week, the following office-bearers were elected for the ensuing year: President, Mr. D. H. Morris, Dundee; vice-president, Mr. Henry Meighan, Glasgow; secretary, Mr. Walter Finlay, W.S., 55, Frederick Street, Edinburgh.

Mr. F. Massingberd Rogers, Sir Edward Hilton Young, Mr. Percy Horsfall and Col. Wade Hampton Hayes have joined the board of the English Electric Co., and, in accordance with the scheme for reorganization of the capital of the company, the following directors have resigned, viz., Sir Charles E. Ellis, Sir John A. F. Aspinall and Lieut.-Col. Sir John H. Mansell.

With reference to the statement in our May 16 issue, page 621, to the effect that the Leyton Town Council had increased the salary of the borough electrical engineer and manager, the name of Mr. J. W. Speight was incorrectly given. The borough electrical engineer and manager at Leyton is, of course, Mr. J. Wetherell, and the increase in salary refers to him.

The President of the Board of Trade has appointed Ald. E. B. Lewis, President of the National Chamber of Trade, as an additional member of the Committee recently set up under the chairmanship of Lord Chelmsford, to examine the present situation as regards the British Industries Fair, and to consider what means can be adopted to increase still further its utility to British trade.

At the first meeting of the new committee of the Association of Consulting Engineers, held last week, Mr. A. H. Dykes, who has for 21 years acted as honorary secretary, was appointed chairman of the committee for the ensuing year, and Mr. S. R. Raffety (Messrs. Rofe and Raffety) was appointed acting honorary secretary during Mr. Dykes's term of office. The address of the office will remain 11, Victoria Street, Westminster, S.W.1.

The Institute of Transport announces that the Council has elected the undernamed to take office at October 1, 1930: President, Sir Arthur Stanley; Past Presidents to serve on the Council, Messrs. R. H. Selbie, Roger T. Smith, Sir Henry P. Maybury, Colonel Sir Joseph Nall, Air Vice-Marshal Sir W. Sefton Brancker, and Sir Josiah C. Stamp. Vice-Presidents. Messrs. A. L. Barber, R. Bell, Sidney E. Garcke, R. J. Howley, J. H. Follows and D. J. Owen. Hon. Treasurer, Sir Henry P Maybury.

Mr. C. C. Paterson, who has been nominated as President of the I.E.E.

The new president nominated by the Council of the I.E.E. is Mr. C. C. Paterson, the director of the research laboratories of the G.E.C., Wembley, and the new vice-president, Col. R. K. Morcom, a director of Belliss and Morcom.

At a meeting of the Senate of the University of London, last week, Prof. J. K. Catterson-Smith was appointed to the University Chair of Electrical Engineering tenable at King's College. Since 1923 he had been Professor and Head of the Department of Electrical Engineering at the Indian Institute of Science, Bangalore, of which he has also officiated as director. At the same meeting of the Senate Prof. H. R. Robinson, of University College, Cardiff, was appointed to the Chair of Physics of the East London College.

The Electricity Commissioners have appointed Messrs. C. D. Taite (chairman), M. H. Adams, H. K. Beale, J. Bruce, A. N. East, A. Holmes, W. Innes, A. B. Owles, S. L. Pearce, T. Roles, W. C. P. Tapper, E. R. Wilkinson, and Alderman W. Walker to be a committee, with Mr. C. S. Jenkins as secretary, to consider and report upon the measures which have been taken, both in this country and abroad, to obviate the emission of soot, ash, grit and gritty particles from the chimneys of electric power stations. The committee held their first meeting on June 2.

Mr. H. Savage, whose retirement is referred to below.

Mr. Henry Savage, who retired from the position of manager of the North Woolwich works of W. T. Henley's Telegraph Works Co., Ltd., after 40 years' service, on June 7, was the recipient of a presentation at the works on June 4. Sir George Sutton, the chairman of the company, who was unable to be present, wrote expressing his regret both at his inability to be there and at the departure of Mr. Savage. He stated that he was glad to be able to include himself as a fellow-worker of Mr. Savage, and he wished that the company could have had a few more years of his life at Woolwich. The presentation consisted of an epidioscope and a pocket wallet to Mr. Savage, and a fitted leather dress case and a writing case to Mrs. Savage. These gifts were subscribed for by the staff and workpeople at North Woolwich, and staffs at the city office and Gravesend works. Mr. Percy Rosling, the company's general manager, presented the gifts, and in doing so mentioned incidentally that when Mr. Savage commenced with the company as a junior, he (Mr. Rosling) was his first immediate chief. It was an achievement of considerable merit to have entered the company's service as a junior and to have reached the position of the manager of the works. Mr. Ernest Lefeaux, assistant works manager, occupied the chair and made the presentation to Mrs. Savage on behalf of the staffs and workpeople. Incidentally, Mr. Lefeaux has been appointed by the company to take over the works managership at North Woolwich. Mr. Charles Andrews, on behalf of the hourly-paid workers, paid a tribute to Mr. Savage for the smooth manner in which he had controlled the employees at Woolwich, and for the interest he had taken in running the sick club, the bowls club and other industrial and social functions. He mentioned that during the course of his managership there had never been the least industrial friction, leaving out of consideration the general strike in 1926. In acknowledgment Mr. Savage said there were various reasons for his retirement, but they were purely personal and voluntary. The management did not wish him to leave and he had no difference with the company, management, staff or the workpeople. He paid tribute to the foundation work of his predecessor, Mr. Robert J. Hatton, now a director of the company, to the board of directors and management for the help they had given him in providing him with adequate finance for new buildings, machinery and apparatus, and to his colleagues at the works, without distinction, for the manner in which they had co-operated with him. Mr. and Mrs. Savage are shortly leaving for a long sea voyage, expecting to be back home in January of next year.

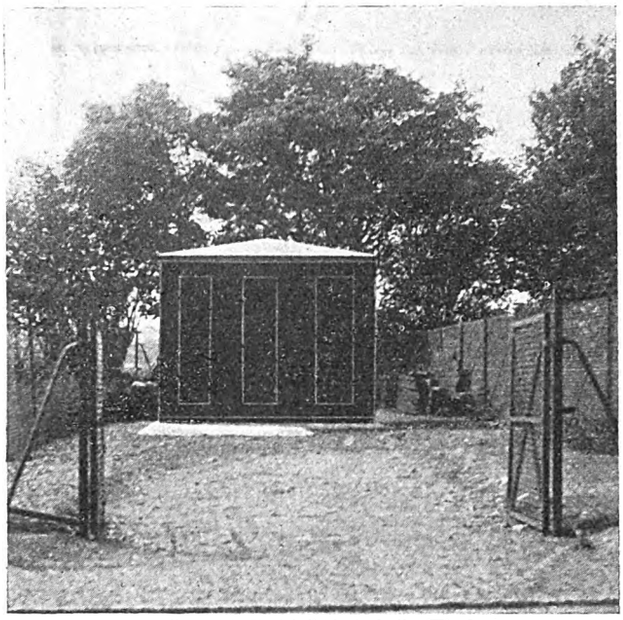
RURAL ELECTRIFICATION.

Inauguration of Rural Supply at Winchester.

THE inauguration ceremony of the scheme to supply with electricity the Parishes of Twyford, Compton and Shawford in the Rural District of Winchester was held in the Parish Hall at Twyford on May 21.

The Chairman of the Winchester Electricity Committee (Alderman Johnson) presided, and among those present were :



One of the "English Electric" kiosks in the Winchester area.

the Mayor and Mayoress, the city electrical engineer (Mr. R. Ayton), Mr. A. M. E. Maylett (representing W. T. Henley's Telegraph Works Co., Ltd., the principal contractors) and members of the Electricity Committee. A large number of residents of the neighbourhood were present in the Hall at the invitation of the Committee, to watch the ceremony of switching on the current, which was performed by the Mayor.

Mr. Maylett presented to the Mayor, on behalf of his firm, a handsome silver electric table lamp with ornamental shade as a memento of the occasion.

Tea was then served to the visitors and afterwards they were invited to inspect a selection of domestic electrical accessories and appliances which were ranged on stands round the Hall.

For the purpose of this rural electrification scheme, energy is purchased in bulk from Southampton Corporation, who deliver it at 11 000 V, three-phase, 50 cycles, to a switching and metering kiosk supplied by the English Electric Co., Ltd., situated at the southern extremity of the Winchester supply area. From this point the current is transmitted by overhead line to the outskirts of Twyford, whence it is carried by underground cable to two transformer kiosks, also supplied by the English Electric Co., Ltd., situated in Compton and Twyford, respectively. These kiosks are provided with oil switches with overload and leakage trips, isolating switches, low tension distribution units of Henley manufacture, and 100 kVA transformers, though space has been allowed for the installation of 300 kVA transformers when they are warranted by the growth of the load.

Low tension distribution is 4-wire, three-phase, 230–400 V, and is carried out generally by overhead lines though in some cases it has been necessary to lay underground cables.

The whole of the overhead work was carried out by W. T. Henley's Telegraph Works Co., Ltd., h.t. and l.t. cables were supplied by the Enfield Cable Works, Ltd., the laying and jointing being done by the Electricity Department's own staff.

NEW TELEPHONE CARD.

We have received a copy of a " Telephone Card " which has been prepared for the North Metropolitan Electric Power Supply Company (the Northmet Company). The card offers a handy means of recording important numbers, gives the telephone number of the nearest Northmet showroom, and can either stand at the side of the telephone or hang from the mouthpiece. A copy of the card will be sent at an early date to all Northmet consumers who are telephone subscribers.

ELECTRIC TRACTION.

Results of Trial Runs with New High Power Electric Locomotive of the P.L.M.

THE Oerlikon Company recently supplied to the P.L.M. Railway Co. four express locomotives which, with their one hour rating of 5 400 H.P., claim to rank as the most powerful single locomotives ever built ; they are for operation with d.c. at 1 500 V, and are now in use on the Mt. Cenis line. The locomotives in question have been the object of special interest on the part of engineers, so much so that the Midi Railway approached the P.L.M. Railway with a view to obtaining the loan of one of these locomotives for the purpose of trial runs. The tests were to be carried out with a trailing weight of about 900 tons at a speed of 120 km./hour (75 m.p.h.) on the section Bordeaux-Bayonne (197·6 km. = 122·7 miles), which is equipped with overhead contact wire. This line has frequent gradients and inclines, with values up to a maximum of 1 in 182, and long straight stretches up to 45 km. (about 30 miles) in length, which are only interrupted by curves of large radius, the latter being only in exceptional cases less than 800 m. (874 yards).

On February 24, shortly after its arrival at Bordeaux, the locomotive was run light over the section Bordeaux-Morcenx (108·5 km. = 67·4 miles) at speeds up to 120 km./hour (75 m.p.h), and, on the return journey it was used for hauling an express train of about 200 tons. During that run, the commercial speed attained was 96 km./hour (59.6 m.p.h.), without this necessitating the use of the parallel connection of motors. On the following day, a train representing a trailing weight of 600 tons, and consisting of 16 four-axle coaches, was hauled. During this run the following readings were taken on the locomotive instruments :—

Connection of motors.	Total current amps.	Pressure Volts.	Output at Wheel rim H.P.	Speed km./hour	(m.p.h.)
Parallel	2 000	1 350	3 270	92	(57)
Parallel with field reduction of—					
45%	1 920	1 300	3 030	107	(66)
30%	1 720	1 320	2 760	112	(69)
45%	1 920	1 250	2 900	115	(71)

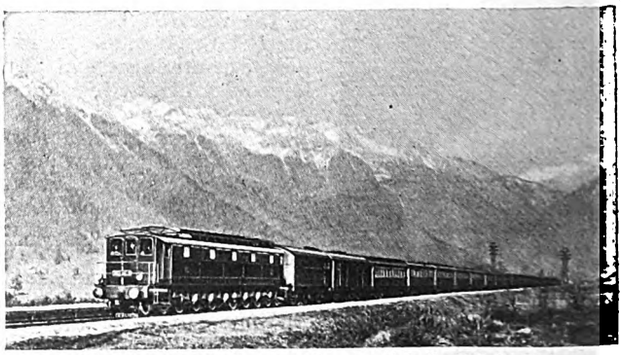
The locomotive soon gained the confidence of the Midi Railway authorities, and was transferred to the regular service, in which connection it was used for hauling the fastest express trains with trailing weights up to about 435 tons.

Work on the permanent way and signals caused some long stoppages. In order to make up for lost time due to these causes, actual speeds of 120 km./hour (75 m.p.h.) had to be maintained over nearly the whole section—197·6 km.

During these runs a few readings were taken on the locomotive instruments ; the values obtained are given in the following table :—

Connection of motors.	Total current amps.	Pressure Volts.	Output at wheel rim H.P.	Speed km./hour.	(m.p.h.)
Parallel-series with field reduction of—					
45%	1 440	1 450	2 530	115	(71)
45%	900	1 600	1 740	102	(63)
Parallel-series with full field ..	1 170	1 500	2,130	118	(73)
" " " ..	1 080	1 490	1 950	120	(74)

It may be noted that it was not necessary to resort to the parallel connection of motors for obtaining the specified speed with the load in question. As heavier loads were not provided for, in the case of ordinary express trains, special trains were formed with a trailing weight of 600 and 800 tons. Even with these heavy loads it was possible to reach speeds up to 120 km./hour (75 m.p.h.). A single pantograph was used for collecting current at all speeds up to about 1 800 A, two collectors being utilised only above that value of current.



One of the electric locomotives recently supplied to the P.L.M. Railway.

FARADAY CENTENARY.

Progress of Arrangements for Celebration in September Next Year.

As a result of the work of the Committees appointed by the Royal Institution and the Institution of Electrical Engineers to act jointly in the arrangements for celebrating in 1931 the centenary of Michael Faraday's discovery of electro-magnetic induction, a scheme has been drawn up and has received the approval of the Managers of the Royal Institution and of the Council of the Institution of Electrical Engineers. The arrangements will include a Faraday Exhibition to which the public will be admitted for ten days, and here will be shown reproductions and illustrations of Faraday's actual experiments, prepared by the Royal Institution, and including a display of some of the historic apparatus. The Institution of Electrical Engineers, the Federal Council for Chemistry, and the representative organisations of the electrical and chemical industries co-operating with them, will illustrate by means of special exhibits the development of electrical and chemical science and industry in all branches which have their origin in Faraday's work. Thus will be illustrated, in a unique display, the fruition of the work of one of the world's greatest natural philosophers. The exhibition will be held in the Albert Hall, which is particularly well suited for the type of exhibition proposed, and will be open to the public from about September 23 to October 3. The draft programme of the arrangements which is still subject to alteration, is as follows :—

SEPTEMBER 21.—Afternoon : Reception of foreign and other delegates at the Royal Institution. Evening : Faraday Commemorative Meeting at the Queen's Hall.

SEPTEMBER 22.—Morning : I.E.E. Summer Meeting begins with Joint Conference of the I.E.E. and allied associations. Afternoon : Visits and social functions. Evening : Conversazione by the Royal Institution (for reasons of space only a limited number can be invited). I.E.E. Conversazione at the Albert Hall, at which the exhibition will be opened.

SEPTEMBER 23.—Morning : I.E.E. Summer Meeting and Conference continued. Opening of Faraday Exhibition to the public. Evening : Opening meeting of the British Association at Westminster Hall.

FOLLOWING DAYS.—Continuation of I.E.E. Summer Meeting and British Association meetings.

The exhibition will be managed by the British Electrical Development Association for, and in the name of, the Institution of Electrical Engineers, and the various associations and organisations connected with the electrical industry are being asked to co-operate by providing the exhibits.

Faraday Celebration Committees.

CALLED BY THE ROYAL INSTITUTION : The Duke of Northumberland, Sir Robert Robertson, Sir William Bragg, Mr. J. S. Highfield, Mr. Charles H. Merz, Major C. E. S. Phillips, Sir Arthur Keith, Sir James Jeans, Dr. F. E. Smith, Lt.-Col. K. Edgcumbe, Prof. H. E. Armstrong, Prof. T. M. Lowry, Major O. J. R. Howarth, Mr. T. Martin.

HOSPITALITY SUB-COMMITTEE : Major C. E. S. Phillips, Sir William Bragg, Mr. J. S. Highfield, Col. Sir Thomas F. Purves, Mr. L. B. Atkinson, Dr. F. E. Smith, Mr. O. J. R. Howarth, Mr. Emile S. Mond.

CALLED BY THE INSTITUTION OF ELECTRICAL ENGINEERS : Col. Sir Thomas F. Purves, Commander Rollo Appleyard, Mr. L. B. Atkinson, Capt. J. M. Donaldson, Mr. D. N. Dunlop, Capt. P. P. Eckersley, Lt.-Col. K. Edgcumbe, Mr. H. Willoughby Ellis, Mr. A. J. Fuller, Mr. E. Leete, Mr. J. T. Mould, Mr. C. C. Paterson, Mr. F. W. Purse, Mr. C. Rodgers, Lt.-Col. W. A. Vignoles, Mr. B. Welbourn, Mr. A. P. Young.

EXHIBITION AND PUBLICITY SUB-COMMITTEE : Lt.-Col. W. A. Vignoles, Col. Sir Thomas F. Purves, Mr. H. Willoughby Ellis, Mr. J. T. Mould, Mr. C. Rodgers, Sir William Bragg, Sir Robert Robertson, Prof. H. E. Armstrong, Mr. W. G. Plummer, Commander Rollo Appleyard, Mr. A. P. Young, Mr. T. Martin, Mr. P. F. Rowell, Mr. C. Holmes Waghorn, Mr. J. I. Bernard.

Plymouth Corporation has asked the Surveyor to obtain alternative schemes for the lighting of the new roads on the Central Park. The Hospital Committee has deferred consideration of tenders for the supply of a new battery installation at the Mental Hospital, and the Electrical Engineer has been asked to submit a report and estimate of the cost of providing an alternative method of generation.

CHURCH LIGHTING.

THE electrical installation recently carried out at the Southwell Minster by A. Dean and Co., Ltd., of Victoria Street, London, S.W.1, furnishes direct evidence of what can be accomplished by skilled electric lighting engineers.

Illustrating the new lighting effects at the Southwell Minster.

According to tradition, the church dates back to A.D. 625. Its history, however, is obscure until some 300 years later, but there is little doubt that the existing Norman nave dates from A.D. 1108. We mention this fact because in the work of installing electric light every possible care had to be taken to preserve not only the masonry, etc., but also to avoid any possible offence to the eye. The scheme of lighting was planned and carried out under the supervision of Mr. W. D. Caroe, of Great College Street, Westminster, S.W.1., acting on behalf of the Ecclesiastical Commissioners. The lighting of the nave, central tower and chancel incorporates the G.E.C. principle of flood lighting by means of silvered glass projectors equipped with 200 W white-sprayed Osram lamps. In all there are over seventy of these units installed in the Minster, thirty-two being employed for lighting the nave and central tower, and a similar number for the chancels. Those in the nave are concealed at clerestory level, 50 ft. from the ground, and are directed eastwards and downwards at an angle of 45°. This results in a softly diffused distribution of the lighting with ample illumination at pew level, and a pleasing form of reflected lighting on the roof. This illumination is supplemented in the transepts and aisles by a system of unconcealed lighting in lantern fittings designed by the architect. That the building has lost nothing in its beauty by this modernising is shown by the above photograph.

LEGAL INTELLIGENCE.

Well-known Brighton Electrical Contractor and the Factory Act.

THE Brighton magistrates on June 7 delivered their judgment in the recently reported action in which Mr. H. J. Galliers, electrical contractor (and a former Mayor of the Borough) was summoned for failing to provide a guard rail and toe board for the protection of his workmen on a building at 81 and 82, King's Road, Brighton.

The governing point, according to the decision of the Bench, was whether on the date of the summons the building in question was a factory within the meaning of Section 105 of the Factories and Workshops Act, the machinery on the premises having been removed on March 11, which was about a week before the accident took place. The premises then ceased to be a factory within the meaning of the Act. The summons therefore failed and the action dismissed.

The Bench allowed Mr. Galliers ten guineas costs.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

LEYTON CORPORATION, June 13.—Re-wiring electric light installation at Farmer Road School. Particulars from the architect, Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.; deposit, £1.

STONE URBAN DISTRICT COUNCIL, June 13.—Re-wiring sewerage works. Specifications from the surveyor, Mr. W. R. Harlow, Stone, Staffs.

OSWESTRY CORPORATION, June 14.—Supply, erection, etc., of 3 core 11 000 V, paper insulated underground cable; l.t. 3 core, 4 core and 2 core, 400 V, paper insulated cable, service material, and link disconnecting boxes (specification No. 1A); e.h.t. 11 000 V, oil immersed, truck type switchgear, and 400 V, ironclad, air break switchgear (specification No. 2A); and one, two or three oil immersed, self-cooled, three phase, step down (11 000 V to 400 V) transformers (specification No. 3A). Specifications from Mr. H. W. Edwards, borough electrical engineer, 28, Oswald Road, Oswestry; deposit £2 2s. for each. All apparatus and materials to be of British manufacture and cable to be C.M.A.

WALLASEY CORPORATION, June 14.—Electric lighting work at New Brighton Ferry, including supply of switches, lamps, etc. Specification from the Ferries General Manager, Seacombe Ferry.

IRVINE CORPORATION, June 16.—Electric lighting work in connection with erection of (1) four blocks, each of four houses, and (2) 16 blocks, each of four houses, on Springbank Farm, Irvine. Specifications from Mr. A. R. Wilson, town clerk, Council Chambers, Irvine; deposit, £1 1s. for each.

LEEDS CORPORATION, June 16.—Supply of (1) 100 tramcar bodies; (2) 100 tramcar trucks, with wheels and axles; (3) 100 tramcar pneumatic brake equipments; (4) 100 tramcar electrical equipments. Specifications from Mr. R. L. Horsfield, general manager and engineer, Tramways and Transport Department, 1, Swinegate, Leeds; deposit £2 for each.

NOTTINGHAM CORPORATION, June 17.—Twelve months' supply of general stores to the electricity department. Forms of tender, etc., from the Engineer, Electricity Station, Talbot Street, Nottingham; deposit 5s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, June 17.—Supply and erection of double circuit, 33 000 V, overhead transmission line, supported by steel towers. Specification (No. 33/T/2), etc., from Mr. E. F. Hetherington, chief engineer and manager, West Midlands Joint Electricity Authority, Phœnix Buildings, Dudley Road, Wolverhampton; deposit 10s. 6d.

COVENTRY CORPORATION, June 18.—Pumping plant in duplicate, for the Brownshill Green Water Scheme—contract No. 4, each set including centrifugal borehole and force pump, with vertical electric motor and all accessories. Specification, etc., from Dr. H. Lapworth, 25, Victoria Street, Westminster, S.W.1; deposit £3.

EAST HAM EDUCATION COMMITTEE, June 18.—Electric light installations at Monega and Sandringham Schools. Specifications, etc., from Mr. F. R. Thompson, Education Office, Town Hall, East Ham, London, E.6.; deposit 10s.

MANCHESTER CORPORATION, June 18.—Heavy a.c. equipment, cables and lighting at new Children's Sanatorium, Abergele, North Wales. Specification from the City Architect, Town Hall, Manchester; deposit, £1 1s.

RICHMOND (SURREY) CORPORATION, June 18.—Borehole pump, with 35 B.H.P. electric motor; two horizontal pumps, with 80 B.H.P. electric motors; two ditto, with 65 B.H.P. electric motors; and two ditto, with 10 B.H.P. electric motors. Specification, etc., from the Water Engineer, Hotham House, Heron Road, Richmond; deposit, £5 5s.

SCUNTHORPE AND FRODINGHAM URBAN DISTRICT COUNCIL, June 18.—Wiring for electric lighting and power at Public Bath to be erected at Doncaster Road, Scunthorpe. Specificatin (D) from Mr. W. Farrar, engineer, Council Offices, Scunthorpe; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, June 19.—Supply and laying of 33 kV and other cables in connection with Central England Electricity Scheme. Specification (C.E.-G.C.3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

OLDHAM PUBLIC ASSISTANCE COMMITTEE, June 20.—Supply of electric lamps and fittings, for the Poor Law Institution. Tender forms from the Public Assistance Officer, Town Hall, Oldham.

BENFLEET URBAN DISTRICT COUNCIL, June 23.—Three vertical spindle centrifugal pumps, with electric motors and automatic control, etc. Specification from Mr. W. E. Blezard, 9, Victoria Street, Westminster, S.W.1; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, June 23.—Supply and erection of 66 000 V and other cables in connection with Mid-East England Electricity Scheme. Specification (M.E.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, June 27.—Supply and laying of pilot cables in connection with the Central England Electricity Scheme. Specification (C.E.-S.C.1), etc., from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, June 30.—Supply and erection of metering equipment required in the area of the Central England Electricity Scheme. Specification (C.E.-G.M.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

METROPOLITAN WATER BOARD, June 30.—Twelve months' supply of electric lamps. Form of tender (No. 24) from the Chief Engineer (Room 155), 173, Rosebery Avenue, London, E.C.1. Stamped, addressed envelope to be sent.

CARDIFF CORPORATION, July 1.—Supply of h.t. switchboard (Contract No. IV); h.t. switchboard (No. V); transformers (No. VI); and battery and charging plant (No. XV), for the Llandough Hospital, now in course of erection. Specifications from Messrs. Plevin and Jenkins, 4, Working Street, Cardiff; deposit £2 2s. for each. Only manufacturers on the King's National Roll are invited to tender.

EPSOM URBAN DISTRICT COUNCIL, July 1.—Sale and removal of two Lancashire boilers, by Edwin Danks, at the generating station, Church Street. Further particulars from Mr. H. W. Watts, resident electrical engineer, the Electricity Works, Church Street, Epsom.

BELFAST CORPORATION, July 5.—Manufacture, supply, delivery and erection of (*a*) h.t. armour clad switchgear (specification No. W.108); and the manufacture, supply and delivery of (*b*) transformer kiosks with h.t. and l.t. switchgear (specification No. W. 109); (*c*) static transformers (specification No. W.110). Specifications from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s. (returnable) for each specification.

SUNDERLAND CORPORATION, July 7.—Manufacture and supply of (1) paper insulated, lead sheathed cable for general main-laying requirements; (2) rubber insulated wire; (3) consumers' meters; and (4) gasfilled and vacuum lamps, for 12 months. Specifications, etc., from the General Manager, Electricity Department, Dunning Street, Sunderland; deposit, 10s. for each.

DUNDEE CORPORATION, July 12.—Supply of six 300 kVA outdoor type transformers. Specification from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 13.—Supply of 2 000 V switch units and l.t. switchboards (tender No. 1 649). (Reference B.X. 6 365.)

BULAWAYO MUNICIPALITY, June 13.—One 5 000 kW turbo-alternator, condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South

Digitized by Google

Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

MADRAS GOVERNMENT, June 15.—Complete electrical equipment of three 66/110 kV outdoor sub-stations, in connection with Pykara hydro-electric scheme. Specification (No. E.26) (price 30s.) and general conditions of contract (price 3s. 6d.) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4, on payment of the respective fees (not returnable).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of indicators (schedule No. C.588). (Reference B.X. 6 333.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of multiple twin cable. (Reference B.X. 6 349.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17.—Supply of loading coil pots. (Reference B.X. 6 350.)

CAPE TOWN MUNICIPALITY, June 18.—Supply of 1 000 steel tubular poles (specification No. 500/1930). (Reference A.X. 9 622).

MELBOURNE CITY COUNCIL, June 18.—Supply and installation of automatic electric signals for traffic control (contract No. 2 787). (Reference B.X. 6 421.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 19.—Supply of metal-clad, 2 000 V switchboard, for Bloemfontein workshops sub-station (tender No. 1 657). (Reference B.X. 6 402.)

INDIAN STORE DEPARTMENT, June 23.—Supply and erection of 11 000 and 400 V a.c. and 220 V d.c. switchgear, power and control cables, etc., at Shanan power house. Forms of tender (£3 15s., not returnable) from the Director General, Belvedere Road, London, S.E.1.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24.—Supply of 110 kV outdoor steelwork and switchgear for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

CAPE TOWN MUNICIPALITY, June 25.—Supply of single phase transformers (specification No. 495/1930). (Reference B.X. 6 378.)

EGYPTIAN MINISTRY OF THE INTERIOR, June 25.—Pumping machinery, electric motors, etc., for waterworks at Abou-Tig-Nekheila. (Reference A.X. 9 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of condensers (P. and T. 151/2 240). (Reference B.X. 6 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of 100 000 3¼ in. and 30 000 2 in. lead clips. (Reference B.X. 6 375.)

JOHANNESBURG MUNICIPALITY, June 26.—Electricity meters and time switches (contract No. 405). (Reference B.X. 6 449.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, June 30.—Supply and maintenance of an electric generating unit, with motors, transmission lines, etc., at Tor Quarantine, on the Gulf of Suez. (Reference B.X. 6 466.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 1.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 63. (Reference B.X. 6 443.)

POWER SECURITIES CORPORATION, LTD., July 1.—Supply of (*a*) 4—3 000 kVA transformers (specification E.28, price 15s.); (*b*) indoor 11 kV switchgear (E.23, price 22s. 6d.), for Pykara, Madras, hydro-electric scheme. Specifications (on payment of above fees and 3s. 6d. for general conditions of contract) from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

CAPE TOWN MUNICIPALITY, July 2.—Supply of paper insulated, lead covered, impregnated, lead sheathed and armoured cable. (Reference B.X. 6 426.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 8.—Supply of telephonists' telephones. (Reference B.X. 6 352.)

MELBOURNE CITY COUNCIL, July 9.—Supply of totally enclosed, metal-clad switchgear (specification No. 1 024). (Reference B.X. 6 401.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

NEW ZEALAND GOVERNMENT RAILWAYS, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

MELBOURNE POSTS AND TELEGRAPHS, August 19.—Supply and delivery of telephone jacks. (Reference B.X. 6 477.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 19.—Three single phase transformers, to step up from 22 000 V to 57 600 V between phases, for Penrose sub-station, Arapuni power scheme, section 308. (Reference B.X. 6 427.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 2.—Supply of 110 kV switchgear, steelwork and controlling equipment, for Mangahao power scheme. (Reference B.X. 6 452.)

A MAGNET scone plate at work in the confectionery department of Cooper's Stores, Liverpool.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 9.—Supply of 110 kV switchgear and controlling equipment, for Mangahao power scheme—section 217. (Reference B.X. 6 454.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 16.—Supply of 110 kV switchgear, steelwork and controlling equipment, for Mangahao electric power scheme (section 221). (Reference B.X. 6 453.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 50 kV switchgear and steelwork, for Arapuni power scheme—section 276. (Reference B.X.6 451.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 110 kV and 50 kV switchgear and protective system, for Arapuni power scheme (section 273). (Reference B.X. 6 450.)

Tenders Accepted.

HALIFAX CORPORATION.—F. Heighington, electrical work in sanitary conveniences, £70.

GLASGOW EDUCATION AUTHORITY.—H. M. Caldwell and Co., supply of electric lamps.

TOTNES CORPORATION.—Tangyes, Ltd., electric motor and centrifugal water pump, £128.

ROMSEY CORPORATION.—L. Groves and Co., electric light installation at Town Hall, £67.

CROYDON CORPORATION.—F. Wingfield, wiring at new switch house, £398. (Recommended.)

DUNDEE EDUCATION AUTHORITY.—J. Smith, electrical installation at Rockwell School, £2 571.

IPSWICH CORPORATION.—Ransomes, Sims and Jefferies, Ltd., supply of three trolley omnibuses.

MERSEY DOCKS AND HARBOUR BOARD.—Liverpool Electric Cable Co., Ltd., supply of electric cables.

WARRINGTOM CORPORATION.—H. Lilley, wiring 260 council houses at Westy estate, £6 1s. per house.

LEITH EDUCATION AUTHORITY.—R. Edgar and Co., electric light installation at new school, Wardie.

BIRKENHEAD CORPORATION.—English Electric Co., Ltd., supply of a 1 000 kVA transformer, £380.

LONDON COUNTY COUNCIL.—Alex. Hawkins and Sons, electrical installation at Tooting Home, £1 495.

AIR MINISTRY.—Siemens Electric Lamps and Supplies, Ltd., supply of automobile type lamps.

HOTEL EXCEL, NEAR BLACKPOOL.—P. J. Frampton, electrical work in connection with erection of new building.

TYNEMOUTH CORPORATION.—Adamson and Green, supply of switchboard at Preston Road sub-station, £85.

EPSOM URBAN DISTRICT COUNCIL.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of lamps.

WORK IN PROSPECT.

BATH.—Telephone exchange, Weston, for H.M. Office of Works, King Charles Street, London, S.W.

CATFORD.—Town Hall, shops and offices, to cost £126 944, for Lewisham Town Council. Particulars from the contractors, G. E. Wallis and Sons, Ltd., 11–12, Old Cavendish Street, W.

CATSHILL.—School for Worcestershire Education Committee. Particulars from the architect, Mr. A. V. Rowe, Worcester.

DARLINGTON.—Grammar School extensions, for the Education Committee. Particulars from the Borough Surveyor.

DERBY.—School (720 places), Nottingham Road, for the Borough Education Committeee. Particulars from the Director of Education.

New Shops and Showrooms.

DEWSBURY.—New shops and showrooms. Particulars, Mr. T. Blakeley, Town Hall, Dewsbury, borough architect.

DONCASTER.—New public baths. Particulars from Mr. R. E. Ford, Priory Place, Doncaster.

DOUGLAS (ISLE OF MAN).—Blocks of flats, for the Town Council. Particulars from the architect, Mr. J. E. Teare, 46, Athol Street.

DUNSTABLE.—Police station, for Beds County Council. Particulars, Mr. F. W. Smart, Bedford.

EVESHAM.—Senior School for Worcestershire Education Committee. Particulars, Mr. A. V. Rowe, Worcester.

HALIFAX.—Licensed premises, Haley Hill. Particulars from the architects, Walsh and Maddock, 10, Harrison Road.

HERNE BAY.—School (650 places), for Kent Education Committee. Particulars from the director of education, Mr. E. S. Davies, Maidstone.

HUDDERSFIELD.—Houses (31), Newsome, for the Town Council. Particulars from the Borough Architect, 26, Ramsden Street.

HUDDERSFIELD.—Shops and offices, Market Street. Particulars from the architect, Mr. J. Ainley, 55, New Street.

LANARKSHIRE.—Housing scheme (50), Harthill, for the County Council. Particulars from the Clerk, Glasgow.

MIDDLETON-IN-TEESDALE.—Co-operative stores. Particulars from the architect, Mr. J. Clayton, High Row Chambers, Darlington.

OSSETT (YORKS).—Houses (42), for Councillor Joseph Illingworth.

PRESTON.—Roman Catholic church (£15 000). Particulars from the contractor, Mr. John Dillon.

ROSSINGTON.—New houses (24). Particulars from Mr. W. R. Crabtree, Nether Hall, Doncaster.

ROTHERHAM.—Houses (20). Particulars from the builder, Mr. A. J. Pugh, Rawmarsh, nr. Rotherham.

ROTHERHAM.—Two schools, for the Education Committee. Particulars from the Clerk.

ROYSTON.—New school, 800 places. Particulars from the Education Architect, County Hall, Wakefield.

SANQUHAR.—Drill hall, for Dumfries-shire Territorial Army Association. Particulars from the Secretary, Dumfries.

SHELF.—Council houses. Particulars from Mr. G. R. Oddy, Ward's End Chambers, Halifax.

SLEAFORD.—Houses (50), Grantham Road, for U.D.C. Particulars from S. F. Clare, surveyor, Jermyn Street.

STRATFORD-ON-AVON.—Houses (24), for the Town Council. Particulars from the contractors, Wheeler and Mansell.

STURRY.—School (400 places), for Kent Education Committee. Particulars from the director of education, Mr. E. S. Davies, Maidstone.

SWANSEA.—Houses (50), at the Gorseinon housing site, for T.C. Particulars from J. T. J. Williams, "Penybryn," Alexander Road, Gorseinon.

TAVISTOCK.—New Grammar School, for T.C. Particulars from County Architect, 97, Heavitree, Exeter.

TWICKENHAM.—Houses (72), at Fielding Avenue, for T.C. Particulars from G. R. King, borough engineer.

WALTON.—Cinema, at corner of Queen Drive and Breeze Hill. Particulars from Mr. A. E. Shennan, architect, 14, North John Street, Liverpool.

WHITWOOD.—Proposed school, 500 places. Particulars from the Education Architect, County Hall, Wakefield.

WOMBWELL.—Extensions to printing works. Particulars from Mr. C. F. Moxon, Regent Street South, Barnsley.

YORK.—Extensions, County Hospital. Particulars from the architect, Mr. E. Stanley Hall, 54, Bedford Square, London, W.C.

YORK.—Various schools extensions. Particulars, borough surveyor, F. Spurr, Guildhall, York.

TRADE PUBLICATIONS.

SPECIFICATION No. A.410, dealing with transformers, has been published by CROMPTON PARKINSON, LTD., Guiseley.

"Marine Electrical Equipment" is the title of a new booklet published by CROMPTON PARKINSON, LTD., of Guiseley.

The FURSE WHOLESALE, Co., LTD., Traffic Street, Nottingham, has published list No. 25/20 of electrical supplies, apparatus and appliances.

Price list No. N.S.110 of the "Selco" carpet washer has been received from S. G. LEACH AND CO., LTD., 26/30, Artillery Lane, London, E.1.

MONEL WEIR, LTD., Cathgart, Glasgow, has sent us publication No. M.M.3 describing the applications of Monel metal and malleable nickel.

List No. A-600 dealing with the "All-Test" instrument for all a.c. tests has been published by CROMPTON PARKINSON, LTD., Guiseley.

The "Midworth" distant repeater is dealt with in catalogue No. 162 issued by EVERSHED AND VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.4.

BROOKHIRST SWITCHGEAR LTD., Northgate Works, Chester, has issued leaflet No. 315 relating to oil immersed synchronous motor starting panel, type S.70-10.

"'A.W.P.' Welds Under the Microscope" is the title of a new leaflet by ALLOY WELDING PROCESSES, LTD., Ferry Lane Works, Forest Road, London, E.17.

Specification No. A.516, dealing with "T.A.P." oil immersed, automatic fuse type, circuit breakers, has been issued by CROMPTON PARKINSON, LTD., Guiseley.

The RELAY AUTOMATIC TELEPHONE CO., LTD., Marconi House, Strand, London, W.C.2, has sent us a leaflet entitled "Take Care of the Seconds and the Hours will Take Care of Themselves."

"How to Make E.H.T. Joints" is the title given to a useful pocket book prepared and published by the engineering department of W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1.

We have received from the ELECTRICAL EQUIPMENT AND CARBON CO., LTD., 107/111, New Oxford Street, London, W.C.1, a copy of pamphlet K.P.4, giving details of the "K.P." tongs for cable drawing.

The CREDENDA CONDUITS CO., LTD., Oldbury, near Birmingham, has published list No. C.103/2/30 dealing with the "Credenda" conduit bender.

We have received from BRUCE PEEBLES AND CO., LTD., Edinburgh, a copy of leaflet No. 172, describing the company's marine type dynamos and motors. The issue includes many interesting photographs of installations afloat.

Leaflet No. 1 013, dealing with across-the-line type, automatic starters, with thermal overload protection, for squirrel cage motors, has been published by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London, E.C.4.

A particularly attractive list relating to the new stop watches introduced by VENNER TIME SWITCHES, LTD., of 45, Horseferry Road, London, S.W.1, has been received. The reference number of the list is X100, and the issue replaces list No. 28A.

BRITISH INSULATED CABLES LTD., Prescot, Lancs, have issued publication P.255, dealing with "Prescot" compound sealed service and joint boxes; P.F.68, relative to "Coraline" soldering paste and replacing P.F. 52; and P.F.69, describing "Helsby" jointing materials, this latter replacing H.92.

A Domestic List.

A special brochure, consisting of 32 pages of well-illustrated matter describing the "Hot-point-Maytag" electric clothes washer, wringer and ironer, has been published by the HOTPOINT ELECTRIC APPLIANCE CO., LTD., 24, Newman Street, London, W.1.

Two new publications of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, are leaflet No. 39/1-1, describing flame-proof motors, and 40/1-4, reprints of two articles by Mr. L. H. A. Carr, namely, "The Determination of the Efficiency of Polyphase Motors from Test Results" and "The Circle Diagram of the Induction Motor."

We have received from AEONIC RADIO, LTD., 90, Regent Street, London, W. a newly issued catalogue dealing with lighting plants, battery charging equipment, theatre, marine, factory and power station switchboards, moving iron and coil instruments, automatic battery cut-outs, shunt regulators, resistance units, quick-break switches, charge and discharge switches, replacement fuses, and dynamos and motors.

CABLES AND RADIO.

Views on Electrical Communication at Imperial Press Conference.

THE first technical session of the Imperial Press Conference was held on June 5th at Grosvenor House, London. The Postmaster-General, Mr. H. B. Lees-Smith, outlined the overseas and Imperial services carried on by the Post Office, and Sir Basil Blackett, chairman of Imperial and International Communications, Ltd., spoke on "Empire Communications and the Empire Press."

The Postmaster-General, referring to the recent opening of a picture telegraphy service between London and Berlin, said the Post Office was now conducting similar services with Frankfort, Munich, Copenhagen, and Vienna, and extensions to other continental cities were under consideration. He had no doubt that before many years picture telegraphy services would be developed between all the principal countries of the world. It was an example of the exceeding modesty of this country in general, and the British Post Office in particular and its aversion to self-advertisement, that there was very little knowledge of the fact that this country possessed at Rugby the largest and most powerful wireless station in the world. In January, 1927, the Post Office began the Transatlantic wireless telephone service between London and New York. The service carried conversations ranging from 300 to 600 a week, and arrangements were in preparation by which in due time similar services would be provided to the Dominions and the other chief countries of the world. The public use of the Australian service, opened a month ago, had been encouraging, and the number of calls had been higher than was expected in the early days of the service.

As a result of the link established by the London and New York service, a subscriber in Vienna could speak to Montreal, provided his message went through Rugby. They had quietly and unostentatiously secured for this country a very important position in the system of long-distance telephone services of the world and enabled the subscriber to a British telephone to communicate with 90 per cent. of all the telephone subscribers in the world. They had started on a task of holding together an Empire of which the political and constitutional bonds were looser than at any previous time.

Sir Basil Blackett said it was a great disappointment to him and his company when the Post Office in this country refused their offer to co-operate with them in providing the wireless link for the overseas telephone service. He did not believe it would be found to be in the true interest of the country and the Empire that there should be competition between Government-run overseas telephone services and telegraph services operated by the Communications Company, especially constituted as it was as a public utility company under considerable Government control, any more than it was found desirable to continue the position that had developed in 1928 when Government-operated beam wireless services were competing with cable services operated both by Government and by companies. He believed the future would prove it to be entirely irrational and economically and scientifically wasteful to draw a hard and fast line between radio-electric telegraphy and radio-electric telephony.

At present they had negotiations in progress in India. Australia, and South Africa for amalgamating cables and wireless in those countries. They had to wait the conclusion of agreements with the Governments concerned, but as soon as the amalgamation took place they intended to reduce the cable rate to the level of the wireless rate.

With regard to the tendency to publish the same newspaper or a chain of newspapers at different points, he said the company had something to offer in facsimile transmission. A whole page of "The Times" had been transmitted experimentally across the Atlantic within half an hour, and full-page American newspaper advertisements had been transmitted commercially from the United States for simultaneous publication in European and American newspapers.

POLISH ELECTRICITY.

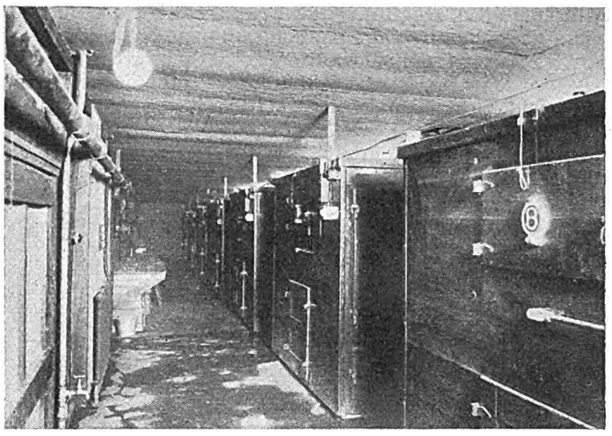
The Polish Government rejected last week the proposal made last year concerning a scheme to build a series of electric plants and transmission lines, using both fuel and water power. In return for this construction a 60 years' concession on the distribution of electric power was to be granted to a Mr. W. A. Harriman. He was to invest at least 25 000 000 dollars (£5 000 000) during the first 10 years of operation in Poland.

BUSINESS ITEMS.

THE EVER READY CO. (GREAT BRITAIN), LTD., Hercules Place, London, N.7, announce price reductions of many of their popular lines, special attention being drawn to radio batteries.

PALMER AND RILEY, wholesale wireless and electrical factors, of Accrington, have opened branch showrooms in King Street, Blackburn.

More than usual interest attaches to Captain Kingsford Smith's contemplated aeroplane flight across the Atlantic, in that a full wireless equipment will be carried. The installation comprises a three-valve receiving set capable of being tuned to a wide wave-band, viz., from 28 to 2 000 metres, a short wave transmitter operating on a wavelength of approximately 33 metres at 250 W, and another transmitter operating on a wavelength of 600 metres. The call sign of the "Southern Cross" is VMZAB and the transmission will be telegraphy on raw a.c. The receiving set installed is one specially made up for Captain Kingsford Smith prior to his flight from Australia as a result of co-operation between the General Electric Co., Ltd., and the New Systems Telephones Co., of Australia. It has been reconditioned by the G.E.C. Research Laboratories in preparation for the trans-Atlantic flight. It is equipped with Osram S.215, HL.210 and L.210 valves, and "Gecophone" headphones will be used. The batteries are of the "Magnet" type, while Osram lamps have been installed for lighting the plane.



SEVEN incubators, each of which will take 16 000 eggs, at the Absol Park Farm, near Felstead, Essex. This farm is the first of its kind in this country, and the method is the Buckeye. It is entirely electrical. Chicks hatched and bred by this means are at five days old equal in development to the naturally bred chick of eight days. Until the age of eight weeks, the chicks enjoy artificial sunlight day and night. At the end of that period they are brought for the first time into touch with natural surroundings. The electrical installation, which ranks as an engineering achievement, was carried out by Mr. E. A. Kett, of Saffron Walden. Henley Cables were used throughout.

The ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, London, W.C.2, has received two more orders for electric trolley buses from Bradford Corporation and from Messrs. Balfour Beatty for the Nottinghamshire and Derbyshire Traction Company. The order from Bradford is for 12 double-deck, top-covered vehicles, each having a seating capacity for 56 passengers. The chassis will be of the "English Electric" low-loading, three-axle type, with air-operated brakes on all wheels, rheostatic braking also being included. The equipment will consist of a DK.122, 100 H.P. twin-type motor, fitted with roller bearings and a contactor-type, foot-operated controller. This further repeat order from Bradford Corporation brings the total of trolley buses supplied by the ENGLISH ELECTRIC CO. to this undertaking to 52 vehicles. The order from Messrs. Balfour Beatty for the Notts and Derby-Ilkeston routes is for 6 single-deck saloon-type trolley buses, each having a seating capacity for 32 passengers, mounted on two-axle type chassis, with which is incorporated air-operated brakes on all four wheels and a system of rheostatic brakes is provided. The electrical equipment will consist of a DK.121, 60 H.P. motor, fitted with roller bearings and contactor-type, foot-operated controller. These vehicles will have the main entrance door at the near side front and an emergency exit at the rear of the body.

ELECTRICITY SUPPLY.

Unemployment Relief Work at Sheffield—Extensions at Glasgow, York and Colchester—Birkenhead and the E.C.A.—Wakefield and Domestic Appliances—Southwark (London) and the Price of Cable—Torquay Tramways—Eastbourne and the Central Board.

GLASGOW electricity department is to extend mains at a cost of £6 000.

The Nigerian Electricity Supply Corporation, Ltd., expects to commence to deliver power this month.

It has been decided that 103 gas lamps in King Street, Aberdeen, be superseded by electric lamps.

Balbriggan (Co. Dublin) is now lighted electrically by means of energy supplied by the Shannon power undertaking.

Sanction is sought by York Electricity Committee to borrow £7 845 for the provision of a switch house and h.t. switchgear.

Wakefield Electricity Committee has obtained sanction for a loan of £5 000 for the provision of domestic apparatus for hire.

Bradford Housing Committee is to wire 22 houses on the Clayton Estate subject to the tenants agreeing to pay 3d. a week increased rent in respect thereof.

Birkenhead Electricity Committee has agreed to receive a deputation from the Electrical Contractors' Association in regard to carrying out installation work under the assisted wiring scheme.

Liverpool Corporation announces its intention to refund, in certain cases, deposits held against electrical energy supplied. Deposits will not be returned in cases where circumstances make its retention desirable.

Eastbourne Electricity Committee has received the Central Electricity Board's proposals for a bulk supply of electricity to Eastbourne. The Electricity Committee seeks sanction to borrow £8 300 for further extensions.

At a recent meeting of ratepayers at Athboy, Mr. Delargy, of the Public Lighting Department of the Irish Free State Electricity Supply Board, delivered an address on the advantages of electric lighting, and the meeting decided in favour of such lighting.

Hereford Electricity Committee has reported that on the completion of the deed of transfer of the electricity undertaking to the Shropshire, Worcestershire and Staffordshire Power Co. the cash balances remaining in the hands of the Corporation amounted to £13 783 on capital account and £11 701 on revenue account.

Cheltenham Electricity Committee has further considered the proposed hire purchase scheme, and the Chairman reports that at a recent conference the local contractors passed a resolution supporting the scheme, and asked that it should be put into operation as soon as possible. The Committee has approved a draft hire-purchase agreement.

The Unemployment Grants Committee has approved a grant to Sheffield Corporation of 50% of the interest on approved expenditure out of loan not exceeding £38 499 to be raised to meet the cost of the changing over of l.t. mains in various districts and extensions of mains in new districts proposed to be carried out as relief works.

Irlam U.D.C. has decided to enter into an agreement with the Stretford and District Electricity Board for a supply of electricity to Irlam and Cadishead. The agreement provides that the Board will carry out the whole of the undertaking under a Provisional Order which the council has held for some years. The cost of the scheme is estimated at £42 000.

At last Saturday's meeting of the Torrington branch of the Devon Farmers' Union, the subject of electricity wayleaves was discussed. Mr. C. Hoskin, county secretary, stated that in a case at Exeter the Union's solicitor secured the inclusion in the agreement of a clause directing that any claim by a farmer should be assessed within seven days and paid within a month.

The Lighting Superintendent has submitted to Bolton Highways Committee estimates of the cost of lighting Victoria Road, Kiln Lane and the new road connecting such roads by gas and electricity respectively, as follows: for 42 lamps, 40 yd. apart, initial cost, £320 11s. 6d. for gas; £318 12s. 10d. for electricity; annual cost, £141 1s. 6d. gas and £151 10s. electricity. The Committee adopted the electric scheme, and authorised the necessary work.

Colchester Electricity Committee has authorised the Borough Electrical Engineer to arrange for the erection of l.t. lines in Great Holland, Rowhedge, Alresford and Weeley at a cost of £3 882. The Committee seeks sanction to borrow £20 000 for mains and services, and £20 000 for cookers, wiring, slot meters and fittings. Terms submitted by the Commercial Engineer and approved by the P.C. for lighting streets at St. Osyth by electricity have been approved.

An inquiry was held recently by Mr. J. H. Monroe, K.C., into the proposed electric lighting scheme for Omagh. Several witnesses said that there was no general demand for electric lighting, and that 75% of the merchants and tradespeople of the town were against the scheme. For the U.D.C., which has approved of the scheme, it was remarked that contemporary cases had shown that people who objected most turned out to be subsequent enthusiastic supporters of such schemes.

Schemes for extensions totalling 390 000 kW to generating plant are understood to have been sanctioned by the Electricity Commission. The capacity of the County of London Electric Supply Company's station at Barking and that of the Newcastle-on-Tyne Company's station at Dunston is to be enlarged by 150 000 kW in each case, while the North Metropolitan Company's plant at Brimsdown is to have an addition of 50 000 kW and a further 40 000 kW are to be added to the London County Council's plant.

The L.C.C. reports that the lighting of the operating theatre at Fulham Hospital should be improved. It regrets that it is not possible to secure a suitable lamp of British make, and it proposes to fix a lamp of French make at an estimated cost of £97 10s. An alternative system of lighting is necessary, and the council proposes that the current should be obtained from accumulators, for use if the supply from the hospital plant should fail. A new sterilising apparatus has recently been provided and storage accommodation is required.

Southwark (London) Electricity Committee reports that the existing contract for the supply of cable provides for a variation in prices according to fluctuations in the prices of copper and lead. During the past few weeks the price of copper dropped from approximately £83 per ton to prices in the neighbourhood of £60 to £65 per ton. Just prior to the meeting the price of copper was £60 10s. per ton, and as the lead market appeared to be on the rise, as a matter of urgency the committee gave instructions for the electrical engineer to order such cable as might be required during the next three or four months at the price then prevailing.

Torquay Electricity Committee has received a report from the Town Clerk pointing out that a draft agreement has been arranged between the corporation and the Torquay Tramways Co., Ltd., for the supply of current. (1) The corporation to supply the company with current at three points instead of at one as at present. (2) The company to pay the interest and redemption upon the costs of the apparatus and its installation at the two additional points of supply until the revision of the supply agreement. (3) That upon the revision of the supply agreement the interest and redemption then outstanding be taken into account in arriving at the price per unit to be paid for the current supplied.—The committee has decided to purchase a booster transformer and to connect at Paignton in order to facilitate the supply throughout the area served by the ring main, and application is to be made to the Electricity Commissioners for sanction to borrow £1 000 to cover the cost.—The committee is seeking sanction to borrow £7 500 to re-cable the urban district of Buckfastleigh.

An inquiry was opened last week at Buckie by Mr. H. Nimmo, on behalf of the Electricity Commissioners, into the electricity scheme promoted by the T.C. The Buckie Gaslight Co. and the Grampian Electric Supply Co. were amongst the objectors. Mr. James Keith, K.C., for the Council, said they did not anticipate any deficiency the first year or perhaps the second. Provost Merson said that there was a general demand for electricity and the local fishermen were unanimously in favour of the scheme. Mr. F. W. Purse, chief engineer to the London and Home Counties Joint Electricity Authority, said the scheme was sound and reasonable and would not hamper national development in any way. Mr. C. M'Ewan, engineer for the scheme, said provided sanction was given quickly, the supply could be on by December of this year. Mr. H. Partington, general manager of the Grampian company, said the company's new draft Order was not yet formulated, since, owing to the extent of the area, they had to prepare, and lodge, over 80 maps. They expected to make application in a month. They were prepared to put down a temporary station at Buckie until they got their Order, and would then go as far as the T.C. could go.

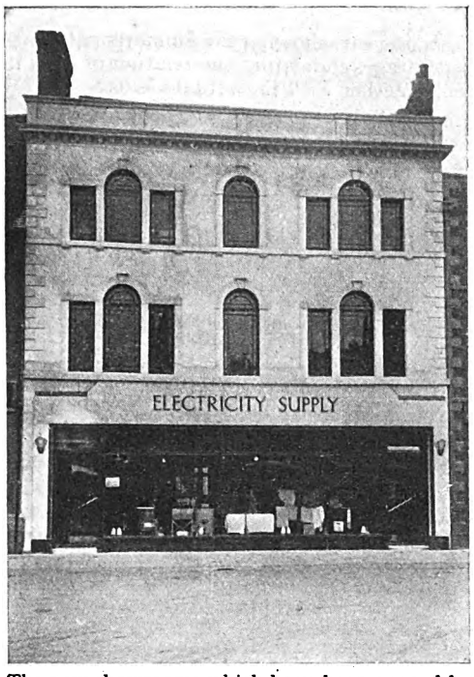
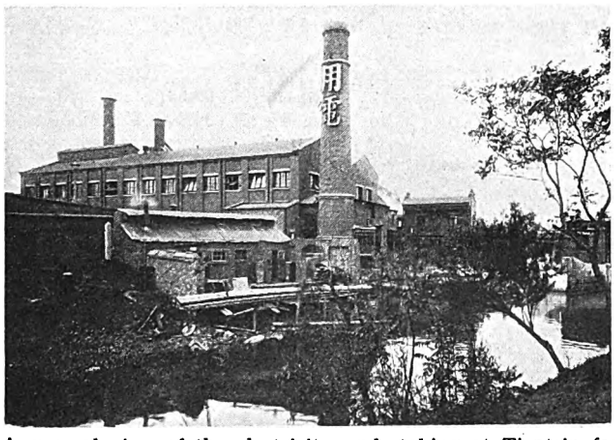
ELECTRICAL PICTURES OF THE WEEK.

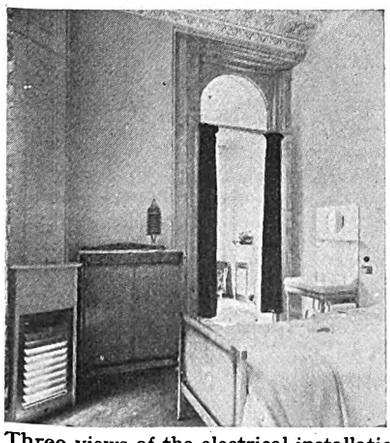


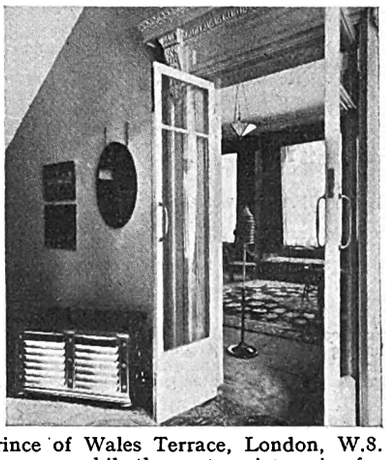
The new showrooms which have been opened by the Shropshire, Worcestershire and Staffordshire Electric Power Co., at Evesham, Worcestershire, in accordance with the company's campaign to increase the sales of electricity in the rural areas. The initial window displays were devoted to wash-boilers, water-heaters, irons, etc. The premises are artistically illuminated, and complete facilities are provided for demonstrations of domestic cookers, fires, and labour-saving appliances. Another part of the company's campaign in the rural areas this summer will be a series of exhibitions, lasting until September, in the nine counties which the company now serves.



A general view of the electricity undertaking at Tientsin for which Mr. A. M. Sillar is consulting engineer. Electrical development in Northern China is making steady progress in spite of the unrestful conditions prevailing in the country.

"Exide" battery service agents photographed at the Forth Bridge during the annual convention arranged by the Chloride Electrical Storage Co., Ltd., last month. Meetings were held at the North British Hotel, Edinburgh, from May 26 to 30.





Three views of the electrical installation at the recently opened Princes Court Hotel, Prince of Wales Terrace, London, W.8. The left-hand picture shows the heating arrangements provided in the bed and dressing rooms, while the centre picture is of a "Tricity" cooker in one of the kitchens. The tasteful appearance of the reception rooms will be appreciated from the view given in the right-hand photograph.

Directors recommend final div. on ord. shs. at rate of 4% making 7% net, carrying forward £28 085, agst. £16 880.

SHANGHAI ELECTRIC CONSTRUCTION CO., LTD.—Pft. for 1929, £170 763, plus £12 028 brt. in. To renewals £40 000, taxatn., £24 000; res., £20 901; Shanghai staff provident fund, £2 049; intm. div. of 5%, £30 000. Fin. div. 7½%, makg. 12½% for year, tax free. Fwd. £20 840. Operatg. pft. was Mex. $1 923 610, agst. Mex. $1 672 325.

INTERNATIONAL HYDRO-ELECTRIC SYSTEM.—The 6% conv. deb., due 1944, of the International Hydro-Electric System have been introduced on the New York Stock Exchange. The company is a subsidiary of the International Paper and Power Co., and one of the most important public utility concerns operatg. in the U.S.A. and Canada. Debs. now listed are part of the $30 000 000 ($6 000 000) issue made in New York last year.

AT a horse show and parade recently held at St. Helen's, British Insulated Cables Ltd., who had entered a horse and decorated wagon, were awarded the silver cup for the best decorated turnout, and were also the recipients of the first prize for the best horse in its class. The accompanying reproduction shows the B.I.'s novel and topical entry.

UNITED INDUSTRIAL ENTERPRISES CO. (VIAG).—Output of operatg. subsidiaries during year ended March 31, 1930, 3 437 930 000 kWh, agst. 3 087 654 000. The company controls the largest electricity supply system in Germany, and its principal subsidiary, Elektrowerke A.-G., which uses brown coal, produced 2 332 000 000 kWh, agst. 2 009 000 000; while East Prussian Works generated 59 679 620 kWh, agst. 39 266 700.

MADRAS ELECTRIC SUPPLY CORPORATION, LTD.—Rev. for 1929, £117 482, agst. £114 363. Net pft. £65 867, agst. £65 935. Fin. div. 5½% on ord., again makg. 8%, tax free. To res. for contingencies, £1 500; gen. res. £8 000 (making £110 000). Fwd. £7 444, agst. £6 906. Result of tramways workg. showed available blce. £10 444, after provisn. for deb. int. and sinkg. fund, depreciation and renewals. Div. paid on pref. shs., 6%. Fwd. £4 444.

ELECTRIC SUPPLY CORPORATION, LTD.—Net rev. for 1929, £55 902, agst. £53 563. To income tax acct. £2 500; directors' extra renumeratn., £2 125. To repairs, renewals and depreciatn. fund, £5 374 (makg. £75 000). Fin. div. on ord. shs. 7%, again makg. 11% for year. Fwd. £20 416, agst. £17 013. Exmouth undertakg. was disposed of as at Jan. 1, 1929, but actual transfer delayed until April, 1930. Company has disposed of its int. in Wellington company.

BRITISH AND INTERNATIONAL UTILITIES, LTD.—This company has been organised with initial cap. of £250 000 to acquire interests in leadg. electrical and public utility undertakgs. in United Kingdom and British Empire. The company has been registered in London by Messrs. Dawnay, Day and Co., Ltd., and the Compagnie Italo-Belge pour Entreprises d'Electricité et d'Utilité Publique, S.A., the Belgian subsidiary of the Adriatica Company of Venice (Societa Adriatica di Elettricita.).

NEW ENGLAND POWER ASSOCIATION.—Gross earngs. in 1929, $40 408 009, agst. $31 835 605. Total productn. for the Association Companies, 1 751 529 000 kWh, agst. 1 581 212 000 kWh. The increase of 10·8% was slightly greater than that reported by the entire industry in U.S.A. Association plants produced 1 402 446 000 kWh, or 80·1% of total, and remainder was purchased. Maximum load for year in primary production, 347 000 kW, and includg. surplus power, 381 000 kW. Association hydro plants generated 573 459 000 kWh, agst. 693 900 000, decrease being result of dry conditions durg. most of year.

on actions de jouissance, agst. coupon No. 11 for bearer shs., Fr. 3.84 ; on actions de jouissance by endorsement on certificate for reg. shs., Fr. 4.20.

Electrical Enterprises-Ludwig Loewe Co. ("Gesfuerel"). — Net pft. for 1929, RM.9 098 143, agst. RM. 5 806 636. Div. of 10% on RM. 76 474 000 has been declared. Cap. was increased at end of last year on occasion of merger of Electric Enterprises Co. with Ludwig Loewe Co. RM. 1 051 737 (£525 868) is carried fwd. Company's hldgs. are shown in blce. sheet at RM. 115 002 370 (£5 750 118), includg. investmts. in Compania Hispano-Americana de Electricidad (Chade), Transports, Electricite et Gaz (Constantinople), Compagnies Reunies Gaz de Electricite (Lisbon), and Soc. Internationale d'Energie Hydro-Electrique (Sidro).

Calcutta Tramways Co., Ltd.—Pft. on tramways for 1929, £127 397, agst. £130 643, after provisn. for depreciation, £64 000, and loss on omnibuses, £28 171. After crediting int. receipts and deductg. income tax, contributn. to redemptn. fund, pref. sh. div. and intm. ord. div., blce. is to be disposed of by placing £7 383 to staff providt. fund, paying fin. div. of 10d. p. sh. on ord. shs., makg. 1s. 2½d. for year, tax free (same rate as last year) and carrying fwd. £13 284, agst. £11 020. Tramways carried over 82 750 000 passengers, an increase of over 9 500 000, and omnibuses carried more than 7 000 000 passengers.

Companies Struck off the Register.—The following joint stock companies were struck off the register on April 4 : Airships Electric Advertising Co. ; Chippenham Electric Supply Co. ; Eureka Electric and Wireless Maintenance Guarantee Co. ; Flactem Wireless ; Melksham Electric Supply Co. ; Midland Electrical Tube Co. ; Scientific Products ; Trowbridge Electric Supply Co. ; Winchcomb Electric Light and Power Co. The following were struck off the register on May 16 ; Oxford Scientific Instrument Co. ; Regent Electrical Co. The following are to be struck off unless cause to the contrary is shown before August 2 : Alklum Electrics ; British Wireless Supply Co. (1924) ; Radio Equipment Co. ; Radio Phonopore and Electricals ; Standard Electric Sign Co.

Callender's Cable and Construction Co., Ltd.—Accounts for year ended Dec. 31, 1929, show bal. of £403 911 19s. 8d. from which there is to be deducted : Appropriation for depreciation of bldgs., plant and machinery, etc., £50 000 ; provision for income tax, £10 000 ; int. on deb. stock, £13 500 ; div. on 6½ % pref. shs. for year, £26 000 ; div. on 7½% pref. shs. for year, £30 000 ; contribution to pension fund, £10 000 ; leaving £264 411 19s. 8d., plus bal. from 1928, £570 246 5s. 7d., less transferred to res. a/c., £238 730 ; making a total available, £595 928 5s. 3d. Directors recommend payment of a div. on ord. shs. Nos. 1–1 116 000 at the rate of 15% per ann., being 3s. per sh., less income tax, of which 1s. per sh., less income tax, was paid on Nov. 2, 1929, and 2s. per sh., less income tax, will be paid forthwith, amounting to £167 400, leaving to be carried forward £428 528 5s. 3d.

Burndept Wireless (1928), Ltd.—In a circular issued to the shareholders, the directors state that the models of apparatus which the company displayed at the Radio Exhibition, in September last, were extremely well received by the trade, and the actual orders obtained very considerably exceeded in value those placed with the company at any previous exhibition. Unfortunately, however, difficulty was experienced with certain components purchased from outside sources, both on acct. of delay in delivery and of their failure, when delivered, to give satisfactory performance, which resulted in a considerable number of orders being cancelled, also in apparatus being returned after delivery. These difficulties have now been overcome, and while full advantage of the winter season was not obtained, ready and substantial sales are being effected of the apparatus now before the public.

Company Meetings.

L. M. Ericsson Telephone Co., Stockholm.—At the annual meeting last week the managing director stated that the amount of unfilled orders on the books of the company's Swedish factories increased by 13% during the past year, and the number of completed orders rose by 17%. For the foreign factories the figures were 35 and 11% respectively.

Dundee, Broughty Ferry and District Tramways Co., Ltd.—Mr. George Balfour, M.P., presiding at the recent annual meeting, said the profit for the year, after payment of income tax, secretarial and administration expenses, etc., and adding £1 169 brought forward, was £2 504. Deducting £1 116 for interest on debenture stock, there was left a balance of £1 388 9s.' This balance was, unfortunately, insufficient to justify the payment of a dividend on either class of share capital, and therefore the directors proposed to carry it forward to next account. The report was adopted.

East Anglian Electric Supply Co., Ltd.—At the meeting last week, Sir James Devonshire, chairman, said those shareholders who were present at their last meeting would remember that they were told of their large contract which had been secured for the supply of electricity to the British Acetate Silk Co. That supply had been brought into operation in the summer of last year, but after operating for a few months that company got into difficulties and the supply had to be disconnected. He understood that a winding-up petition had been presented to the Courts by other creditors. Unless the silk works were able to resume operations, it would appear probable that East Anglian Electric Co. would make a substantial loss, and the heavy cost of the line erected to supply them would be a burden until they could find other work for it. On May 15 of this year, the Electricity Commissioners made an Order which confirmed the company's statutory powers to supply electricity over a large part of Norfolk and Suffolk. Construction work during the next few years would involve the expenditure of over £500 000. A resolution to increase the capital of the company by a further £200 000 was carried at a subsequent extraordinary meeting.

Rangoon Electric Tramways and Supply Co., Ltd.—Mr. W. A. W. Dawn, presiding at the meeting on June 4, said the gross profit for the year was £178 040, against £175 599 ; £61 000 had been transferred to reserve for renewals. The net profit was £62 828, an increase of £4 770. The plant had been operated satisfactorily during the year, and there was a slight reduction in the cost of generation. The plant was sufficient to meet all foreseeable requirements for some years ahead. Notwithstanding the trade depression in Burma during the year under review the demand for current might be considered satisfactory, the increase in receipts from this side of their business being £12 236 over the previous year. Work was in hand on an extension of the supply to Bauktaw, and temporary supply to Kanbe was under consideration. A cable for a supply to the 15th mile on the Prome Road had been laid, and would be put into use as soon as the new wireless plant was ready. It was anticipated that the reconstruction of the tramway track on concrete foundations would be completed by the end of the next dry season. Plans were being got out for a new and experimental type of tramcar with a central entrance. The electrical re-equipment of the existing cars was being pushed forward ; the new equipment was a considerable saving in weight. The number of omnibuses had been increased in the course of the year. There was a slight improvement in the company's omnibus position. The department showed a loss, but the loss was less than that which occurred last year. The report was adopted and the dividends were approved.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

MORRIS, C. E., electrical engineer and radio expert, trading as BALDWIN'S, The Arcade, Littlehampton, Sussex. Creditors were called together on June 4 at the offices of Mr. A. E. Orbell, accountant and auditor, 6 and 7, Old Steine, Brighton. The statement of affairs showed liabilities of £400, all due to the trade, and assets (including stock £80, and book debts, estimated to realise £30) of £120, less £57 preferential claims, a deficiency of £337. Mr. Orbell reported that the debtor had been employed by various firms of electrical engineers and in April, 1929, he took over the business known as "Baldwin's" at The Arcade, Littlehampton, agreeing to pay £500 for the stock, goodwill, etc. The debtor estimated the value of the stock at about £250. Later he acquired a lease for seven years at a rental of £120 per annum. He had no capital of his own, but his mother paid the full purchase price and gave the debtor £50 as capital. Accounts were prepared for the six months to October 31, 1929, and they showed sales of £1 033, with a net profit of £31, while the debtor's drawings were £153. Recently an execution was levied on behalf of a judgment creditor, but the sheriff's officer withdrew and reported that the assets were insufficient to cover the rent. The creditors decided that the stock, fixtures, fittings, etc., should be sold and if there was any surplus after discharging the distrainable rent it should be received by Mr. Orbell, who was also to collect the book debts and distribute the proceeds *pro rata* amongst the creditors in settlement of their claims.

London Gazette, etc.

Winding-up Petition.

MAYFAIR ELECTRIC GRAMOPHONES, LTD. A petition for winding-up has been presented, and is to be heard at the Royal Courts of Justice, Strand, London, on June 23.

Company Winding-up.

"K. N." ELECTRICAL PRODUCTS, LTD. Meetings of creditors, June 20, 11.30 a.m.; and contributories, 12 noon, 33, Carey Street, Lincoln's Inn, London, W.C.2.

Company Winding-up Voluntarily.

TAYLOR (LEO), LTD. Meeting of creditors at the office of W. Latham, chartered accountant, 27, Birley Street, Blackpool, on Thursday, June 12, for the purpose, if thought fit, of nominating a liquidator and of appointing a committee of inspection.

Bankruptcy Information.

TUCKER, Joseph, 30, Lower Ashley Road, formerly 876, Filton Avenue, Bristol, trading as the Bristol Radiator Co., wireless dealer. Receiving order June 4. Debtor's petition.

Application for Discharge.

BAYNES, Maudslay, lately trading with another at 96, Regent Street, London, W.1, as Langham Radio, wireless manufacturers. Hearing, July 4, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Partnership Dissolved.

THE VENUS RADIOPHONE CO. (HARBURN, Frank Kilner, and THORNTON, John Tyne), radio engineers, Palace Hotel Buildings, Kirkgate, Huddersfield, by mutual consent as from May 31, 1930. Debts received and paid by J. T. Thornton, who continues business.

Bankruptcy Proceedings.

CLEMINSON (M.), LTD., wholesale merchants in electrical and wireless goods, 5, 6 and 7, Dysart Street, Finsbury Square, London, E.C. Under a winding-up order made in this case on May 5, on a creditor's petition, the statutory meetings were held last week, at the Board of Trade Offices, Carey Street. It appeared that the company was incorporated in December, 1925, with a nominal capital of £3 500, all of which had been issued. Shares to the number of 1 200 were subscribed for in cash. The directors had been Charles E. Cleminson, Nikolaus Brenz and James W. Rochester, but Brenz resigned on June 11 of last year. Cleminson had stated that he began business in Bishop Auckland in March, 1923, and he traded as a wholesale merchant chiefly in electrical goods. In September, 1926, the business was removed to London, and it was taken over by the company as from December 31 following. The purchase price was £2 348, which was satisfied by the issue of £2 300 in shares, and as to the balance in cash. The company's business was originally carried on at 4, Milton Street, City, and it chiefly consisted of the purchase and sale of electrical goods and wireless

Digitized by Google

parts obtained from Germany. The company also acted as agents for certain German firms, but it bought and sold the goods for its own account. In December, 1927, it took the premises in Dysart Street, City. The turnover during the perod of thirteen months ending January 31, 1928, amounted to £42 495, on which there was a gross profit of £4 560, but a net loss of £599. During the subsequent period ending January 31 last, the turnover amounted to £46 949, on which there was a gross profit of £2 974, but a net loss of £2 198. The statement of the company's affairs had not yet been received, but the gross liabilities had been estimated at £13 860, of which £10 860 were due to unsecured creditors for goods supplied, and the balance represented the approximate amount of outstanding bills given by the company. The assets were valued at £440. Cleminson had attributed the failure of the company to its having to meet bills, to bad debts and to goods being sold at an insufficient margin of profit. In the opinion of the Official Receiver, the failure was also due to the fact that the overhead charges were much greater than the turnover and gross profit justified. The meetings passed a resolution for the appointment of Mr. F. S. Salaman, C.A., 1 and 2, Bucklersbury, City, as liquidator of the company.

M.E.D.A.S., LTD., electrical, radio, lighting and heating engineers and contractors, 185, Hammersmith Road, London. In the compulsory liquidation of this company the Official Receiver has issued a summary of its statement of affairs, showing liabilities £2 861, of which £2 021 are expected to rank, and estimated assets £840, absorbed in payment of preferential claims and part payment of four debenture holders. In his accompanying observations the Official Receiver reports that the company was registered on January 11 of last year with a nominal capital of £3 150, its objects being to take over as a going concern the business which had been carried on by A. C. L. Covell and D. J. Quenzer at the above address. In January last certain creditors were pressing the company for payment, and two of them began proceedings and obtained judgment. One creditor levied execution, and on January 29 the debenture holders appointed a receiver, who entered into possession, and the execution was withdrawn. He reports that up to the present he has not been successful in obtaining an offer for the business, and assets, and that there is no likelihood of enough moneys being realised to meet the debenture holders' claims. Mr. O. G. Sunderland, C.A., 15, Eastcheap, City, has been appointed liquidator.

MULLER, Moses Aaron, 17, Duncan Terrace, Islington, London. This debtor carried on business as an importer and merchant, dealing chiefly in electrical goods, and a sitting for his public examination was held in the London Bankruptcy Court last week before Mr. Registrar Mellor. The statement of the debtor's affairs showed liabilities £6 723, of which £6 600 are expected to rank, and net assets £62. It appeared that the debtor, who came to this country from Germany in 1922, carried on business as a manufacturers' agent until 1925, latterly at the above address. He then began business as a merchant and importer, chiefly dealing in electrical goods. He had a capital of £2 500, of which £500 represented his savings, and the balance borrowed money, and in March of last year he entered into a contract with a Germany firm who agreed to manufacture and supply to him goods to the value of £7 500. In order to finance the contract he accepted bills of exchange drawn by the German firm amounting in all to £3 000, but the goods were never delivered, although certain of the bills were met by the firm in question. In September he began proceedings against it for the recovery of £1 750, the amount for which he was liable on the outstanding bills, and damages. In February he obtained judgment for damages to be assessed. In October a writ was served on him by the holder of some of the bills, and in December he convened a private meeting of his creditors, when an offer of 4s. in the £ was made to the holders of the bills, the other creditors agreeing to defer their claims for the time being. But his offer was not accepted, and an execution being levied at the instance of a judgment creditor, he filed his petition. The debtor attributed his insolvency to the failure of the German firm to deliver the goods, to his liability in respect of the bills, and to bad debts. The examination was ordered to be concluded.

THE LEAD MARKET.

Quiet conditions again prevailed in the market last week, and according to James Forster and Co. prices moved within narrow limits. The American price is unchanged at 5.50 cents per lb. Closing prices on June 6 were: £18 1s. 3d. for June, £18 2s. 6d. for July, £18 3s. 9d. for August, and £18 5s. for September, or 3s. 9d. per ton up on the week.

COMING EVENTS.

Friday, June 13 (To-day).

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Mr. E. J. Williams on "The Induction of Electromotive Forces in a Moving Liquid by a Magnetic Field, and their Application to the Investigation of the Flow of Liquids," Prof. E. V. Appleton on "Wireless Methods of Investigating the Electrical Structure of the Upper Atmosphere," and a demonstration by Dr. H. R. Lang on "A Modified Calendar Recorder for the Automatic Control of a High Temperature Oil Bath." 5 *p.m.*

Wednesday, June 18.

ELECTRICAL CONTRACTORS' ASSOCIATION (SUSSEX BRANCH).—Midland Bank Chambers, Brighton. Ordinary meeting.

Saturday, June 21.

SHEFFIELD ILLUMINATION SOCIETY..—Annual Outing, Belle Vue, Manchester.

NEW COMPANIES.

DISTRICT TRANSMISSION LINES, LTD.—Cap., £100. Electricians, electrical and mechanical engineers, etc. A director: J. Collier, Ecclerigg, Windermere.

ROBERTS (KENT), LTD.—Cap., £1 000. Electrical engineers, wireless and mechanical engineers, etc. Solicitor: M. Borg, 6, Cecil Square, Margate.

STATIC ELECTRIC, LTD.—Cap., £500. Electrical engineers, wireless and mechanical engineers, etc. Solicitor: J. L. Beech, 23, King Street, Manchester.

J. W. LEWSLEY, LTD.—Cap., £2 000. To acquire business of electrical and cinematograph engineer carried on by J. W. Lewsley at 33, Derby Road, Nottingham.

"BEEANTEE," ILLUMINATIONS, LTD.—Cap., £1 000. Electrical accessories manufacturers, agents, etc. Reg. office: Wingo House, 25, Norton Folgate, London, E.1.

BELGRAVIA ENGINEERING CO., LTD.—Cap., £2 000. Civil, mechanical and electrical engineers, etc. Reg. office: 8–10, Grosvenor Gardens, London, S.W.1.

STANDAGE POWER COUPLINGS, LTD.—Cap., £500. Mechanical, electrical and general engineers, etc. Reg. office: Precision Works, 100, Blackstock Road, London, N.4.

REES RADIO, LTD.—Cap., £1 000. Engineers, electricians, manufacturers of and dealers in wireless apparatus, etc. Reg. office: 75, Kilburn Lane, London, W.10.

STEAM USERS' SUPPLY CO., LTD.—Cap., £100. Electrical, mechanical and general engineers, etc. A director: G. F. Coombes, 480, Huddersfield Road, Wyke, Bradford.

STEWARD'S ELECTRICAL CO., LTD.—Cap., £2 500. Manufacturers and sellers of electric machinery, instruments, etc. Reg. office: 327, Southchurch Road, Southend-on-Sea.

BRIGHTON RADIO CIRCUIT, LTD.—Cap., £100. To acquire, construct and deal with wireless, land and submarine telegraphs, etc. Solicitors: J. K. Nye and Conne, Brighton.

JOHN SHAW AND CO. (ELECTRICAL), LTD.—Cap., £1 000. Electric lighting, heating, wireless, and general engineers, etc. A first director: J. S. Shaw, 46, Cranbrook Avenue, Hull.

STRATFORD WIRELESS, LTD.—Cap., £600. Manufacturers of and dealers in electrical and wireless apparatus and appliances, etc. Reg. office: 284, High Street, Stratford, London, E.15.

ELECTROHOMES, LTD.—Cap., £1 000. To acquire business of electrical appliance manufacturers carried on by Technical and General Trust, Ltd., at 52, Bedford Street, Strand, W.C.

BIAFONE CO., LTD.—Cap., £4 000. To acquire business of manufacturer of electrical apparatus carried on by M. E. Elliott at Gosford Road, Beccles, as Automatic Radio Manufacturing Co.

PENNINGTON, STEVENS AND TAYLOR, LTD.—Cap., £5 000. To acquire business of electrical and mechanical engineer, etc., carried on by P. E. Stevens at 17 and 18, Devonshire Square, London, E.C.

C. A. CARTER AND CO., LTD.—Cap., £1 000. Manufacturers and dealers in scientific, telegraph, telephone and radio appliances, etc. Reg. office: Edison Works, Edison Road, Crouch End, London, N.8.

BURGOYNE WIRELESS (1930), LTD.—Cap., £500. Manufacturers of and dealers in accumulators and batteries, wireless aerials, receivers, etc. Reg. office: 34A, York Road, King's Cross, London, N.1.

EUSTON MAGNETO CO., LTD.—Cap., £1 000. Manufacturers of, agents for and dealers in magnetos, lamps, bulbs, etc. Solicitors: Kenneth Brown, Baker, Baker, Essex House, Essex Street, London, W.C.2.

MAJESTIC ELECTRIC CO., LTD.—Cap., £10 000. Agents for sale and distribution of radio, telegraphic, telephonic, electrical, magnetic, and radio-active instruments and switchboards, etc. Solicitors: Wansbroughs, Robinson, Taylor and Taylor, Lion Chambers, Broad Street, Bristol.

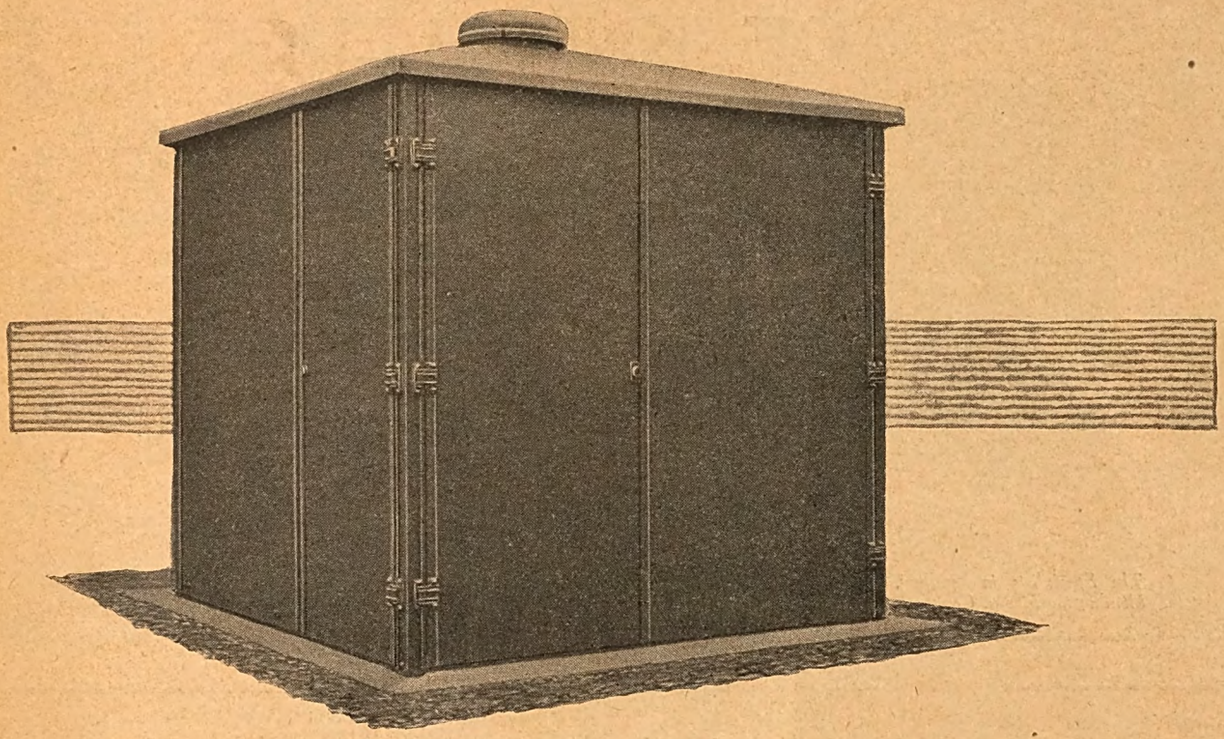
THE ELECTRICIAN

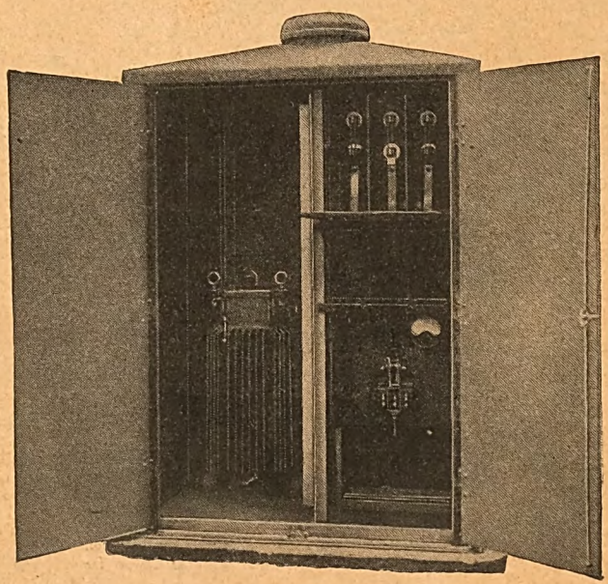
Vol. CIV.—No. 2716. Friday, June 20, 1930. [Registered at the General Post Office.] Sixpence



THE
"CALLENDER" TRANSFORMER PILLAR

Designed for Safety in operation and accessibility

The larger Transformer Pillar shown above is constructed of $\frac{3}{16}$" mild steel plates, is of the ventilating pattern, and has internal dimensions of 7' 6" x 7' 6" x 7' 0" high. Doors or removable panels are provided on all sides to allow of easy access. The E.H.T. Gear provides for the termination and control of a 3-core ·0225 sq. in. 11,000 volt cable looped in and out. The Pillar will accommodate a 100 K.V.A. Transformer and contains both a metering and a L.T. distributor panel. The smaller Transformer Pillar is designed to receive and terminate one 3-core ·0225 11,000 volt cable; has a Transformer Chamber suitable for a 50 K.V.A. Transformer and provides room for several sets of L.T. 4-core 3 phase gear of the well known C.S.W. unit type.



CALLENDER'S Engineering Department specializes in the design and manufacture of Transformer Pillars and Joint Boxes and will willingly supply information on Electrical Engineering problems to customers stating their requirements.

CALLENDER'S CABLE & CONSTRUCTION CO., LTD.

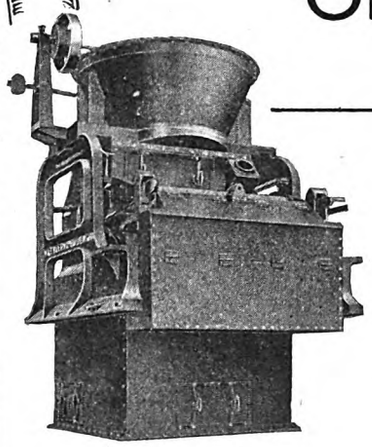
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

The Avery Automatic Weigher for Pulverised Fuel gives correct records of fuel consumption, without dust escape.

The machine illustrated has a capacity of 10 cwts. per discharge and will handle 50 tons per hour.

Thus, accurate records of fuel consumption are automatically kept, losses instantly detected, and economy achieved.

Ask for List 1255.

Electricity Supply.

PUBLICATION by the Electricity Commission of the return of all authorised undertakers holding statutory powers of supply at the end of 1928 in the case of company undertakers and 1928–29 in that of public authority undertakings brings up to date the statistical returns issued by the Commission. Three volumes have been published during the past twelve months and it is hoped to issue subsequent returns not later than December in each year. Prompt publication will undoubtedly increase the value of the statistics to the industry and it is to be hoped that all undertakings will co-operate to this end by making their returns at the earliest possible moment. This applies particularly to those undertakings whose year ends on December 31, as early receipt of their returns enables the Commission to deal with them before those relating to others whose year extends over portions of two calendar years. There has been a certain tardiness on the part of some undertakings in providing the required information, and they will help matters forward if they will make every effort to send in their returns with the minimum of delay in future.

Some impressive figures indicating the growth of the supply industry since 1921-22 are contained in the large volume of statistics which has just been published by the Commission. Sales of electricity to consumers increased in seven years by 150 per cent., the average annual increase being nearly 670 000 000 units. At the end of 1928-29 some 3 000 000 individual consumers were connected to public supply systems, two thirds of the consumption being provided by public authorities and one third by companies. The generating stations engaged in public supply numbered 485 with an aggregate of 5 801 770 kW of plant, of which 69 per cent. was contained in 76 stations each of 25 000 kW capacity or more. Of the remaining 409 stations 200 had a capacity of less than 1 000 kW each. During 1928-29 additional plant installed amounted to about 543 000 kW and by the end of that financial year nearly half the total plant installed consisted of steam turbo-alternator units of 10 000 kW or over. Nearly two thirds of the current consumption was for power purposes, rather more than a quarter being used for lighting and domestic supplies and one-eleventh for traction. Direct employment was given by the electricity supply industry to more than 56 700 people engaged on generation, distribution and administration, the salaries and wages bill amounting to £9 386 000. It must be remembered that these figures do not take into account electricity generated by railways and tramways for their own requirements, nor do they include the large number of private stations owned by collieries and other industrial and commercial concerns nor supplies given by undertakings which have no statutory powers.

How important the electricity supply industry has become in the economic life of the country is shown by the financial side of the returns issued by the Electricity Commission. In 1928-29 the total working receipts of all authorised undertakings was £55 454 000, an increase of £2 124 000 compared with the previous year. Working expenses, exclusive of capital charges amounted to over £31 260 000 the percentage of revenue being 56 per cent. Generating costs account for over 35 per cent. of the total expenses. The burden of local rating, which has been substantially increased since the period covered by these statistics, was heavy enough in 1928-29, when it represented more than 9 per cent. of the total expenses. An excess of revenue over expenditure of £24 188 000, representing 8·1 per cent. on the capital expenditure, which was increased to 8·7 per cent. by the inclusion of £1 667 000 of revenue from other sources, cannot be regarded as excessive, being just about sufficient to maintain the industry in a healthy condition by enabling it to keep its plant efficient and up-to-date and to offer a reasonable return to investors.

Current Topics.

World Power Conference.

On Monday the second Plenary World Power Conference was opened in the Reichstag, Berlin. There are over 4 000 registered members, of whom 2 500 are Germans. The British members number over 200. Austria has sent about 180, and the United States and Japan about 120 each. Of the 400 papers a large proportion are electrical or have some connection with electrical energy, but no newspaper can hope to publish even a résumé of such a large mass of material, which will eventually become available in volume form. The Electrician is represented at the Conference by Dr. A. Eckstrom and Mr. Vidar Eckstrom; who are contributing a series of articles reviewing the proceedings of the electrical section.

Professor Einstein on Space.

At the end of an address to the World Power Conference on Monday, Professor Einstein summed up the conclusions to which his latest mathematical work has led him by saying that, metaphorically speaking, space, which had been abstracted from material objects and made a scientific reality by Newton had, during the past century, swallowed up both ether and light and was about to swallow up both the gravitational and electro-magnetic fields and corpuscles as well, so that it would be left as the sole theoretical representative of reality. If these views are to be accepted we seem to have reached, by a process of mathematical analysis which must be taken on trust by all save a very few individuals, a very similar conclusion to that enunciated 3 000 years ago by Indian philosophers that all is illusion except Brahma—now, apparently, to be called Space.

Faraday Centenary.

In order to prevent any misconception in other countries as to the spirit in which the Faraday Centenary Celebrations are being organised, it is desirable to make it clear that the summary of the provisional arrangements which appeared in our issue of June 13 omitted certain references to the work of other electrical pioneers whose experiments preceded those of Faraday. The opening sentence of the statement actually issued by the Exhibition and Publicity Sub-Committee in connection with the provisional programme for next year's centenary was worded: "In 1831 Michael Faraday, following up the work of Volta, Oersted and Ampere, began, or rather resumed . . . experiment on the induction of electric currents." The centenary of Oersted's electro-magnetic discoveries was recently celebrated in Denmark, and our Continental friends may rest assured that, when commemorating the work of Faraday next year, earlier important electro-magnetic discoveries will not be overlooked.

Electrical Imports and Exports.

The decline in exports of British electrical manufactures, which began in April, continued in May, the value being £231 924 less than in May, 1929. Owing to the headway made during the first quarter of this year, exports for the five months ended May 31 were £58 656 above those of the corresponding period of 1929, but it is is unpleasantly evident that unless the June figures reverse the tendency that began to manifest itself at the beginning of the current quarter the total for the first half of 1930 will be below that of the first six months of last year. On the other hand, imports are still increasing—by £85 595 in May and by £1 017 733 for the first five months of this year—during which period they amounted to £3 858 590, or more than 48% of the value of exports.

G.E.C.'s Good Year.

In the year ended March 31 the General Electric Company made a profit of £1 179 007 compared with £1 084 077 in the preceding year, and this increase, aided by a larger sum brought forward and a decrease in the amount required for interest, depreciation, preference dividends, and pension fund contribution, and after transferring £130 000 as before to reserve, leaves £694 676 available for the Ordinary shares—£107 240 more than in 1928-29. Shareholders are to receive 10 per cent., as in the previous year, together with a special bonus of 4 per cent. and £379 165 is to be carried forward, against £362 072. The company, which now employs nearly 25 000 people—an addition of 2 600 during the twelve months—established a new record by the extent of its activities in 1929-30 and the G.E.C. magnet is still far from having lost its power of attracting new business.

OPENING OF THE WORLD POWER CONFERENCE IN THE KROLL OPERA HOUSE, BERLIN, ON MONDAY.

To the right of the President are Dr. Carl Köttgen (chairman), Sir C. A. Parsons, Mr. G. Malm (Sweden), Director L. Tolloczko (Poland) and Prof. P. S. Ossadtschy (Russia); to the left of Dr. von Miller are Reichskanzler Dr. Bruning (Germany), Dr. Ed. Tissot (Switzerland) the Lord Mayor of Berlin (Herr Scholz), Dr. M. Kamo (Japan), Dr. C. Camsell (Canada), Senhor M. S. Rodrigues (Brazil), and Dr. H. S. van der Bijl (South Africa). Sir A. Page and Sir A. Duncan are in the second row; Mr. Ll. B. Atkinson and Miss C. Haslett in the third.

SECOND WORLD POWER CONFERENCE.

Opening Proceedings in Berlin—Scope of the Present Conference—Economic Aspects of Power Supply—3 000 Members Representing 50 Nations in Attendance.

By ALFRED ECKSTROM, D.Sc., M.I.E.E., and VIDAR ECKSTROM, C.E.

THE necessity of world co-operation is daily becoming more obvious with the widening scope of the various branches of industry, and every country is beginning to realise how essential it is to learn of the progress and work done in other countries beside their own. Technical journals all over the world are doing a great deal towards keeping those who are interested in touch with every development, but it is obvious that such papers, however excellent, cannot achieve the same result as can verbal discussion between technical representatives and leading personalities from many different countries. Realisation of this fact caused the British Electrical and Allied Manufacturers' Association, under the chairmanship of Mr. Dunlop, to initiate the World Power Conference in 1924.

The first plenary meeting of the World Power Conference, which was held in London in connection with the Wembley Exhibition in 1924, was attended by the representatives of 47 nations. At this meeting 305 papers were read and discussions held on every aspect of power. The tremendous field covered made it unnecessary for such a conference to be an annual event. In view of this fact, it was decided that such plenary meetings need only be held every six years and that sectional meetings, devoted to more particular problems relating to power, should be held whenever considered necessary.

Since the first plenary conference there have been four of these sectional meetings. The first, held in Bâle in 1926, dealt with water power and inland navigation; the second, held in London in 1928, with fuel; the third, held in Barcelona in the spring of 1929, with the utilisation of water power resources; and the fourth, held in Tokyo in the autumn of 1929, with the development of power resources.

As the sectional meetings during the last few years have dealt with the production of energy, the Second Plenary World Power Conference now being held in Berlin is dealing with the distribution and employment of energy. Generally speaking, the conference is more concerned with the economic aspects of power supply.

The patron of this Second World Power Conference is Reichspräsident Von Hindenburg; the Honorary President is Dr. Oskar von Miller who, succeeding the Earl of Derby in this capacity, will hold the position until the next plenary meeting which will probably be held in the United States in 1936. Under the chairmanship of Generaldirektor Dr.-Ing. C. Köttgen, the management of the Conference is in the hands of a Board of which Professor Matschos is the manager.

A number of special technical committees were organised in the winter of 1928–1929, and a series of suggestions regarding discussions were issued and circulated to the National Committees of the various countries. The suggestions related to what was conceived to be the most important problems with which the Conference would have to deal, and were to be used as a guide for the preparation of papers. It was stipulated that any papers for the Conference should reach the Managing Bureau by November 1, 1929, so that those interested could read the details of the papers before the Conference. In order to save time, a general report, giving a short review and critical summary of the papers submitted, has been prepared by the Chairman of each of the 34 sections. The sessions are opened by the reading of one of these reports, the subsequent discussion often resulting in important decisions being made by the Conference.

This conference has made full use of the experience gained at previous ones, especially in regard to the language problem, for it is possible, merely by putting on a headphone, and moving a switch, to hear the speeches, translated by expert interpreters, in any of the three official languages (English, French or German) at the actual time of delivery.

On Sunday evening the Hon. President of the First Conference, Lord Derby, handed over his Presidential Insignia to Dr. Oskar v. Miller at the Reichstag. Members were then received by the new President and the Hon. Chairman, Dr. Carl Köttgen.

On Monday morning, the ceremonial inauguration took place at the Kroll Opera House, and speeches were delivered by the Hon. President, the Reichskanzler and the Chairman of the National Committees, expressing their keen admiration of the important task the W.P.C. has to fulfill. There followed speeches of greeting from representatives of other countries. Sir Algernon Parsons spoke for Great Britain; Dr. Hendrik van der Bijl for South Africa; Dr. Charles Camsell for Canada and North America; and Dr. A. C. Rivett for Australia and New Zealand. Over 3 000 members, representing about 50 nations, attended this meeting.

This was followed by the first of the technical meetings, and in the evening Professor Einstein delivered his address on "The Space, Field and Ether Problems in Physics."

SOME REFLECTIONS.

By D. WINTON THORPE, A.M.I.E.E.

LAST Monday saw the opening of the second Plenary Session of the World Power Conference at Berlin. That is a dull sentence full of rather irritating words. It is a defect of the English language that the word "power" is saddled with too many meanings, and the phrase "world power" has a decidedly unsavoury suggestion about it. I think I prefer the French version, which is Conférence Mondiale de l'Energie. In that title there is something more than a suggestion of the romance which imagination can extract from this Conference. "Plenary Session"—here again the English language breaks down, while the French does more justice to the occasion with "Séance Mondiale." It is only twelve years since German and Austrian scientists on the one hand, and Russian, French, and English scientists on the other hand, were engaged upon the most vicious work to which competition can descend. Now they are engaged upon the closest co-operation which the world has ever seen—and that at Berlin! From fifty nations throughout the world delegates and members have come to pour into the common pool their donation to scientific progress.

Engineers have the reputation of being rather cold-blooded and matter-of-fact folk who feel nothing but the "cold steel" of their work. But engineers who have attended the World Power Conference have, in every case, been sensible to the romantic aspect of pooling the world's scientific knowledge for the benefit of the world. It has no narrow limits, this Conference. Anything which bears at all on the subject of power has a place in its programme. I use the word "programme" in its broader sense and do not refer to the actual schedule of papers to be presented and discussed at the forthcoming Berlin Conference. These papers, formally presented and spontaneously discussed, are essential to the Conference, but it is what is behind these papers which matters—the spirit of giving, the spirit of friendship and the spirit of having a common purpose. I have attended many conferences and I have met some delightful acquaintances at all. In none but the World Power Conference have I made real friends. Every day of the year members of the World Power Conference are in touch with one another throughout the length and breadth of the world, whether it be socially or scientifically. Friendships started and scientific discussions begun during a session do not finish when that session ends, and each formal meeting of the Conference gives proof of this fact in the papers presented, papers which are, in many cases, the fruit of this constant intercourse.

"For aught I know this Watercataster of Siberia Water-power which is after quoted on the next pages, is the first attempt in this direction." Thus an engineer opened his paper which was to be presented to the first World Power Conference. It was, indeed, one of the first attempts to analyse and classify the water-power of Siberia, and the broken English in which the paper was written would have been laughable had it not been so full of goodwill in the common interest. Written in green ink in spidery hand-writing on the most common of paper, it represented indeed the "widow's mite"—none the less acceptable for that.

Of the technical aspect of the Conference much has been written and much will be written, but when engineers read and digest the scientific points which arise they must not forget the romance which lies behind this ambitious scheme. The World Power Conference has not yet reached completion. An organisation so great and so far-reaching takes many many years to build. After the splendid launch in 1924 it has been steadily growing in influence, and the time will come very soon, I am convinced, when it will represent the greatest influence operating for world peace.

E.C.A. OF SCOTLAND CONFERENCE.

Successful Innovation in Conjunction with the Annual Meeting—Pleasant Week-end at Taymouth Castle—New President on Organisation of Contractors.

(CONTRIBUTED.)

THE Electrical Contractors' Association of Scotland this year combined their annual general meeting with a week-end conference of members and the gathering was held at Taymouth Castle, Perthshire, one of the finest baronial halls in Scotland, from May 30 to June 2.

The party assembled at Taymouth in the course of the Friday morning, and were received by the President, Mr. Johnston Foggo, and his wife. The majority of members travelled to the Conference by car. The opening luncheon party was a very happy affair. Immediately afterwards friends foregathered, and many games were played on the magnificent 18-hole golf course in the Deer Park. The pitching and putting courses were also well patronised.

Later in the afternoon the annual general meeting of members of the Association was held in the Castle Library, the retiring President, Mr. Johnston Foggo, presiding. A detailed report dealing with the Association business for the past year was submitted, and, after an interesting discussion, unanimously approved. The annual accounts showed that the Association was in a very strong financial position. The accounts of the Associated Benevolent Fund, which was instituted two years ago, also show a substantial credit balance. Further contributions to the Benevolent Fund were made from the general funds of the Association, and the hope was expressed that members would take advantage of every available opportunity for raising funds for this praiseworthy object. Arrangements were made for numerous sporting engagements in connection with the Conference to raise additional money for the fund. The results were very satisfactory.

Members of the E.C.A. of Scotland at Taymouth Castle.

The following office bearers for the ensuing year were elected :—

President—Mr. D. H. Morris, Dundee.

Vice-President—Mr. Henry Meighan, Glasgow.

Secretary—Mr. Walter Finlay, W.S., 55, Frederick Street, Edinburgh.

In addition, the branch representatives who make up the new Central Board, are :—

Glasgow—Mr. David Bennett, Mr. Alexander Lindsay, Mr. R. A. Ure, Mr. James Allan, Mr. A. S. Nairn and Mr. Thomas Rigg.

Edinburgh—Mr. Alexander Pratt, Mr. R. E. Douglas, Mr. Johnston Foggo and Mr. George Lyall.

Dundee—Mr. John Smith and Mr. Robert Kilpatrick.

Aberdeen—Mr. J. L. Anderson and Mr. James Bell.

Messrs. Davies Dunn and Co., C.A., Glasgow, were re-elected auditors of the Association.

After dinner on the Friday evening a large whist drive was held for prizes presented by the Glasgow Branch of the Association, and thereafter the party engaged in dancing in the Banner Hall of the Castle. Scotch reels in the appropriate surroundings were much enjoyed.

On Saturday the chief morning engagement was the annual golf match of old standing, East *v.* West, for the trophy presented in 1913 by Mr. Alexander Pratt. The match resulted on this occasion in a win for the East by 9½ matches to 7½ matches. In addition a stroke competition was held, the scratch prize being won by Mr. A. Shand, Edinburgh, with the good score of 78. The handicap prizes were won by Mr. T. Rigg, Glasgow, with a net score of 73; Mr. R. Edgar, Edinburgh, 74; Mr. J. Bathgate, Edinburgh, and Mr. J. L. Anderson, Aberdeen, with 75. A sweepstake on the stroke competition was organised in support of the Benevolent Fund, for a special prize presented by the President.

In the afternoon papers were read by the new President, Mr. Morris; the immediate past President, Mr. Foggo; and a former past President, Mr. Alexander Lindsay.

Value of Union.

Mr. Morris chose the appropriate subject of "The Extension of the Organisation of the Association." He pointed out that this was the first occasion on which the Association had ventured on a week-end Conference, and congratulated those who had initiated the proposal on its success. The members to-day realised the truth of the motto, "United we stand, divided we fall." This was shown by the growth of the Association, which now contained 260 members throughout Scotland. Contractors in the electrical world of to-day were all small men when compared with the great combines and organisations that were to be found in the other branches of the electrical industry. It was all the more necessary, therefore, for the contractors to bind themselves closely together for the legitimate defence of their interests, and also to speak and act unitedly in the councils of the industry.

Mr. Morris pointed out the advantages to be gained by the Association on behalf of its members negotiating appropriate trade agreements. In the future manufacturers would require to do more in recognising the associated strength of the Contractors' Organisations in England and Scotland. Trade abuses could be much more efficiently dealt with by an association than by individuals, and he hoped that before long a definite fair trading agreement would be reached which would place trade on a sounder basis, and, at the same time, strengthen the position of the British manufacturer in the home market. He suggested a forward campaign for the enrolment of additional members both in the large cities and in the provinces, and pointed out that, with the extension of supply in the rural areas, new businesses were starting up. He believed that if the advantages of the Association were clearly brought before the founders of these new businesses a large increase in the membership might be looked for. The Association was primarily a trade association, but in the admission of members the appropriate qualifications for membership must not

Mrs. Morris, the wife of the new president of the E.C.A. of Scotland, presenting the golf trophy to Mr. Pratt of "The East."

Digitized by Google

be overlooked. Membership of the Association should also be looked on as a hall mark.

In the course of discussion, in which members representative of all the districts in Scotland took part, suggestions were made that where branches were impossible, circles should be formed, that the Association was of as much use to the rural contractor as to the city contractor, and that public contract and work on assisted wiring schemes should be confined to members of the Association and registered contractors.

Mr. Johnston Foggo took for his subject: "How to Strengthen the E.C.A. of Scotland by Maintaining the Standard and Quality of Installation Work."

He began by mentioning that the types of insulated wires and cables accepted in this country as most suitable for the internal wiring of buildings were :—

1. Rubber and composition sheathed V.I.R. insulated conductors.
2. Lead alloy V.I.R. insulated conductors.
3. V.I.R. insulated conductors contained in steel pipes.

The merits of these three types of wiring had from time to time caused much controversy in the technical Press, and Nos. 1 and 2 had, within recent date, become very popular, not because of their durability, safety and fireproofness, but owing to intensive advertising and the possibility of employing unskilled labour for installation.

Deterioration of Insulation.

The rubber of the rubber-sheathed conductors deteriorated rapidly in sunlight, dry atmospheres, and also in moist situations. The composition sheathed type had, so far, proved more durable in these respects, especially in very moist conditions. If fitted on the surface, as they should be, they required to be fixed at very short intervals and every advantage was taken to avoid this labour cost by concealment under floors and plaster, but this only increased their danger.

Little attention was paid to the terminal ends of the wires and bare conductors were found on woodwork and on lathed walls and ceilings at these points. When fitted on the surface they were a source of joy to the painter, who, when re-decorating, without difficulty detached them from their precarious fittings. Again, as the all-insulated cooker, glass kettle and iron were not yet with us, the present-day appliances must remain unearthed irrespective of their situation, unless a separate earth wire was fitted with the insulated conductors to the socket points—another additional labour and material cost, which was seldom carried out.

Lead alloy sheathed conductors suffered from all the foregoing disabilities, but had the advantage that if suitable junction and outlet boxes were used, continuity of the sheathing might be maintained throughout the installation. One disadvantage experienced, however, was from a breakdown of the V.I.R. insulation and earthing to the metal sheath. In several instances this had been due to lightning discharge and the cost of renewal might be very considerable.

Next he considered V.I.R. conductors contained in steel screwed pipes, for he did not take into consideration pipes other than those capable of being connected together by screwed ends and couplings, because slip jointed pipes or slip jointed pipes with "grip" substitutes for screwing, did not give a permanent and lasting continuity. If a wiring installation was to possess the qualities of safety, to be fireproof, and to allow the wiring to be renewed when necessary without destroying the decorations, then such an installation could only be contained in a system of screwed steel pipes with all bends formed on the pipes and with the minimum number of junction and draw-in boxes. At all the outlet and accessory points iron boxes must be fitted, and where the tubing was concealed these boxes must have their top edges made flush with the surface of the material they were fitted into, so that when the accessory plate or fitting plate was fixed to the box all the wiring was completely enclosed in metal—wood blocks were unnecessary. All pipe holes in boxes must be screwed to receive the pipes, as clearance holes with lock nuts did not form a permanent connection.

Such an installation when carried out by experienced tradesmen and with generous supplies of boxes available, need not be prohibitive in cost, and its advantages far outweighed the weaknesses of the other systems. "Looped in" wiring was sometimes specified, but not always carried out in practice, as very few of those who specified this system know it when they saw it. Again, as the rubber installation must perish in time, why increase the quantity.

If a specification for a screwed steel conduit system of wiring, such as he had outlined was formulated, to which the members of the Association would estimate, it would, he felt sure, be for their good and strengthen the Association.

Mr. Alexander Lindsay, Glasgow, opened the third subject and explained the "Scheme for the Registration of Electrical Contractors." He pointed out that in Britain at present compulsory registration was not practical politics but voluntary schemes of registration had been and were being promoted both in the United States and many of the Dominions. In America the Registration Authority had been appointed by the state with full power to examine applicants and grant or cancel licences. He submitted that it was only by registration that the difficulty of the irresponsible contractor could be dealt with. It had been suggested that as the scheme only concerned contractors it should be entirely worked by them, but he submitted that it was quite fitting and proper that other branches of the industry should be adequately represented on the Registration Authority. He urged every member to become a registered contractor.

In the discussion which followed, strong support was expressed for the scheme by many, while others expressed the view that its voluntary character was its greatest defect.

Business meetings and conferences did not take up the whole time of the representatives present at the conference and they enjoyed a motor car drive round Loch Rannoch. Opportunity was taken to visit, with the kind permission of Messrs. Balfour, Beatty and Co., Ltd., the new hydro-electric station on the shores of the loch.

The Conference ended on the Monday morning and members returned to their districts well satisfied with the first Scottish Conference and with the splendid weather which prevailed throughout the week-end. It seems probable that the E.C.A. of Scotland members' conference will become an annual engagement, but if it grows in size the ideal venue of Taymouth Castle will not be available as the accommodation was taxed to its utmost on this occasion.

FIFTH E.C.A. CONFERENCE.

Programme of Next Week's Meeting at Llandudno—Subjects for Discussion.

NEXT Wednesday the preliminary proceedings in connection with the fifth annual conference of the E.C.A. Allied Associations open at Llandudno at 10 a.m., with the meeting of the Council of the three associations (E.C.A., N.E.C.T.A., Ltd., and N.F.E.A.) at the Town Hall.

Between 10 a.m. and 6 p.m. the registration of delegates will take place at the Grand Hotel, and at 7.30 p.m. the president, Mr. H. Willoughby Ellis, will hold a reception at the hotel. This will be followed by dancing.

The annual general meeting (open only to members) is timed for 9.30 on Thursday morning (Town Hall). Two hours later the Conference will be formally opened with a civic welcome in the Town Hall. After replying Mr. Willoughby Ellis will deliver his presidential address. At 12.30 p.m. the official photograph is to be taken.

The Conference will reassemble at 2.30 p.m., when Mr. C. H. Flower (London) will read a paper on "The Future of Electrical Contracting," which, with the discussion, is expected to occupy the delegates until 5.30 p.m. In the evening there will be a smoking concert in the Grand Hotel.

On Friday the Conference will reassemble at 9.30 in the Town Hall. Mr. W. Cross (Newcastle) will read a paper on "Specifications and Their Problems," which, with the subsequent discussion, will occupy the forenoon. At 12 noon the new president Mr. H. C. Hazel, will be installed, and will give a short address. The business sessions of the Conference will end at 1 p.m. In the afternoon a garden party will be held and there will be a ball in the evening.

Those who decide to remain in Llandudno over the week-end will be able to take part in golf drives if they wish to do so. In the case of ladies who do not care to attend the Conference sessions suitable arrangements for their entertainment will be made.

Llandudno, which has great scenic attractions, stands on the narrow isthmus which joins Great Orme's Head to the mainland. Conway Castle is within easy reach and Snowdon is not far away. In such surroundings, given reasonable luck with the weather, the delegates and the ladies who accompany them will find plenty of interest during their leisure moments. This year's E.C.A. Conference will doubtless mark an advance on the very successful gatherings—successful from both the business and social viewpoints—of previous years.

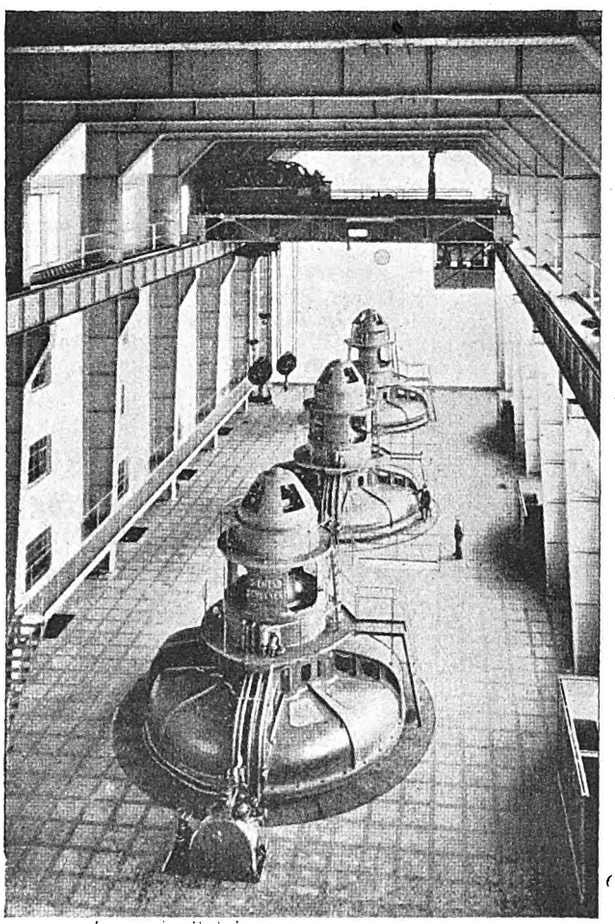
ELECTRICITY SUPPLY IN IRELAND.

Progress of the Irish Free State Electricity Supply Board—Load Building for the Shannon Development—The Belfast Undertaking—Projected Northern Ireland "Grid."

IN the course of the recent visit of the Institution of Electrical Engineers to Ireland, members had an opportunity of seeing something of the two largest electric supply undertakings in the country—the Shannon development of the Irish Free State Electricity Supply Board, which is now distributing current over the greater part of Southern Ireland, and the Belfast Corporation Electricity Department which supplies the greater part of the load in Northern Ireland. It may be remarked in passing that, from the technical and economic points of view, one cannot help regretting that political considerations should have created a frontier which cuts off the



The turbine hall at Ardnacrusha.

Shannon development from the chief industrial area of the island. But facts must be faced and the ultimate fate of the Shannon undertaking must be governed by the outcome of the efforts which are being made to build up an adequate load in the Free State.

Viewed as a technical achievement, the works on the Shannon and the transmission and distribution network that now covers the country are certainly impressive. The weir at Parteen Villa, the large head race canal, 7½ miles long, with an average depth of 32 ft.; the dam at Ardnacrusha, with its three huge penstocks 20 ft. in diameter, and two chasm-like barge locks; and the turbine hall containing the three 30 000 kVA Francis type turbines of the first stage of the development, are imposing structurally and pleasing in the power, neatness and simplicity of design which they display. Provision having been made for duplication of the present installation at Ardnacrusha when required, the cost of installing the second set of three turbines will be comparatively small, but the additional water storage works involved will be expensive. Owing to the exceptional dryness of the past two months in the Shannon basin, there is some slight anxiety as to the adequacy of the present water storage arrangements during the late summer.

The turbines run at 150 r.p.m. and generate three-phase current at 10 500 V. The current generated at Ardnacrusha is stepped up to 110 kV for the main transmission lines to Dublin and Cork—the former is a double circuit line—and to 38 kV for the secondary lines radiating from the power station. There are 66 38 kV sub-stations on the secondary network, which has three main feeding centres—Ardnacrusha, Dublin and Cork. At a later stage a fourth will be added at Maryborough, where there is at present a 38/10½ kV transformer station. The 38 kV system, divided into four loops, two of which can be subdivided via Maryborough, and several short spurs, has a mileage of over 1 000 and the 10½ kV system is almost as extensive. It is claimed that every village with a population of 400 and upwards—apart from a few in the extreme south-west and west—which is within a reasonable distance of the transmission network, has now been connected.

Interesting features of the overhead line system are the use of wooden sleepers instead of concrete as anchorage for the masts, the absence of guarding at crossings and the extensive overhead l.t. distribution system. "Wired wireless" telephone communication has been established between Ardnacrusha and the Inchicore sub-station in Dublin, using one of the 110 kV conductors. Speech is clear and free from noise.

At an early stage of its activities the Supply Board carried out a canvass of possible consumers. Dwellings were divided into five categories, and particulars were also taken of industrial prospects and existing power users. It is stated that an average of over 50% of the consumers noted as possibilities have been connected. The tariffs vary in different districts. In Dublin and suburbs the rates are :—

Lighting :—	Per unit
Private residences, places of amusement, churches, and daily newspapers	4d.
Shops, offices, etc.	4½d.
Shop window and continuous lighting	2d.
Factory lighting (to the extent of 5% of the annual power consumption	2d.

Large consumers pay 4½d. for the first 20 000 units consumed in any year, 4d. for all units in excess of 20 000 and up to 50 000, and 2d. for all units in excess of 50 000.

Heating and Cooking :—	Per unit
Private residences (on flat rate)	1d.
,, ,, (on Poor Law Valuation tariff)	¾d.
Shops and offices	1d.
Hotels and Institutions (Intermittent loading)	¾d.
,, ,, (constant ,,)	½d.
Water heating (domestic supply)	½d.

Motive Power (*l.t. supply*) :—	
For first 3 000 units per quarter	2d.
,, next 2 000 ,, ,, ,,	1½d.
,, any further quantity above 5 000 units per quarter	1d.

Special rates are made for h.t. supply.

An alternative rate is offered for private residences in the form of a fixed annual charge of 30s. plus ¾d. per unit, where the Poor Law Valuation does not exceed £12 and 12½% of the Poor Law Valuation, where this exceeds £12, plus ¾d. per unit. The fixed charge includes meter rent.

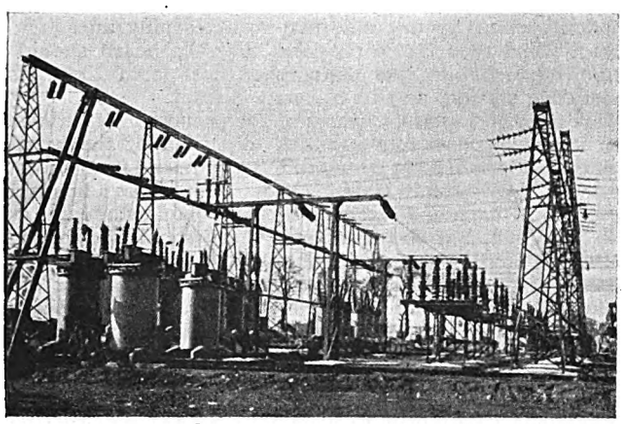
In other areas electricity for lighting and domestic purposes is charged for at the fixed amount dependent on the Poor Law valuation of the dwelling, office or shop, plus 1d. per unit. The lighting rate for institutions, churches, schools, courthouses, hotels, etc., is 6d. per unit, and for other domestic purposes 1d. per unit.

Consumers may have their premises wired by the Supply Board on a short-term credit payment system. Under this system a complete electrical installation may be obtained by an initial payment of one quarter of the estimate submitted, the remainder being payable at 6, 12, 18, or 24 monthly instalments, depending on the cost of the installation. For example, an installation costing £9 17s. 6d. may be obtained by a first payment of £2 10s. and six monthly instalments of £1 6s. 3d., these payments including interest at the rate of 5% per annum on the amount outstanding after the first payment has been made, and a charge of 2s. 6d. for fire insurance.

There is also a long-term credit system, applicable only to premises of less than £15 Poor Law Valuation. Under this system consumers may have premises of less than £15 Poor

Digitized by Google

Law Valuation wired by the Board on undertaking to pay for the installation at 6d. per week for a maximum of 60 payments per outlet where the Poor Law Valuation of the premises is less than £7 10s. and the total number of electricity outlets fitted by the Board does not exceed five. In



110 kV transformer station, Inchicore, Dublin.

all other cases the weekly charge is 1s. per week until a maximum of 30 payments per outlet have been made.

The Pigeon House steam generating station at Dublin ceased operating last February, but is being maintained as a stand-by station which can feed the city through the Fleet Street distributing station. This station now receives current by cable from the Inchicore sub-station at the Dublin end of the 110 kV line from the Shannon. At the old Fleet Street station across the road are several Holben generators which supply current for the arc lamps still to be found in some of the principal thoroughfares. The Dublin tramways have not yet come on to the Shannon supply, but are expected to do so before the end of this month. The Guinness brewery has its own generating plant, capable of supplying 1 800 kW.

At Cork, the Fordson Tractor Works are connected, and their normal annual consumption is said to be 16 000 000 units, but at the moment the factory is partly shut down. The city supply at Cork is d.c., so that converters will have to be put in before current from Ardnacrusha can be used. It is expected that Cork will come on to the Shannon load before the end of this year, and the change over from d.c. to a.c. will then be gradually effected.

For the moment the Dublin area provides almost the whole of the load on Ardnacrusha, and during the visit of the I.E.E. party only one of the three generators was at work, though two are used during part of the twenty-four hours. The addition of the Dublin tramways will keep two generators working, though not at full capacity at this season.

The Supply Board claim to be very satisfied with the rate of progress attained, and state that a good cooking load is developing with some advance in water heating. Little has yet been done in the sphere of agricultural machinery, which should in time prove important. The Canadian Moffat cooker appears to be favoured.

As for the economics of the Shannon undertaking, it is difficult to form an accurate opinion. The cost—nearly £6 000 000—is a heavy liability. Yet the Supply Board express confidence that by next year the undertaking will be earning interest and sinking fund charges. It is undoubtedly a courageous enterprise and can hardly be judged by ordinary standards. Possessing a single source of energy which can supply all the electricity required by the entire country, the Irish Free State was confronted with a special case which can hardly be paralleled elsewhere. Whether the optimism of its promoters will be justified and the undertaking will shortly be able to stand on its own feet, must be left to time to disclose, but Dr. T. A. MacLaughlin and his associates deserve success and are undoubtedly setting about attaining it with great energy and enterprise.

Progress in Belfast.

Northern Ireland has few large electricity undertakings, that of the Belfast Corporation being the only one which can be compared with those of the large cities of Great Britain. Rapid strides have been made in Belfast in recent years.

The first section of the new Harbour power station was officially opened, on August 15, 1923, by the Governor of Northern Ireland. This consisted of eight boilers, each of 50 000 lb. capacity, two 6 000 kW sets and one 15 000 kW set. Another 15 000 kW set, with auxiliary plant, was set going on March 16, 1925, and an 18 750 kW turbo-alternator, with auxiliaries, was put into service on November 22, 1928. The M.C.R. of the present generating plant is, therefore, 60 750 kW, and the winter peak load is about 36·000 kW. A scheme for the addition of further plant is under consideration, two boiler units of a maximum capacity of 150 000 lb. per hour each being proposed as the first section of a new boiler house.

The East Bridge Street station, which was the primary generating station before the Harbour station was brought into use, still contains about 9 000 kW of effective plant. It will have to be employed for the winter peak, during the next two winters, owing to the limitation of steam at the Harbour Power Station, and because of inadequate transmission capacity between the latter station and the city.

The number of units sold per head of population in 1920-21 was only 53. This year the quantity has increased to 127. The works cost per unit sold has fallen from 1·31d. in 1922-23 to 0·55d. in the current year, and the coal consumption per unit generated has dropped from 3·44d. to 1·78d. Thermal efficiency has risen from 10% to 17·43% in the past seven years. Units generated have grown from 38 132 457 in 1922-23 to 80 809 500 in 1929-30, and units sold from 31 644 322 to 68 470 739. The load factor is now 25·7%.

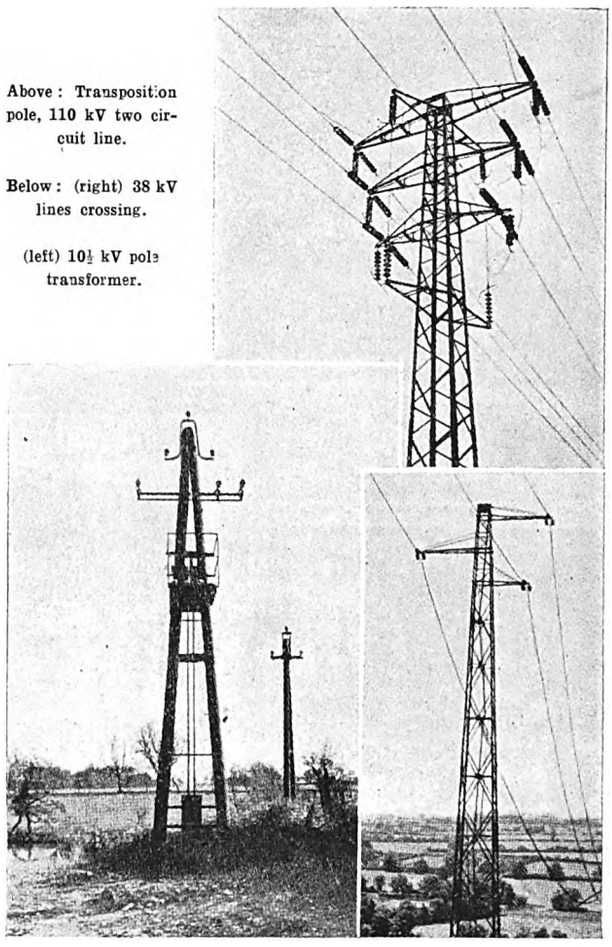
Primary distribution is at present effected at 6 600 V. A scheme for stepping up to 33 000 V is being prepared. This may necessitate a harbour crossing with steel towers and an overhead bus line partly round the city on the north side.

Thirteen rotary converting stations (including three fully automatic and two semi-automatic) for traction and general supply are in use, and there are 46 static transformer sub-stations, including those on consumers' premises. A good

Above: Transposition pole, 110 kV two circuit line.

Below: (right) 38 kV lines crossing.

(left) 10½ kV pole transformer.



Types of overhead lines in the Irish Free State.

deal of changing over to a.c. distribution has been effected in the supply area, many kiosk sub-stations being in use.

Belfast is now operating an assisted wiring scheme, and is seeking legislative authority to give hire-purchase facilities.

C.

Digitized by Google

Average rates in the year ended March 31, 1929, were :—
Lighting, 3·874d.; power, 1·046d; tramways supply, 0·82d.

Lighting current is obtainable at rates varying from 1d. to 6d., less 5% for prompt payment of accounts. Power is obtainable by the smaller consumers, up to 10 kW demand, for about 1d. at 20% load factor; larger consumers pay about 0·8d. at the same load factor.

On the rateable value tariff domestic consumers can obtain current on the following basis of charge :—

Fixed charge per annum of 18% on the rateable value of the property up to £60, and 2½% on that portion of any rateable value in excess of £60, no rateable value being reckoned on more than £150 of the valuation, plus ¾d. per unit for energy consumed up to 2 000 units per annum, and ½d. per unit for all energy in excess of 2 000 units per annum. As the Belfast valuation is on the average about half that of most cities in Scotland and England, this tariff is considered equivalent to that of any undertaking having a 10 per cent. fixed charge on the valuation in Great Britain. It is hoped that in the near future the Department will be able to abolish the ¾d. rate, making the unit charge ½d. for all energy.

The City Electrical Engineer and General Manager is Mr. F. H. Whysall, M.I.E.E., who succeeded Mr. Johnstone Wright, M.I.E.E., when Mr. Wright resigned, to take up an appointment with the Central Electricity Board, in 1927.

Recently the Government of Northern Ireland appointed an expert, Mr. J. M. Kennedy, M.I.E.E., to report on the whole aspect of electrical development in Northern Ireland.

Mr. Kennedy's report deals with the area to the south of an imaginary line from Belfast to Dungannon, and to the east of a line from Dungannon to Newry, which extends to approximately 1 200 sq. miles, with a population of 304 000. In this area there are 19 undertakings, three of which, Bangor, Holywood, and Lisburn, take supplies in bulk from Belfast; the remainder operate local generating stations. Mr. Kennedy reaches the conclusion that electricity can be made available at a lower cost than would be possible under the individual development of separate generating stations.

The report elaborates a scheme for the control of the transmission system by a public non-profit earning authority or board. The report also proposes that the board should be empowered to purchase supplies at cost from the Belfast generating station, and to transmit current.

The more important features of the proposed h.t. transmission system are as follows :—An extension of the existing Belfast-Lisburn line via Dromore to Lurgan, and from Dromore through Poyntzpass to Newry. From Poyntzpass a line is projected to Armagh and back to Lurgan via Portadown; it is also proposed that the line from Newry should be extended round the South Coast of County Down to meet an extension of the existing Belfast-Bangor line. The capital cost of the main transmission system is estimated at £245 000. With the capitalisation of interest and the suspension of sinking fund payments during the first five years of development the scheme should be self supporting.

The report recommends that the proposed board should be empowered to take over existing distributing undertakings in the area at a capital cost estimated at a further £250 000.

The Government has decided to adopt the report as a basis for the future electrical development of the area defined, and has accepted the view that the financial success of the scheme is dependent upon it being managed and controlled by a non-profit earning board. The necessary legislative provisions will be laid before Parliament.

TRANSPORT FOR CONTRACTORS.

The Three-ton Lorry: Comparison on "Ton-per-Mile" Basis with Other Capacities—Building Up a Fleet for the Future—One Extensive Use for Three-ton Vehicles.

PREVIOUS articles have given detailed running costs of the popular types of delivery vehicles up to two tons capacity, but there are often instances where even the 35–40 cwt. van or lorry is not large enough or not powerful enough for heavy work.

The large-capacity vehicle differs in many ways from the smaller type of commercial van. The former is more of an individual job, while the latter usually emanates from a mass-production factory. The large vehicle is built to last; it is expressly intended to give a long life, and there are lorries on the road to-day with 150 000 miles to their credit still earning a profit for their owners. The average life of the one-ton or 30-cwt. chassis is much shorter. This inherent difference between the two types of vehicles has caused transport accountants to calculate depreciation on an entirely opposite basis, for while the smaller and cheaper vehicle is calculated to depreciate at the rate of 20% per annum, the larger and more solid vehicle is depreciated according to the mileage it has covered. Briefly, the position is this: A one-ton van is written off to nil at the end of five years, irrespective of mileage, while a three-ton vehicle with an estimated life of 125 000 miles and with half of that life used up in five years still remains in the books at half its original cost.

Depreciation, therefore, has become a running cost rather than a standing charge, and if the table reproduced in the adjoining column had been compiled with the sole object of giving the running costs for the three-ton vehicle depreciation would appear along with petrol, oil and tyres; but as the purpose of this article is to compare one type of transport with another, the depreciation item has been retained as a standing charge, despite the fact that it has been calculated on the estimated life, and not the age, of the vehicle.

The table refers to a four-cylinder British chassis weighing 2 tons 4 cwt., unladen, the engine developing 47 B.H.P., and rated at 22·4 H.P., the drive being taken through a four-speed and reverse gear-box to an overhead worm back axle with a gear ratio of 7 to 1. Either solids or pneumatics are fitted, with twin tyres on the rear wheels. The turning circle is 54 ft., wheel-base 13 ft., and body space (measured from back of driver's seat to end of frame) 13 ft. 5 in. As a chassis, the price is £610, the bodywork depending upon individual requirements of the contractor. An open-sided body may be fitted for £30 or £40, but for the purpose of this article it is assumed that a well-built closed body is fitted (arranged to suit the electrical trade, and painted with the contractor's name and address), for which an amount of £170 has been allowed. Details of bodywork were described in THE ELECTRICIAN, April 18.

A motor van of this type classifies the contractor at once as a commerical vehicle user, and as such he is entitled to various discounts which reduce the cost of tyres and in other ways reduce running costs. The table has been compiled on the assumption that such discounts are obtained.

Comparative Efficiency.

Reference to previous tables will prove that the three-ton vehicle does not cost a great deal more to operate than the 35–40 cwt. van. In comparing the efficiency of vehicles of different capacities, it is usual to reduce the running costs to terms of pence-per-ton-miles, and if this test is applied to the various capacities with which this series has dealt, the three-ton vehicle shows up in a most favourable light. The actual figures are as follows:—

PENCE PER TON MILE.

	Miles per annum.		
	5 000	10 000	20 000
1 ton van	14·91d.	8·45d.	5·07d.
35–40 cwt.	8·41d.	4·79d.	2·90d.
3 ton van	5·68d.	3·58d.	2·47d.

In ordinary, everyday experience, however, it is not possible to guarantee full loads, and allowance must be made for many journeys without any load, or with a non-productive load.

As a commercial vehicle user, the electrical contractor will be expected to adhere to any trade union agreements affecting drivers' wages and overtime which may be in force locally, and therefore it may be necessary to alter the allowance for wages shown in the table. Then it may be possible to make an arrangement with the local agents for the vehicle whereby certain maintenance work is done under contract, while the garage allowance may be on the high side in a country district, and the amount set down for insurance premium is a compromise between London and country rates. An alteration in any of these charges is not a serious matter as far as the smaller vehicles are concerned, but when the three-ton lorry is being considered it is most essential to make whatever adjustments are necessary in order to arrive at the actual cost in any given area and for any given type of transport. The table is so arranged that any item can be altered with ease; and in doing so allowance can be made for any difference in the prices of oil, petrol or tyres.

Estimating Ahead.

A comparison between the one-ton and the three-ton, or between the 35–40 cwt. and the three-ton vehicle will indicate which is the more suitable for a contractor's individual requirements. By dissecting the jobs calling for motor transport during the past year or two, and making allowances for any anticipated increase in business, it will be possible to form a rough estimate of what transport will be needed during the coming year or two. It may be that two vehicles each of one-ton capacity will be more convenient than one vehicle of 35–40 cwt., or that a single three-ton vehicle will be more economical than two 35–40 cwt. vans. And in making up an estimate of this kind, it is well to think more than two years ahead. It may be that business will develop quickly and in a large volume, in which case a fleet of three or four vehicles will be essential. If the development does not take place, the vehicles will not be purchased; on the other hand, if the need does arise, consideration devoted to transport to-day will make it possible to add to the fleet to-morrow in an efficient manner and without scrapping a comparatively new vehicle merely because it is no longer economical.

It appears almost a certainty that with most Town Councils booming electricity for heating, power and lighting, and with architects, house furnishers and builders advocating the cleanliness and efficiency of electricity in the home, there will be a great increase in the number of "all-electric" houses within the next few years. Even to-day there are new housing areas requiring extensive supplies of equipment and labour, districts where fifty or a hundred new houses can all be wired and equipped from one temporary store in the area. For delivering stocks to such areas, the three-ton van is the most economical and efficient type of transport, allowing the contractor to reduce transport costs to the minimum, and permitting him to quote attractive prices.

RUNNING COSTS FOR THE THREE-TON VEHICLE.

Petrol.—8 m.p.g., 1s. 4d. per gallon.
Oil.—400 m.p.g., 6s. per gallon
Tyres.—25 000 miles per set, replacement cost, £55 10s.

Chassis price	£610
Allow for bodywork and painting	170
TOTAL INITIAL COST	£780

	NUMBER OF MILES PER ANNUM.

ROUND THE JOBS.

Signs of Returning Activity—Power Factor as the Froth on the Beer—A Small Circuit-Breaker—Craze for Black Enamel—Llandudno Conference—Loyalty and Price-cutting.

By "CONTRACTOR."

WORK has been very slack for electrical contractors during the past few months. Though a few firms may have been fortunate, the majority have suffered from the general depression. A very good barometer of trade generally is to be found in the class of wireman who offers himself for employment. When trade is brisk it is naturally difficult to find very good men. On the other hand, at times, such as the present, the best of workmen are unable to find employment. I was talking to a doctor the other day who remarked that he also had been particularly slack, not, he suggested, from any climatic peculiarities or absence of epidemics, but purely and simply because no one seemed to have the money to be ill. If the medical profession has been "feeling the draught," electrical contractors may well extract what comfort they may from the thought that if the public has no money to be ill it certainly has no money to spend on electrical installation work. Now that the summer is upon us contractors are faced with the usual inactivity in jobbing work. However, after a slump there is commonly a reaction and it is to be hoped—indeed there are signs of it already—that general building work which has been conspicuous by its absence will now begin to materialise.

* * *

The electrical contractor is frequently called upon to explain, or try to explain, to his customer some of the technical details of electrical supply. In such cases he usually falls back upon analogy and, in particular, upon the water analogy. Straightforward elementary problems can, in most cases, be roughly explained by taking the flow of water as analogous to the flow of electricity, but there are undoubtedly certain features of the behaviour of electricity which cannot be explained by this means. It would, for instance, be extremely difficult to find a water analogy which would satisfactorily convey the idea of power factor to the lay mind. In this connection I am reminded of an extremely amusing and sound analogy which was published some years ago in the "Clyde Valley Magazine." In this the author took for the medium of his analogy, beer. He added the rather naïve remark that he presumed his readers knew what beer was. He took the case of a glass of beer, of which half was froth, and pointed out that in a particularly heady beer, where half of the volume was froth, it would be necessary to have two glasses in which to serve one glassful of pure beer, each glass being occupied as to half of its contents with beer, and as to the other half with froth only. Froth he explained, was analogous to wattless current. The nearer home you get with any analogy the more readily will the listener understand it, and I seriously commend this analogy of beer and froth to anyone who is faced with the explanation of power factor or wattless current to a layman.

* * *

Some time ago a manufacturer produced a small circuit-breaker rated at 10 amps. for use in domestic installations. Although the design was open to a certain amount of criticism the idea seemed to me to be so good that I am surprised that nothing seems to have been made of it. At all events I have not come across this circuit-breaker in use in any installation. One criticism was that it would be necessary, in order to satisfy the regulations, to have a main switch in addition to the circuit-breaker, but even so the great convenience of not having to change a main fuse would have made the appliance well worth while. Another criticism was that it had evidently been designed by a switchboard designer and was so constructed that it could only be mounted on some form of board, whereas in ordinary domestic installations it is necessary to mount such a switch direct on to the wall, having a top or bottom or side entry for the cables. However, a point like this could very easily have been corrected.

* * *

Is there any real reason why conduit accessories and ironclad switchgear of the domestic variety should always be finished in black enamel? Black is nearly always the most unsightly and most inappropriate colour—if it can be called a colour—which could be chosen. Personally, I always advocate to my customers the painting over of switchgear in a colour which harmonises with the surroundings, even though those surroundings may be the back passage. In the case of conduit which is run upon the surface of walls and ceilings (and this is, after all, a very common practice, especially in office installations), white is a far more appropriate colour, and indeed the tubing usually has to be painted white after it is erected. To get a good effect on the black background necessitates several coats of paint, all of which puts up the cost of the installation. Alternatively, some people whitewash their tubes, but if the black enamel is chipped anywhere—and there are usually apt to be one or two such chips—the tube rusts at this point and shows itself in the form of an ugly brown smudge on the whitened tube. The argument that white conduit would very soon get dirty in the handling can be answered by saying that even if it did get dirty it would only be necessary to give the tubing one coat of white enamel or white paint when in position, as against the several coats which it is necessary to give it now that it is finished in black as a standard. Another point which occurs to me on the same subject is the persistence with which manufacturers use an unbroken white for the standard finish for white wood blocks. It is very rare to find such an unbroken white harmonising with the background. Blocks of this sort should, I think, be finished in a cream, or, at any rate, a broken white. The present type of white wood block fitted to the average skirting board is just as unsightly as a teak block would be. It does not match the skirting board and it does not match the white porcelain of the switch base or plug base.

* * *

It is to be hoped that as many contractors as possible will have made up their minds to make a point of being present at the Electrical Contractors' Association Conference at Llandudno this month. I know that there are many who scoff at conferences, saying that the world to-day is too full of conferences, and that the papers presented could be given equally effective publicity in the columns of a newspaper. I do not agree with this view a little bit, but I do regard the papers presented at a conference as the least important part of that conference. The real object is to bring together the members of the Association in a pleasant atmosphere of geniality and even gaiety, so that while competition, that essential factor in trade, shall continue unabated, mistrust as between one electrical contractor and the next shall be entirely eradicated. The most important thing which the Association demands of members is loyalty to that Association, that is to say, loyalty to one another. That loyalty must not be confined to a few, or even to the majority, but must be one hundred per cent. efficient. This is, perhaps, a "counsel of perfection," for it is a goal which is quite out of reach. At the present time this quality of loyalty is undoubtedly absent in some of the members of the Association. Though some, who, having set their hand to the plough do not look back but work stedfastly for something which is more than an association in name, there remain the few whose membership of the Association is confined to falling back upon it when they are in difficulties. These same people fail to see the disloyalty as well as the foolishness which attaches to such practices as price-cutting. For this reason I say that I hope all members of the Association will year by year make a real effort to attend the Annual Conference. After you have met a man at dinner and danced with his wife you are more likely in your business to observe the rules under which competition flourishes.

* * *

There are two sorts of price-cutters. There is the man who cuts his price below the published price in order to secure an order which he thinks would otherwise go to a competitor. There is the other man who, especially when things are bad, considers that it is better to take a small profit than no profit at all, and, in order to increase his turnover, cuts the prices. There is among some contractors a feeling that while they would never cut the price of lamps or any other commodity, concerning which they have signed an agreement, yet they are quite prepared to cut prices in other standard products, oblivious to the fact that their very membership of the N.E.C.T.A. constitutes an agreement not to indulge in these evil practices. Price-cutting is bad enough in the man who holds aloof from any form of association and refuses to sign any agreement with manufacturers, but in a person who has joined an association, of which one of the chief aims is the elimination of unfair competition, it is nothing short of criminal.

UNEMPLOYMENT AND WORK—VIII.

The Employer's Responsibility.

By SIR ERNEST J. P. BENN.

THE unemployed is, of course, always a worker. The dole is only paid to that class of person who still reserves to himself the title of "a working man," and thus it comes about that the discussion of unemployment tends in the main to mean a discussion of the so-called working man, his habits, his failings or his qualities. Such a discussion leaves out of account the larger part of the problem considered as a whole. Unemployment is as much, or more, concerned with the doings of employers as with the actions of those whom they employ.

When the first quarter of this century is old enough to be fit material for the historian, somebody will point out the biggest of the movements which have characterised recent years. Whereas in the nineteenth century public opinion looked to the business classes for the supply of the material needs of life, it is unquestionably the fact that the people of the twentieth century have so far inclined to the view that the politicians could be of more use to them than the merchants and manufacturers. The country is looking to the political method rather than the private enterprise method, and still seems to think that through political action a solution of our economic difficulties may be found. That is a false view, the error of which is slowly dawning upon the people. They will in time learn again, what they should never have forgotten, that so far from the Government being able to take the place of private enterprise in trade, the continuance of the Government itself depends absolutely and entirely upon the well-being and prosperity of trade conducted by private persons which can be taxed for Government support.

In the meantime, however, we find on examining the matter closely that the habit of depending on the Government, so disastrously prevalent in the working classes, is also developed to a highly dangerous degree among employers and all other classes. There is some excuse for it. The Government has pretended, and goes on pretending, to be able to develop trade. We still have a Department of Overseas Trade, although the Geddes Committee on two occasions reported in favour of its abolition. This Department goes on growing and goes on fussing about at home and abroad, keeping card indices and issuing reports, and in its innocence imagining that in some way or another it is helpful to the interests of British industry. Parliament appears to remain firm in this false opinion, notwithstanding the disturbing fact that trade gets worse and worse as the Department of Overseas Trade gets bigger and bigger.

It seems to be forgotten that the presence of a lot of salaried officials in any market drives out of that market all the free and independent business men. It is Gresham's currency law over again. Very little thought is necessary to understand how natural this is. The independent business man, making his own enquiries into the possibilities of a market for his specialities in Rumania or Finland, will feel a nervousness which is, perhaps, stupid but none the less natural, if he knows that Government officials are ferreting about in the same market, producing information and reports which may or may not be any good, but which will be available for everybody else in the trade. In these circumstances, the individual not unnaturally leaves the market alone. The element of competition between him and other people in the trade is eliminated, and without competition trade can do nothing but wither and decay.

Present Day Disadvantages.

The modern employer requires a much more highly developed sense of responsibility than was ever asked from his predecessor. He has to work under disadvantages that were unknown to previous generations. They had incentives left to them of which he has been robbed. It requires much more pluck in these days for a successful manufacturer to undertake an extension of his business than was necessary even a few years ago. Mr. Snowden's Budget has sown the seeds of another big batch of unemployment by adding to the numbers of successful men who are now faced with the new danger that they may worsen their position by adding to their prosperity. There are many hundreds of leading employers full of experience and knowledge anxious and willing to use it in the extension of the trade of the country, now faced with the necessity of spending their remaining years in getting their resources into a condition which is liquid enough to meet the heavier demands of the new death duties. All these people, unless, as I say, they possess a very highly developed sense of public duty, are stopped from performing their natural functions as the providers of employment. Government interference thus works both ways. On the one hand, it discourages a man from undertaking new enterprise by pretending to do it for him, and, on the other hand, it makes it clear to him that if he does it himself he will be punished for so doing.

The spirit of the dole, the spirit of dependence, of helplessness, the mentality which leaves everything to the arrogant claims of official authority, is as deadly in its effects upon the employing classes as upon any of the rest of us. It is hard to estimate how much of the business brains of the country has been diverted from the natural study of markets to the study of the more complicated problems of subsidies, guarantees, tariffs, safeguards and other political substitutes for work and effort.

Position of Manufacturers.

It would, I think, be extremely useful if more emphasis were laid upon the profession of employing and if more study were given to the functions of an employer as distinguished from a merchant or a manufacturer. The man who sets up in business assumes a variety of responsibilities. He puts up a sign on the front of his premises which announces him to be a manufacturer of something, and the public is inclined to think of him wholly in connection with the something which he sells. That, however, is a rather limited view of the average manufacturer. He not only makes an article but he employs a number of people in so doing. The best among our manufacturers think a good deal more of their responsibilities as employers than of their work as mere business men. It is their function to organise the work of a number of other people and to adjust the markets on both sides, and all the incidents associated with the undertaking for which they are responsible, to the requirements and the convenience of the people whom they employ. It would, of course, be absurd to claim for manufacturers as a whole that this side of their natural function is always uppermost in their minds, but few will be found to deny its weight and its importance with the better type of employer. There are some trades, such as large scale contracting and railway building, where no employer could ever pretend to be responsible for his workpeople for the period of their lives. The very nature of the work requires that a number of people shall undertake it for a limited time. But that, after all, is a mere fraction of our trade, and most of it can be done, as much of it is already done, with a view to the constant employment of a given number of people who have developed in them a due sense of the unity of interest between employers and employed.

There is another way in which the responsibility of employers has tended to drop into the background in recent years. If a return could be compiled showing the number of hours spent in recent years by business men sitting on committees to deal with futile political obstruction, and if it were at the same time remembered that all those hours might have been spent by those same business men in calling on customers, a better conception of the real reason of our industrial plight would be secured. This committee habit is beginning to wane, because, after all, business men still have a certain sense of the value of their time. They are beginning to rebel at weary hours spent in considering documents which will in due course be sent on to some other advisory body only to waste, as they proceed from authority to authority, more valuable time on the part of others, and in the end to achieve nothing.

Mention of the committee habit brings out yet another aspect of this question of the employer's responsibility for unemployment. The war did one good piece of work for us in that it perfected the habit of consultation between members of a given trade. The trade union, the trade asso-tion and the joint council were for war purposes brought to the point of the highest efficiency, but it is on the consciences of many business men that that efficiency tends to be used in the interests of the trade as distinct from the interests of the community. Just as we have trade unions which deliberately limit the right of the rest of us to undertake certain classes of work, so we have developed trade associations and joint councils which tend to be afflicted with the same unsocial

Digitized by Google

folly. The case for the trade union and for the trade association and for the joint council disappears entirely unless these bodies are prepared to accept their responsibilities as citizens, to remember that their trade is a service to society as a whole, and to use their powers to extend, develop and facilitate that service. The moment when any of these organisations begins to play the trust or combine, and tends to create scarcity in order to enhance price, it becomes a social evil. It not only robs the rest of us of the enjoyment of products which might be ours, but fills its own pockets with inflated prices at the cost of the unemployed to whom it denies the right to work. We have followed far too closely and taken too literally the old adage that "union is strength." We forget that such strength may be used for evil as well as for good. We overlook the warlike implications in "union is strength." No one can doubt the truth of the saying when it is a question of war. There is some doubt in my mind whether the natural tendency of union is not to use its strength for war, and whether, therefore, all these unions, of whatever kind, do not tend to make war upon the rest of us. If that is so, then we arrive at another of the many explanations required to account for the unemployment difficulties which we are discussing.

Many of our employers have yet to understand that high prices do not necessarily mean prosperity. A good deal of our difficulty arises from the present clinging of some of our employers' associations to inflated or unnatural prices. This difficulty is perhaps most notable in connection with associations of retail traders. It is evident when one looks at the index figures of wholesale and retail prices. Manufacturing and wholesale trades have done much more than their retail colleagues in the difficult work of getting back to normality. The result is that wholesale prices and wages have in many cases come near to reason, only to find that when their products reached the retail market the old inflated figures remained. There is probably no one cause which has more to do with unemployment to-day than this. We really must give up the theory that wealth can be secured out of small quantities and high prices. Money, it is true, may be got that way, but always at the cost of suffering to others. Real wealth, which consists in goods and services, can only be got and developed by a policy of increased production at an ever decreasing price. If these basic principles were properly understood by employers and employed, we have to-day, with all the machinery of trade organisation, wonderful opportunities for increasing the wealth of the community and raising the standard of living. What is wanted is a change of heart, an alteration in the point of view. One by one our traders must begin to re-absorb the old spirit of service. They must recognise that they exist for the purpose of supplying the needs of others, and no other excuse can be found for their activities. They must realise that in the long run wealth and prosperity will come to them from an expression of this view, and that any temporary gains obtainable from its denial can never be anything but very temporary in their nature.

STROBAESTHESIA.

Physiological Effects of Electrostatic Charging—Experiences with Electric Cushions—Feeling through a "Time-Microscope."

By DR. R. HEILBRUN and A. J. MAKOWER, M.A.

IF two persons connect themselves, with due precautions, in series through their arms on a 220 V a.c. supply, completing the circuit between the two persons by touching the backs of their hands together, they will experience an unpleasant pricking sensation on the backs of the hands that are in contact. This pricking increases with the current, and becomes so strong at about 10^{-3} ampere that the experiment must be stopped. The current may be conveniently varied by means of a variable condenser of several hundred centimetres capacity, and the current may be measured by a rectifying valve and a d.c. meter of suitable range. If the hands are stroked lightly across each other, instead of being kept in stationary contact, a new phenomenon occurs, which is easily distinguished from the pricking sensation.

Fig. 1.—Corduroy effect produced by stroking with finger tips.

With such *stroking contact* the pricking sensation, for which a minimum current of about 10^{-5} ampere is necessary, disappears, and in its place a new sensation arises, which we call the "corduroy sensation." The surfaces of the skin, which without the electrification feel smooth, now feel hard and rough, as if ridges and depressions exist at right angles to the direction of motion. It feels as though the smooth skin has been replaced by a corduroy material. This corduroy sensation can still be felt if the current is reduced to 10^{-8} ampere, or even to still lower values. Clearly the effect is produced by electrostatic charging of the surfaces of the hands by the a.c. supply, and not by the passage of current.

The necessary conditions for the appearance of the corduroy sensation are in the first place the use of a.c.—with d.c. it is not produced—and in the second place the stroking contact between the hands—nothing is felt with small currents and stationary contact. The sensation is felt with stroking contact between other surfaces, such as between finger tips or finger nails of one observer and the neck, forehead, ear or dry lip of the other.

A single observer suffices if he connects his body to one pole of the a.c. supply and holds by an insulating handle an electrode connected to the other pole through a condenser. His skin then experiences the corduroy sensation when he passes the electrode along it with a stroking contact. Such contact in the neighbourhood of the ear is attended by a humming tone. It is necessary in all cases that the skin surface be dry. The smallest amount of dampness causes the sensation to disappear.

It is not surprising that the effect is unequally felt by different observers. The same is well known for other electrophysiological effects. Such differences may arise from the condition of the skin, the layer of fat under the skin, or from other bodily differences. At any rate the corduroy effect is very definite and always reproducible, although we have not found any pervious mention of it.

The effect may be rendered visible by dusting the surface of the skin with lycopodium powder, preferably after browning the powder by heating it in a porcelain crucible over a Bunsen flame. If now the stroking contact is made in any of the above ways, the powder ranges itself in stripes in a very striking manner. The picture shown in Fig. 1 was produced by making three strokes with a finger tip at the same velocity. Similar pictures may be produced on the finger nails or other parts of the body.

From the foregoing it might be supposed that the corduroy sensation must be a very rare occurrence owing to the great improbability of a person without set purpose connecting himself to one pole of an a.c. circuit and stroking the skin with a suitably insulated electrode. Nevertheless the phenomenon is by no means rare and forced itself upon our notice in a series of instances in connection with the greatly increasing use of electrically heated cushions.

Various reports reached us that slight feelings of electri-

Digitized by Google

fication had been experienced during the use of the cushions. These could not be explained by leakage and another reason had to be sought. In fact we found that an electrically heated cushion constitutes a condenser. The heating wire and the user form its two plates, and the fabrics between them the dielectric. Calculation and test give results in close agreement considering the variable nature of a condenser of this type. The capacity of a "milliwatt" electric cushion under normal conditions of use may be taken to lie between 170 and 190 cm., which capacity, when used on a 220 V 50-cycle supply, allows a current to flow of the order of 10^{-5} ampere, or the lower limit of current that just suffices to give rise to the corduroy sensation.

Suppose that the electric cushion is controlled by a single-pole switch, which is open, so that one end of the winding is connected to an unearthed pole of the a.c. mains, the other end being disconnected from the mains. The cushion lies on the body of an invalid, who is well insulated in bed. The doctor stands by the bed and shakes the patient's hand, or passes his own hand over the patient's forehead. By so doing he establishes a stroking contact between his slightly earthed hand and the patient, who is connected to one pole of the supply through the capacity between himself and the cushion. If the doctor's and patient's skins are dry all the necessary conditions exist for a distinct feeling to be experienced.

The origin of the corduroy feeling must be ascribed to the phenomenon described by Johnsen and Rahbeck before the Institution of Electrical Engineers on May 26, 1921 ("Journal I.E.E.," Vol. 61, July, 1923; "E.T.Z.," 1922, p. 587; "Zeitschrift f. Techn. Physik," 1921, p. 315). They describe an unexpectedly large electrostatic attraction between a conductor and a semi-conductor placed in contact with each other and connected to the two poles of an electric supply. The conductivity of the semi-conductor enables electric charges to reach the surface of separation between the semi-conductor and the conductor, but the passage across the gap is prevented by the high insulating property of the separating surface. Thus a condenser is formed with a very thin dielectric and large electrostatic attraction is produced between the materials that are in contact. Johnsen and Rahbeck find that for plane surfaces in good contact, the effective thickness of the dielectric is equivalent to about 10^{-3} cm. of air, and that the force of attraction between the surfaces at 220 V is several hundred grammes per sq. cm.

The presence of moisture at the separating surface between the conductor and semi-conductor destroys the high insulating property of the gap and the electric charges at the separating surface disappear. This explains the absence of the corduroy effect when the skin is moist. In the case of contact between two persons, as described above, the conductor and semi-conductor of Johnsen and Rahbeck are replaced by two semi-conductors, otherwise the conditions are similar.

The effect between two semi-conductors is shown in Fig. 2, produced by photographing the ordered deposit of lycopodium powder upon the surface of a slate slab connected to one pole that has been stroked at various speeds by a piece of slate connected to the other pole of the alternating current supply.

Similar effects are produced if the stroking pole consists of a piece of carbon, a finger, a metal rod covered with leather, a piece of bone, or a fresh plant-stem or leaf. The quicker the motion of the electrode the greater is the distance between the deposited rows of powder.

Pendulum Experiments.

That the rows are, indeed, produced by the alternations of the current was proved by pendulum experiments in which the speed of passage of the electrode along the slate slab was calculated and from this the distance between the rows of powder deduced from the known frequency of the supply.

In order to ascertain whether the lycopodium powder was deposited at moments of maximum or minimum potential a pulsating direct current was produced by a rotating contact with adjustable speed and length of contact. When rotating the contact slowly, it could be seen by means of a lamp connected in series that the passing electrode swept away the powder at periods of maximum potential, no doubt by reason of the increased pressure between the electrode and the slab, and that the powder was left at rest during the periods of zero potential.

If only one semi-conductor is used and the conductor and semi-conductor are interchanged, for instance by stroking a thin

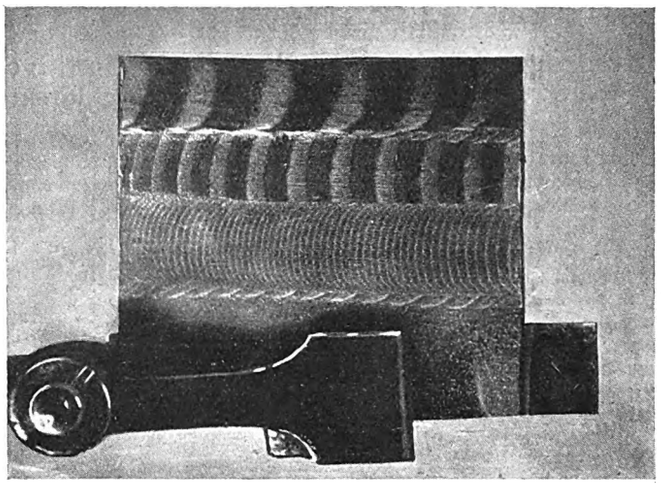

Fig. 2.—Effect produced on surface of slate slab by stroking.

sheet of metal (zinc of 0·3 mm. thickness), by a slate rod, a distinct chattering noise is produced, which was already noticed by Johnsen and Rahbeck. The rod is evidently caused to strike the slab periodically by the periodic increase of force produced by electrostatic attraction between them.

The optical presentation of the phenomenon that we have described reminds us closely of the stroboscopic effects produced by the periodic illumination of a moving body by an a.c. lamp. The moving body then assumes a corduroy appearance. By analogy we call the sensation which we have been dealing with strobaesthesia, the motion producing an interrupted feeling in place of an interrupted vision. The skin feels, so to speak, through a time-microscope so that the maxima and minima of attractions, which would be superposed upon each other, are separated so as to be distinctly felt.

I.E.E. CONVERSAZIONE.

Birthday Congratulations to Colonel Crompton.

MORE than 1 600 guests were present at the Conversazione of the Institution of Electrical Engineers in the Natural History Museum, South Kensington, on June 12. Col. Sir Thomas F. Purves, O.B.E., the President, Lady Purves and the Council received the company, who found much to interest them in the portions of the Museum which were open, by the kind permission of the Trustees.

The string band of the Royal Engineers, playing in the Central Hall, was greatly appreciated, and the concert in the Reptile Gallery—a very fine "crocodile" was formed by the arriving guests between the cloak rooms and the reception hall—also proved attractive. The performers were Miss Hetty Bolton, Mr. Robert Easton, Mr. Melsa, Miss Sylva van Dyck and the Salisbury Singers—Mr. Victor Maesters, Mr. John Collett, Mr. Arthur Frith and Mr. Leonard Salisbury. Mr. Edward Brightwell was the accompanist.

In the course of the evening the opportunity was taken by Sir Thomas Purves to present to Colonel Crompton a vellum diploma conveying the congratulations of the President and Council of the Institution on the occasion of his 85th birthday. The diploma read as follows:—

"The President and Council of the Institution of Electrical Engineers desire to convey their heartiest congratulations to its esteemed Past-President, Colonel Rookes Evelyn Bell Crompton, on the occasion of his eighty-fifth birthday, on the 31st May, 1930, and cordially wish him 'ad multos annos.'

"His pioneer work in the advancement of Electrical Science and Engineering and their applications, which is universally recognised, entitles him in the fullest degree to the respect and admiration of Electrical Engineers.

"As a mark of appreciation of the great services rendered by Colonel Crompton to the Electrical Engineering Profession during his 50 years' membership of the Institution, he was elected one of its Honorary Members in 1923, and was awarded its Faraday Medal in 1926.

"Witness our hands and seal at Westminster this twenty-ninth day of May, 1930."

T. F. PURVES, President.
W. M. MORDEY, Member of Council.
P. F. ROWELL, Secretary.

THERMAL STORAGE COOKERS.

Advantages for Domestic Purposes—The Seves Stove—Time Saving—Comparison of Current Consumption.

By HILDA L. DOVER, B.Sc.

FOR some years now the usual method of heating saucepans by conduction from enclosed and open hotplates has been recognised as too long in comparison with gas heating. When high power hotplates are used the high load demand on the distributing system is inconvenient and the upkeep of the hotplates is too expensive. The hotplates warp badly and often the leads break at the connections, necessitating a new hotplate. In order to avoid high loads the idea of storing heat evolved electrically was conceived. This has been put into practice by storing heat in a suitably shaped iron block surrounded by a good heat insulating material. The idea has been so perfected as to produce the Seves stove, which is manufactured in Sweden and is largely used in Stockholm. A diagram of a section of the cooker is shown in Fig. 1.

The stove consists of an iron block containing two heating elements which are supplied with current so as to produce an average temperature of about 500 deg. C. or 900 deg. F. The iron block is imbedded in a well insulated box and fitted with a light insulated cover. A thermostat is connected to the block which operates a mercury switch controlling the current passing through the elements. When the temperature of the iron block reaches about 500 deg. C. the current is automatically switched off, and when the temperature falls slightly the current is automatically switched on. The current is being switched on and off through the whole 24 hours. By supplying the iron block with heat at a low rate over a long period it becomes as effective as an ordinary 2 kW boiling plate. The two elements are of the same power, about 350 watts. These are connected to two plugs so that either one element or both elements may be used as desired. When little or no cooking is being done one element only need be in the circuit. On the other hand when much cooking is being done the two elements are switched on. From the foregoing it will be seen that a *hot* hotplate is always available and the difficulty of rapid heating has been overcome. Two pints of water will boil in less than three minutes. When the hotplate is required for use the cover is raised. The saucepan, which should have a perfectly flat bottom, is put on this. The saucepan bottom

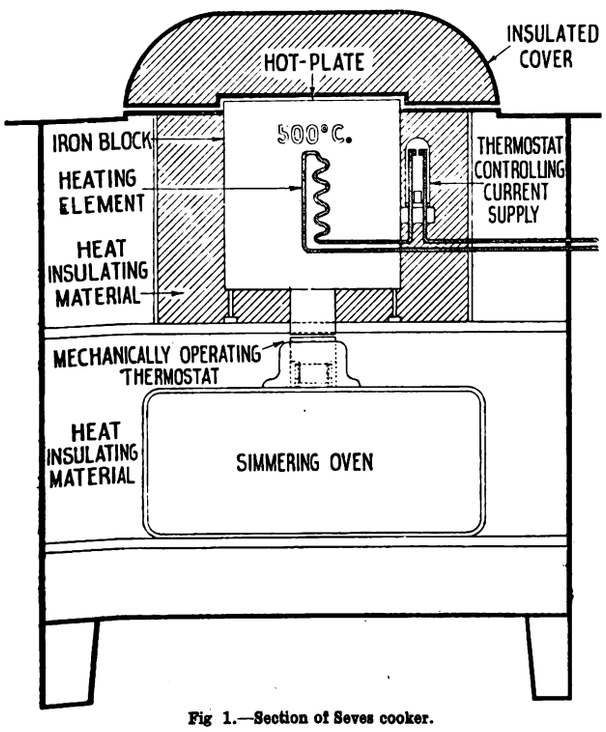

Fig 1.—Section of Seves cooker.

and the hotplate must be kept scrupulously clean to ensure good conduction. For the same reason the saucepans should be of heavy engine turned aluminium. If the contents of the saucepan boil too rapidly, the saucepan is raised slightly from the hotplate by turning a knob in front of the stove.

Passing to the lower chamber, which is called a " simmering oven " and is surrounded by good insulating material, heat is transferred from the iron block to this chamber by a mechanical device, and by thermostatic control the temperature of the oven is maintained at about 90 deg. to 95 deg. C., i.e., just under the boiling point of water. There has been much re-

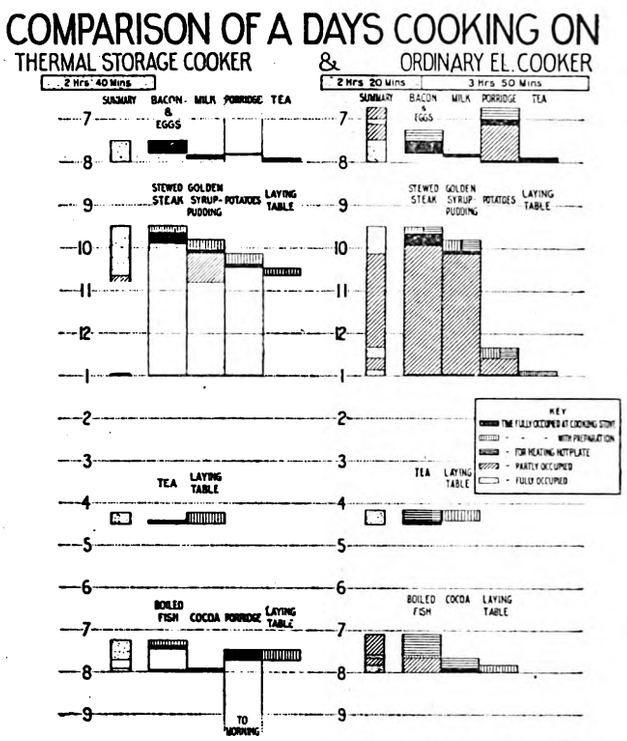

Fig. 2.—Cooking costs with thermal-storage and ordinary electric cookers.

search on the most suitable temperature for cooking food in the most nourishing way and it has been agreed that slow boiling or simmering is the best method. This requires a temperature of about 90 deg. to 95 deg. C., and is the temperature of the simmering oven. At this temperature volatile aromatic substances are not lost in the steam and the cooking is not violent enough to dissolve out appreciably nourishing salts. When the saucepan of food has been boiled on the hot-plate and the food throughly heated through the saucepan containing the food (which is fitted with an airtight lid) is put into the simmering oven to simmer. As there will be no evaporation, no stirring or burning, the food during cooking will require no further attention until it is dished up. The time required on the hotplate after the food has been boiled depends upon the texture of the food. The time required for the food to be thoroughly cooked in the simmering oven again depends upon the texture of the food. It would be as simple to teach women to cook by this method as with the ordinary electric cooker. Education in the use of electricity for cooking is necessary, and the best method—the one which saves time, labour and money—should be the one that is advertised and taught.

Besides boiled food, braised meat and vegetables can be cooked by the hotplate and simmering oven. The meat is browned in the casserole on the hotplate, which coagulates the albumen, thus preventing the juices from escaping from the meat. Then the casserole is fitted with an airtight lid and put into the simmering oven. This method of cooking makes the meat very tender and juicy; thus the cheaper varieties of meat can be used.

It has been found that over 50% of the usual cooking can be conveniently done by the hotplate and simmering oven. It may be of interest to know that scientific investigation has proved that slow cooking for several hours in an airtight saucepan at a temperature of 94 deg. to 97 deg. C. will by no means spoil the value of the food. Experiments with raw, restaurant and slowly cooked food show that slowly cooked food is the most nourishing.

For roasting and baking a separate high-temperature oven is necessary, and whilst this is in use the heating elements of the

Digitized by Google

thermal storage cooker are switched off, thus keeping the load low.

The diagram in Fig. 2 represents the time spent on one day's preparation of food and cooking for a family of six to eight persons when using (1) a thermal storage cooker, (2) an ordinary electric cooker. A very simple wholesome menu for a working class family has been taken to show that the thermal storage cooker is of service to the poor. The diagram shows that when the thermal storage cooker is used the housewife has $3\frac{1}{2}$ hours more time during the day when her thoughts are free from all cooking. During the morning alone the housewife has two whole hours in which she can do her shopping, housework or needlework without fear of the dinner being spoiled or insufficiently cooked, for it has been found that by bringing the potatoes to boil on the hotplate at 10.45 a.m. and putting them at once into the simmering oven they are in no way overcooked by 1 o'clock. Taking an ordinary week's menu the time saved averages 13 hours per week, which is equivalent to 676 hours per annum. Should the meal time be delayed the food will in no way dry up or spoil.

The all important question of the consumption of electrical energy is by no means alarming. A relationship has been derived experimentally for the average energy consumption per annum. Thus if P = number of persons in the household, W_s = energy consumption per annum for the thermal storage cooker, W_o = energy consumption per annum for the ordinary electric cooker, then

$$W_s = 1\,850 + 165P$$

$$W_o = 1\,000 + 275P$$

For example, for a household of three persons the annual consumption will be 2 345 kWh with a thermal storage cooker, and 1 825 kWh with an ordinary cooker. For a household of nine persons the annual consumptions are 3 335 kWh and 3 475 kWh respectively, averaging 1·02 and 1·06 kWh per person per day.

Supply undertakings should be able to give a better tariff for thermal storage cookers than for ordinary cookers on account of the low maximum demand and high load factor Under these circumstances the annual cost of the thermal storage cooker will always be lower than that of the ordinary cooker.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—VIII.

Recording Cash Payments and Discounts Obtained—Keeping and Balancing the Accounts of Creditors—An Alternative Method.

By S. HOWARD WITHEY, F.C.I.

PAYMENTS made in the form of legal tender, whether to creditors or as expenses, will be entered in the " cash " column on the credit side of the contractor's cash book, giving the date and the name of the account to be debited in the ledger, while all payments by cheque will be detailed in the " bank " column. If the contractor is entitled to deduct a discount in respect of prompt payment of a creditor's account, the amount of such discount should be inserted in the " discount " column on the credit side of the cash book, on the same line as the particular cash item to which it relates. Failure to record a discount item would make it impossible to reconcile the balance of the personal account with that shown on the monthly statement as rendered, consequently care should be exercised to ensure that all discounts are booked.

Both the cash and the discount transactions will have to be posted to the debit side of their respective purchases ledger accounts. This may be effected by means of two entries in each case, reading " To Cash " or " To Cheque " and " To Discount," or as one entry reading " To Cash and Discount " or " To Cheque and Discount." For the purpose of facilitating all future references to details, it is better to show the cash and the discount as separate items, thereby avoiding the constant turning up of the cash book records. At the end of each month the total of the discount columns of the cash book should be transferred to a discounts account in the impersonal ledger.

The expenditure incurred in carrying on the business—such as wages, advertising, carriage and cartage, postages and stationery, rent, rates, taxes, insurance, etc.—should be posted from the cash book to the debit side of suitable expenses accounts, each item showing the date of payment and the cash book folio. All expenditure, however, which has the effect of increasing either the number or the value of the assets employed by the contractor or electrician for profit-earning purposes should be capitalised by debiting the amounts involved to the particular asset accounts kept in the private or general ledger.

It is very necessary that the contractor should be constantly aware of the total sum owing to creditors and trade suppliers, and for this reason the personal accounts kept in the purchases ledger should be balanced and ruled off at the end of every month, and a complete list of all outstanding balances made out. For the most part, the amounts appearing on the credit side of any particular account will represent the invoiced prices of products and components supplied, as detailed in the purchases book, the folio of which will be shown against each item. On the debit side of the account will be recorded the various amounts of cash paid by the contractor from time to time, either in settlement or part settlement, and the discounts obtained, while if any goods or articles have been returned or any allowances have been made by the supplier, the value of same will also appear on the debit side.

To balance a personal account, the two sides should be added up, and if the credit total is greater than the debit total, the difference will represent the sum actually owing to that person, firm, or company. This difference should be inserted as the last entry on the debit side of the account, with the balancing date and the words " To balance carried down," after which the two totals will agree with each other. When this has been checked, the totals should be ruled off opposite each other, and the balance brought down on the credit side as the opening entry for the next month or period, giving the balancing date and the words " By balance brought down." In some cases, owing to an account being overpaid or an insufficient amount of discount deducted, the debit total will be higher than the credit total, and when balancing such an account the difference should be inserted as the last entry on the credit side, reading " By balance carried down," enabling the totals to be ruled off on the same line as each other and the balance brought down as the first item on the debit side for the following period. When the two totals of an account are seen to correspond with each other, they should be ruled off at once to show no balance outstanding. This will avoid the constant adding of the same figures month after month. It is a good plan to show all ledger balances in red ink, and to compare the amounts with the figures brought down at the end of the previous month.

Where possible, the purchases ledger should be balanced independently of the other ledgers. To do this a reconciliation account should be prepared showing, on the credit side, the total of the balances outstanding at the end of the previous month, followed by the cost of the purchases made during the month—as shown in the purchases book—and on the debit side the total of the cash paid and the discounts obtained, as per cash book, and the value of the returns outwards and allowances as detailed at the end of the purchases book, or in the returns and allowances book, as the case may be. Apart from unusual transactions—which would have to be allowed for—the difference between the two sides of the reconciliation account will correspond with the total of the ledger balances outstanding at the end of the month, providing no clerical errors have been made.

In those cases where the contractor obtains his products from a limited number of sources, a simple but effective method of keeping the creditors accounts may be adopted. All the invoices received from the same suppliers could be pinned together, or otherwise attached, as soon as the details have been checked, to await the receipt of the monthly statement of account. The credit notes received in respect of returns or allowances should be attached to their invoices, and at the end of each month or quarter a list of accounts owing should be made out, the total of this list being recorded on the credit side of a " Sundry Creditors' Account." Each payment made by the contractor on account of these balances should be posted from his cash book to the debit side of the " Sundry Creditors' Account," the balance of which at any given time will correspond with the total of the unpaid bills on the file.

The next instalment of this series will show the method of keeping and balancing the different management and working expenses accounts, and the accounts of assets and liabilities.

Research and Wireless.

[To the Editor.]

Sir,—It is always a thankless undertaking to offer any criticism on statements made in scientific journals or reported utterances of any scientific man, because it will at least be regarded with disfavour if not met with excuses. There are, however, occasions in which it is necessary in the interests of historical accuracy,

Dr. Eccles set himself a difficult task in his recent presidential address to the Institute of Physics to deal in a brief hour with such an extensive subject as the influence of physical research on the development of the wireless art. It is not easy to say exactly where the pure research ends and the technical invention begins, for many inventors have also been physical investigators of the first rank.

It is not always possible sharply to divide achievements into pure research which have provided the raw material and subsequent inventions, because much that had its beginnings in merely scientific curiosity often has to be done over again more carefully when once it is seen to be likely to have some useful application. Dr. Eccles begins his address, according to published reports (see The Electrician May 30, also "The Times," May 28, and "The Engineer," May 30), with the remark that the (electric wave) "detectors discovered by Lodge, Branly and Minchin in 1889 and 1890 were essential apparatus to any prospective practical application," and he adds, "after these purely scientific investigations had provided the means and materials, wireless telegraphy was born at the British Association meeting at Oxford in 1894, when Lodge sent Morse signals by a spark apparatus worked by a telegraph key, and recorded them on a moving paper tape by receiving apparatus at a distance." One naturally asks why the prior scientific discoveries of D. E. Hughes, a physicist of high rank, are not included? He made, in 1878–79, metallic filings and carbon-steel coherers with which he detected signals by means of a telephone, due to electric waves, and his results were mentioned by Crookes in 1892 in a remarkable forecast of the achievements which might be expected from wireless telegraphy as the result of Hughes' work. Hughes' apparatus, rescued from loss by Campbell Swinton, is now on view in the National Science Museum, London. Moreover, it is by no means certain that the coherer before it had received the scientific improvement due to Marconi in 1896 (and probably also to Sir Henry Jackson) could have been used to send intelligible messages by electric waves to which alone the term "telegraphy" is applicable.

Sir Oliver Lodge himself in his interesting book "Talks About Wireless" says (p. 38): "In August 1894, I exhibited this method of signalling at the British Association at Oxford. None of us ever, so far as I know, unless it was Sir Henry Jackson, actually applied these waves to anything that could be called practical telegraphy" . . "The first strenuous effort at actual telegraphy was made by Senatore Marconi."

One could not have better testimony than this to the fact that wireless telegraphy was not "'born' at Oxford in 1894," but that its true birthplace was Bologna in 1895, when Marconi there sent his first intelligible messages in Morse code.

Another section of Dr. Eccles' reported address is headed "The Thermionic Valve," but although this is claimed as the "work of physicists," there is a curious absence of any reference to all my own papers in the journals of the Physical Society or Royal Society on the subject, for example:—

"Molecular Shadows in Incandescent Lamps," "Phil. Mag," August, 1885.

"Electric Discharge in Vacua," "Proc. Roy. Soc.," 1889.

"The Physics of an Electric Lamp," "Proc. Roy. Inst.," 1890.

"Edison Effect in Glow Lamps," "Phil. Mag.," 1896.

"Conversion of Electric Oscillations into Direct Currents," "Proc. Roy. Soc.," 1904.

All of which, purely physical researches, led me to the invention in 1904 of the two-electrode thermionic valve, the necessary precursor of the amplifier, as held by Mr. Justice Sargant in 1918.

Dr. Eccles says the "Grid" was traceable to the experiments of a German physicist in 1902. If Dr. Eccles will pay a visit to the National Science Museum at South Kensington he will see a valve there made by me and described in a paper to the Physical Society on March 27, 1896, which contains a "grid" made exactly as subsequently used by de Forest, and long prior to any German publication.

Then, surely, any discussion of the influence of research on wireless should have contained some brief reference to Marconi's great scientific discovery of the influence of daylight on long-distance wireless. It was that which led to Heaviside's suggestion as to the so-called Heaviside layer in the atmosphere.

The whole subject of short wave propagation round the world was for years the work of Marchese Marconi in his voyages in his yacht "Elettra," and full details were given by him of this purely scientific work—in papers read to the American Institution of Electrical Engineers in New York in June, 1922, and to the Royal Society of Arts in London in July, 1924.

Sir Oliver Lodge pays a handsome tribute to this work in his book "Talks on Wireless" (p. 41), where he says:—"It is needless to emphasise the world-wide character of Mr. Marconi's subsequent developments, his discovery of the power of ether waves to curve round the earth to immense distances, his discovery of the adverse effect of sunshine, and the more recent discovery that short waves can travel efficiently to the antipodes, the theory of which travel by reason of the peculiarities in the atmosphere has been given both by Dr. Eccles and Sir Joseph Larmor."

These researches though conducted with the world as a laboratory were purely scientific, and the essential preliminaries to the great inventions by Marchese Marconi and Mr. Franklin which evolved the Beam system of wireless. It is also a notable feature of Dr. Eccles's address that, whilst Hertz's experimental demonstration of electric waves is taken as a starting point, the name of James Clerk Maxwell, who first conceived their existence, is not mentioned. Neither is Lord Kelvin's classical paper in 1853 on electric oscillations of a Leyden Jar, nor Lodges' experimental researches on this subject—which almost anticipated Hertz's work. These were all epoch-making physical researches which surely helped to lay the foundations of wireless.

It seems necessary also to offer a word of respectful protest against the tone of an article and leader in The Electrician of May 23, 1930, on this subject of priority in the invention of electric wave telegraphy. It is not very obvious why it should have been necessary to reproduce now statements in that journal made in 1897, which, to say the least, were based on an imperfect knowledge, nor why it should claim approval for having "championed" the cause of one or other inventor.

The chief duty it would seem of scientific journalism is to record fairly and without bias actual achievements, and leave to posterity or the law courts the more difficult task of assigning to the various contributors to the upbuilding of a new art or industry the share of the credit which properly belongs to them.—Yours faithfully,

Ambrose Fleming.

June, 1930.

[*We print Sir Ambrose Fleming's letter with pleasure, in spite of his criticism of certain passages in our issue of May 23, for no one is better qualified than the inventor of the thermionic valve—the keystone of the immense progress made by wireless methods of communication in the past decade—to write with authority on the development of the various inventions which have contributed to the progress of the new art. We feel, however, that he has rather exaggerated the significance of the quotation from* The Electrician *of September 17, 1897. This was reproduced, purely as a matter of historic interest, in the brief reference to the past activities of this journal contained in the Jubilee History of Benn Brothers, which was included in our issue of May 23.*—Ed.]

NEWS IN BRIEF.

Burton-on-Trent and Overhead Line Insulators—The Advertising Convention—Electrical Women at Wimbledon—The Scottish Regional Broadcasting Station.

HULL municipal telephone department made a gross profit of £38 156 for the past year, and a net profit of £11 968.

The annual outing of the Clyde Valley Electric Power Company took the form of a visit to Tarbert by the steamer "Duchess of Argyll," when 500 employees attended.

It was stated at a meeting of Inverness Town Council that the cost of their opposition to the West Highland hydro-electric scheme was £1 087 and £400 for the Grampian scheme.

Signed by 43 electricity consumers, a petition, asking reconsideration of the decision refusing to replace battery eliminators rendered useless by the change-over from d.c. to a.c., has been received by Burnley Electricity Committee.

A mains assistant is required in Watford Corporation's electricity department.

The L.M.S. Railway Co. is considering a scheme for the electrification of Cathcart Circle, a Glasgow suburban line.

A Kirkham Council has appointed a special committee to consider replacing existing street gas lamps with electric lighting.

Douglas (I.O.M.) Electricity Committee has authorised the borough electrical engineer to purchase a power factor meter at a cost of £60 10s.

The accounts for the year ended March 31, of the Douglas (I.O.M.) electricity undertaking are now practically complete and a substantial profit is indicated.

Dumfries Town Council has adopted an assisted wiring scheme, and the electrical engineer is arranging with contractors for the adoption of a uniform specification.

Burton-on-Trent Corporation has offered a reward for information regarding malicious breakage of insulators on e.h.t. overhead lines supplying districts around the town.

A large party of members of the Electrical Association for Women visited the Wimbledon electricity works and showrooms on June 4. The party was received by the Chairman of the Electricity Committee, Ald. Hickmott and Mr. McKenzie, chief engineer and manager.

It is reported that, as soon as permission is obtained from the Post Office, the erection of the Scottish regional broadcasting station will be commenced at Falkirk. When it is completed the stations at Glasgow, Edinburgh and Dundee will close down. It is possible that the Aberdeen transmitter will remain in commission.

The inquiry as to whether imported motor vehicles and parts should be required to bear an indication of origin, which was to have been held on July 7, has been postponed, and will be held in September or October. The goods concerned are :—(*a*) Motor-cars, motor-vans, motor-lorries, motor-trucks, and other motor-vehicles ; (*b*) internal combustion engines of all descriptions ; (*c*) chassis units, parts or fittings for the above ; (*d*) magnetos, batteries, and ignition plugs of all descriptions.

The fifth annual sports meeting of the Hackbridge Electric Construction Co., Ltd., and the Hewittic Electric Co., Ltd., was held at Hersham on Saturday, June 14. The enthusiastic efforts of the staff fully justified the decision to abolish all open events this year. Under the presidency of Mr. W. W. Hughes, the keen interest shown should prove extremely helpful in work and play. The cycling, pillow-fight and tilting the bucket items were very popular and amusing. After an extremely interesting afternoon in glorious weather, Mr. W. W. Hughes distributed the prizes. An innovation which proved helpful in organising the sports was the installation of loud speakers round the field, this equipment providing music meanwhile.

Manchester Health Committee recommends the provision of an electric lift at the Crumpsall Institution, at a cost of £2 700.

The staff of James Bros., electricians, of Devizes, Trowbridge, Chippenham, and Marlborough, held their annual outing on May 28, when upwards of 50 visited Portsmouth and Southsea.

Herbert Terry and Sons, Ltd., held their works annual outing on May 31, the record number of 780 taking part in the programme arranged. The party left Redditch at 8 a.m., and made its way by road to Llangollen. After lunch a trip across the mountains was made via the Horseshoe Pass.

Rotherham Education Committee has asked the Secretary for Education to invite tenders for the installation of the electric heating apparatus at the Thorpe Hesley Council school.

The summer meeting of the Institution of Engineers and Shipbuilders in Scotland and the North-East Coast Institution of Engineers and Shipbuilders will take place in Holland from June 21 to 28.

The inhabitants of Langenburg (Germany) have commenced a boycott of gas and electricity, and are reducing the use of water to the lowest limit, as a protest against increases in the rates levied by the municipality for these commodities.

About 90 members of the North Western Branch of the Institution of Mechanical Engineers recently visited the works of Hopkinsons, Ltd., Huddersfield. The members were entertained to luncheon at the George Hotel, and then proceeded to the works. Under the guidance of members of Hopkinsons' staff, a tour was made of all departments.

The priority permit, for the development of the White Mud Fall, Northern Manitoba, issued last year to the British Dominion Power Company, has been renewed for a year.

The Anglo-Australian telephone service was extended to Adelaide (South Australia) yesterday (Thursday). The charge is £6 for the first three minutes and £2 for each additional minute. Calls will be accepted for places in South Australia beyond Adelaide subject to a preliminary test proving successful.

It is reported that a company has received from the New Zealand Government a concession for the use of water power to a maximum of 50 000 H.P., in the neighbourhood of Milford Sound, for a hydro-electric scheme, associated with the electro-chemical industry. Unless an expenditure of £100 000 is made by January, 1933, the concession will be forfeited.

The sixth annual convention of the Advertising Association will be opened by Sir James Parr, at Hastings, to-morrow, Saturday. Over 1 200 delegates are expected to attend and 27 different speakers will take part. The general theme of the convention will be increasing trade by advertising, and among the speakers will be Sir Ernest Benn, Mr. E. A. Gatehouse, who will preside over the Industrial Press Section, and Mr. C. Pinkham.

Ten years ago on Sunday, Dame Melba made her memorable broadcast on 2 800 metres from Chelmsford. The transmitter, rated at 6 kW, was at the Marconi Works, and was later substituted by a 15 kW set, which radiated two daily programmes. In 1921 the well-remembered Writtle station was brought into being, to be followed later by 2LO at Marconi House. It is interesting to note that the Marconi Works is now the site of G5SW, the short wave station, and was the first home of 5XX before its removal to Daventry.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of June 19, 1880, recorded that a network of underground telegraphs had been completed, connecting Berlin with all the more important inland and frontier towns of the western half of Germany. Most of the underground cables contained seven conductors.*

Speaking at a meeting of the British Association of Gas Managers, Mr. C. Hunt said that the electric lamp for ordinary indoor purposes had yet to be invented. No advance whatever had been made towards the adaptation of the light to domestic requirements.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of June 23, 1905, stated that radical improvements in incandescent electric lamps had been a long time coming, but now seemed to be coming thick and fast. Dr. Louis Bell and Professor W. L. Puffer had expressed the opinion, after testing tantalum lamps, that it would be more economical to use these lamps at a cost of $1 each than carbon lamps costing nothing at all, assuming the cost of current to be between 6 and 10 cents per unit.*

Tests of a 400 kW Westinghouse turbo-alternator showed a steam consumption of 17½ lb. per kWh at full load, and it was stated that the lowest steam consumption then recorded was believed to be 14·4 lb. per kWh in the case of a 3 000 kW Brown, Boveri-Parsons turbo-generator installed at Frankfort-on-Main.

PERSONAL.

COLONEL Blunt-Mackenzie, Satle Leod, has been re-elected a director of Ross-shire Electricity Supply Co.

Mr. James A. Spence, Broughty Ferry, and Mr. Robert W. Murray, Dundee, have each been awarded a £150 scholarship for the study of electricity.

Major J. T. Rodwell, of the Cordoba Central Railway, writing from 9, Haldon Avenue, Teignmouth, South Devon, advises us that he is home on leave from the Argentine.

Mr. Lawson, who has been in charge of the radio side of Brown Brothers, Ltd., since 1922, has been appointed controller of sales with Radio Instruments, Ltd.

The Council of the Institution of Civil Engineers has awarded a Telford Premium to Dr. E. G. Coker, F.R.S., professor of civil and mechanical engineering at University College, London.

Dr. F. G. Donnan, F.R.S., will be awarded the honorary degree of D.Sc at the Convocation to be held at Durham University next week. He is the author of innumerable papers dealing with electro-chemistry.

Mr. C. H. Rayner, who has been with the Manchester Corporation electricity department for 36 years, has been appointed chairman of the Manchester branch of the Incorporated Sales Managers' Association.

Since his retirement from Birmingham, Mr. R. A. Chattock is frequently meeting friends in the electrical industry who are not aware that he has moved to London. We are pleased therefore to publish his address as 14A, Marlborough Place, St. John's Wood, London, N.W.8.

The James Scott Prize (1927-1930) of the Royal Society of Edinburgh has been presented to Professor Niels Bohr, of the University of Theoretical Physics, Copenhagen, who was described by the president (Professor Sir E. A. Sharpey-Schafer, F.R.S.) as chief among the contributors to the physical theory.

Mr. H. T. Tizard, F.R.S., Rector of the Imperial College of Science and Technology, is to be president of the Association of Special Libraries and Information Bureaux for the year 1930–1931, in succession to Sir Joseph J. Thomson. His year of office dates from the Annual Conference of the Association to be held at New College, Oxford, in September.

The honorary degree of M.Sc. has been conferred by the Council and Senate of the University of Liverpool on Mr. George Hinde Nisbett, managing director of the British Insulated Cables Ltd., Prescot, since July, 1928. He joined the firm in 1894 as chief engineer, became chief engineer and manager in 1902, and was appointed director and engineer in 1924.

The L.C.C. Establishments Committee has recommended that, as from dates to be arranged, Mr. A. H. Sears, senior assistant in the chief engineer's department, and Mr. J. R. Walker, senior technical assistant in the electrical branch of the tramways department, be promoted to be assistant engineers in the chief engineer's department, at commencing salaries of £700 and £750 a year respectively, rising by annual increments of £50 to £900 a year.

Mr. G. H. Lake, recommended for appointment as chief engineer and general manager of the Nottingham electricity undertaking.

Mr. G. H. Lake was last week recommended by the Nottingham Electricity Committee for appointment as chief engineer and general manager to the city electricity department. Mr. Lake was selected from 41 applicants, 11 of whom were interviewed by the committee. Mr. Lake has been connected with Derby Corporation in various capacities for over 30 years. He was appointed deputy borough electrical engineer and general manager in 1917, and promoted to his present position of borough electrical engineer in 1926.

Mr. E. T. Goslin, general manager of the Clyde Valley Electrical Power Co., was the subject of an appreciative sketch in "The Glasgow Evening News" last week, when a brief sketch of his career was given. Mr. Goslin, a native of Ramsgate, was employed by the Electric Lighting Co. of Hove before joining the staff of the County of London Supply Co., under whose auspices he laid the high ing mains in the centre of the city. After a while spent with the British Electric Traction Co. he went to Glasgow as mains engineer to the Corporation Tramways, rising to be chief engineer. In March, 1920, he succeeded Mr. (now Sir) Archibald Page as general manager of the Clyde Valley Co.

A pen and ink sketch of Dr. Oskar v. Miller, of Austria, Hon. President of the World Power Conference, 1930 to 1936.

Owing to additional duties and responsibilities placed on certain members of the Liverpool electricity department, in connection with the Clarence Dock power station, the Corporation has voted special payments per annum during the period of construction of the station, but for not exceeding two years, such payments to form part of the engineering expenses, to the following: Mr. J. Hamilton, generation engineer, £100; Mr. E. L. Morland, distribution engineer, £50; Mr. H. Midgley, chief technical assistant, £125; Mr. L. Breach, chief electrical assistant, £75; Mr. H. Pryce Jones, assistant technical engineer, £30; Mr. A. C. Hansen, engineer's secretary, £50; Mr. H. A. Williams, station superintendent, £50; Mr. K. M. Ferguson, assistant boiler house superintendent, £50; Mr. S. R. Hollway, shift engineer, £40.

Obituary.

MR. PERCIVAL JOHN PRINGLE, June 10, aged 60 years. He was general manager and chief engineer of the Electric Supply Co. of Victoria, Ltd., Australia. He served his time with Dubs and Co., Glasgow, and was afterwards appointed by Prof. G. Forbes on research work. At the age of 20 he was appointed works manager of Drake and Gorham, Ltd., later becoming assistant engineer to the Brush Co. In 1900 he was appointed resident engineer of the Midland Electric Power Corporation to represent the consulting engineers, Messrs. Kincaid, Waller, Manville and Dawson. In 1903 he became borough electrical engineer and tramways manager to Burton-on-Trent Corporation.

MR. JACK CAVE, on June 14, aged 57 years, one of the earliest of the Marconi Company's employees. His special knowledge of glass blowing and his skill as a master instrument maker led to his appointment in 1897 to the personal research staff of the Marchese Marconi. He was thus the first mechanic to be associated with the commercial development of wireless telegraphy, and under him in those early years the art of coherer manufacture and testing reached a high degree of performance. He began his work at Bournemouth and it was continued at Poole, and in 1899 commercial manufacture was begun at Chelmsford. With the advent of the magnetic detector superseding the coherer, Mr. Cave was appointed in 1907 a foreman of the machine shop. In 1922 he was appointed chief rate fixer, which position he held at the time of his death.

MR. WILLIAM G. GORDON, on May 13, aged 53 years. After graduation from Cornell University in 1899, he was employed in the Railway Engineering and Constructional Department of the Canadian General Electric Co., which position he held until 1905. Between 1905 and 1907, he acted in the capacity of railway engineer with the Australian G. E. Company; from 1907 to 1908 as manager and engineer of the North Melbourne Traction and Lighting Company; from 1908 to 1909 as chief engineer of the National Electrical and Engineering Co., and from 1909 to 1913 in the same capacity with Brisbane Tramways. Since 1913, with the exception of eight months in 1918 during which time he was a member of the firm of Malm, Gordon and Co., Ltd., Mr. Gordon was associated with the Canadian General Electric Co. In 1919, he was appointed manager of the Railway and Traction Engineering Department, which position he held at the time of his death.

SUPPLY IN GREAT BRITAIN.

Points from the Electricity Commission's Latest Return.

SOME of the salient features of the "Return of Engineering and Financial Statistics relating to Authorised Undertakings in Great Britain," for 1928 and 1928–29, issued by the Electricity Commission (Stationery Office, 15s. net), are dealt with in our leading article this week. Below we give other interesting points brought out by the statistics:—

The stage of development attained by the public supply undertakings in Great Britain in 1928–29 was represented by the following average figures per head of estimated population in 1928, namely, a connected load of approximately 225 watts, a maximum demand of about 92 watts and the sale to consumers of 176 units per annum.

Of the total generating plant installed over 95% was of a.c. type, this figure including plant of 12 different frequencies. Over 79% of all a.c. plant was of the standard accepted frequency of 50 cycles, the two predominating non-standard frequencies of 25 and 40 cycles accounting for 13% and 6% respectively. In 1928–29 a.c. supplies of 15 different frequencies were being distributed and the declared voltages at consumers' terminals for low and medium pressure a.c. and d.c. supplies taken collectively numbered 44.

Nearly 82% of the total public supply was sold to consumers, the remaining 18% being accounted for by the works requirements of undertakers and by losses in transmission and distribution. Sales of electricity for lighting and domestic purposes increased by 328 000 000 units and for power purposes by 389 000 000 units. There was an increase during the year of more than 394 000 consumers, or about 15%. Intersales of energy in bulk between undertakings for distribution to consumers accounted for 20·2% of the total public supply as compared with 18·4% in the previous year.

Combined maximum load on public supply undertakings, and on units generated and/or purchased, was of the order of 4 077 000 kW, and that on the generating stations of authorised undertakers was of the order of 3 369 000 kW. The capacity of the generating plant installed was about 72% in excess of the combined maximum demand. The load factor was of the order of 30% in the case of public authorities and 34% in that of companies, giving a combined figure of about 31·6%.

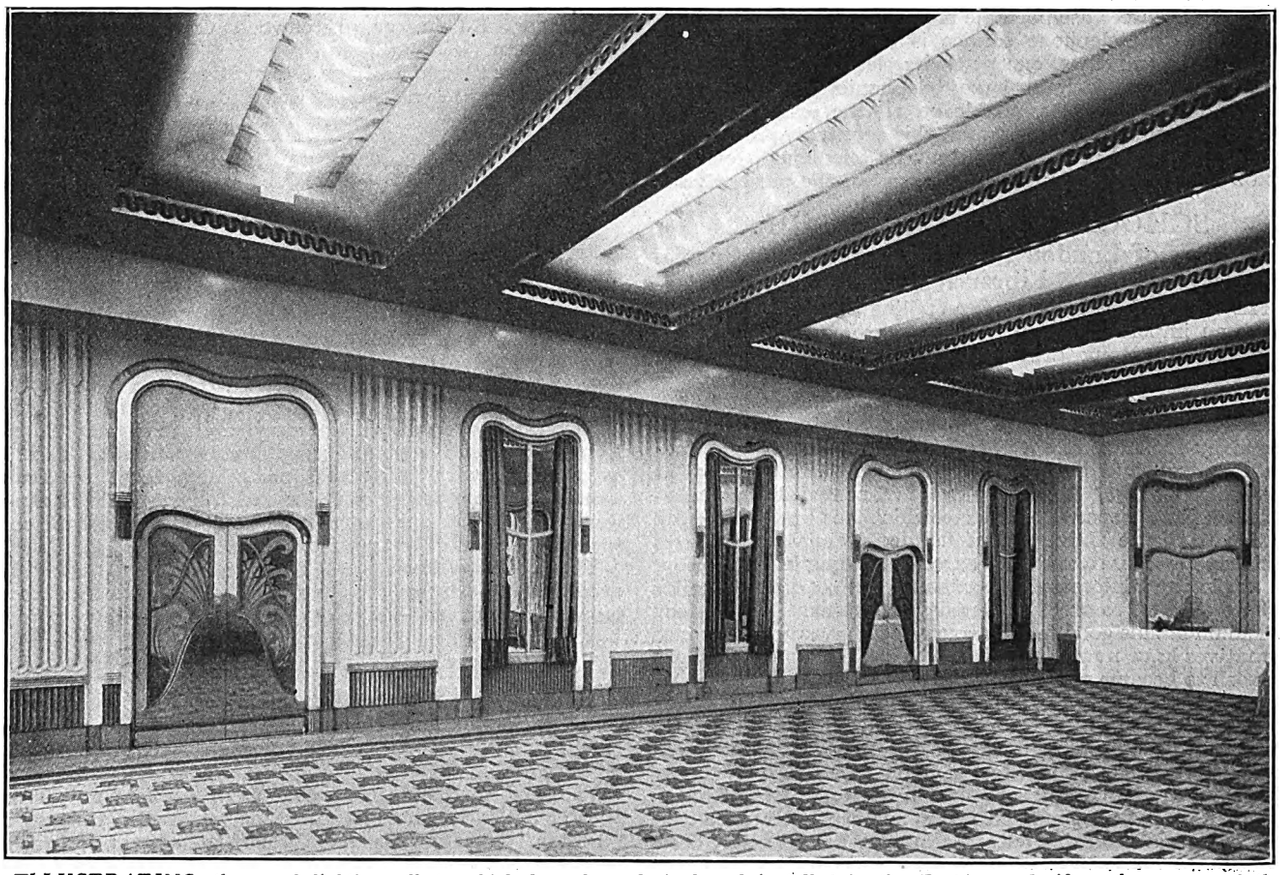
Economies continued to be effected in the utilisation of fuel. Public supply undertakings consumed over 8 200 000 tons of coal and coke in 1928–29. The average cost amounted to 15s. 7d. per ton, against 17s. 10d. in 1927–28.

The total expenditure charged to capital account by authorised undertakings at the end of 1928–29 amounted to about £297 677 000, 41% being in respect of generation and 59% in respect of transmission, distribution, etc. The average expenditure for all purposes per kW of generating plant installed was £51. During 1928–29 new capital expenditure amounted to over £28 670 000, an increase of more than 10%.

The total revenue of £55 454 000 represented an average of 1·37d. per unit sold against 1·49 per unit in 1927–28. Average revenue for £100 of capital expenditure was £18·6, but this figure is reduced to £16·9 if revenue from the intersale of energy in bulk is excluded. Average working expenses for £100 of capital expenditure amounted to £10·5.

In the case of public authorities, the gross surplus of £25 855 000 was appropriated to the extent of 35·1% for interest charges, 48.4% for repayments of loans and transfers to sinking funds and to reserve and renewals funds, 10% for capital expenditure and 2·7% in relief of local rates, the latter item representing a net contribution of £414 509. The remaining 3·8% (about £598 000) represented increase in the balances on net revenue account.

In the case of company undertakers the gross surplus was appropriated to the extent of 60% for interest charges and dividends and 33·4% for transfers to depreciation and reserev funds. About 3·4% (£350 535) represented increases in balances on net revenue account. The average ratio of preference and ordinary dividends, calculated on the capital at the end of 1928, were 5·41% and 7·36% respectively.



ILLUSTRATING the novel lighting effects which have been devised and installed in the Empire and Alexander rooms of the Trocadero Restaurant, London. The fittings employed comprise hollow fluted glass tubes approximately one-third inch in diameter, mounted horizontally on almost invisible frames. These frames are suspended below the rows of lamps which are thus obscured from view, and the refraction of light produces an illumination in the form of continuous bands—rays, soft and subdued from which all glare is eliminated. The lighting effect is efficient and restful, and at the same time blends with the modern scheme of decoration. The whole of the fittings were manufactured by the British Central Electrical Co., Ltd., 6 and 8, Rosebery Avenue, E.C.1, under licence from the patentees.

IN PARLIAMENT.

Points from Replies to Recent Questions in the House of Commons.

PRESS telegrams can be sent to Buenos Ayres at a cheaper rate via New York than if sent by the direct route of the Imperial and International Communications Co. The Postmaster-General has communicated with the Imperial Communications Advisory Committee on the matter.

The salary of the chairman of the British Broadcasting Corporation is determined by resolution of the Corporation, subject to a maximum of £3 000 a year.

If there is a desire by members of the Opposition in the House of Commons for conversations on the subject of permitting the use of the broadcast for controversial politics to be resumed, the Prime Minister will be glad to comply with the request.

Following on progressive improvements in the trunk telephone service designed to accelerate the growth of traffic, it was possible last year to put in hand works estimated to cost £750 000 in addition to the authorised programme for that year, and this year to accelerate the expenditure of a further £750 000.

The International Institute of Scientific Management is recognised by the International Labour Office, and receives support from that body in the form of premises and staff.

There is no reason to think that the number of errors in telegrams transmitted by telephone is materially greater than in telegrams transmitted by Morse or other telegraph instruments. The Postmaster-General has no evidence of any general dissatisfaction with the telephonic method of transmission.

The Lord Privy Seal is aware of the increase in the quantity of foreign electrical goods imported into this country during the last year. The difference as compared with the previous year was about 2%. It is in the main due to increased imports of the smaller type of appliance bought by the private user of electricity and wireless.

The number of wireless receiving licences in force on April 30 last was 3 117 000. There are no statistics available showing how many licensees use portable receiving sets.

Personal call telephone service is available with all the 23 European countries, except Switzerland, with which subscribers in Great Britain have telephonic communication. Personal calls are also available on all the extra-European services available to subscribers in this country.

Three or possibly four new automatic telephone exchanges will be opened in London before the end of the present year.

SCHOOL OF LIBRARIANSHIP.

University of London Diploma Scheme for Special Librarians.

THE electrical industry needs no telling that special libraries are an important organ in the research departments and information bureaux attached to the large technical and industrial corporations, and also to the great scientific and other learned societies. To train competent librarians to run them is an urgent problem, which has been anxiously considered by the Association of Special Libraries and Information Bureaux, and also by the School of Librarianship at University College, London. The last-named has, in consequence, just prepared a scheme which has been passed by the Senate of the University of London to enable graduates in science to receive a suitable course of training in one session, and attain the Diploma of Librarianship on conditions similar to those allowed to other university graduates. The present curriculum stands good for every type of librarian, but certain alternatives have now been introduced for the benefit of those who wish to become special librarians. The separate subjects, Library Organisation and Library Routine, have been modified and combined into the new subject, Library Economy (omitting those features to public library administration); the History of Science is given as an alternative to Palæography and Archives; and a new subject, Special Library Services, dealing with the point of view and the scope of special libraries and information bureaux has been introduced. These regulations come into force at once, and a course of instruction is being provided for the session beginning in October, 1930, when the new courses will start, provided that a fair number of persons desiring to train for work in special libraries enrol themselves before the middle of July. Further information can be obtained from the Secretary, University College, Gower Street, London, W.C.1.

THE NATIONAL REGISTER.

Further Applications for Registration Approved at June Meeting of Committee.

THE Executive Committee of the National Register of Electrical Installation Contractors, at a meeting held on June 6, received thirty-three applications from electrical installation contractors for registration, of which number one application was withdrawn, nine were declined, and twenty-four accepted.

The names and addresses of the successful applicants are given below :—

Saraikin, S. P., The Triangle Electric, 1A, Great Western Street, Moss Side, Manchester.

Gazard, W. A., and Son, Stechford Electrical Depot, Stechford Lane, Ward End, Birmingham.

Roberts, Charlie, Electraville, West Ardsley, Nr. Wakefield.

Terry, Sidney, 88, St. Dunstan's Street, Canterbury.

Oates, Edgar, Ltd., 17, Clegg Street, Oldham.

Bentley-Hunt, James E., 4, Wood Street, Queens Square, Bath.

Frank Craven (trading as Holt, W. P., and Co.), 14, Chester Street, Bradford.

Milne, Alex., and Co., Blythswood Chambers, 180, West Regent Street, Glasgow.

Smith, Joseph, 34, Blanche Street, Preston.

Greenwood, Denis, 128, Main Street, Bingley.

Smith and Lomerton, 3, St. Aldate Street, Gloucester.

Mountford, Harry H., 33, Carrs Lane, Birmingham.

Carter, Jaley, 27, Wade Street, Thornton Road, Bradford.

Edwards and Godding, Ltd., The Market Place, Newbury, Berks.

Nash, Herbert, 1, High Street, Notting Hill Gate, London, W.11.

Fraser and Borthwick, Ltd., 59, Pitt Street, Glasgow.

Trapnell, Gordon H., 106A, Albion Street, New Brighton.

Dargue, Arthur E., 33, Stringhey Road, Wallasey.

Exors. of R. J. Atkins, 28/32, Halesowen Street, Oldbury.

The Central Electric Co., Washbrook Road, Rushden, Northants.

Butcher, Edwin, 24, Birchwood Crescent, Sparkbrook, Birmingham.

Hamilton, Claude, Ltd., 71, Otago Street, Hillhead, Glasgow.

Cambridge Electric Supply Co., Ltd., 4, Market Hill, Cambridge.

OVERSEAS TRADE.

Five Months' Trading Shows Exports Over £4 000 000 in Excess of Imports.

IMPORTS of electrical apparatus, machinery and materials into the United Kingdom during May were valued at £704 280, as against £618 685 for the same month last year, an increase of £85 595. Similar imports during the five months of this year amounted to £3 858 590, as against £2 840 857 during the corresponding period of 1929, the increase being £1 017 733.

Electrical apparatus, machinery and materials shipped, from the United Kingdom during May amounted to £1 618 320 as compared with £1 850 244 during May, 1929, representing a decline of £231 924. For the five months of this year exports were valued at £8 032 491, as against £7 973 835 for the corresponding period of last year, an increase of £58 656.

These figures show that electrical exports during May exceeded imports by £525 972, and for the five months the favourable balance was £4 173 901.

TRADE PUBLICATIONS.

A special booklet relative to "Steeloscopes" has been published by ADAM HILGER, LTD., 24, Rochester Place, London, N.W.1. The publication is highly descriptive and very well produced.

The Foster Engineering Co., Ltd., of "Apex" Works, South Wimbledon, manufacturers of "Apex" switchgear and "Foster" transformers, have issued an attractive brochure to mark the completion of 25 years progress in electrical engineering. From quite small beginnings, "Foster's" development has necessitated frequent extensions to their works, and it is interesting to note that they have made over 80 000 transformers up to 2 000 kVA. The brochure is well produced and profusely illustrated. Anyone writing direct to the sales manager will be sent a copy free of charge.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

CARDIFF CORPORATION.—Electric light installation in Spottlands Branch Library extensions, Cardiff. Specifications from the City Electrical Engineer, The Hayes, Cardiff.

THANET JOINT HOSPITAL BOARD.—Installation of electric light at Thanet Isolation Hospital, near Ramsgate. Specification, etc., from Mr. S. Shea, clerk, 19, Cecil Square, Margate; deposit £2 2s., returnable.

WEETON CHURCH.—Electric light installation. Schedule from Mr. H. E. Gilbert, Briarfield, Huby, near Leeds.

Lamps and Fittings.

OLDHAM PUBLIC ASSISTANCE COMMITTEE, June 20.—Supply of electric lamps and fittings, for the Poor Law Institution. Tender forms from the Public Assistance Officer, Town Hall, Oldham.

BENFLEET URBAN DISTRICT COUNCIL, June 23.—Three vertical spindle centrifugal pumps, with electric motors and automatic control, etc. Specification from Mr. W. E. Blezard, 9, Victoria Street, Westminster, S.W.1; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, June 23.—Supply and erection of 66 000 V and other cables in connection with Mid-East England Electricity Scheme. Specification (M.E.E.-G.C.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

DUKE OF LEEDS HOTEL, NEWMILL, NEAR HUDDERSFIELD.—June 23.—Electricians' work in connection with erection of hotel. Plans, etc., can be seen at the offices of Messrs. Abbey and Hanson, 11, Cloth Hall Street, Huddersfield.

GLASGOW CORPORATION, June 23.—Electric light installation work at M'Nair Street rehousing scheme, and Quarrybrae (intermediate) housing scheme. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.3.

DUNDEE CORPORATION, June 25.—Supply and erection of e.h.t. switchgear and bus-bar reactors. Specification from the General Manager, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

EAST RIDING AND CITY OF YORK JOINT SANATORIUM COMMITTEE, June 25.—Repairs and renewals to electric lighting installation at Raywell Sanatorium, and supply and installation of electric motors in the sanatorium laundry. Tenders to the Joint Clerks, Sanatorium Committee, County Hall, Beverley.

SALFORD CORPORATION, June 25.—Supply and delivery of one 1 000 kVA step-down Scott connected transformer bank, ratio 6 600 V three-phase, 50 cycles, to 3 130 V two-phase. Specifications, etc., from the City Electrical Engineer, Electricity Department, Frederick Road, Salford.

CENTRAL ELECTRICITY BOARD, June 27.—Supply and laying of pilot cables in connection with the Central England Electricity Scheme. Specification (C.E.-S.C.1), etc., from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

MANCHESTER CORPORATION, June 27.—Supply and erection of three-phase 6 600 V switchgear, sheet steel cubicle type, specification No.279. Supply and delivery of supervisory control gear at Cumberland Street sub-station (Specification No. 280). Specifications, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester; deposit, £1 1s. for each specification, returnable.

DUNDEE TOWN COUNCIL, June 30.—Supply, delivery and erection of e.h.t. switchgear and e.h.t. busbar reactors to the main generating station at Carolina Port. Specifications, etc., from Mr. D. H. Bishop, general manager and engineer, Dudhope Crescent Road, Dundee; deposit £2 2s., returnable.

METROPOLITAN WATER BOARD, June 30.—Supply and fixing of two 120 kW steam-driven electric generators, switchboard, piping, etc., at Deptford pumping station. Specification from the Chief Engineer, 173, Rosebery Avenue, London, E.C.; deposit £1 1s.

SALFORD CORPORATION, June 30.—Electric lighting installation for new nurses' home at Hope Hospital. Tenders to Mr. H. H. Tomson, town clerk.

WEST RIDING EDUCATION COMMITTEE, June 30.—Electric lighting at Kippas Council School. Specifications, etc., from Mr. H. W. Powell, Education Offices, Garforth.

CARDIFF CORPORATION, July 1.—Supply of h.t. switchboard (Contract No. IV); h.t. switchboard (No. V); transformers (No. VI); and battery and charging plant (No. XV), for the Llandough Hospital, now in course of erection. Specifications from Messrs. Plevin and Jenkins, 4, Working Street, Cardiff; deposit £2 2s. for each. Only manufacturers on the King's National Roll are invited to tender.

BIRMINGHAM CORPORATION, July 1.—Electric lighting and power installation at Uffculme Mental Hospital, King's Heath; deposit £5.

KINGHORN CORPORATION, July 1.—Electric wiring, etc., in 40 houses to be erected on Baliol Field site. Specification from Mr. J. Gentles, surveyor, Central Chambers, Kirkcaldy.

KILKEEL RURAL DISTRICT COUNCIL, July 2.—Supply of 30-38 B.H.P. crude oil engine generator, booster, switchgear, etc. Specifications (5s.) from the clerk, Mr. J. J. Bell.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, July 3.—Electric lighting installation at a block of tenement dwellings. Specification, etc., from Mr. David J. Keep, town clerk, Town Hall, Cambridge Road, E.2; deposit £2 2s. Technical inquiries may be made of Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1.

LOUTH CORPORATION, July 4.—Electric lighting and power installation at Town Hall. Specification, etc., from Messrs. Burstall and Monkhouse, 14, Old Queen Street, Westminster, S.W.1; deposit £3.

BELFAST CORPORATION, July 5.—Manufacture, supply, delivery and erection of (*a*) h.t. armour clad switchgear (specification No. W.108); and the manufacture, supply and delivery of (*b*) transformer kiosks with h.t. and l.t. switchgear (specification No. W.109); (*c*) static transformers (specification No. W.110). Specifications from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s. (returnable) for each specification.

SUNDERLAND CORPORATION, July 7.—Manufacture and supply of (1) paper insulated, lead sheathed cable for general main-laying requirements; (2) rubber insulated wire; (3) consumers' meters; and (4) gasfilled and vacuum lamps, for 12 months. Specifications, etc., from the General Manager, Electricity Department, Dunning Street, Sunderland; deposit 10s. for each.

BEDFORD CORPORATION, July 10.—Supply and erection of coal handling plant and extension of sidings at Bedford electric generating station. Specification and form of tender from the Borough Electrical Engineer, Electricity Offices, Prebend Street, Bedford; deposit £2 2s. Only British manufacturers in the United Kingdom are invited to tender.

DUNDEE CORPORATION, July 12.—Supply of six 300 kVA outdoor type transformers. Specification from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD., July 14.—Supply and erection at Dunston-on-Tyne power house of 12 water tube boilers, with economisers, stokers, etc. Specification (No. N. 243) from the Company's Offices, Carliol House, Newcastle-upon-Tyne; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, July 28.—Supply and erection of 132 kV transmission line crossing of the river Thames. Specification (No. S.E.E.-P.L.3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIA STORE DEPARTMENT, June 23.—Supply and erection of 11 000 and 400 V a.c. and 220 V d.c. switchgear, power and control cables, etc., at Shanan power house. Forms of tender (£3 15s., not returnable) from the Director General, Belvedere Road, London, S.E.1.

Digitized by Google

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24.—Supply of 110 kV outdoor steelwork and switchgear for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

NEW ZEALAND POSTS AND TELEGRAPH DEPARTMENT, June 24.—Supply and delivery of telephone cords. (Reference B.X. 6 848.)

CAPE TOWN MUNICIPALITY, June 25.—Supply of single phase transformers (specification No. 495/1930). (Reference B.X. 6 378.)

EGYPTIAN MINISTRY OF THE INTERIOR, June 25.—Pumping machinery, electric motors, etc., for waterworks at Abou-Tig-Nekheila. (Reference A.X. 9 509.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of condensers (P. and T. 151/2 240). (Reference B.X. 6 308.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25.—Supply of 100 000 3¼ in. and 30 000 2 in. lead clips. (Reference B.X. 6 375.)

JOHANNESBURG MUNICIPALITY, June 26.—Electricity meters and time switches (contract No. 405). (Reference B.X. 6 449.)

EGYPTIAN PORTS AND LIGHTHOUSES ADMINISTRATION, ALEXANDRIA, June 28.—Four portable electric drills, one portable electric planer, one two-ton electric batter truck, etc. (Reference A.X. 9 676.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, June 30.—Supply and maintenance of an electric generating unit, with motors, transmission lines, etc., at Tor Quarantine, on the Gulf of Suez. (Reference B.X. 6 466.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 1.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 63. (Reference B.X. 6 443.)

POWER SECURITIES CORPORATION, LTD., July 1.—Supply of (*a*) 4—3 000 kVA transformers (specification E.28, price 15s.); (*b*) indoor 11 kV switchgear (E.23, price 22s. 6d.), for Pykara, Madras, hydro-electric scheme. Specifications (on payment of above fees and 3s. 6d. for general conditions of contract), from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

CAPE TOWN MUNICIPALITY, July 2.—Supply of paper insulated, lead covered, impregnated, lead sheathed and armoured cable. (Reference B.X. 6 426.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 8.—Supply of telephonists' telephones. (Reference B.X. 6 352.)

MELBOURNE CITY COUNCIL, July 9.—Supply of totally enclosed, metal-clad switchgear (specification No. 1 024). (Reference B.X. 6 401.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1 (£10 5s., not returnable).

INDIA STORE DEPARTMENT, July 16.—Supply of 70, 20 and 15 kVA transformers, with motors and switchgear. Form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

MELBOURNE CITY COUNCIL, July 16. (extension of time).—Supply and installation of electric traffic control signals (contract No. 2 787). (Reference B.X. 6 492.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 16.—Supply of two overhead electric, 30 cwt., underhung, travelling jib cranes, with 12 ft. jib, for goods sheds at Wellington and Auckland. (Reference A.X. 9 442.)

NEW ZEALAND GOVERNMENT RAILWAYS, July 17.—Supply of cable, switchgear and junction boxes. (Reference B.X. 6 385.)

EGYPTIAN MINISTRY OF THE INTERIOR, July 26.—Supply and erection of cooling tower, construction of concrete well and basin; supply of electrically-driven and centrifugal pumps, electric motors, switchgear, etc., at Assiout electric power station. (Reference A.X. 9 627.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 28.—Supply and erection of 23 electric lifts at new Railway Building, Johannesburg (tender No. 1 673). (Reference A.X. 9 623.)

CHILEAN STATE RAILWAYS, July 29.—Supply of electric clocks (one master clock and up to 50 wall clocks). (Reference B.X. 6 472.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 29.—Supply of auxiliary turbines and generating sets for Arapuni power scheme—section 305. (Reference B.X. 6 356.)

VICTORIAN RAILWAY COMMISSIONERS, July 30.—Supply and erection of turbo-alternators, condensing plant and control gear. (Reference B.X. 6 355.)

VICTORIAN RAILWAY COMMISSION, July 30.—Supply of renewals for caustic soda primary cells (contract No. 43 701). (Reference B.X. 6 441.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 6.—Two pumping units, for Ameria pumping station, including two Diesel engines, two centrifugal pumps and two small d.c. generators, electrically driven compressor, 10 kW auxiliary d.c. generator, with engine, etc. Specifications (£1 0s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

SOUTH AFRICAN RAILWAYS AND HARBOURS ADMINISTRATION, August 11.—Thirteen 4-ton electrically driven portal jib cranes: tender No. 1 653. (Reference A.X. 9 683.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 12.—Supply of 11 000 V metal-clad switchgear and accessories, for Mangahao power scheme—section 239. (Reference B.X. 6 455.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, August 17.—Supply and erection of 15 electric pumping stations, with pumps, motors, switchgear, etc., at the isolated basins between Esna and Aswan. (Reference A.X. 9 594.)

MELBOURNE POSTS AND TELEGRAPHS, August 19.—Supply and delivery of telephone jacks. (Reference B.X. 6 477.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 19.—Three single phase transformers, to step up from 22 000 V to 57 600 V between phases, for Penrose sub-station, Arapuni power scheme, section 308. (Reference B.X. 6 427.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 2.—Supply of 110 kV switchgear, steelwork and controlling equipment, for Mangahao power scheme. (Reference B.X. 6 452.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 9.—Supply of 110 kV switchgear and controlling equipment, for Mangahao power scheme—section 217. (Reference B.X. 6 454.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 13.—One set of 50 000 V switchgear, for Mangahao power scheme. (Reference B.X. 6 486.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, September 16.—Supply of 110 kV switchgear, steelwork and controlling equipment, for Mangahao electric power scheme (section 221). (Reference B.X. 6 453.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 50 kV switchgear and steelwork, for Arapuni power scheme—section 276. (Reference B.X. 6 451.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, October 7.—Supply of 110 kV and 50 kV switchgear and protective system, for Arapuni power scheme (section 273). (Reference B.X. 6 450.)

Tenders Accepted.

SYDNEY (N.S.W.) CITY COUNCIL.—Johnson and Phillips, Ltd., heavy power cable, £30 000 (approximate).

BLACKBURN CORPORATION.—British Thomson-Houston Co., Ltd., supply of Mazda gasfilled and vacuum lamps, for one year.

ELTHAM SCHOOL.—W. H. Gaze and Sons, Ltd., electric wiring and fitting of new school, Henwick Road, Eltham, £763.

BIRMINGHAM EDUCATION COMMITTEE.—Ellis and Ward, electric light installation at Trescott Road (Northfield) Council School, £630.

WORTHING CORPORATION.—W. H. Allen, Sons and Co., Ltd., centrifugal pump and electric motor, for new borehole at Broadwater pumping station, £1 370.

BEXHILL-ON-SEA CORPORATION.—Hewittic Electric Co., Ltd., rectifying plant for Little Common sub-station, £1 490, and for proposed sub-station in Terminus Road district, £1 490.

HULL CORPORATION.—English Steel Corporation, Ltd., supply of make-up pump for cooling tower, £133 10s.; City Electrical Engineering Co. (Hull), Ltd., electrical installation at Technical College, £1 805 1s. 3d.

BRIGHTON CORPORATION.—Richardsons, Westgarth and Co., Ltd., provision of steam air ejector and pump, for turbine, £850; General Electric Co., Ltd., lighting improvements in Grand Junction Road and Madeira Drive, £780 10s. 1½d.

GLASGOW CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £5 567 8s. 6d.; Bruce Peebles and Co., Ltd., supply of a transformer, £194; Johnston, Park and Co., Ltd., electrical installation at St. Andrew's Hall, £1 239 18s. 7d.

LONDON COUNTY COUNCIL.—A. Dean, wiring and fittings for electric lighting at Columbia Market and Old Church Road schools. Also tendered: J. Briggs, £251; H. J. Cash and Co., Ltd., £281; Electric Installations, Ltd., £283; Burdette and Co., Ltd., £353.

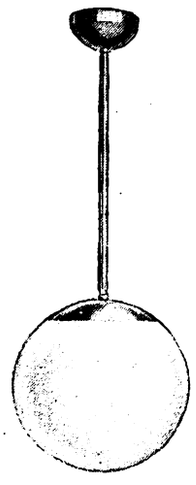
DOMESTIC ELECTRICAL APPLIANCES.

New Fires and Heating Apparatus for the Contractor—Charging Equipment for Battery Service—Another Mains-Valve.

THE well-known range of "Magicoal" imitation coal fires produced by BERRY'S ELECTRIC (1928), LTD. (85-87, Newman Street, Oxford Street, London, W.1) has now been supplemented by the "Magiclog"—an imitation log fire of the open hearth type. This realistic fire has some genuine, partially-burnt logs and some that are skilfully made of metal, treated with a special solution—which helps to deceive the eye and at the same time assists in reflecting the warm red light. The flame effect is produced by three amber lamps on the same principle as in the "Magicoal" fires, and reflection is aided by the metal base supporting the various logs and the lamps. The 3 kW cylindrical heating element is horizontal, and arranged to slide up or down two vertical bars placed near the back of the fireplace chimney. The element can thus be slid into such a position as to be just concealed by the sloping front portion of the fireplace, according to the size and shape of the particular one that is being converted. A parabolic reflector is used in a similar manner to that employed in the firm's "York Adam" fire. The "Magiclog" is supplied with or without fire dogs.

The HOTPOINT ELECTRIC APPLIANCE CO., LTD. (24, Newman Street, Oxford Street, London, W.1), have sent us particulars of their handbasin water heater which may be fixed over the wash-basin by means of two brackets rivetted to the back of the cylinder. A rubber hose is provided for connecting the cold water tap to the inlet pipe at the bottom of the heater so that plumbing work is unnecessary. This type of heater is convenient for household and office use, for the full capacity of the tank when switched on at full heat attains a temperature of approximately 100° F. in 15 minutes. The low heat position of the switch is sufficient for normal hot water output during the day. The capacity of the heater is three gallons; it is cylindrical in shape and the size is approximately 9½ ins. diameter by 21 ins. high. The heater is constructed of heavy gauge copper, tinned on the inside and finished in white cellulose enamel on the outside. It is operated on the "push-through" system, incoming cold water displacing hot water. An internal siphon arrangement is fitted to prevent dripping. The heating element is a Hotpoint sheathed-wire immersion heater, which has a loading of 2 kW and is wired up for control by a three heat switch mounted at the base on the front of the cylinder. The heater is supplied complete with hot water swivel outlet pipe, and 3 ft. of rubber connecting hose.

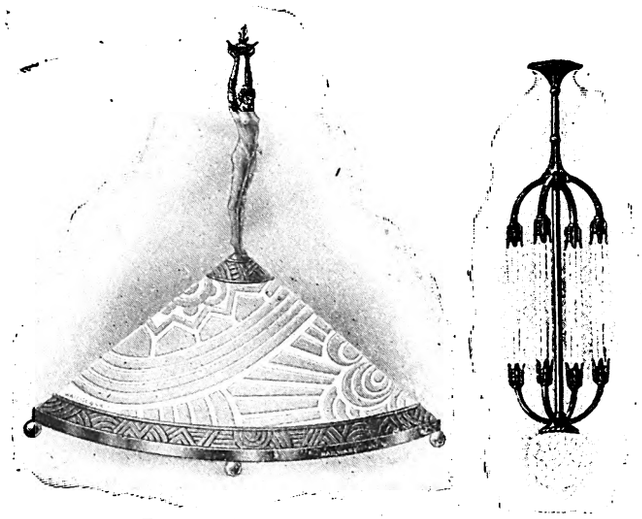
The Hotpoint electric hot water radiators are similar to those used on the low pressure heating system, with a central boiler, but as the heating is electrical, boilers, flues, pipes, etc., are dispensed with. The radiators are installed in small units and fitted preferably under windows. They give hygienic warmth and even distribution of heat and are suitable for installing in bedrooms, offices, halls, etc. They are arranged so that excessive temperatures are not reached and when in normal use they require filling with approximately half a pint of water every heating season. The radiators are made up of a number of well finished cast iron sections and are fitted with Hotpoint immersion heaters, water filler, relief valve and water level test cock. The smaller size is rated at 1 000 W and has single heat control, the larger takes 2 000 W and has three-heat control.



An attractive lighting unit by Philips' Lamps Ltd.

Another of the Hotpoint domestic fittings is an electrically heated towel rail. These heaters warm and dry towels without any danger of scorching. Hot water is used, but no water piping connections are required. The rails are constructed of hard drawn copper tubing and all parts are finished in polished nickel-plate. Each type is supplied complete with immersion heater, water filler, relief valve and water level test cock.

In THE ELECTRICIAN of March 21 was described the "Davenset" starter charger of PARTRIDGE, WILSON AND CO., Leicester. This charger was intended for charging motor car starter batteries, but the gasfilled valve rectification system employed by the firm is also applied to other charging apparatus, among which may be mentioned the "Davenset" high-tension accumulator charger, type H.T.2. In this device the bi-anode gasfilled valve is mounted in a vertical position in the top centre of the panel. On each side of the valve are two pairs



Two new fittings by Hailwood and Ackroyd, Ltd.

of resistance lamps, and the transformer for heating the filament is directly beneath the valve platform. The anodes are not transformer fed, but obtain their supply directly from the mains, the current which they rectify being limited by the sequence of the resistance lamps, one or more of which is always in series. Two pairs of output terminals provide two separate circuits for charging, and each is independently controlled by its four position rotary switch. The current flowing in each circuit is measured on a Ferranti moving coil milliammeter, by plugging in to the respective jack. It is worth noting that, owing to a bi-anode valve being used, no back-feed can occur from one bank of cells of a high voltage on one circuit to a bank of cells of a lower voltage on another circuit.

The number of wireless set owners who have been converted to the principle of deriving their power for operating purposes from the supply mains will probably be increased now that the Osram PX4 valve has appeared upon the market. This, as its nomenclature denotes, has a nominal filament rating of 4 V, is designed to work in all-mains sets without a l.t. battery, and is made by the GENERAL ELECTRIC CO., LTD., London.

While in the ordinary valve the heater and the cathode are the same, in each of the M series of valves the cathode encloses a separate heating element, so that it may be connected to the mains by means of the secondary winding of a transformer of suitable ratio without introducing any appreciable hum. Until the advent of the PX4, it was necessary, where larger power was required than that with which the ML4 could successfully cope, for the users of Osram valves to adopt the expedient of utilising power valves of the standard type with a different filament voltage rating. Although this difference presents no difficulties in many cases, there are instances in which the same voltage for the valve filaments throughout the set is an advantage. The PX4 is stated to differ from other power valves in that it has been developed specially for the last stage of a.c.-mains receivers using indirectly-heated cathode valves in the early stages. In order to furnish the required emission for a large power output it is fitted with a heavy filament, consuming 0·6 A—which may seem to be a somewhat large consumption for a single stage of a wireless set until it is remembered that such a current is negligible when taken from the mains. The characteristics of the PX4 have been designed to provide a power output between that of the P625A and the LS5A power valves, and its stability and resources can be gauged by the claim that it can be allowed to dissipate 10 W at its maximum anode voltage of 200. The amplification factor of the valve is 3·8 and its impedance 1 450 ohms measured at approximately 100 V with the grid at zero potential.

ELECTRICITY SUPPLY.

Mains and Plant Extensions—Wigan and Rate Relief—Salford's Good Year—Kenley and Coulsdon Housing Schemes—Electrical Development at Birkenhead—Swiss Hydro-electric Stations—Chester Public Lighting.

DARTFORD Electricity Committee has obtained sanction to borrow £2,569 for mains and plant.

Dorchester Lighting Committee is seeking sanction to borrow £500 for meters and £500 for mains development.

Hull Electricity Committee has obtained sanction to borrow £110 858 for additional supply mains in various parts of the city.

Hastings Electricity Committee is seeking sanction to borrow a sum of £10 000 for prospective expenditure on electricity meters.

South Shields Electricity Committee has obtained sanction to borrow £5 000 for house wiring installations with prepayment meters to be let on hire.

Stoke-on-Trent Electricity Committee is to extend mains at a cost of £1 050 to supply an estate being developed by the Sutton Trustees in Trent Vale.

Bradford Tramways Committee has granted the application of the city electrical engineer to instal automatic circuit breakers at Bankfoot and at Bolton depot.

On the year's working, a profit of £16 960 has been made by Wigan electricity undertaking out of which the sum of £4 400 has been allocated to the relief of rates.

West Lancashire Rural Council has received the sanction of the Electricity Commissioners to borrow £27 337 to inaugurate a supply for Tarleton, and the contractors have been requested to proceed with the laying of cables.

Middlesex County Council has voted £2 600 for the main cables required in connection with the electricity supply for the Middlesex County Hospital and Colony at Porters Park and £412 for fire alarms, electric bells, telephones and wireless.

Warrington Electricity Committee has received an application from the Warrington Electrical Co., Ltd., for special terms for current in connection with the proposed new showroom in Bridge Street. The matter has been referred to the engineer.

Carlisle Electricity Committee has obtained a Fringe Order to supply in the rural districts of Brampton and Carlisle. The Committee is to seek sanction to borrow £5 000 for assisted wiring schemes; £15 000 for mains and services, and £5 000 for transformers and sub-stations.

A net profit of £24 898 has been made by the St. Helens electricity undertaking. Of this amount £5 000 has been transferred to the renewals account, £11 864 spent on special expenditure and revenue contributions to capital, and the balance of £8 033 carried to the reserve fund.

Liverpool city electrical engineer has been authorised by the Tramways and Electric Power and Lighting Committee to instal two 750 kVA transformers and l.t. boards in Lodge Lane sub-station, and to advertise for tenders for high tension and low tension switchgear for static sub-stations.

Westminster (London) City Housing Committee recommends the provision of time switches to control the electric lights on the staircases and balconies of the eight blocks of dwellings on the Ebury Estate. Two time switches on each staircase, one to control the outside and balcony lights and one to control the staircase lights of each block, are suggested.

Blackburn T.C. has decided to extend the supply main at Clayton-le-Dale, and to change the d.c. supply to Little Harwood to a.c. The Town Council has approved the supply of current to Hall Street Mill Co., necessitating the laying of sub-station equipment, etc., at a cost of £1 200. The council has also approved amended terms for the supply of current to Messrs. Livesey's Ewood Mills.

Hampton General Purposes Committee has received from the London and Home Counties Joint Electricity Authority, the terms upon which the Joint Advisory Committee is prepared to recommend the lighting of streets in the district by electricity and it has been decided to instruct the surveyor to present a report upon the capital expenditure which would be involved in substituting electricity for gas, and upon the annual cost of the maintenance supply as compared with the present system.

The gross income of the Salford electricity undertaking during the year ended March 31 last, amounted to £318 218 as against £307 669 the previous year. The undertaking has made a net profit of £26 689, compared with £29 825 the preceding year. Out of profits the sum of £10 000 has been added to the reserve fund, plus £4 659 representing interest, etc., bringing the total reserve to £80 350. The balance of profits has been utilised for the purchase of cookers, appliances, meters, etc.

Coulsdon Housing Committee has received correspondence from the County of London Electricity Supply Co., Ltd., in which the company expresses its willingness to undertake the free wiring of council houses on the Kenley and Coulsdon housing schemes, subject to 80% of the tenants being willing to take a constant supply of current and to the execution of landlord's and tenant's agreements. The Committee agreed in principle with the suggestion of the company and instructed the clerk to negotiate with the company upon the matter.

Eastbourne Electricity Committee has received application for a special rate for the supply of current to houses to be erected on the Downlands Estate, in which it is proposed to use electricity throughout for all purposes. This would not be an economic proposition at the proposed flat rates of 8d. per kWh for lighting and 1½d. per kWh for other purposes and the electrical engineer suggests that in this and similar instances for " all-electric " houses a two-part tariff should be adopted, the fixed charge on the premises being 20% of the rateable value and a charge for electricity consumed of 1d. per kWh, with a minimum consumption of 500 kWh per quarter. The suggestion was approved.

Birkenhead Corporation electricity undertaking, which now supplies twenty-eight parishes in addition to the urban areas of Bebington and Bromborough and Neston and Parkgate, has just connected Greasby Village with the Corporation mains. There are nearly 300 miles of h.t. and l.t. mains in an area of over 70 square miles. Six years ago there were 8 000 domestic consumers while to-day there are over 21 000. The consumption last year was 24 593 680 kWh as compared with 10 534 270 in the year 1925. Over 12 000 fires, cookers and other appliances are in use. Overhead lines to supply current from Greasby to the Wirral Council's sewerage works at Saughall Massie are being erected.

The electrical engineer of Guildford reports that, owing to the rapid growth of the supply in the Guildown area, the mains which were laid many years before the Corporation acquired the undertaking are now inadequate. He recommends that an overhead transmission line be erected from Shalford Road across the meadows, crossing the river at St. Catherine's, and that an underground line be laid up Ferry Lane, and along Portsmouth Road and Chestnut Avenue to Guildown. The estimated cost of the scheme, including transformers and the conversion of consumers' appliances, is £2 350. The Electricity Committee has approved the proposal, and is asking the consent of Hambledon R.D.C. and the Ministry of Transport to the erection of the overhead lines.

A report published by the Swiss Federal Water Board states that in 1929 three power stations with 94 000 H.P. were put into operation, making the total capacity of Swiss hydro-electric stations 2 236 000 H.P. At the end of the year there were six stations in course of construction, which will have an aggregate capacity of 328 000 H.P. The total production of electricity in the Swiss hydro-electric stations last year was approximately 5 300 000 000 kWh, or 1 300 kWh per head of the population. The increase in the quantity generated showed an increase of about 159 000 000 kWh. At the end of 1929 permission had been given for the export of 446 614 kW, but the plant in operation would only have enabled 274 074 kW to be exported. Only 990 000 000 kWh, or 26·4% of the energy available to third parties, was actually exported.

Chester Corporation has authorised the carrying out of the scheme for public lighting approved by the Watch Committee at an estimated cost of £13 000, and the electrical engineer has been authorised to purchase from the Revo Electric Co. the necessary standards and fittings in accordance with the drawings approved by the Watch Committee, and arrange for the carrying out of the necessary work of erection and installation of standards and fittings and the laying of cables. The electrical engineer having reported that the electricity department, in collaboration with Ferranti, Ltd., has been experimenting with electricity on the heating of comparatively large quantities of water, with satisfactory results, and advised the adoption of a commercial tariff for the supply of electricity for heating water during off-peak load periods. It has been decided to supply electricity for water heating at a charge of ½d. per kWh net.

ELECTRICAL PICTURES OF THE WEEK.

Attractive new showrooms have been opened by the Birmingham Electric Supply Department at 23, Lordswood Road, Harborne, a rapidly growing suburb, by means of which the department hopes to increase the domestic load. Externally the premises present a smart appearance and the initial window displays were devoted to vacuum cleaners, bowl fires and small appliances. A large vertical illuminated sign is placed over the shop, and can be seen a considerable distance away, while two bracket lights finished in bronze illuminate the shop front. Inside, the walls are lined with oak panelling, and there is one large show case, running the entire length of the shop, in which is displayed a full range of domestic appliances. At the rear, a room has been equipped with a range of cookers, as supplied by the department on hire or hire-purchase, water-heaters of various sizes, and wash boilers. Arrangements are made for all of these to be demonstrated at any time.

A panoramic view of Chicago by night with the Wrigley building in floodlight on the left. In the centre are the Liquid Carbide, the London Life and Guarantee buildings, and the Chicago Motor Club. On the right is the Pureol building, with the famous West Walker drive in the foreground. The photograph was taken from Clarke Street Bridge.

The City Hall, Belfast, was subjected to floodlight during the visit of the Institution of Electrical Engineers on the occasion of their summer meeting, and, as the picture on the left shows, the beauties of the building lost nothing by the experiment. The right-hand picture was also taken during the summer meeting, and shows Mr. T. J. Monaghan, chairman of the Irish Centre, passing up the gangway of the s.s. "Musgrave" prior to casting off for a cruise round Belfast Harbour.

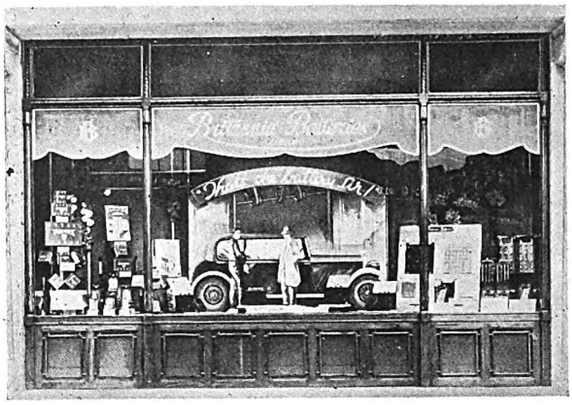
BUSINESS ITEMS.

IN connection with the illustration on page 773 of our last issue, of the electrically operated incubators at the Absol Park Farm, BLACKSTONE AND CO., LTD., advise us that two 32 B.H.P. spring injection heavy oil engines of their manufacture are included in the installation.



A WINDOW display of "Pertrix" batteries in the window of Britannia Batteries, Ltd., in Shaftesbury Avenue, London, W.

On and after June 21, the whole of the business of RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C.1, will be transferred to new premises comprising works, offices and showrooms, which have been built in Purley Way, Croydon, where all future goods and correspondence should be sent. The new telephone number is Croydon 3211 (3 lines) and the telegraphic address "Instradio, Croydon."

The ENGLISH ELECTRIC CO., LTD., has received a contract from the Central Electricity Board for transformers for the Mid-East England Scheme. The contract is for 16 units totalling 130 000 kVA and comprises six 10 000 kVA, 66kV transformers, two each for Kirkstall, Harrogate, and York; two 10 000 kVA, 22 kV transformers for Huddersfield; four 7 500 kVA, 33 kV units, two each for Peterborough and Barnsley; four 5 000 kVA, 33 kV transformers, two each for Rotherham and Doncaster. Each unit will be complete with "English Electric" on-load tap changing gear. The English Electric Co. believe themselves to be the only manufacturer to have in hand transformers for all the regional schemes for which orders have been placed.

METAL AND CHEMICAL PRICES.

TUESDAY, June 17

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£54 0 0	—	£5 10s. 0d.

Rubber—Para fine, 7½d.; plantation, 1st latex, 6 11/16d.

∴ The metal prices are supplied by British Insulated Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

According to James Forster and Co., the market has been quiet and, in spite of some official support, values have tended to sag away and close at the lowest. Closing prices on June 12 were £17 16s. 3d. for June, £17 17s. 6d. for July and August, and £17 18s. 9d. for September.

I.E.E. COMMITTEES.

Officers of Meter and Instrument, and Wireless Sections for Next Session.

NO nominations having been received from the general body of members of the Meter and Instrument Section to fill the vacancies which will occur on the Section Committee of the I.E.E. on September 30, those members nominated by the Committee are, under the Section's Rules, duly elected. The Committee for 1930-31 will therefore be:—CHAIRMAN: Mr. E. Fawssett. ORDINARY MEMBERS OF COMMITTEE: Messrs. F. A. East, A. J. Gibbons, E. W. Hill, W. Holmes, F. C. Knowles, W. Lawson, C. W. Marshall, E. H. Miller, William Phillips, G. F. Shotter, R. S. J. Spilsbury and Dr. C. V. Drysdale; a Member of Council (to be selected by the Section Committee), the President, I.E.E. (*ex officio*), the Chairman of the I.E.E. Papers Committee (*ex officio*).

No nominations having been received from the general body of members of the Wireless Section to fill the vacancies which will occur on the Section Committee on September 30 next, those members nominated by the Committee are under the Section's Rules elected. The Committee for 1930-31 will therefore be:—Mr. C. E. Rickard, Chairman; the President, I.E.E. (*ex officio*); the Chairman I.E.E. Papers Committee (*ex officio*); a representative of the I.E.E. Council; a representative of the I.E.E. General Purposes Committee; Lt.-Col. A. S. Angwin (nominated by the Post Office); Mr. R. H. Barfield, Mr. F. S. Barton (nominated by the Air Ministry); Mr. G. W. N. Cobbold; Mr. A. J. Gill; Capt. J. W. S. Dorling, R.N. (nominated by the Admiralty); Prof. E. Mallett; Mr. B. E. G. Mittell; Mr. E. B. Moullin; Mr. L. C. Pocock; Mr. E. H. Shaughnessy; Mr. G. Shearing; Commdr. J. A. Slee; Mr. L. B. Turner; Mr. P. K. Turner and Major J. S. Yule (nominated by the War Office).

Institution Premiums.

The Council of the Institution of Electrical Engineers have awarded the following premiums for Meter and Instrument Section papers and also for Students' papers for the Session 1929–1930:—METER AND INSTRUMENT SECTION.—SILVANUS THOMPSON PREMIUM to Messrs. E. H. Rayner, W. G. Standring, R. Davis and G. W. Bowdler. A Premium to Messrs. A. E. Moore and W. T. Slater. STUDENTS' PREMIUMS to Mr. E. W. Connon, J. C. Emerson and J. W. Moffatt, L. E. C. Hughes, C. S. T. Paul, W. G. Thompson, C. H. Bradbury and S. M. Lejeune. THE STUDENTS' PRIZE, SESSION 1929–30. The Students' Prize of £10 offered by the Council for the best paper on the subject of "The Relations between Economics and Engineering," submitted by a Student, or Graduate under the age of 28, during the Session 1929–30, has been awarded jointly to Mr. V. A. H. Clements and Mr. A. K. Robinson for the papers submitted by them, the amount of the prize being divided equally between these two authors.

COMING EVENTS.

Saturday, June 21.

SHEFFIELD ILLUMINATION SOCIETY.—Annual Outing, Belle Vue, Manchester.
THE ADVERTISING ASSOCIATION.—Sixth Annual Convention, Hastings. Opening ceremony by Sir James Parr. 4.30 *p.m.*

Saturday, June 21—Saturday, June 28.

INSTITUTION OF ENGINEERS AND SHIPBUILDERS IN SCOTLAND.—Summer meeting in Holland.

Monday, June 23.

THE ADVERTISING ASSOCIATION CONVENTION.—Hastings. "Increasing Trade by Advertising." Speakers include Lord Riddell, Lord Luke of Pavenham, Sir Stanley Reed and Sir Ernest Benn. 10.30 a.m. Invtaition Luncheon. 1 *p.m.*

Monday, June 23—Wednesday, June 25.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS.—Grand Hotel, Eastbourne. Annual Summer Meeting.

Tuesday, June 24.

THE ADVERTISING ASSOCIATION CONVENTION.—Hastings. Industrial Press Luncheon. Chairman: Mr. E. A. Gatehouse. 1 *p.m.* "The Service Expected from a Trade Journal," by Mr. C. Pinkham. Official Banquet, White Rock Pavilion. 7 for 7.30 *p.m.*

Wednesday, June 25.

ELECTRICAL CONTRACTORS' ASSOCIATION.—Llandudno. Annual Conference.
ELECTRICAL CONTRACTORS' ASSOCIATION (WEST OF LONDON SUB-BRANCH).—Ordinary meeting.
ELECTRICAL CONTRACTORS' ASSOCIATION (BELFAST BRANCH).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*
ROYAL SOCIETY.—Burlington House, London. Conversazione.

Thursday, June 26.

ELECTRICAL CONTRACTORS' ASSOCIATION.—Town Hall, Llandudno. Annual Conference. Annual General Meeting, 9.30 *a.m.*; Presidential Address by Mr. H. Willoughby-Ellis, 11.30 *a.m.*; Paper by Mr. C. H. Flower on "The Future of Electrical Contracting." 2.30 *p.m.*

Friday, June 27.

ELECTRICAL CONTRACTORS' ASSOCIATION.—Town Hall, Llandudno. Annual Conference. Paper by Mr. W. Cross on "Specifications and their Problems," 9.30 *a.m.*; short address by the new President, 12 *noon*; ball and supper, Grand Hotel, 9 *p.m.*

FINANCIAL INTELLIGENCE.

Electrical Companies' Profits for 1929, with Appropriations and Percentages to Capital.

By "AUDITOR."

THE results of 25 electrical manufacturing and equipment companies for the last financial year are tabulated below, showing the sums distributed in the form of dividends; the reserves, etc., allocated; and the amounts of other appropriations, together with percentages indicating the relation of each item to the issued capital. Current or recent prices are given, with the yield :—

* Including other income £8 250 (0·71%).

The issued capital of above 25 companies ranking for dividend aggregates £20 293 588. Summary of Appropriation Accounts :—

Brt. Fwd. from 1928	£1 053 183	Divs. Distributed ..	£1 715 230
Profits, 1929 ..	2 607 183	To Reserves, etc...	719 803
Other Income ..	8 250	Other Appropriations	55 170
		Carried Fwd. ..	1 178 413
	£3 668 616		£3 668 616

The percentage of profit realised in relation to issued capital works out at 12·85%, while the percentage allocated to reserves, etc., was 3·55%. Dividends actually distributed on ordinary and preference capital averaged 8·45% of the invested capital, and "other appropriations" absorbed 0·27%. The sum brought forward from the previous accounting period was 5·19% of the capital, and the sum carried forward to the next appropriation is 5·81%. "Other Income" was 0·04% of capital.

COMPANY NEWS.

Dull Market in Electrical Securities—General Electric Dividend and Bonus—Motor Accessories Companies' Arrangement—Meeting of British Electric Traction Company.

THE market in electrical securities during the past week has again been dull, and the changes in quotations have been for the most part in a downward direction. County of London Electric Supply ordinary have dropped nearly 2s. to 45s. 7½d.; the 7% preference, however, have maintained last week's rise of 6d. Hydro-Electric Securities and International Holdings have continued to decline, the former having receded from 44¼ to 41 and the latter from 5⅜ to 5¼; Metropolitan Electric Supply ordinary have declined from 41s. 3d. to 40s., Scottish Power ordinary from 29s. to 28s., Victoria Falls Power ordinary from 60s. 7½d. to 60s., Whitehall Electric Investments debentures from 103 to 102 and Yorkshire Electric Power ordinary from 33s. 1½d. to 31s. 3d. A bright spot in the electricity supply section is the increase in Adelaide Electric Supply 6½% preference stock from 104 to 106.

London Electric Railway preference having dropped a point to 70, Metropolitan Railway consolidated ordinary a point to 64½, while the 3½% preference have suffered a similar decline to 63½, and Rio de Janeiro Tramways 50-year bonds have receded from 89½ to 88½. Metropolitan District ordinary have shed a half, and stand at 76.

In the manufacturing section, Henley's Telegraph Works ordinary advanced a sixteenth to 123s. 9d. and General Electric ordinary from 47s. 6d. to 48s. 9d., while Associated Electrical Industries 8% preference have retained last week's rise of nearly 2s. and Crompton Parkinson 8% preference have also remained at last week's increased figure of 25s.

American Telephone and Telegraph have continued to slump, having dropped a further $10 to $220, and Cables and Wireless stocks are also still on the down grade, A. and B. ordinary and 5½% preference each having dropped half a point. Eastern Telegraph 3½% preference have fallen from 64½ to 63½, Eastern Extension 4% debenture stock from 78 to 76½; International Telephone and Telegraph from 58¼ to 50, Marconi International Marine from 36s. 3d. to 33s. 9d. and Radio Corporation from 42½ to 40¼.

Directors' Reports, etc.

MIRRLEES, BICKERTON AND DAY, LTD.—A final div. of 7% less tax, is announced.

SOCIETA GENERALE ELETTRICA DELL 'ADAMELLO, MILAN.—Div. of 14 lire, agst. 18 lire, is announced.

NORTHERN MEXICO POWER AND DEVELOPMENT CO.—Div. of 1¾% on pref. stk. for qtr. ended June 13, 1930, is announced.

TELEPHONE RENTALS CO., LTD.—Fin. div. of 2½%. Net rev. for past year £50 748. Pfts. earned by subsidiary companies, £68 020.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.—Div. for half year ending June 30, 1930, on 8% cum. pref. shs. will be payable on July 1.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Directors have declared regular qtrly. div. of 50 cents. p. sh. payable July 15.

KANSAS GAS AND ELECTRIC CO.—An issue of $16 000 000 1st mtge. 4½% bonds of this company was made in NewYork on May 26.

EASTERN TELEGRAPH CO., LTD.—Payment of div. at the rate of 3½% per annum, less income tax, on the pref. stock for quarter ending June 30, will be made on July 15.

BIG DEAL IN NORWEGIAN CABLE MAKERS' SHARES.—The Standard Electric Co., of Oslo, has acquired a majority holding in the Scandinavian Cable and Rubber Manufacturing Co.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Fin. div. of 5% on ord. shs., makg. 10% for year to May 31 (same) and div. on dfd. shs. of 200%, agst. 100%. The divs. will be payable on July 1.

GENERAL ELECTRIC CO., LTD.—Pfts. for year ended March 31 last, £1 179 007; an increase of £94 930 compared with previous year, when the high level attained in 1926–27 of £1 076 809 was exceeded. Proposed to pay a bonus of 4 % in addition to the 10 % div. on ord. shs. For two precedg. years div. was at 10 % per annum, without bonus.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—Net rev. for 1929, $2 759 674, increase $146 362. Fixed div. of 7% and participatg. div. of 1% on pref. cap. and div. of 1% on ord. shs. were paid during year. Surplus, includg. $413 159 brt. in, $1 159 099. Divs. of 2¾% on pref. and 1% on ord. shs. were paid in March, 1930. Prospects for currt. year are stated, on the whole, to be good.

DUDLEY, STOURBRIDGE AND DISTRICT ELECTRIC TRACTION CO., LTD.—Mtg. of shhldrs. is to be held for purpose of passg. resolutns. for winding-up company voluntarily. Birmingham and District Investment Trust will forthwith hand to company sufficient funds to enable it to purchase for cancellation any or all of outstandg. £103 140 6% deb. stk. at par, with accrued int. up to July 15. Whole system of tramways worked by co. was discontinued on March 1 last.

JAMES KEITH AND BLACKMAN CO., LTD.—Amt. of business done during year ended March 31, 1930, exceeded that of previous year. After providg. for deb. int., paymt. of pref. div. and makg. allowance for depreciatn. and reserves against doubtful debts, accts. show available blce. at credit of the pft. and loss acct., £55 369. It is proposed to declare div. on ord. shs. at rate of 17½%, less tax at 4s. 6d. in £, absorbing £27 125; to transfer to res. acct., £12 000; and carry fwd., £16 244.

INDIA RUBBER, GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD.—In presentg. half-yrly. statemt. regardg. co.'s tradg., directors regret that results for first half of currt. year have not come up to their expectatns. Trade conditns. in their industry, in common with many others, have been very difficult and have adversely affected certain sectns. of their business. Other sectns., however, are maintaining both output and pfts. and directors are takg. energetic steps to develop these departmts. and, if necessary, to restrict or even abandon others which hamper their progress. From past experience directors look for usual improvemt. in second half of co.'s year, and have decided that pref. div. due July 1 shall be paid on that date. Sh. registers are closed until June 30.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—Company announces that it has sold to Messrs. Joseph Lucas the electric lighting and starting and magneto portn. of its business. It is stated that this sale will enable both companies to concentrate their efforts on those lines in which they have specialised for many years. There is no question of any amalgamatn. between the two firms, but arrangemts. are being considered by which the servicing of Smith instrumts. will be carried out at the depots and service stations of Messrs. Lucas throughout the country, as well as at the present Smith depots and service statns. It is stated that the demand for the new lines introduced last year by S. Smith and Sons (Motor Accessories), Ltd., will more than fill the loss in turnover created by the sale of their lighting and starting business.

Company Meetings.

ELECTRAMONIC CO., LTD.—An extraordinary general meeting of this company was held at the Cannon Street Hotel, London, E.C., on June 11. Mr. A. Jerrold Nathan (chairman), who presided, said that in consequence of the shareholders' decision at the last meeting to accept the resignation of the then directors and to appoint the present board as a committee of inspection, it to-day placed before them the report and accounts of the company as at October 31. The present directors were not responsible for a single item therein. To go into the details of the document, said the chairman, was unnecessary, nor would it advance the purpose they had in hand to criticise individual members of the past board. Mr. Nathan attributed the position in which the company now found itself in part to the fact that shortly after the commencement of manufacture some new models came on the market, which caught the fancy of the public. The Electramonic Board had either to alter the models already made or to scrap them. It was decided to adopt the former course, and this had cost the company thousands of pounds. A great deal of money would have been saved had the directors exercised that amount of caution so essential in the first years of a company's life. Mr. Nathan then put to the meeting resolutions providing for the winding up of the old company, and for the registration of a new undertaking to be called the Electramonic Co. (1930), and for the appointment of Mr. George E. Seaman as liquidator. The resolutions were put to the meeting and carried with one dissentient, and the meeting concluded.

ELECTRIC SUPPLY CORPORATION, LTD.—Speaking at the annual general meeting of this company on June 12, Mr. J. G. B. Stone (chairman) said the number of the undertakings in their hands was reduced by the exclusion of Jedburgh, Dollar and Exmouth. The list of company undertakings was the same as last year, with the exception of Wellington, with which they had parted. The lamp connections of their own undertakings showed an increase of 28 504, which was a normal figure. As to the other company undertakings, Hendon showed a steady increase; Steyning figures for 1928 had been omitted, as before acquisition of the company the records were kept differently. Haywards Heath could not extend rapidly until a bulk supply from the Central Electricity Board was forthcoming; Petersfield, which changed over to bulk supply in the latter part of the year, showed a gratifying increase; Alton was also progressing, with an increase of nearly 50 %; Newhaven and Seaford was developing rapidly; and Peterhead, which operated only during the latter part of the year, had made a good beginning. The capital account of the company increased by £16 715 during the year. At Chelmsford the expenditure had been on mains, in Dumbarton on mains and additional converting plant, in St. Andrews the figure was trifling, and in Hitchin mains and transformers accounted for the outlay. The statements of capital and of reserve accounts called for no special comment. The exclusion of figures for Dollar, Exmouth, and Jedburgh, which appeared in the 1928 revenue account, was responsible for the reduction under the headings of working costs and revenue, but by the investment of funds received from the sale of these undertakings there was an increase in the amount of the interest received. They had made some alteration in the arrangement of accounts since last year by bringing the interest and rent items and the transfer fees into the revenue account. They previously took these items into the net revenue account. An actual comparison with 1928 showed that in that year their own undertakings, revenue exceeded working costs by £40 316; for 1929 the figure was £35 119. In 1928 the interest on investments amounted to £15 151, whereas in 1929 it was £21 028. Taking these two items together, they had £55 467 in 1928, against £56 147 in 1929. Transfer fees and interest payable accounted for the difference between this last figure and the balance carried to net revenue account. Finally, they carried to the balance-sheet £43 289, against £38 902 in 1928. The directors recommended a transfer of £5 373 13s. 9d. to the repairs, renewals, and depreciation fund, bringing it up to £75 000. This fund was now relieved of any provision on account of Exmouth Undertaking, on which they had expended £52 490. The directors recommended also the distribution of a final dividend of 7 % on the ordinary shares, which was the same as last year, and they proposed to carry forward £20 415 17s. 3d., compared with £17 012 18s. 11d. brought in from 1928.

BRITISH ELECTRIC TRACTION CO., LTD.

Increase of £56 000 in Profits During Past Year—Sale of Pelotas Undertaking—The Position of the Deferred Stock—Sales of Omnibus Interests.

THE thirty-fourth ordinary general meeting of the British Electric Traction Co., Ltd., was held on Monday, June 16, at Winchester House, London, E.C.

Mr. J. S. Austen (chairman) said that the profits during the past year had increased by £56 000. That figure had been arrived at after the deduction of income tax, which meant that they had really had to make £70 000, which, for a company which derived its income from dividends of a miscellaneous character, was a very considerable sum. He did not know what the shareholders had expected, but personally it was larger than he had anticipated.

There were two events of the past year to which he must draw attention, and the first was the sale of the undertaking which they had always called the Pelotas undertaking, which had been an unremunerative electric concern in Brazil. Part of the purchase money had been paid, and the rest was payable by instalments. The net effect of the transaction was that £300 000, which had hitherto been unproductive, now came gradually into bearing. The other event was the sales which had taken place of their various omnibus interests by their allied company, the Tilling and British Automobile Traction Co. and themselves. He might mention that their own interests had been insignificant. The only comment he would make on that was that it was his belief that the community of interests between the omnibus companies and the railway companies which had now been created would ultimately redound to the benefit at any rate of the 'bus companies. Otherwise those sales did not immediately affect the company. Since the end of the year, however, their subsidiary, the Birmingham and District Investment Trust, had carried out a very large deal.

Dealing with the position of the deferred stock, the chairman said that the real object of its creation had been so that by that means the stockholders might recover the serious losses of capital which they had sustained. Therefore, they must not look for any increase in dividends on that stock, at any rate, this year. So far, their present system had worked extremely well, but it could not go on for ever, and sooner or later they must see whether they could not form some other scheme by means of which they could extract from the company the very last ounce of capital value which was inherent in it. When that time came they would know a little better than they did to-day exactly how they stood. He would like to give them an indication of its present value based on the earning power of the company. In the first place he had assumed a value of 1 500%. Then he multiplied the present amount of stock by 15, and, as a result, they got £2 500 000, as being the capitalised value of that stock. To pay 6% on a sum of £2 500 000 took £150 000 a year. Comparing that with the income of the past year, by putting that income on a gross basis, that was before deduction of tax, he found they had £109 000, which left a deficiency of £41 000. They must not be disappointed with that deficiency, because, since the end of the year, their subsidiary, the Birmingham and District Investment Trust, in which they held £847 000, had declared a bonus of 100% in 6% preference shares which would bring them in a very comfortable £50 000 a year. Those figures, he thought, indicated that a value of 1 500% for the stock was justified, without taking into account the future possibilities of the company. But that was regarding the stock simply as an ordinary dividend-paying proposition; it indicated that the break-up value was considerably more. If they could put the company into liquidation and pay off their debentures and their preference and preferred ordinary stocks, he had not the slightest doubt that they would get nearer 2 000 than 1 500 for their stock, but unfortunately, that was an impossible proposition, because the preponderating vote was held by the preferred ordinary stock, and it was most improbable that the holders of that stock were going to give up the 8% which they got, just for the benefit of the deferred stockholders.

He was not going to say anything about the economic disaster which seemed to be falling upon the whole of the world, because he hoped to strike a note of encouragement. If he had done that he would be satisfied, and he hoped that the stockholders on their part would be equally satisfied with what he had said. (Applause.)

The report and accounts were adopted, and the other business of the meeting was duly transacted.

Receiverships.

ANEMOSTAT, LTD.—A. A. Lowe, C.A., of 12, Coleman Street, E.C., was appointed Receiver and Manager on May 30, 1930, under powers contained in 1st and 2nd debentures dated August 30 and December 18, 1929.

PICCADILLY SIGNS, LTD.—J. H. Macaulay, of 82, Cranley Gardens, Muswell Hill, N.10, was appointed Receiver and Manager on June 2, 1930, under powers contained in first debenture dated May 31, 1928.

RISSIK FRASER AND CO., LTD.—C. O. Skey, of 10, St. Swithin's Lane, E.C.4, was appointed receiver and manager on June 2, 1930, under powers contained in mortgage and charge dated December 8, 1928, in place of H. A. Brown, who died on May 30, 1930.

TRUPHONIC RADIO, LTD.—E. D. Besden, F.C.A., of 73, Basinghall Street, E.C., was appointed Receiver on May 31, 1930, under powers contained in debenture dated October 30, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

LAMBERT LAWS, LTD., electrical suppliers, 15, Gloucester Place, Brighton, and 109A, Chapel Road, Worthing. The statutory meeting of the creditors in this voluntary winding-up was held on June 10th at the offices of Mr. A. E. Orbell, accountant and auditor, 6 and 7, Old Steine, Brighton. The statement of affairs showed ranking liabilities of £2 687, of which £2 665 was due to the trade and £22 in respect of rent. After allowing for preferential claims, the net assets were £2 323, or a deficiency of £364. The assets comprised stock at cost £1 756; book debts, £749, estimated to produce £350; fixtures, fittings, office furniture, etc., valued at £28; cash at bank, £52; and cash in hand £150.

Mr. Orbell reported that the company was registered on March 29, 1928, with a capital of £2 000, for the purpose of taking over a business which had previously been carried on by Mr. Ernest Lambert at No. 15, Gloucester Place, Brighton. The company took over the assets of the business which were valued at £2 670, agreed to discharge liabilities of £670, and to allot to the vendor or his nominee fully paid shares to the value of £2 000. The assets transferred to the company consisted of book debts, £584; stock, £1 200; cash at bank, £100; lease, £100; fixed plant, £25; and loose plant and goodwill, £661. The first directors were Mr. and Mrs. Lambert, and subsequently Mr. A. W. Finn joined the board. The business at Worthing was opened on May 25, 1928. That business had been treated as a customer of the Brighton company. Between June, 1928, and March, 1929, the turnover at Worthing was £1 841, whilst in the following twelve months it increased to

WINNER H.T. BATTERIES

The Ever Ready Co. (G.B.) Ltd., Hercules Place, Holloway, London, N.7

Digitized by Google

£2 266. The accounts of the company for the year to March, 1929, showed sales, etc., of £6 682, against purchases of £5 630. There was a gross profit earned of £1 024, but, after allowing for all the expenses, a net loss was incurred of £537. During the year to March, 1930, the sales were £8 392, the purchases being £7 717, and there was a further net loss of £180. Mr. Orbell added that the deficiency was attributed to the loss on trading and the depreciation written off the assets in the statement of affairs. A resolution was passed confirming the voluntary liquidation of the company, with Mr. Orbell and Mr. W. A. J. Osborne, of Messrs. Corfield and Cripwell, Balfour House, Finsbury Pavement, E.C., as joint liquidators, and a committee.

LAWSON, R. J. AND R. G., electrical engineers, trading as R. H. LAWSON AND SON, 26, Pilgrim Street, Newcastle-on-Tyne. At the meeting of the creditors of the above, held recently, a statement of affairs was submitted which showed liabilities of £1 683 all due to the trade, with the exception of a claim by the bank for £290. The bank, however, held collateral security in the shape of two life policies valued at £180. The assets consisted of book debts, £197; fixtures and fittings, £20; motors, etc., £20; and surplus from separate estate of R. J. Lawson, £500, making a total of £738. After allowing £12 for preferential claims, the net assets were £726, or a deficiency of £958. It was stated that the debtors were father and son. The father took over the business from his grandfather in 1911. For many years the business was carried on profitably, but recently losses had been sustained. Owing to the closing down of one firm for whom large contracts had been carried out, there had been a substantial falling off in the turnover. During 1926–27 the turnover was £14 500, but in 1929–30 it had fallen to £3,045. A resolution was passed in favour of the matter being dealt with under a deed of assignment and a committee was also appointed consisting of the representatives of three of the principal creditors.

LEO TAYLOR, LTD., radio engineers, Lytham Road, South Shore, Blackpool. The statutory meeting of the creditors of the above was held, on June 12, at the offices of Mr. W. Latham, C.A., 27, Birley Street, Blackpool. Mr. J. L. Taylor occupied the chair and a statement of affairs was submitted which showed ranking liabilities of £1 287 due to unsecured creditors. After allowing £8 for preferential claims the net assets were £409, or a deficiency so far as the creditors were concerned of £878. The assets comprised stock, plant and tools £441, estimated to realise £250, motor car £10 and good book debts £158. The issued capital of the company was £900, and as regarded the shareholders there was a deficiency of £1 778. It was reported that there was a contingent liability in respect of rent for a year and a half at £120 per annum. The company was registered in 1928 with a nominal capital of £1 000 divided into shares of the face value of £1 each. The accounts showed that there had been a loss on the trading and when proceedings were commenced by a creditor it was deemed advisable for voluntary liquidation to take place. The ranking liabilities included a sum of £302 due to the bank, in respect of which third party guarantees were held. A resolution was passed in favour of the voluntary liquidation of the company being continued with Mr. Latham as liquidator, and a committee was also appointed.

London Gazette, etc.

Winding-up Petition.

CHEAP ELECTRIC POWER CORPORATION, LTD. A creditors' petition for winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, on Monday, June 23.

Companies Winding-up Voluntarily.

LAMBERT LAWS, LTD. By reason of its liabilities, June 10. A. E. Orbell, 6 and 7, Old Steine, Brighton, and W. A. J. Osborne, Balfour House, Finsbury Pavement, London, E.C., appointed as liquidators.

ZONE DYNAMO AND MOTOR PATENTS CO., LTD.—By special resolution, June 12, J. J. Reid, of J. W. Best and Co., chartered accountants, 94, Old Broad Street, London, E.C.2, appointed as liquidator.

Bankruptcy Information.

ANDERSON, Cyril Morton, 1556, Stratford Road, Hall Green, Birmingham, trading as ROBIN HOOD ELECTRICAL CO., electrical contractor, and at Back 330, Icknield Port Road, Birmingham, as THE MAROON MOTOR CO. Receiving order, June 12. Debtor's petition.

BLACKMORE, Glanville, 62, Coventry Road, Market Harborough, wireless engineer. Receiving order, June 13. Debtor's petition.

HANSON, Thomas Stanley, 26, Nether Hall Road, Doncaster, Yorks, electrical contractor. First meeting, June 25, 12 noon, Official Receiver's Offices, Figtree Lane, Sheffield. Public examination, July 3, 2 p.m., County Court Hall, Bank Street, Sheffield.

HUNT, Jonathan William, Christmas Street, Bristol, electrical engineer. Receiving order, June 5. Debtor's petition. First meeting, June 25, 12 noon, Official Receiver's Offices, 26, Baldwin Street, Bristol. Public examination, July 4, 11 a.m., The Guildhall, Bristol.

TUCKER, Joseph, 30, Lower Ashley Road, and formerly 876, Filton Avenue, Bristol, trading as THE BRISTOL RADIATOR CO., wireless dealer. First meeting, June 25, 11.30 a.m., Official Receiver's Offices, 26, Baldwin Street, Bristol. Public examination, July 4, 11 a.m., The Guildhall, Bristol.

TURNER, Harry, 20, Battersea Rise, Clapham Common, London, radio and electrical contractor. Receiving order, June 11. Debtor's petition.

Notices of Dividends.

HORSFALL, William Miles, 7, Redcross Street, Liverpool, electrical engineer. Sixth dividend, 4¾d., per £, payable June 24, Offices of the Official Receiver, Government Buildings, Victoria Street, Liverpool.

MADDOX, Victor Frederick, 6, Homend Street, Ledbury, Hereford. electrical and wireless engineer. First and final dividend, 1s. 2½d., per £, payable June 25, Official Receiver's Office, 133, Saint Owen Street, Hereford.

Application for Discharge.

Ross, William, 35, Bridge Street, Haverfordwest, Pembroke, wireless engineer. Hearing, July 16, 11 a.m., The Shirehall-Haverfordwest.

Order Made on Application for Discharge.

MORPHY, Donal William, lately 4 and 5, Dorset Mews North, Upper Gloucester Place, London, N.W.1, manufacturer of wireless apparatus. Discharge suspended for six months, until November 23.

Partnership Dissolved.

GRUNDY (M.) AND CO. (May RAYBOULD and John Henry CARTER). radio manufacturers and dealers in wireless accessories, 54, Clerken, well Road, by mutual consent, as from June 7, 1930. Debts received and paid by M. Raybould, who continues the business.

Bankruptcy Proceedings.

HEMBER, Lionel Edwin, 4, Pepper Street, Lymm, Cheshire, electrical engineer. The public examination of this debtor was held recently at the Court House, Palmyra Square, Warrington, when a statement of affairs was produced showing liabilities of £994 and a deficiency of £693. The debtor stated that he commenced trading in August 1927, his only capital being £35. He attributed his failure to lack of capital and keen competition The hearing was concluded.

WYNSOR ELECTRIC RANGE CO., LTD., 31, Lombard Street, E.C., formerly 1, Broad Street Place, London, E.C. Under a winding up order made against this company on May 5 on a creditor's petition the statutory meetings were held recently at the Board of Trade Offices, Carey Street. A statement of affairs was submitted showing liabilities £2 702, of which £2 652 are expected to rank, and net assets £336. A total deficiency of £3 316 is disclosed with regard to the shareholders. The company was incorporated on May 6 of last year with a capital of £1 000 in £1 shares, and obtained a lease of two rooms at Roxburghe House, Regent Street, W., for seven years from June 1, 1929, at £150 per annum inclusive, occupying them as a sales depot until early this year. The landlord then released the company from all liability on certain conditions. Before the formation of the company the ranges were made by the vendor, Louis Burn, by hand, but as that was not a suitable procedure an arrangement was made with a certain electrical company for their manufacture and under that arrangement the company gave an order for ranges amounting to £21 000 to be delivered during a period of three years. It appeared, however, that much difficulty was experienced with the suppliers owing to alleged faulty workmanship and also delay in delivering the ranges, and although the company repeatedly made representations to them in that matter the position did not improve, and it was stated that this had had an adverse effect on the company's business. The sums payable by the company to the suppliers in respect of goods manufactured and delivered to the company's order was guaranteed by W. D. Stevens, who had acted as a director, and the suppliers had made a claim against him for £230 and were in addition claiming £1 000 in respect of materials bought and goods manufactured under the company's order. Stevens had stated that his reason for presenting the petition against the company was to safeguard himself against further liability under his guarantee and to protect the interests of creditors. He had added that the company could not carry on without further capital, and since that was not forthcoming no good purpose could be served by the continuation of the company's business. The failure of the company was attributed to insufficient capital and to disputes with the suppliers. A resolution was passed for the appointment of Mr. W. H. Stentiford, chartered secretary, as liquidator.

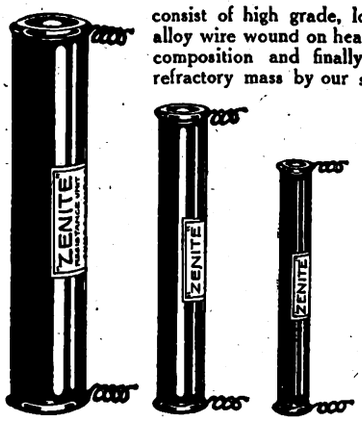
REGISTERED "ZENITE" TRADE MARK

VITREOUS ENAMELLED, EMBEDDED

RESISTANCE UNITS



consist of high grade, low temperature co-efficient alloy wire wound on heat-resisting tubes of special composition and finally embedded in a vitreous refractory mass by our special process.

For use in Motor Starters, Speed Regulators, Dimmers and for Protective purposes.

They can be supplied in seven sizes, 2" × ¼" up to 8½" × 1½", and 130 standard windings between the limits of 0·1 ohm and 44 amperes and 150,000 ohms and 0·02 ampere; and can now be fitted with brass caps like cartridge fuses, a feature which makes for increased convenience.

WIRELESS WORK

"ZENITE" Units on account of their permanence are particularly suitable for "leaks" in connection with Medium Power Thermionic Valves as well as in the construction of Resistance Capacity Amplifiers.

Thousands in constant use for many years in all parts of the world.

COMPETITIVE PRICES and PROMPT DELIVERIES

Catalogue of Resistances and Units post free

Changing World Conditions.

LORD RIDDELL, in his presidential address to the annual Convention of the Advertising Association at Hastings on Monday, gave some figures which go a long way towards explaining why there is to-day such a serious maladjustment between production and consumption. He pointed out that although in 1927 the world's population was only about 9% greater than in 1913, the production of foodstuffs was 13% greater, and that of raw materials 35% greater. This disparity alone would almost suffice to account for the present glut of commodities and the resulting unremunerative prices. Other factors are operating in the same direction. Increased technical efficiency has largely increased the output of finished products from a given quantity of raw material, and changes in habit are altering demand and diverting spending power into other channels.

The population factor seems likely to become more important as time goes on. In the latter part of the nineteenth century, increasing industrialisation rode to prosperity on a rapidly-growing population, of which it was a leading cause. In this respect the tide has definitely turned. Lord RIDDELL mentioned that the excess of births over deaths had declined in England from 11·6 to 4·3 per thousand, in Germany from 14 to 6·3 and in Belgium from 8·9 to 4·8. Undoubtedly the present tendency is towards a stabilised population such as France has long known. It is quite clear that one effect of the slowing down of the growth of population must be to remove part of the momentum which carried forward the industrialisation of the immediate past. For the cruder forms of production and manufacture, which supply essential needs, the demand must be fairly closely related to the number of consumers. It can, of course, be greatly increased beyond present levels in countries where the population is in a depressed economic state, provided that the purchasing power of such peoples can be augmented. The average quantities of food and clothing, for example, likely to be required by a world in which the growth of population has been so greatly retarded, even under conditions of relative prosperity, will certainly not absorb an annual increase in production on the pre-war basis, and it is as well that this fact should be recognised. Until there is a better adjustment not only between supply and demand, but also between commodity prices and the retail prices of manufactured goods, world trade must continue to suffer from present ills.

Similar considerations govern the production and sale of non-essentials, though here the position is more elastic in some respects. The purchaser has an ever widening range of choice as to the disposal of that portion of his income which is not absorbed either by the expenditure which may be grouped under the familiar heading of "Cost of Living" or by the rapacious demands of local and national taxgatherers. Changes of taste and habit, often brought about by the progress of invention and by social developments, such as the increased economic independence of women, tend to destroy or modify old trades and to give birth to new industries. The electrical industry has the good fortune to be concerned with a vast domain, to which it is impossible to set limits, of human requirements. It can ameliorate living conditions and add immensely to health, comfort, happiness and amusement. But, failing a general increase in spending power, all progress by the new must be to some extent at the expense of the old, and without a steady rise in the number of purchasers to ease the pressure of the attack, the competition must inevitably become intense, adding considerably to the cost of selling and thereby further reducing the total sales. In a world with a static population—at least in the chief civilised countries—conditions cannot be the same as those which have prevailed during the past century, and we must readjust our outlook and our economics to meet the new situation which is already in process of establishing itself.

Current Topics.

E.C.A. Conference.

YESTERDAY the fifth annual E.C.A. Conference began at Llandudno under the presidency of Mr. H. WILLOUGHBY ELLIS who will, to-day, hand over the office to his successor, Mr. H. C. HAZEL, to whom we offer our congratulations and best wishes. Next week, as on previous occasions, we shall publish a full illustrated report of the Conference.

World Wide Broadcasting.

SOME idea of the possibilities of wireless broadcasting as a new world force must have been conveyed to an immense number of listeners on June 18. Speeches delivered at the World Power Conference festival in Berlin, at the National Electric Light Association Convention in San Francisco, by Mr. EDISON from Orange, N.J., by Lord DERBY from Aldershot and by the Marchese MARCONI from London were radiated by European and American stations and picked up and re-transmitted in other continents so that the majority of owners of receiving sets were able to hear in quick succession speakers separated by many thousands of miles. To-day, when a suitable occasion arises, all the civilised world can become one vast audience.

Electric Farming in Suffolk.

WE gather that in spite of the severe agricultural depression good progress is being made in East Suffolk with the electrification of farming. Mr. H. A. VERNET, the chairman of the British Power and Light Corporation, which controls a group of supply undertakings mainly operating in rural areas, mentioned last week that nine farmers had been secured during the past year in the East Suffolk area as consumers of electricity for all farm and domestic purposes. From another source we hear that a large labour colony in the area, which formerly generated its own light at an annual cost of £300, now has a connected load of 64 H.P. and its bill for current for all purposes supplied by the company operating in this district is only £180.

World Output of Electricity.

A RECENT estimate of the present annual output of electricity in the world as a whole places it at 300 000 000 000 kWh, of which the United States contributes 41%. Germany with 34 000 000 000 kWh is accorded second place, followed by Canada with 18 000 000 000 kWh. Great Britain and France, each producing about 16 000 000 000 kWh, are rivals for fourth place. It is remarkable that Canada with less than 10 000 000 inhabitants should rank so high, but this is partly due to the superabundance of easily developed water power in the Dominion (coupled with a shortage of coal in the places where it is needed), and partly to the large consumption of the pulp and paper industry. Almost 8% of Canada's production of electrical energy is exported to the United States.

Expensive Waste.

SIX hours of the time of the House of Commons was devoted the other night to the discussion of two points, first, the exemption from income tax of the salaries of consuls, and secondly, the wisdom or otherwise of deducting tax from "grants in aid of revenue-producing schemes made to local authorities." Six hours of Parliamentary time! Yet it is often impossible to get five minutes of Parliamentary time to discuss the affairs of the business taxpayer. This sort of thing helps to explain the irritation and contempt of the business man for the politician. When we remember that out of these six hours' discussion will arise hundreds of new appointments for expensive officials with statistical training who will argue among themselves which column in the public accounts is to be used for a given purpose, and that all this totally unnecessary expense will add to the burden of the miserable taxpayer and still further delay both public and private work wherever it is attempted, a little irritation seems to be justified.

Buenos Ayres Exhibition.

THE Department of Overseas Trade has circulated a letter drawing the attention of British manufacturers to the importance of representation at the British Empire Exhibition to be held at Buenos Ayres from March 14 to April 27 next year. In our issue of April 18 last we gave some particulars concerning the electrical section of the exhibition and the plans of the B.E.A.M.A. It is very desirable that the display of British electrical products should be as comprehensive as possible, and that thoroughly suitable printed matter should be prepared. Full information as to the scope of the exhibition and details as to cost of space, stand erection, services, supplies and transport of exhibits can be obtained from the General Manager, British Empire Trade Exhibition, Buenos Ayres, 1931, at 5, Parliament Mansions, Orchard Street, Victoria Street, S.W.1.

Rural Distribution in Ontario.

To cheapen the cost of electricity in rural areas legislation has just been passed by the Ontario Provincial Parliament providing $2 000 000 for loans up to maxima of $1 000 to farmers in order to cover the cost of installations. These loans will carry a low rate of interest and be repayable over 20 years. A second Bill fixes $2·50 monthly as the maximum service charge for rural hydro-electric districts, against a present maximum of $4·10. Between 1923 and 1929 the number of rural consumers on the Ontario Hydro Electric Power Commission's network increased from 4 200 to 37 000. There were more than 5 000 miles of rural transmission lines in existence at the end of last year, and it is expected that an additional 1 500 miles will be built during 1930.

An American Criticism.

FROM the point of view of those who believe that the fundamental principle in fixing rates for light and power for various types of service should be that each should carry its own burden, the Ontario policy savours of cramming electricity down the throats of the farmers at the expense of the general taxpayer of the Province. In other words, if rural services cannot be made self-supporting, the general revenue is drawn upon to make good the deficiency. The equity of penalising trade and industry, as well as the general taxpayer, for the benefit of the small consumer, particularly in rural areas, is certainly questionable, but the policy is not confined to Ontario. In this country it has been applied in another form in the De-Rating Act, which relieves agricultural land of rates. The question is indeed one of national policy rather than of equity. If encouragement of agriculture is considered to be in the general interest, such measures are justifiable, but there are limits beyond which the policy cannot be pursued without injustice to the non-agricultural elements.

WORLD POWER CONFERENCE.

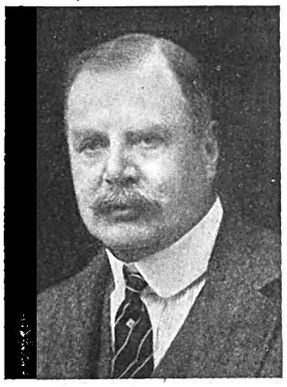
Electrification of Rural Areas—Dr. Gaby's Survey of the Work of the Ontario Hydro-Electric Commission—Development of Domestic Electrification.

By ALFRED EKSTROM, D.Sc., M.I.E.E., and VIDAR EKSTROM, C.E.

THE technical work of the Second Plenary World Power Conference began on Monday, June 16, in the afternoon, at the Kroll Opera House under the presidency of Sir Archibald Page.

Director A. Petri read the general report on: ELECTRICITY IN HOUSEHOLD AND AGRICULTURE.

Mr. Petri mentioned that the most important problem which electricity supply undertakings were faced with at present was the electrification of the household. Electricity in the household meant a saving of labour for the housewife, and from the electricity supply undertakings' point of view a better utilisation of their plant. Further, the scope for electricity in the household was growing with the ever-increasing number of new labour saving devices.



Lord Derby, President of the First World Power Conference, 1924-1930.

Electricity employed in dairies, poultry-farming, and agriculture was, he said, a load which in the near future will be of great importance to electricity supply undertakings. As an example, he mentioned Sweden, where 75% of the arable land was supplied with electricity. He also mentioned the interesting work begun in England in regard to electric ploughing.

Dr. F. A. Gaby's paper on ECONOMIC RESULTS OBTAINED BY THE HYDRO-ELECTRIC POWER COMMISSION OF ONTARIO IN THE SUPPLY OF ELECTRICITY IN THE HOUSE AND ON THE FARM, was outstandingly interesting. This Commission generates, transmits and supplies energy wholesale to 592 towns and villages in Ontario, serving about 2 400 000 inhabitants. Bulk supply is given to individual municipalities, large industrial consumers and rural power districts, on the principle of service "at cost." Retail distribution is managed by the various municipalities and rural power districts.

This electricity supply system has a certain similarity to that now being developed by the Central Board of England. Even though this supply is based almost entirely upon generation by very cheap hydro-electric power, while that in England is based principally upon energy generated by coal, the lengths of the transmission lines are very considerable—sometimes even up to 450 miles—so that the energy costs for bulk supply to many of the municipalities are comparable with those served by steam-electric plants by the Central Board.

We can, therefore, see no reason why it should not be possible for supply undertakings in England to achieve similar results as those which have been attained by the municipalities in Ontario. Dr. Gaby's report might, therefore, prove instructive to English electrical engineers.

Dr. Gaby, himself, thinks that the phenomenal success which has been achieved over this extensive territory is due to efficient propaganda and to suitable tariffs being given to the domestic consumers, thus inducing them to utilise labour-saving and comfort-giving electric appliances, i.e., electric light, cooking, water-heating and sundry other electric household conveniences.

At the end of 1928 408 000 domestic consumers, consuming 550 million kWh, were supplied in municipalities, and 30 000 rural consumers with a maximum demand of 12 500 kWh.

The tariff consists of:—

(1) A fixed service charge of 1s. 4d. per month per domestic consumer.
(2) A price of 1d. to 1·5d. per kWh for first 55 to 60 kWh per month.
(3) A price of 0·5d. to 0·75d. per kWh for additional kWh.
(4) Minimum charge of about 4s. per month, 10% discount for prompt payment.

In his paper Dr. Gaby showed the steady increase of domestic consumption of electricity and the entirely sound financial profit on the invested capital of the supply undertaking, which has been the result of this policy during the years 1916-1928. During this period there was practically no alteration in the tariffs.

While the domestic consumers connected to all these municipalities had an *average* annual consumption of 300 units per annum in 1916, this average consumption had increased to about 1 400 units in 1928. If we calculate that each consumer consists of four persons, this means that the consumption of energy had increased from 75 units to 350 units per head. From the figures given in regard to saturation of electric appliances among the connected domestic consumers, there still seems to be a very great possibility of further increase in the future.

During this period, the average cost per kWh for the domestic consumers decreased from 2·45d. to 0·82d., a decrease due to the higher average consumption per consumer.

Dr. Gaby gave some interesting figures regarding the domestic load characteristics obtained in different municipalities, as well as regarding the individual consumers.

The load characteristic resulting from consumers using electric cookers in conjunction with lighting and other appliances was 0·83 kW per consumer in the case of favourable diversity, while it was 1·35 kW per consumer in the case of unfavourable diversity. In the latter case the load characteristic from consumers using lighting but no cooking was 0·28 kW.

It should be noted that the electric cookers in general use in Ontario are of high capacity. The average installed capacity for a consumer using cookers, lights and small appliances is about 11 kW per consumer, whereas for consumers using lighting and small appliances, but no cookers, the average installed capacity is 2·2 kW.

Dr. Gaby's paper gave some figures in detail for a municipality which seem to be comparable with English conditions. The town of Sandwich has a population of 9 400 inhabitants with a transmission distance of 245 miles. The revenue from electricity supply is derived predominantly from domestic service. It has 2 700 domestic consumers with an average annual consumption per consumer of 2 160 kWh, paying an average price of 0·88d. per unit, giving a total annual cost for electricity of £8 5s.

The cost of bulk supply from the Commission to the municipality is about ½d. per unit. The first cost for the distribution plant within the town is about £22 per consumer.

After all costs for power in bulk, operation and maintenance of the distribution system, as well as depreciation, are paid, there results a net profit for the municipal electrical undertaking of 12·3% on the total invested capital (including reserved sinking funds).

Mr. D. N. Dunlop, Founder of the World Power Conference, and Chairman of the British Executive Council. Mr. Dunlop was prevented by indisposition from attending the present Conference in Berlin.

While the electricity supply to towns and villages has been carried out in accordance with self-supporting financial business lines, giving a remarkably satisfactory result, the rural supply has been carried out by means of subvention from the Province. The capital necessary for the extension of the agricultural supply was provided half by the supply undertaking of the Commission, and half, as "grant-in-aid," by the Government of the Province. It was thus possible to reduce the tariffs originally given for rural supply, so that they now approximately tally with those valid for urban consumers. The result of this policy is said to have been enormously satisfactory in its assistance to agriculture. It has brought about some interesting results which are worth mentioning here.

A large percentage of the farmers, i.e., 25%, use electric motors and electric pumping equipment. Electric cookers have reached a degree of saturation almost equal to that existing in the urban municipalities of the Province, i.e., 20%. Washing machines are used to a much larger extent on the farms than in the municipalities, i.e., 50%. The general conclusion to be drawn, therefore, respecting the economic results of the Commission's policies in the field of rural elec-

C

Digitized by Google

trical supply is that, having regard to the circumstances in Ontario, these policies have been the means whereby service could be extended on a large scale to rural consumers at relatively low costs without detriment to the financial status of the undertaking, and with great economic benefit to the Province as a whole.

The paper on DEVELOPING THE DOMESTIC USE OF ELECTRICITY IN THE UNITED STATES OF AMERICA, by Marshall E. Sampsell, gave a survey of the vast extent of long distance light and power supply plants. There are now more than 175 000 miles of high tension lines in service in the United States for pressures over 11 000 V. Electric service is given to every community with a population of 5 000 or over; to 97% of the communities having between 1 000 and 5 000 inhabitants; to 50% of those having between 250 and 1 000 inhabitants; and to more than 25% of those having less than 250 inhabitants sixty-eight per cent. of the population in the United States are using electricity in their homes—electric flat irons have a saturation of approximately 90%, vacuum cleaners approximately 40%, electric refrigerators 9%, electric cookers 5% and electric water-heaters 2%. Electric service is given to 500 000 farmers, who utilise it in their homes as well as for farm work. This, however, constitutes only about 7% of all the farms existing in the United States.

The average consumption per individual consumer has increased from 293 kWh per year to 500 kWh per year. The average price for electricity to domestic consumers has decreased from 3·65d. per kWh to 3d. per kWh. Particular attention is devoted to methods for propaganda for a stimulated use of electricity in the home, in order to save the housewife's time and labour.

Mr. C. A. Cameron-Brown, in his paper on THE MOST RECENT APPLICATION OF ELECTRICITY TO AGRICULTURE, referred to a report made by the Electricity Commissioners in which they point out that although the rural areas in Great Britain cover 92·3% of the total area of the country, the average density of their population is only 115 persons per square mile. Rural electrification must, therefore, generally be developed supplementary to adjacent urban supplies. He further stated that, generally speaking, electricity for agricultural purposes in Great Britain has been devoted more to the development of well-known, rather than to the creation of new, applications.

Good results have been obtained by the use of electricity for milking, poultry farming, dairies, etc., but, on the other hand, the use of electricity for electro-culture, curing animals by electric light, electrosilage, electric heating of greenhouses, as well as for the curing of hay and corn, has proved to be too expensive for practical purposes. An exception in this respect is the electric curing of hops. Promising results have been obtained from experiments in this regard, made by the Research Department of the Shropshire, Worcestershire, Staffordshire Electric Power Company.

The author also described some experiments made with an electric tractor, fed by means of a flexible cable, designed by Major A. McDowall, in Scotland, as a result of which it is hoped that the difficulties inherent in the handling of the flexible supply cable will be overcome.

Data connected with THE APPLICATION OF ELECTRICITY TO DOMESTIC USE are supplied by the American Home Economics Association. According to extensive estimates made by this Association, the home-maker spends more of her time in her housework than the industrial labourer does on his work. As the employment of paid labour in the household is decreasing, there is an urgent need for lightening of household duties by the use of electricity. The Association gives data regarding the saving in time achieved by the use of electricity for different purposes. It points out, further, the necessity of improvement and standardisation of the existing types of electrical equipment, as well as of giving reliable information to the home-makers regarding the usefulness of various labour-saving devices and services, as a means of lessening household work.

Dr. Moertsch, of the V.D.E. in Berlin, gave some interesting statistics in the discussion: 76·5% of all farms in Germany have electric supply, consuming during 1928 629 000 000 kWh, giving an average consumption per connected farm of 396 units; 5% of the total units sold from all electricity undertakings in Germany during that year were consumed for agricultural purposes. He also gave the following data regarding connected electric appliances on German farms:—

Appliances.	Number of appliances.	Total connected kW.	Average kW per connected appliances.	Number of appliances per 1 000 farms.
Motors	1 046 000	3 770 000	3·6	660
Potato boilers	8 780	9 930	1·1	5·5
Waterheating (thermal storage)	2 960	2 940	1·0	1·9
Household appliances (including cooking)	961 000	417 500	0·4	60·5
Dairies	4 480	5 170	1·2	2·8

Miss Haslett, Director of the Electrical Association for Women, drew attention to the necessity for close co-operation between architects, engineers and housewives.

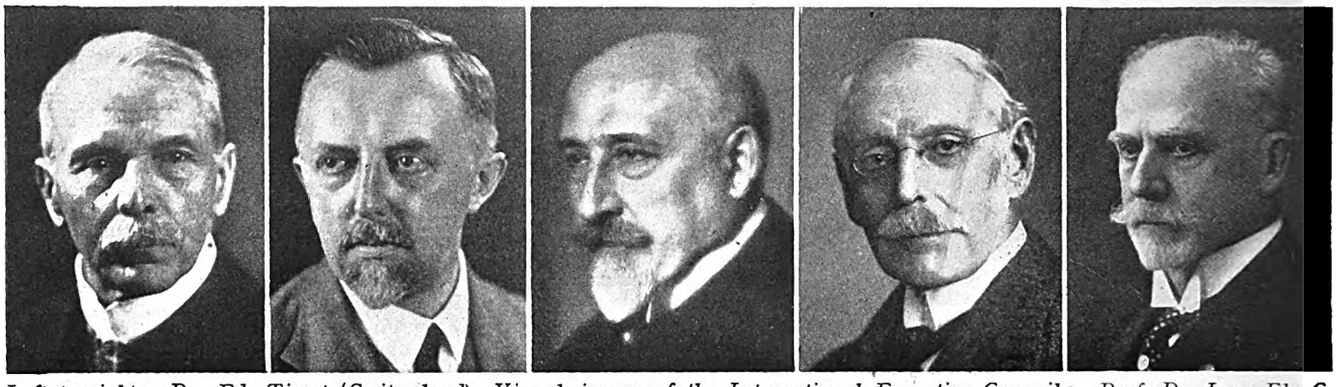
PERSONALITIES AT THE SECOND WORLD POWER CONFERENCE.



Left to right: Dr. Ed. Tissot (Switzerland), Vice-chairman of the International Executive Council; Prof. Dr.-Ing. Eh. C. Matschoss (Germany), Secretary of the Conference; Dr. Carl Köttgen (Germany), Chairman of the Conference; Sir Charles Parsons, Vice-president; Prof. Dr. G. H. de Thierry, Vice-chairman of the Conference and Chairman of the German National Executive Council.

POWER TRANSMISSION BY RADIO.

Not a Present Possibility—Greetings to Mr. Edison.

IN the course of the speech by the Marchese Marconi, which was broadcast throughout the world last week, in connection with the World Power Festival, he took occasion to make it clear that some radio tests which he carried out last March, between his yacht laboratory at Genoa, and Sydney, Australia, somewhat erroneously brought before the popular mind the possibility of the transmission by radio of electrical energy through space over great distances. The Marchese Marconi explained that this was at present not possible. Radio, he added, was nevertheless now sending power to and fro across the world in ever increasing amounts.

Sending respectful greetings to Mr. Thomas A. Edison, the Marchese Marconi said that Mr. Edison, through his innumerable inventions had brought light and cheerfulness to countless homes besides showing us the way of utilising enormous amounts of electrical power for the benefit of mankind. He personally should never forget the encouragement and friendship Mr. Edison so generously extended to him in the early days of his work. He was glad now to be able to wish him through space, the continued good health and happiness he so thoroughly deserved.

SIXTH ADVERTISING CONVENTION.

Sir Ernest Benn on Too Much "Safety First"—Mr. Charles Pinkham's Stimulating Paper—Progress of Electric Signs.

FROM the large and varied programme of papers and addresses delivered at the Sixth Annual Advertising Convention at Hastings this week, we are compelled by limitations of space to restrict ourselves to summarising two or three of special interest to readers of this journal. Prominent among such was the paper on "The Service Expected from a Trade Journal," read by Mr. Charles Pinkham, Publicity Manager of the General Electric Co.—a vigorous and well-considered survey which touched on a number of important points.

In the course of an address at the opening general session on Monday—following the Presidential address by Lord Riddell and short addresses by Lord Luke of Pavenham and Lt.-Col. Sir Stanley Reed—Sir Ernest Benn said that he clung to the belief that in the matter of trade and industry the greatest benefactor was the man who brought the article or the service within reach of the people who wanted it, and that of course was advertising. He doubted whether the delights and benefits which he derived from the use of electricity were more due to the efforts of Faraday than to the life's work of Hugo Hirst.

The Marxian idea that the maker or the worker was the all-important factor in the development of trade and industry was all too slowly losing ground. If wealth was land and labour, as Marx contended, then music was catgut and horsehair and literature was paper and ink. Land, representing raw materials, and labour of hand or brain, were futile and useless until the advertising idea brought them into service.

He proposed to do a bit of pleading for the small man, the modest manufacturer, the retail tradesman and the people who were left out of account when we talked of things in the big way which alone was popular to-day. We must get our people out of the big figure habit and make the little man feel that he counted for something. The mass idea always led to inertia and we were suffering from mass inertia more than from any other national ailment to-day. We must give up the notion that organisation was an unmixed blessing. When one organised in such a way as to restrict, limit, or restrain the efforts of the individual to render better or more service, one had bad organisation. The public mind was obsessed with the false notion that organisation for organisation's sake always meant progress.

From being a nation of shopkeepers we had become a nation of politicians. Politics was the art of looking for trouble, finding it whether it existed or not, diagnosing it incorrectly and then applying the wrong remedy. This was the age of "Safety First." We needed less safety first and a few more healthy bankruptcies—a revival of the old spirit of individual adventure. "Safety First" was a psychological mistake and a libel on the true character of the Englishman. It was part and parcel of the Government Department and the rationalising idea.

There was more in life than a card index and a rotary press. We required less education and more intelligence. If we were to develop trade and industry we must get the parsons and the politicians out of business and re-establish the self-confidence of the individual business man. He did not believe that everything new was bad; he only objected to the modern view that everything old was stupid. We must strive to discover what little good there might be, and it was little enough, in both the old and the new.

Trade Journals.

Speaking first on the subject of circulations, Mr. Pinkham associated himself wholeheartedly with the demand for an Audit Bureau of Circulations. He went on to discuss editorial contents of trade papers and said that the value of a paper to advertisers depended eventually on the appeal of the editorial matter. They were, therefore, justly entitled to expect that the live wires on the staff of the paper should not be confined to the advertising manager and his satellites, but that the editorial side should be equally bright. It was just as essential that a trade journal should be conducted with a view to stimulating a live interest in its readers as it is for any other type of periodical. The editorial outlook should be bold, and independent, and should not be swayed by the advertising. He could not deprecate too strongly the practice which one frequently encountered of the holding out of editorial space as a bait to the prospective advertiser. Editorially, a journal should be observant of every development and movement within the industry with which it was connected, and should endeavour so to present these phases to its readers that they would stop to read about them.

There was one direction in which he thought the editorial pages of trade papers could do a very good work in all industries where there was a retail trade. Sir Ernest Benn had referred to it in his speech at the Imperial Press Conference early this month, when he said: "The retailer must be taught to pull his weight and do his share as an advertiser. That is the next big job in the advertising field. The retailer takes one-third of the gross products of the whole of our industrial output, but he still expects the manufacturer to find his market for him." Everyone on the manufacturing side was only too painfully aware of the truth of Sir Ernest's remarks, and the more those trade journals which reached the retailer educated him up to a proper understanding of his responsibilities in that direction, the better it would be not only for the manufacturer, but also for the retailer, as well as for industry in general.

Mr. Charles Pinkham.

He did not think that sufficient attention was paid by trade journals, as a whole, to the choice of type face and to the layout in their editorial columns. In the general body of editorial matter, he did not think any of them desired, or were better off for having, "puff" publicity. He sent to technical journals endless quantities of write-ups on his company's material and installations. He was not overjoyed when he saw notices concerning any particular item in five or six or more journals all phrased in identically the same words as those which emanated from his Department. He thought they were entitled to expect that there should be sufficient journalists of ability on the staffs of the papers to take the material which was sent to them, and, *if it was of sufficient interest to warrant publication*, to re-write it in a manner possessing some individuality.

He would like to urge that advertisers should receive advance information of forthcoming editorial matter. If this were done, it would be a service of considerable use to the advertiser in enabling him to bring his advertisements into line with the editorial content where he so desired it.

Referring to special issues Mr. Pinkham said that in every industry there were important events in the course of the year that had a large national interest and undoubtedly had very beneficial results upon the industry. Such events were the Motor Show, the Wireless Show, the Dairy Show, the Royal Show, the Furnishing Trades Exhibition, the Fashions Show, etc. Important annual events such as these justified special issues and, generally speaking, the numbers published specially for these occasions reached a high standard and did quite a lot of good. There was another side of the picture. A number of events occurred in the course of the year (sometimes invented and fostered by the journals) which did not assume national importance. Such issues as these should never be raised to the dignity of being called "special." If the contents were assumed to be of particular interest to readers their proper place was in the ordinary issues. In the best interest of trade publications he did not consider the incidence of frequent special issues healthy. He expected, and liked to see, editorial stunts, if only to show that the journal was alive and up-to-date, but he did not expect to be asked to adjust his appropriation to support an obvious *advertising stunt*. The best service many trade journals could render with regard to special issues was to scrap 75 per cent. of them.

On the advertising side great service could be rendered by the adoption of a standard size of page. The saving in art work and in blocks, etc., was obvious. He did not think there

Digitized by Google

was any question that the expenditure saved in such a direction would be used in further advertising of some sort. Although the standard size page would be a very considerable advance, this in itself was not sufficient. As well as a standard size page, they wanted a standard quality paper and a standard printing service, so that they could rely on getting a standard result of the highest class. Often many of them had to turn down suggested layouts because they knew that they could not rely on the advertisements being reproduced in a satisfactory manner.

The range of type stocked by trade journals—though much better than it was a few years ago—was still woefully lacking in variety and quality. When they supplied a paper with a complete stereo, were they not entitled to some financial preference in consideration of the composition and setting they saved the journal ?

Should trade journals give service by the actual preparation of advertisements ? He could see no great harm in this in itself, although it did cut across the agents' work ; but, if such service was rendered, it should be charged for at an economic rate and not held out as a bribe to advertisers.

There was a practice which seemed to be creeping into the advertisement policy of trade journals, that of limiting advertisers in the use of black, either in respect of type and lettering or the amount of black used in the display. With regard to the daily Press, he was convinced that the practice was in principle sound and in everyone's interests, though it was often interpreted in a high-handed and peremptory manner. Trade journals had not anything like the printing limitations of a daily newspaper. He could appreciate their concern lest their advertisement pages might become a mass of ugly black, like a number of their present Continental contemporaries, but he thought that the time was a long way distant when this menace would become a reality in this country. If the need did arise, he expected the publishers to approach the offending advertiser to explain their difficulties, and he was certain that they would be met in a spirit of helpful co-operation. He did not think that any " house rules " justified a publisher in scoring or otherwise tampering with an advertiser's blocks without permission.

The question of colour pages must be in the mind of every publisher of a trade paper. He was not over enthusiastic on the use of colour in trade journals, especially while the standard sized page was so much a thing of the future. Where one had to change " copy " very frequently as most of them did in this class of advertising, the cost of blocks made the overall cost of the advertisement extremely high when the limited circulation was considered, and could only be economically justified (except on very special occasions) if the number of pages in the issue was limited so that the use of colour achieved real prominence. He definitely did not like the coloured supplement, particularly when it assumed considerable dimensions, with every advertiser seeming to vie with his competitor in obtaining weird and wonderful colour effects that must dazzle and confuse the reader. He preferred to see the colour pages placed judiciously and fairly among the ordinary black and white pages. If they were to have them, they should be so distributed as to give them a chance of justifying themselves by standing out conspicuously among a run of black pages and not be so placed that they did their best to murder one another.

Electric Signs.

At the Signmakers' Session, on Monday afternoon, Mr. J. M. Woolnough read a paper on the " Progress of the Electric Sign." He said that the first purely electric sign, designed as such, was made and erected by Major Hammer in 1882 at the International Exhibition at the Crystal Palace. This was an electric bulb outlined sign displaying the word " Edison," and although crude in design and constructed for indoor use, it was the forerunner of the electric signs of to-day. In subsequent years the development of electric signs was extremely slow. To-day no large commercial concern, having a commodity to sell or service to render to the public, could consider itself up to date if it did not appropriate a considerable portion of its advertising expenditure to some form of illuminated publicity.

Mr. Woolnough said that he considered illuminated signs to be the cheapest form of advertisement extant. For the cost of a single front page insertion in a daily newspaper, a large, permanent electric sign can be completely installed, and, if placed in a prominent position, it would be seen by thousands of passers-by daily. The Ministry of Transport had actually recently issued a circular, illustrating various types of electrically illuminated road directional signs, which it recommended should be erected by local authorities.

Owing to the increased demand during the last decade for illuminated publicity, a new type of sign specialist had gradually evolved. It was now possible to carry out an advertisement or decorative design in illuminated form at quite a moderate cost. Facsimiles of trains, ships, advertisements in pictorial form with text, either still or animated, had now become a feature of London and provincial city night life. Just to mention a few—the Royal Mail Steam Packet liner " Asturias " ploughing its way through the sea on the company's West End office in Trafalgar Square, the adjacent Canadian National Railways sign depicting a " cow-catcher " American express travelling at 100 miles per hour (incidentally this is fixed 130 feet from the ground, a difficult height for an animated electric sign), the L.M.S. sign opposite the Hippodrome, showing one of their trains in motion, a wonderful electric picture advertising Deauville in Piccadilly Circus, and the intricate animated sign showing a bottle of " Bubbly " being poured into a glass, on Grand Buildings, all of which are correctly outlined in electric lamps.

Daylight Effects.

There were indications that experimenters would eventually be able to evolve illuminated signs with animated effects which would be clearly visible against strong sunlight—a real 24-hour sign.

The ordinary electric box sign or enclosed sign in many cases had become an object of artistic merit and their efficiency was beyond question. To-day few things were impossible to the sign expert. Although there had been no great change in workshop practice, there had been an enormous advance in the adaptation of scientific and artistic ideas in electric sign design and construction during the past 10 to 15 years.

The Neon, or luminous tube sign manufacturers, had introduced several new colour effects, and this step had removed one of the principal objections to this type of sign—monotony of colour. These wonderful signs were rapidly coming into their own and we should see some unusually striking examples of this type in London and elsewhere before long. Another novelty connected with Neon signs was the introduction of interchangeable illuminated letters.

In the event of the erection of a new building as a headquarters or depot of a business, it was very important to impress upon the architects the desirability of designing the front in such a manner as to accommodate a large electric sign, so that it appeared to form an integral part of the building. The L.C.C. and other regulations regarding the size of signs which protrude over the building line were very strict ; therefore, if recesses of suitable size could be incorporated in a building, to take such a sign as might be contemplated, this very great difficulty would be removed. The scheme should be submitted to a qualified sign electrician to determine the size of the lettering, etc., and the number of lamps to be employed to give the most efficient illumination at night.

The value of floodlighting the façade of a building, or any existing unilluminated lettering or signs that may be fixed thereon, if scientifically carried out, could hardly be over estimated and it was becoming very popular.

When an advertiser decided upon the erection of a sign, he should also consider the question of maintenance. This should form a part of the contract with the sign maker.

STREET LIGHTING.

" Illumination Research," Technical paper No. 9, issued by the Department of Scientific and Industrial Research (Stationery Office, 6d. net) deals with Reflection from Road Surfaces. Curves are given of reflection factor for sand carpet, tarmac, rock asphalt and wood paving, as well as a polar curve of light distribution and horizontal illumination and brightness curves. Some conclusions are drawn as to the relative effectiveness of various placing arrangements for street lamps.

In No. 281 of the Researches of the Electrotechnical Laboratory, Tokyo, Mr. Mochinori Gotô deals with " Undamped Electric Oscillation of an Alternator Connected to a Transmission Line." A series of experiments was carried out by the author, collaborating with Mr. Urushibota, and the theoretical part of the study made by Mr. Gotô is described in this paper. A practical method of calculating the range of the field current to produce the undamped oscillation is derived.

THE PARIS FAIR.

Electrical Exhibits—Enclosed Circuit Breaker for Sudden and Retarded Overload Protection—Watertight Lampholder—Sockets and Plugs for Outdoor Use—A Small Water Steriliser.

By THEODORE RICH.

THE Paris Fair, which is held at the end of May each year, is one of the big Fairs of Europe; it is not so large as Leipzig as it has not so many sections, but those trades which are covered are well organised.

The organisers believe that if a fair is open to the public the advertisement effect as a stimulator of trade is valuable. The main business takes place on days other than Saturdays and Sundays.

The 1930 Fair had 7,500 exhibitors and in 1929 there were 2 000 000 admissions to the grounds. A material proportion of the public are admitted at half price when furnished with vouchers from makers or agents of various firms; the undertaking is carried out by a nominal limited company in which the City of Paris, Chamber of Commerce and such-like bodies have a material share. Last year the receipts more than covered the outlay.

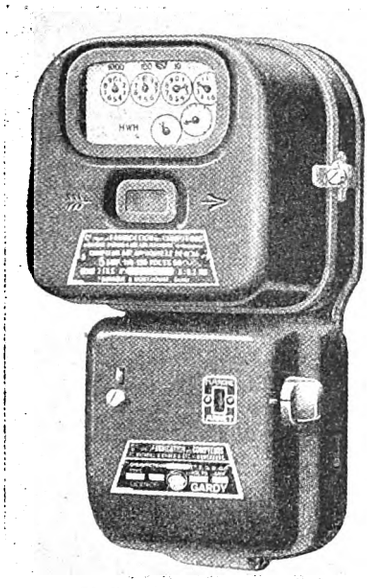

Fig. 1.—Limiter and switch to replace service main fuse.

It is not a sample fair to the same extent as Leipzig, London and Birmingham. With a few exceptions makers have not attempted to cover their stalls with innumerable patterns and types which, like the advertisements on a theatre curtain, tend to weary the eye and cancel out; there is more concentration on a few specialities. One notes the effect of some of the so-called rationalisation, as the impression of a very wide variety of articles on a very large stand is nothing like as good as that made by firms close by that concentrate on certain lines only.

The wholesaler-middleman is not worshipped in France to the same extent as he is in England, and therefore makers names are more often placed on articles than with us.

There was such a demand for space that for the electrical section a new complete building of 12 500 square metres (130 000 sq. ft.) floor space, about 580 ft. by 213, was put up in the spring; there were in this department 360 exhibitors of which about 40% were related to wireless.

New buildings of about the same floor space were also put up to accommodate office fittings, hygiene and musical instruments with wireless reception and gramophones. These new structures are made with light steel framework and corrugated asbestos sheets. Where space is available there is no doubt that a trade fair is best on one floor; lighting becomes easier and there is not the same cramping effect as where several floors are used. As a change from the ultra-modern fashion the buildings were " not " ornamented with meaningless ugliness, but looked like what they were intended to be.

The bulk of the plant on view was light in character; some good machine tools were shown in the mechanical section, also some vertical and horizontal Diesel engines, some of British make.

Owing perhaps to the fact that so much of the l.t. current is at 110/190 V there has not been the same movement towards the use of bakelite for holders and fittings generally. The use of very small fool-proof circuit breakers instead of fuses for section boxes and so on, a tendency which apparently began in Germany, seems to be making headway.

Messrs. Gardy, of Paris, have brought out a neat enclosed circuit-breaker for one or two poles for use on the same mounting as the service meter, to replace a service main fuse, which combines the function of sudden overload protection and retarded overload protection for use when a limited overload is continued too long (Fig. 1). It therefore acts as a limiter with facilities for use as an ordinary switch. One of the problems of farm and rural supply is to prevent the simultaneous use of too much what might be termed low load factor apparatus as that would involve larger transformers and excessive low load losses. The current limiting feature at once draws the attention of the user to the existence of an overload which he can remedy at once; the risk of the client having to call up the supply authority to replace a fuse is eliminated; the linking relay is thermic. It is impossible to keep the circuit closed if the relay is kept hot by overload or short-circuit; in the latter case the thermic element is cut out. The whole thing can be sealed up. It is made for currents from 1 amp. upwards; a 3 ampere breaker can be adjusted to open on a permanent overload from 2·6 to 3·6 amperes.

There are not nearly so many so-called systems of wiring in use as with us. Screwed barrel is also not used to the same extent as at home. Neither in France nor Germany are the house main and distribution fuses and switches up to British standards although the Siemens screw and Gardy plug fuse systems seem to be popular.

A safety watertight lampholder of porcelain for outdoor use made by the Adt company of Ensheim, Germany, has interesting features (Fig. 2). The conductors are not used for suspension, a separate ring being provided. The leads are threaded through two inlet tubes and are fastened to a porcelain contact base the lower part of which acts as an insulating shield, and a slotway for the pins of the bayonet lamp cap. A porcelain ring with a rubber washer is screwed up to hold the loose base in position; this same ring can also support a shade if required. It is claimed that it can be handled in safety.

The demand for tapping points suitable for agricultural works for three-phase current at 300–400 V has led to the development of sockets and plugs which are watertight and earthed. A series has been got out with spring closed flaps, the pins are protected by an aluminium collar, when pressed home a lip on the open flap forms a lock, so that the plug will not pull out until unlocked with the fingers. Fig. 3 shows a type with circular plug. Fig. 4 has an earthing contact; it is designed for three-phase motors so that a reversal of the plug reverses the direction of motion of the motor. A socket made of aluminium for connection to a multiple cable which has a plug at the far end is used for the extension of a flexible fuse. The plugs and sockets illustrated are known as the " Prisinter."

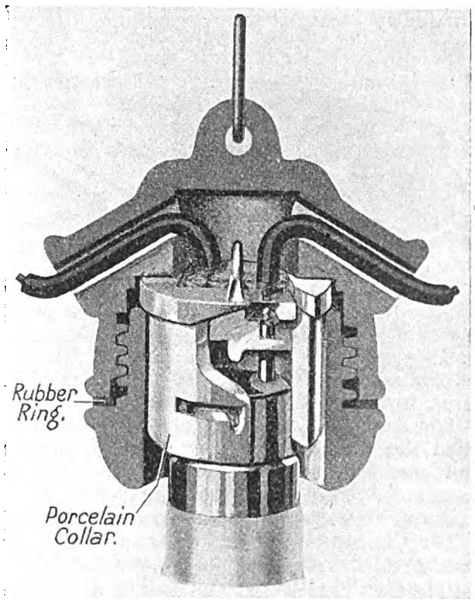

Fig. 2.—Safety watertight lampholder for outdoor use.

Numbers of bowl fires, small coil wound radiators, small hot plates and diminutive ovens were to be seen, but what might be termed more serious heating was not so much in evidence as might be expected. The Compagnie Parisienne de Chauffage showed storage pedestal heaters for night heat charging. This undertaking makes contracts for heating by the year for schools and institutions where low night rates are in force. Improvements in

Digitized by Google

electrically operated runways in France, Germany and England seem to be operating in parallel lines to the extent that instead of having a series of cords for raising, lowering and traversing to the right or left a multiple cable is used with a control gear hanging from the hoist above at hand height is operated with the thumb, a French hoist using a series of push buttons for the purpose.

A combined hand and floor vacuum cleaner of American origin, very light in weight and low in price, aroused some

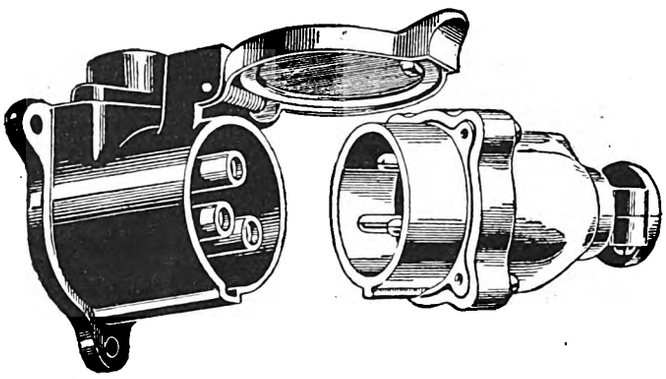

Fig. 3.—Watertight tapping point with circular plug.

curiosity. An electric iron heated on a stand with protected contacts and used without a flexible cord, so that dangers from fire if left on a table are eliminated, has some material attractions. Quite a number of flat disc and cylinder floor polishers were on view.

A feature of the fair was the number of miscrocopic motors on view for industrial and domestic purposes. Some were fitted with self-contained reduction gears, one of 1/100 H.P. had a worm reduction gear to 40 revs. It requires good design and manufacture to make a universal motor 1/25th of a horse power to weigh only 2¾ lb. Improvements in laminated magnet steel, in bearings, and in aluminium casting in recent years have made the construction of such machines possible. The making of electric motors on a commercial scale to replace the hand wound spring gear of phonographs, with the facility of an automatic stop, seems to have now been reached.

There seems to be a tendency to modify some of the very cold looking or ultra-bizarre cubist lamp glassware to something softer and more homely; freaks in art matters rarely stand the test of time. Automatic telephones for workshop and office work seem to be going ahead.

Lamp prices are dearer than they were some years back, apparently owing to the operations of a ring, but they are lower than in England, a 25 W pearl lamp costing about

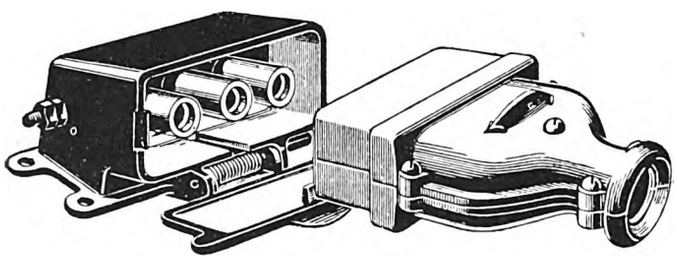

Fig. 4.—Outdoor tapping point with earthing contact.

1s. 3d., a 40 W clear gas-filled 1s. 4d. Normal wireless valves range from about 6s. 8d. to 13s.

The spread of electricity over the countryside has multiplied the demands for very small pumps for house service, and also for various forms of electrically-driven deep well pumps. A trouble has been that well water may be badly contaminated; this can be overcome by sterilising it with ozone.

The Cie. des Eaux et de l'Ozone of Paris, which has for nearly thirty years arranged sterilisation for public water supply on the Otto system, makes a small domestic ozoniser (Fig. 5), which can go on to any lamp circuit. It requires a little rectifier if operated on d.c., and can be arranged so that no water can flow unless the current is on.

The small domestic apparatus is mounted on a wood or marble board, 3 in. by 13 in., on the wall above a sink; it will supply 33 gallons of sterilised water per hour with a consumption of about 1 W per gallon.

The ozone is made between electrodes subject to a high tension discharge, and the ozonised air is drawn into the top by the running water with the aid of an ejector cone. This type of domestic steriliser might be very useful in many parts of the Dominions. It is difficult to make a chlorinating apparatus nearly as foolproof as an ozoniser. The ozone has little taste, and this passes off almost at once. It is made in a modified form for schools, hotels, hospitals, barracks and ships and for works canteens; it is used for the water supply of Paris. It is strange that the system has not been adopted anywhere in this country.

A special building was devoted to oxy-acetylene and electric welding and oxy-acetylene cutting of metals; a clever machine was one electrically driven to cut thick plates with a blow-pipe in accordance with a master pattern.

An electric chain welding machine made a remarkably good job of chains with links about ⅔ in. thick. The competition between the two classes of welding tends to keep both of them up to the mark.

A small building was given up to bakehouse plant; bakers' bread ovens, using heavy oil, competed for customers with those operated by electricity; the former, however, used electric motors for driving blowers for atomising the oil. The movement to abolish night baking, at first thought one might think would upset the furnishing of electricity at very low rates at night for such purpose; this is being got over by the use of heat-storage ovens with the added benefit that there is practically no danger of bread being over baked and further the heating elements being embedded in some granular material inside a casing cannot be injured by bakers' tools. Recent improvements in heat insulation have made it possible to bake bread quite a number of hours after current has been cut off, one maker, the Société Parisienne d'Etudes Spéciales, with a two-tier oven on a steamer, baked nearly 9 cwt. of bread 12 hours after cutting off the power. Another firm in the same line of business is Messrs. Lablyet, of Paris. This company embeds the heating elements in a sort of sand; it is not merely desirable to find a material with a good heat-storage capacity, but also one which will give up the heat readily when required.

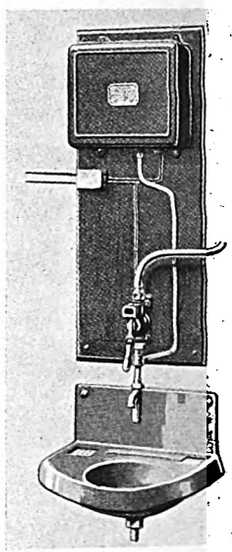

Fig. 5.—Small domestic water steriliser.

It is of interest that storage ovens have found scope on large passenger steamers, which have a peak on their power generating plant much like that of a residential neighbourhood on land. The extra fuel which must be burnt to make up for the low thermal efficiency of the plant is made up by the great advantages which can be had in the placing and fitting up of the ship's galley where most convenient relative to the saloon, the cleanliness and, also it is claimed, the saving in uptake trunk space for steam pipes or smoke pipes, with room for the repair of the former, etc. This increases the cabin accommodation to an extent which will tend to balance the extra fuel bill.

France is going ahead in the use of concrete for ornamental lamp posts and power posts, armoured concrete tanks and asbestos cement pipes made in long lengths; some quite neat looking wood frame buildings are covered with asbestos cement ornamental sheets. Armoured concrete for buildings and for power posts will never make the progress that it has in a number of countries abroad until the pronounced hostility and timidity of the authorities at home is materially abated.

An interesting appliance is a combustion of a mercury vapour lamp with a revolving shutter to give an intermittent light of ultra-violet rays, to attract noxious flying insects such as mosquitoes, tsetse flies, Phyloxera beetles, and so on, and then by means of an electric fan to draw them into a trap in which is acidulated water.

In a swampy district last year over half a million mosquitoes were trapped in three hours; a machine of large capacity is designed to minimise the effect of such pests over an area of about 100 acres. Special arrangements have to be made to keep off the rabbits and hares which are also attracted to the light. A special appliance is made for creeping insects. The plant is made by the Société d'Exploitation des Brevets

Digitized by Google

Georges Gourdon of Paris. The same inventor is experimenting on the use of ultra-violet rays to attract sea fish into a pursenet by suspending a lamp below a steam trawler, thus avoiding the power used for trawling and the heavy wear and tear on the tackle.

At the Fair generally one was much struck by the way in which electricity was being used to back up a rival, for example a petrol gas generating plant was to be seen wound up periodically by a little electric motor.

The Fair has one advantage over some of our shows, in that apart from the food section, there was practically none of the touting and screeching going on from the efforts of salesmen or sales ladies to attract custom; that sort of thing is not encouraged, neither are there so many rows of individuals in opera-bouffe costumes, although some of the electrically operated advertising moving figures, connected with the booths of sellers of wines and other exhilarating beverages, were very clever.

Quite a number of ingenious items were on view, and, as remarked by a British merchant, far more people would visit the Fair from this side if it was better advertised by the home railway companies and others, and if business people knew the nature of much of the material on view.

A certain number of the stands were marked wholesale only, but at a great many of them retail orders could be booked. It was quite remarkable to see the large numbers of people of the working class on a Saturday afternoon and Sunday obviously out to learn something of interest in their trade. Perhaps that is one of the reasons why, as compared with our million and three-quarters unemployed, there are only a few thousands out of work in the whole of France; great efforts are being made to get over the difficulties due to the shortage of labour by the adoption of mechanical and electrical appliances. There is very little hostility to what some cold-footed gentry at home are afraid to call labour-saving appliances. The socialism which exists is very largely skin deep, with a large element of common sense in the background. The war taught many districts in France that there was much latent manufacturing talent available; there are a number of good trade schools and the standard of education required before one can become an elementary school teacher is one that would make some self-assertive and noisy fraternities elsewhere feel very uncomfortable.

There is also the point that has a material influence on electricity supply, and also on manufacturing, and that is that a very material percentage of those holding high executive positions are individuals who have passed through the highest class of scientific and technical schools; men from the Ecole Polytechnique can be found all over the place. There are not nearly so many decoy duck directors on the boards of concerns of standing as with us, and recent criminal proceedings have accentuated the feeling that those who are asked to join undertakings for the sake of their positions and followings have not merely to draw their emoluments and do what they are told, but also have a responsibility towards the public at large. This tendency makes for public confidence and therefore stimulates honest trade and trade methods.

At the Paris Fair there were a certain number of British exhibitors, mainly in the mechanical section, but there is scope for greater efforts. The Federation of British Industries has done what it could to help British exhibitors, and no doubt will do so again next year.

HOW TO PUSH RETAIL SALES.

Powerful Appeal of Electrical Appliances—Linking up Local with National Advertising—Adequate Stocks must be Kept.

By R. J. WILLIS.

IT is sometimes said that the electrical contractor is envied by his confrères in other trades because of the ease with which convincing sales arguments for his goods spring to the mind. This is quite possibly true (indeed, it is the firm conviction of the writer that its truth is self-evident), but what concerns us at present is to consider what use can be made of the inherent sales possibilities of electrical appliances in general.

Let us just consider for a moment what is our own attitude when buying, say, a motor-car. Now we do not buy a car because it has a glossy finish, or a streamline body, or a Gabriel horn, or because combustion takes place in the engine so many thousand times per minute, or even because the salesman is well dressed and anyhow has a nice, kind face. We buy that car because it will take us about from place to place with more comfort and convenience than we could possibly expect to enjoy without it. In other words—we buy transport. This method of reasoning applies with equal force if for car we substitute boots, clothes, furniture, house, or even public house, according to the needs and taste of the individual.

Applying the same argument to the sale of electrical appliances immediately shows us what a really powerful and convincing appeal such appliances have. With vacuum cleaners, for instance, the obvious course, and the one which seems to commend itself to the majority of retailers, is to sell the *machine* and to dilate upon the perfections of its motor ("runs for years without oiling, madam"), the sturdiness of its dust bag and the sweet and refreshing odour which it may or may not leave behind in its passage throughout the house. Now how much better, and how immeasurably more convincing, to deal instead with the real advantages of electric cleaning—its speed, efficiency, simplicity, economy, the saving in decorations and furnishings due to thorough cleaning, and finally, the most clinching argument of all, the unnecessary labour it saves and the amount of leisure it gains for the housewife.

As with vacuum cleaners, so with electric fires. Where is the necessity for telling Mrs. Smith, of "The Laurels," that So-and-So's fire has a patent fire bar giving 100% radiation efficiency and embodies quick make and break switches, which break the circuit so rapidly that even the fire itself does not know the current has been cut off until it hears the click and obediently dies away? Why not tell Mrs. Smith instead that when she has electric fires installed there will be no further need for the unholy trinity of wood, coal, and yesterday's newspaper, heaped in an unsightly pile preparatory to "laying the fire"? that she can have heat just when it is wanted, whether it is 7 a.m. for breakfast or 1 a.m. on returning from a dance? that with electric fires the room does not take several hours to heat—it is warm almost immediately? Nor would it be out of place to mention that the reason for spring cleaning is to clean the house from the effects of the winter's coal fires, so that during the summer, when there is no need for fires, the house will remain clean. The inference that electric fires would abolish spring cleaning should immediately enlist the active and enthusiastic support of Mr. Smith on their behalf.

The sales arguments which can be advanced in favour of electric cleaning, electric heating, or any other of the electrical ways of doing things are irresistible and can be used with the most telling effect. It is not as if the electrical contractor is left to himself in educating the public in his area. Most of the manufacturers take advertising space in the national dailies, and it only needs a regular advertisement in the local paper, linked up with the various national advertising schemes, to let the public know where the goods can be obtained.

It follows, of course, that the contractor must actually have the goods in stock. So many contractors seem to think that they can rely on the excellent service maintained by the wholesalers and keep only the bare minimum of stock themselves. No matter how quickly the contractor can promise to have the goods in, it is 99 chances to 1 that he will lose the customer when he cannot immediately clinch the sale. This question is one which deeply affects the whole trade. If the retailer refrains from buying, why should not the public do the same when there is no immediate necessity for the article in question?

If, on the other hand, the retailer has a good stock of such seasonable lines as vacuum cleaners, small portable heaters, electric light fittings, electric floor polishers, toasters and electric washers—and if he displays and advertises them by every means in his power, he must get the eventual benefit from the consistent efforts of the national advertisers.

ELECTRICAL MARKET OF SOUTHERN AFRICA.

Value of the Gold Mining Industry—Contemplated Power Supply Extensions—Domestic Appliances—Telephones and Wireless Equipment—Standardisation—Points for British Manufacturers.

(FROM OUR JOHANNESBURG CORRESPONDENT.)

AT the present time the commerce of the Union of South Africa is experiencing a setback, caused largely by the unprecedented fall in the price of her agricultural staples of wool and maize. Since the end of the after-war slump in 1923, South Africa has progressed uninterruptedly in its agricultural, mining and industrial activities. The Union has adopted a policy of protective tariffs to foster her industrial development, and under it steady progress has been made, although it is considered in some commercial circles that the policy, which provides a revenue from customs duties of £9 000 000 per annum, has tended to maintain the costs of living and production at a level which reacts unfavourably on the primary industries of agriculture and mining.

The present setback in the country's progress is generally considered to be only of a temporary nature and of minor extent, due largely to the stabilisation of conditions effected by the gold mining industry of the Witwatersrand, which produces and markets over £40 000 000 worth of the precious metal per annum. Although the Rand gold mining industry is a wasting asset, it continues to expand, despite innumerable prophecies that it has passed the zenith of its production. At the present time three new mines are in process of development, i.e., the Geduld East Leases, the Witpoort Areas and the Daggafontein Mines. All of them show excellent prospects of developing into prosperous and long-life ventures, and they will provide a large market for electrical mining equipment during the next two or three years. As an example of the value of the mining industry to electrical manufacturers, it may be mentioned that the Geduld East Leases mine will be completely electrified and will provide a maximum demand of approximately 12 000 kW for its power requirements. As another example of the extent of electrification in the gold mining industry, four years ago a comparison of mining power consumption with some British undertakings showed that the largest single mine on the Rand had an annual power consumption equal to the entire output of the Birmingham Corporation electricity supply undertaking.

The bulk of the electrical and compressed air power requirements of the Rand mining industry are supplied by the Victoria Falls and Transvaal Power Co., Ltd., which has a maximum load of approximately 250 000 kW, of which 50 000 kW are required for the company's compressed air reticulation system. In addition to the company mentioned, three mines, i.e., Randfontein Estates, East Rand Proprietary Mines, and the New Kleinfontein Mine, derive their power from their own power stations. The Victoria Falls Co. has on order extensions of its system (70 000 kW) of electrical generating machinery in addition to increased step-down transformer capacity, and a new electrically-driven air compressing station is under consideration on the West Rand section of the company's system. The figures given are quoted to show the value of the Witwatersrand mining business in electrical machinery, more especially in view of the fact that apart from repair shops no electrical material is manufactured in South Africa.

New Steel Works Load

Most of the immediate municipal requirements have been met in the way of power supply for the time being, but it is probable that the Pretoria (Transvaal) undertaking, both on the generation and distribution sides, will require extension in the near future to meet the new load provided by the State steel works, which are shortly to be established in the vicinity of Pretoria at a cost of approximately £3 000 000; tenders for the establishment of the steel works are now under consideration in London.

Work is actively in progress for the provision of the power requirements of the copper fields in Northern Rhodesia, and this area during the next few years should provide a valuable market for electrical machinery.

One of the features of the development of the Union during the past five years has been an unprecedented boom in the building trade, and at the present time there is little sign of its abatement. It has been particularly noticeable on the Rand, and the city of Johannesburg has been revolutionised in appearance during the past few years. Practically all the old landmarks of the early mining days have given place to many-storied office buildings, and the suburbs of the city have shown similar activity in the erection of residential property, more especially flats. There is a ready market for lifts and heating apparatus in the office buildings, and it may be noted that central heating by steam or hot water has not been developed to the same extent that it has overseas, especially in America. When it is considered that in some of the new townships which form the suburbs on the outskirts of Johannesburg, a clause is inserted in building leases stipulating the minimum value of the property to be erected, and such minimum is frequently £2 000, it will be realised that there is a valuable outlet for such domestic appliances as refrigerators, vacuum cleaners, cooking apparatus, irons, kettles, radiators and the best class of lighting fittings.

South African E.D.A.

In this connection, it may be noted that plans for the establishment of an Electrical Development Association for South Africa, based largely on the British Development organisation, are reaching maturity, and its activities should be of very great value in fostering electrical development and making the manifold applications of electricity more widely appreciated.

The wireless market is practically stagnant at the present time, due to some extent to the difficulties experienced in providing a broadcast service for a white population of one and three-quarter million people scattered over an area of 471 000 sq. miles. There is a possibility of the service being taken over by the Government, but at the present time the wireless market is under a cloud.

The State telephone system has made steady progress since the Great War, and an expenditure of £750 000, spread over the next five years, has been authorised for the extension of the system and the provision of automatic exchanges and equipment for the Witwatersrand area.

Although municipal supplies vary from a.c. to d.c., and no attempt has been made in the case of a.c. supplies to adopt a national standard frequency or supply voltage, the mining supplies of the Witwatersrand, with the exception of those of the East Rand Proprietary mine and the New Kleinfontein mine, are standardised at 50 cycles, three-phase, and voltages of 2 100 and 525 for power, with 220 volts for lighting and domestic supplies. The standardisation of frequency and voltages for mining purposes has proved an inestimable boon to the mining industry due to the interchangeability of plant and equipment between mines, and it has also assisted the merchanting of electrical wares because it has reduced the variety of stocks to be carried.

Competition in electrical material in the Union of South Africa is severe, and a number of Continental and American manufacturing firms have established well-organised and excellently-equipped branches in the Union, officered by trained and able engineers. It cannot be too strongly emphasised that British houses seeking outlets in the Union, particularly in the heavier branches of electrical engineering for mining work, require adequate representation by qualified engineers, capable of assisting clients with technical and practical advice and information. Many of the larger British firms are splendidly represented, both in Johannesburg and the other large towns of the Union, but too much care cannot be exercised in appointing business agents in the sub-continent. To illustrate the need for care, it may be quoted that the writer was recently approached by the local agent for a well-known Continental insulator manufacturer. In the course of a conversation, which disclosed that the agent had no knowledge, other than that derived from a catalogue, of the product he was trying to sell, it transpired that his actual business was the sale of domestic crockery, such as dinner services. Knowing that insulators were also made of porcelain, he had obtained the local agency for the insulator factory, and intended selling them as a side line to his crockeryware business!

A REAL ELECTRIC KITCHEN.

Cheaper Tariffs Needed—The Kitchen as a Restaurant Showroom—Advantages of Complete Alteration of Layout.

By BEN QUARMBY.

MY idea of an electric kitchen in a modern café or restaurant is one in which no other medium than electricity is used for any purpose, everything possible being done by the aid of electricity.

I have not yet seen, nor do I think that there is in existence n this country anything approaching to this ideal. Yet there must be a remarkable future for the development of the restaurant kitchen on these lines.

Electrical development is slow on account of the fact that the tariff for electricity is so high as to prevent its adoption in a kitchen for all purposes. The result is that almost every restaurant of note, although having electric illumination and power plugs for the vacuum cleaner, draws the line at any further appliances. Perhaps this is due in a certain measure to our supply authorities not pushing complete electrification, but, apparently, satisfying themselves with the lighting load. This, to my mind, is a great mistake, complete electrification of restaurant kitchens being mainly a matter of the offering of inducements, as everyone is acquainted with the superior cleanliness of electricity for all purposes over any other fuel.

If we could find a supply company courageous enough to offer a ½d. unit rate through one meter, exclusive of any other charge, for all purposes, we should secure a gratifying response from restaurant proprietors, who are only too anxious to improve working conditions in their kitchens.

The manager of a well-known café with whom I was recently exchanging confidences was bewailing the fact that comparatively few people had availed themselves of an open invitation to inspect his kitchen, which had been extended to customers over several years by means of a well-worded invitation on the menu. He was rightly proud of his kitchen, and stressed the point of cleanliness and comfort. I pointed out that his kitchen was altogether too hot and stuffy and unbearable to me ; it was, in point of fact, a good kitchen as kitchens go, but far below my ideal of an up-to-date kitchen.

I stressed my ideal of all-electric equipment, only to be met by the bugbear of cost, or the common understanding of cost, and could only come to the conclusion that much yet remains to be done to educate potential users of electric appliances in regard to the advantages offered by their use for all purposes.

The basis of this article was a remark of this particular manager that his kitchen was an important part of his business, consequently he was anxious for as many of his patrons as possible to see it. I am, therefore, making the revolutionary proposal of completely reversing the present layout of a modern kitchen.

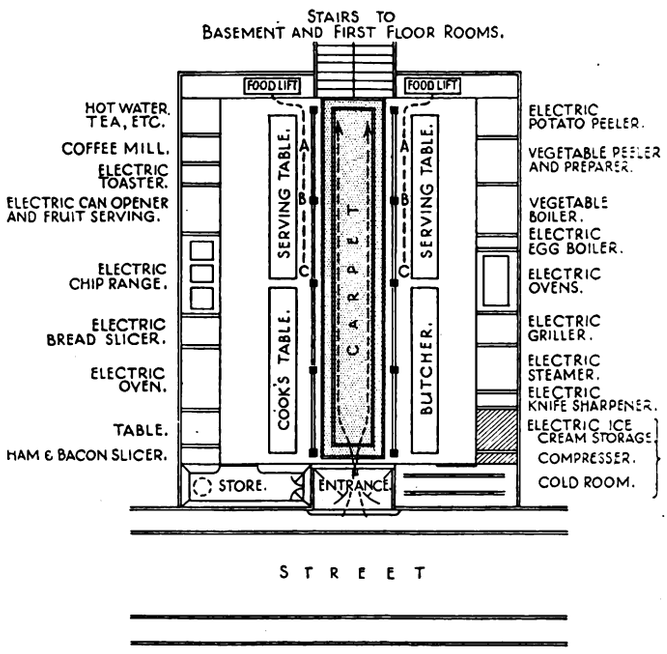
The present policy seems to be to hide the kitchen, but if it is desired that the public should see the kitchen and the food they are to eat in process of preparation and cooking, the obvious thing to do, if they will not avail themselves of an invitation to inspect the kitchen is to make the entrance to the café through the kitchen itself, so that all customers must of necessity pass through the kitchen on their way to the café proper.

The objection will be raised that the ground floor is the most valuable part of the premises, and must, therefore, be used as a dining-room. Yet if the kitchen is the most important part of the business, to be logical it should be placed in the most valuable part of the premises. It is on the kitchen and on what is produced by the kitchen that the reputation of any café or restaurant depends ; no amount of civility or good management could outlive a series of complaints about the cooking and quality of the food.

My method in the case of a two-storey building, consisting of ground floor and basement, would be to put the kitchen on the ground floor and the dining-rooms in the basement, making it necessary for all customers to walk through the kitchen to get to the dining-room proper.

This is a complete reversal of present policy, and would apply similarly if the premises were on the ground floor and first floor. In that case the dining-room would be on the first floor and the kitchen on the ground floor. Below is a sketch of the proposed layout.

It will be noticed the entrance from the street is directly into the kitchen, and that a carpet is provided on which the customers walk through. The walk is guarded by pillars and either brass rails or ornamental ropes on each side of the carpet for the entire length of the building. By careful organisation, it should easily be possible to avoid the necessity for employees to cross the carpet, as it will be seen that food lifts are provided on each side, giving service either up or down as may be required. The waitresses, A, B, C, would have access to the serving tables on each side between the rails, and the tables without interfering in any way with the kitchen staff.



I do not claim, of course, that the layout is completely satisfactory in every respect, my intention merely being to give the electrical trade an idea in order that it may be able to interest possible customers in the idea of adapting or converting existing premises.

From my experience of work in modern kitchens, I know that the staff would then be working in ideal surroundings, and the public, who are naturally curious as to what is happening in the kitchen, and would be better satisfied to see their food prepared under such conditions, would respond to and be thankful for such an innovation.

In the course of my work I have been in hundreds of café kitchens, in connection with the fixing and repairing of electrical refrigerators, and can say that there are very few comfortable, let alone ideal, kitchens; the majority are full of gas fumes, hot, stuffy and unbearable, allowing a minimum of comfort to the workers employed therein, and far short of providing a healthy atmosphere in which to work.

In summer the heat rising from a kitchen in the basement to the dining-room on the ground floor adds considerably to the stuffiness and temperature, while the reversal of their positions would add to the comfort of the dining-room.

Complete electrification would also decrease the heat in the kitchens, the heat being used in the electric appliances and not allowed to heat the kitchen by wastage, as at present. The kitchen would then be a cool and pleasant place in which to work ; the customers could walk through it without being met with a hot, sickly odour, as at present when entering a kitchen.

A kitchen set out on such lines could rival in magnificence, as far as decoration is concerned, the usual lavishness displayed in the decoration of dining-rooms, without the danger of decorations being spoiled by excessive heat or steam.

In my ideal kitchen, as many appliances as possible should be electric, and this fact alone, from the point of view of the electrical trade, would be of considerable importance, opening

Digitized by Google

up new avenues in design and manufacture of appliances, and in the improvement in design and manufacture of apparatus with a view to better performance and results on a lower tariff.

The all-electric chip range would have to be developed for better service; there would not be the slightest difficulty in this direction, on the basis of a lower tariff. The improvement would make this a better selling product in the open market, benefiting the electrical trade and assisting in the abolition of chimney smoke and the pollution of the atmosphere to the immediate advantage of the community generally. Most people use well-known appliances because of custom which dies very slowly, so that the sooner all-electric appliances are used for an increased number of purposes the sooner will the resistance of custom against their use be broken down.

I have shown on my drawing the cold room and the ice-cream storage cabinet as being worked by the same compressor; this is possible with an installation of a certain character. I should also like to stress the superiority of British apparatus, as I have found that no foreign appliances of the kind can equal those now being made in this country.

There is still a wide field among restaurants and cafés in this country for electrical refrigeration; also for electric potato peelers and knife sharpeners. I therefore recommend the trade generally to get into touch with British firms manufacturing such apparatus with a view to acquainting themselves of the possibilities in this direction, and to get a little of the cream along with the hard work, as there is a tendency to concentrate sales of such apparatus through the medium of specialty salesmen. These are not interested in increasing the load from any other than a commission-snatching point of view, and invariably make mistakes in their explanations of the electrical side of the matter to our detriment.

Let us concentrate, as traders and citizens, on a crusade for the all-electric café.

UNEMPLOYMENT AND WORK—IX.

Housing the Key.

By SIR ERNEST J. P. BENN.

IF any one thing can be singled out as the essential basis of civilised life it is surely a house to live in. Everything follows on that. Most of our trades can be regarded as subsidiaries to the house building business; if that is active others follow on, if no houses are built others have nothing to do. All trades are, of course, to some extent dependent on other trades; the Post Office could not exist without a paper-making industry; spoons and forks would find no sale in a market where plates and cups were absent; but a house is in a category by itself and promotes and encourages and, indeed, demands the work of almost every other trade. You cannot even have your photograph taken until you have a house with sufficient room to keep it in, while the sale of pianos almost depends upon a collection of family photographs, suitably framed and requiring a worthy pedestal on which to stand.

The satisfactory arrangement of the employment question involves much more than merely finding jobs for those who are at the moment out of work. There is the much bigger problem of all the employed who are wrongly or inadequately or unsuitably employed. Every one of these people, by failing to fill his or her natural place in the complicated scheme of things, is causing some little bit of trouble and hindering progress. It is impossible to know how many of us are working at uncongenial tasks and thus wasting such natural abilities as we possess because we happen to live in a particular place and we see no prospect of getting out of it. All the experts agree as to the importance of mobility to good and satisfactory employment. If things were right, a man or a woman with labour power to sell should be able to take it where it is most wanted, but how many workers to-day have any choice whatever in the matter?

There are many trades where a variety of experience is essential to proficiency. The newspaper reporter is a good illustration. These men do in fact move about, they simply have to, but the moving is a troublesome, indeed, a heartrending, business. If it were not absolutely imperative it would not be done. The method is also uniform. The man, the breadwinner, moves on and leaves his family behind. He goes into lodgings and spends much time which he can ill afford searching for permission to rent some sort of premises to which he can bring his wife and children, and then a few years later he goes over it all again. There are many thousands of people in many trades in this absurd position. If a man wants to stand as a Parliamentary candidate, he has the choice of 615 constituencies in which to work, but if he desires to serve his fellow-creatures in some humbler capacity he must do it in the district where his mother happens to have half a bedroom she can spare for his use.

When a boy leaves his school full of enthusiasm and ambition and sets out to be a baker, or a steeplejack, or a golf pro., his problem, difficult enough in any case, is not complicated by uncertainty whether there are clothes for him to wear, and there is no good reason why the whole of his desires should be limited and thwarted by the absence of living accommodation in the places where he might be able to work out his ideas. There is a certain amount of irony in the present situation, when we find a bricklayer out of work because there is no house for him in the very district where bricklaying is most in demand. If we can imagine a condition of affairs in which everybody was free to go anywhere they chose, we can see the end of any trouble about unemployment? And why should it not be so?

We have pampered the housing trade into a position where it is able to avoid many of the obligations which press so heavily upon every other sort of occupation. The makers of clothes, furniture, books, cars, bicycles and, indeed, everything else are obliged to produce their commodities, put them into stock, display them in the market, and wait the convenience and the pleasure of the buyers. But not so with houses. The fortunate persons who have chosen to adopt the making of houses as a livelihood are able to force the rest of us into the attitude of supplicants, waiting upon their pleasure, and this, as I have said, is the central cause of all our economic ills. The reason is not far to seek. Indeed, there are two main reasons, the first natural and unavoidable, the second unnatural and crying out for alteration. The former consists in the fact that housing is a sheltered industry, there is no export or import of houses, and the trade is therefore almost free from the health-giving effects of anything which can be recognised as competition. We have been foolish enough, in the second place, to intensify this natural monopoly by allowing public authorities to drive everybody else out of the housing market. There will be no real improvement in the housing situation until we return to the days of the speculative builder and through the natural wealth-making qualities of profit making and bankruptcy, over-production and under-production, good and bad, retrieve that resilience and variety which in later Victorian days taught us all we know about the possibilities of houses and home making.

Housing is capital, and the lack of capital is a good big part of our trouble. When the coal trade is flourishing, wages are paid to miners, and wages seem on the surface to be of first importance when we are considering unemployment. It remains true, however, that every ton of coal mined is so much capital exhausted, while every house built is so much capital created. Capital in the form of a house is capital with a maximum of reproductive power and from the point of view of society, if not of the landlord, there is no better investment than houses. This is not merely because a house lasts for a long time, but because during every day of its existence it is an active promoter of trade and employment. I am, indeed, inclined to doubt the wisdom of building houses to last a century, and I rather prefer the American view which puts the proper life of a house at twenty years. From the public point of view, a twenty-year house may be as good an investment of capital as one that stands for the ninety-nine years of a lease. A series of twenty-year houses yielding, say, 15 per cent. interest to their owners, would be far better for owners and occupiers and everybody else than the present long-dated 4 per cent. idea of the way the housing and landlord trade should be conducted. But whichever way you look at it and whoever builds houses or, for that matter, whoever owns them, they are the most valuable form of capital that any nation can possess. The best-managed state, therefore, and the one in which employment and prosperity will be plentiful, will be the one which places the fewest obstacles to the provision of houses.

Whether we take the long or the short view, we must come to the conclusion that to allow the housing market to retain its

Digitized by Google

present restricted character is sheer folly. Our lack of proper houses offers more work than could ever be done by all our unemployed. The figures are, roughly, these. We have 10 000 000 families and 8 000 000 houses, but of these not more than a quarter give us real satisfaction. If we consider one house per family a proper standard to aim at, there are orders waiting for 2 000 000 new houses and 6 000 000 replacements; if we go further and accept the twenty-year American idea, we find that we have a regular market for half-a-million houses a year. Nothing short of a perfectly free market, subject to all the stimulation of open competition, will even scratch the surface of this mine of national wealth.

There are quite enough natural and necessary difficulties about the building of a house to make it very important to keep the market clear of troubles that can be prevented. The scarcity of land, the risk of fire, the need for drains and water, all tend to limit our ability to satisfy the full demand, and we should therefore take special care to see that no monopolies, whether of materials or labour, or worst of all the monopoly of public ownership, are allowed to damp down enterprise.

We must really retrace our steps in this matter of housing. We were over-building within living memory, and we all know how it was done. Surely we shoud be delighted to see a condition of over-building to-day. No better social service is possible, and yet we hesitate. One final point. All this talk about housing for the working classes must be recognised as retrograde nonsense. We do not build bicycles or make gramophones for the working classes, then why houses? The builders must be free to build for anybody who will pay them. Every room built for any class relieves the pressure on all classes; the only thing that matters is that more rooms should be built and that the persons who live in them should pay for them. Rents would tumble just like bicycle prices if only we had the sense to adopt this policy.

On the question of unemployment, therefore, building helps us in a double way. It offers unlimited prospects of work first on the building itself, and secondly and subsequently on all the other processes and operations which come into play as soon as a house is available.

Housing is the master key to the situation.

BRITISH POWER AND LIGHT CORPORATION.

Annual Dinner and Reunion.

MR. H. A. Vernet, chairman of the British Power and Light Corporation (1929), Ltd., presided at the annual dinner and foregathering of the personnel of the Corporation and its constituent companies at the Savoy Hotel on June 20. Mr. Vernet, proposing the toast of "The Constituent Companies," said that up to the end of last year progress had admittedly been disappointing from a bankers' standpoint. The drought in North Wales, which lasted six months, had cost them £17 000 and there had been a number of small disappointments elsewhere. A great deal of work had been done in the past year in building up the association between the constituent bodies, and real progress was now being made. In North Wales the increase in units sold during the first five months of this year over the corresponding period of last year was 52½ per cent. and for May 80 per cent. The East Suffolk Co. had made splendid progress in spite of the depressed condition of agriculture and had obtained nine farmers as consumers not only for driving implements but for all household purposes.

Mr. H. S. Prowse replied.

Mr. A. V. Twiss, replying to the toast of "The Corporation," proposed by Mr. G. K. Paton, said that the group represented assets in excess of £4 000 000, operated over an area exceeding 5 000 sq. miles and directly supplied 10 000 consumers. Indirectly it supplied a further 20 000. Fifteen years ago electricity was still fighting to establish its supremacy for lighting; that matter had been decided. To-day a similar position existed in regard to cooking.

Brigadier-General R. F. Legge, who proposed "The Visitors," said that as the result of an electric cooker campaign they had sold 185 cookers at a publicity cost of a little over £1 each. In America the expenditure of £3 000 on a campaign of this kind had only resulted in the sale of 600, i.e., £5 per cooker. They would follow up the cookery campaign with cooling, heating and farming campaigns.

Sir Harry Haward, who replied, said that in some districts people who had not an electric cooker were finding it difficult to get cooks. The development of the cooking load largely depended on suitable tariffs. (*See page* 836).

Round the Jobs.

By "CONTRACTOR."

I WAS glad to see the electrical contracting profession—should I call it trade?—so well represented the other night at the I.E.E. Conversazione at the Natural History Museum, South Kensington. The first group of electrical contractors that I set eyes on were consuming claret cup and sandwiches blissfully unaware of a large notice over their, heads reading "Domesticated Animals and Hybrids"! There is to me a consistent charm about these annual conversaziones in which everything conspires to produce just the right atmosphere. Not the least of which is the annual reminder of the bond between the Royal Engineers and civilian engineers. I suggest that this bond is made all the more secure by the admirable qualities of Neville Flux.

* * *

In these days of socialism we hear a great deal of that phrase "Class Consciousness." It is a principle which extreme socialists and communists try to inculcate into their followers. From their point of view it is a very sound principle, in that in order to arrive at any achievement of note it is necessary that those who are striving for the achievement should force themselves into a state of mind receptive to availing themselves of every means to the end in view. It is a pity the idea is not more applied in the direction of making the public "Electricity Conscious." With the majority of the public electricity and all that it can do is quite a subsidiary thing in their minds. The householder who builds himself a house will take the utmost care that that house is built, let us say, on gravel. He will take a great personal interest in the drainage system, in the hot water system, in the type of window which is put in. He will then spend a considerable amount of money upon the decorating of the house, upon the furnishing of the house. But when it comes to electricity, to the quality of the installation, to the convenience of the switching arrangements, and, ultimately, to the choice of fittings, there will be only one thing uppermost in his mind, and that will be the question of *price*. He is not "electricity conscious," he regards electricity as quite the least important thing in his house, whereas, in fact, it is one of the most important. A little while ago I attended a discussion at my club on the subject of some new building work which was in progress in the club premises. The façade was discussed at length, the decorations, the colour scheme, the furniture and upholstering were all the subject of lengthy discussion and the expression of opinion; the heating apparatus, the service arrangements, in fact, every single detail but one was carefully and conscientiously discussed. The one point which received no mention whatsoever was, of course, the subject of the electric lighting. When I mentioned this omission to someone the answer was: "Oh, but there's nothing to discuss about that, is there? It will be just ordinary electric lighting."

* * *

There seems to be insufficient anticipation on the part of some supply undertakings of developments in their own area. As the electrical contractor is usually the go-between in the matter of lay-out between his customer and the supply undertaking, it is he who is apt to get the blame for what appears to be a muddle. Such a case occurred to me the other day. Quite a large building was in process of erection and having secured the electrical contract for the work I ascertained from the supply undertaking in writing that their supply would be 100 V, single-phase. Accordingly provision was made for a large amount of current to be carried. When the installation was nearly complete I was informed by the supply undertaking that the supply would, after all, be 200 V, d.c. This, of course, made no difference to the installation, except that a great deal of copper had been already wasted upon it. When the installation was finally complete in every detail the undertaking again informed me of a further change, this time the supply was to be 230 V, three-phase. This, of course, necessitated balancing and a triplication of switching and fusing arrangements, so that ultimately the customer had to pay for far more copper than was necessary in the installation, and a last-minute alteration of my estimate in view of the complications of balancing the three-phase. Needless to say, I got the blame for what was regarded as a muddled job. Worst of all, there appears to be no redress of any sort in such cases.

BOOK REVIEWS.

Electric and Magnetic Circuits. By E. N. PINK. (London: Pitman and Sons.) Pp. vii+124. 3s. 6d. net.

The author of this book is an assistant professor in the electrical engineering department of the Heriot Watt College, Edinburgh; the work represents what, in the author's opinion, students of electrical engineering should know about electrical and magnetic circuits if they are to pass examinations in this subject. This work is clear and concise. It is divided into three sections; the direct current circuit, the magnetic circuit and alternating currents. The first section contains the essential factors of e.m.f., power, energy, resistance, flow of electricity, circuits, multiple circuits and motor efficiency. The portion dealing with multiple circuits is valuable from the fact that, although only d.c. current is considered, circuits of three-phase type are discussed; this paves the way for the more intricate three-phase circuits which are later dealt with. Two complicated circuits are given on p. 40; these should, if thoroughly considered, remove all doubt in a student's mind as to how to deal with almost any circuit set at an examination. The second section is comprehensive. Magnetism, the molecular theory of magnetism, flux and permeability, etc., are thoroughly treated. The calculations are helpful. The last section occupies the largest portion of the work. There are several portions in this section, including vector diagrams, condensers and capacity, polyphase working and non-sinusoidal currents. The portion devoted to vectors is to be commended; students will find it very useful as an aid to understanding phase angles, angles of lag, etc. As a primer the book is to be commended, especially to students in technical schools and colleges.

CYRIL SYLVESTER.

Theorie der Elektrizität. By M. ABRAHAM. Band I—Einführung in die Maxwellsche Theorie der Elektrizität. Eighth Edition. Completely revised by R. Becker. (Leipsig and Berlin: B. G. Teubner). Pp. vii+242. 15 marks.

Of all the treatises devoted to the interpretation of Maxwell's theory of electricity the classic work now under review has been regarded as unsurpassed by many physicists for nearly a generation. Originated in 1894 by A. Föppl, it was rewritten by M. Abraham 10 years later. Since then seven editions of this famous work have served to instruct teachers and students in the fundamentals of the theory of electricity. In taking over the task of keeping the work up to date, Prof. Becker has retained in the main the method followed by his predecessor. The opening section deals with vectors and vector fields, necessary as an introduction to what follows. The second section is on the electric field, and comprises chapters on the electrostatic field, dielectrics, energy and forces in the electrostatic field, and the steady current.

The electromagnetic field is the third section and in it magnetic vectors, electro-dynamics of currents under different conditions, and electromagnetic waves are dealt with. The last section is devoted to considerations of energy and force in the Maxwellian theory.

It may be mentioned that the second volume, now in its sixth edition, deals with the electromagnetic theory of radiation.

Enough has been said to show that this is essentially a book for the advanced reader, with a leaning towards mathematical physics. Commendation is superfluous.

S. PARKER SMITH.

Elements of Electricity. By A. ZELENY. (London McGraw-Hill Publishing Co.) Pp xxiii+438. 15s. net.

This book covers a fair amount of technical ground, and the descriptions and plates are much more up-to-date than most textbooks of physics. The author states that it is intended for the preliminary courses in arts and medicine, as well as engineering (and presumably physics). If an arts student can find time to digest so large a volume on electricity, and presumably similar books on other branches of physics in addition to his other "first year" subjects, the average of intelligence in America must far exceed that in Europe. For all that, I think it excellent that all students should, if possible, have a sound knowledge of modern physics, and doctors in particular are often dangerously ignorant of the electrical apparatus which they may be called upon to use to-day. It is also excellent that the future financier and legislator should have some knowledge of the technicalities of the supply industry and electrical engineering generally—though a little knowledge is a dangerous thing.

Although the treatment is fairly elementary, modern electrical theory and its application is very adequately described, and the student should be well prepared to proceed to more advanced or specialised works if he has read the book conscientiously, and if, of course, it has been backed up by laboratory work. A very pleasing feature is the series of photographs of the important discoverers in the field of electricity. The ground covered is indicated by the following list of selected chapter headings:—

Electric Charges and Forces; Magnetic Forces, Magnets and Magnetic Fields; Electrostatic Field; Electric Current; Electric Resistance; Capacity; Conduction of Electricity through Liquids and Gases; Relative Motion between a Conductor and a Magnetic Field; Inductance; Alternating Currents; Eddy Currents; Magnetic Properties of Iron; Magnetic Circuit-Measuring Instruments; Transformer; Generation and Transmission of Electric Power; Velocity, Charge and Mass of Electrons, Protons and Isotopes; X-Rays, Radioactivity; Production and Detection of Electromagnetic Waves; Communication by Electricity; Electricity of the Atmosphere.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Hydro-electric Stations in South Africa.

[TO THE EDITOR.]

SIR,—Whilst reading our copy of THE ELECTRICIAN, dated May 2, 1930, we were very interested in your leading article on page 541 entitled "Hydro-electric Power in Africa."

In commenting on the small installations existing you mentioned Howick Falls in Natal. The Electricity Supply Commission, the largest generators of electric power in the Union of South Africa, have a power station at Sabie Falls in the Eastern Transvaal. This station contains three units, which, rated at 450 kW, make a total station capacity of 1 350 kW. The Howick Falls station referred to in your article is owned by the South African Rubber Manufacturing Co., and is rated at 400 H.P. This plant is no longer in commission, the S.A. Rubber Manufacturing Co., Ltd., having decided to take bulk supply from the Electricity Commission's Natal Central Undertaking; this power is steam generated at Colenso.

You will thus realise that the Commission's plant at Sabie is the largest in the Union of South Africa. The plant is fully described in the 1925 report of the Electricity Supply Commission, and subsequent progress is recorded in the succeeding reports, each of which has illustrations showing various portions of the plant.

There are two similar stations privately owned by the mines in the Sabie district. The one station is of about 1 000 kW and the other 800 kW; both supply power for mining purposes.—Yours faithfully,

W. VAN DALSEN,
Assistant to Chairman,
Electricity Supply Commission.

Johannesburg.
June 3.

WORLD POWER CONFERENCE EDITION OF THE "E.T.Z."

The "Elektrotechnische Zeitschrift" of June 12 (No. 24, Vol. 51) contains an article by Dr. O. von Miller on the objects and organisation of the Second World Power Conference, which was opened on June 16, the general report of the Conference, and the plans for the meeting of the International Elektrotechnical Commission in Scandinavia from June 27 to July 9. Amongst the interesting special articles in this issue of the "E.T.Z." are those on water power in Germany, by E. Mattern; fuel, by B. Thierbach; the telegraph and telephone systems as consumers of electricity, by E. Feyerabend; German electro-chemistry as a current consumer, by K. Arndt; electricity in German industries, by K. Dohrn; the installation for the transmission of the reports of the World Power Conference in different languages, by W. Jackel; the first international electricity statistics and Norwegian electricity works, by N. Schulz; the utilisation of Swedish water powers, by W. Borgquist, etc.

NEWS IN BRIEF.

Dundee and Foreign Cables—The Newton Abbot Power Station—Electrical Women at Birmingham—The London and Home Counties Joint Authority.

THE Secretary of the National Federated Electrical Association desires us to state that the rate in operation for the London District is in accordance with the declaration recently issued by the E.T.U. and the N.F.E.A., namely, 1s. 10d. per hour.

The Electricity Commissioners have approved the Metropolitan-Vickers, type NE, single-phase watthour meter, rated sizes 2½, 5, 10 and 20 A, for voltages of 100, 200, 240 and 400, at frequencies of 40, 50, 80 and 100 cycles, 240 V at frequencies of 25 and 39 cycles and 200 to 250 V at frequency of 50 cycles.

The "Faraday House Journal," summer term issue (No. 6, Vol. XIII), contains many personal notes relating to old Faradians, book reviews, results of examinations, lists of students and the officers and staff of the Faraday House Old Students' Association and particulars of the system of training electrical engineers at Faraday House.

Arundel Corporation is considering the advisability of lighting the town hall electrically.

The all-electric totalisator was used for the first time in Scotland at Hamilton Park last week.

Islington (London) Electricity Committee is acquiring premises in Holloway Road for showroom purposes.

A meeting of electrical contractors, interested in the allocation of corporation hire-purchase wiring, is to be held in Glasgow soon.

The annual general meeting of the Institution of Electrical Engineers, South Midland Students' Section, took place on Tuesday, June 24.

The Centre of British Engineering and Transport Institutions has moved to its new and permanent premises, Prince George's Hall Building, Sarmiento, 1 230 (fourth floor), Buenos Aires. Mr. L. Greaven is secretary.

The completion of a large dam on the Gatineau River, Quebec—bringing the amount of water available at all times up to 145 000 000 000 cu. ft.—is announced in the first year's report issued by the International Hydro-Electric System. This system, which operates both in Canada and the United States, has now a total installed capacity of 1 300 000 H.P., of which 852 000 H.P. is obtained from water power.

On Wednesday the Prince of Wales will open the Constantine Technical College near Middlesbrough. He will subsequently visit Messrs. Dorman, Long's Britannia Works and the Billingham Works of Imperial Chemical Industries, Ltd., which has one of the largest industrial electric generating plants in the country. On Thursday the Prince of Wales will visit William Blosford's shipyards at Sunderland.

The new electrical showrooms in King Street, Clitheroe, which are to be opened shortly, contain two chairs of more than usual historical interest in that they were made for the Prince and Princess of Wales and used by them at a luncheon given by Mr. R. Dixon, Mayor of Middlesbrough, when opening the Municipal Buildings there in 1889. Both bear the Prince of Wales's crest. A small silver plate behind each contains an appropriate inscription.

At the end of last year, only 560 426 (8·8 per cent.) of the 6 371 640 farms in the United States were supplied with electricity. Nearly 100 000 farms were connected last year, an increase of 21·6 per cent. California heads the list of States with 53·3 per cent. of farms served; Washington has 51·6 per cent., Utah 45·1 per cent., and Arizona 37 per cent. In the East, Massachusetts leads with 36·9 per cent., and New Jersey has 32·1 per cent. of its farms connected. Tennessee, with 0·6 per cent. is at the bottom of the list, but North Dakota, Arkansas and Mississippi are little higher.

An earth fracture in the bank of the overflow channe below the spillway has occurred at the Arapuni hydro-electric works. The spillway is being partially drained to permit of inspection.

Dundee Electricity Committee last week considered British and foreign offers for cables. The total of the lowest foreign offer was £5 620, while the lowest British all-in offer was £6 525. It was decided to accept three British offers where the price was not much above the foreign offers and to accept the other foreign tenders.

Since the Illinois Central Railroad began electrifying its suburban lines around Chicago in 1926, the rate of increase in its passenger business has more than quadrupled. The average increase for the last two years of steam operation was 818 611 passengers a year. The average increase for the last two years of electric operation was 4 013 111 passengers a year.

Torquay Corporation has accepted a tender, amounting to £14 230, for the construction of new buildings at Newton Abbot generating station.

Bedford Electricity Committee seeks sanction to borrow £2 000 for the purchase of motors for the purposes of hire and hire-purchase schemes.

Applications are invited for junior assistantships at the National Physical Laboratory. Candidates should have good honours degrees in metallurgy, engineering or physics.

About 3 500 telephone lines in the London area were put out of order by the heavy storms on Tuesday and Wednesday of last week. Trunk and toll lines were not affected.

The chairman of Seaham Harbour Electricity Committee has been authorised to visit London firms regarding supply of meters. The Committee is to acquire premises in Blandford Place for electricity showroom and offices.

On June 17 members of the Birmingham and Midland Branch of the Electrical Association for Women spent an afternoon at Birmingham Corporation's power station at Ham's Hall. The members were received by Mrs. H. K. Beale (president) and Mr. F. Forrest, city electrical engineer, and they also had the pleasure of seeing Mr. and Mrs. R. A. Chattock.

It is understood that negotiations have been opened between the L. and N.E. Railway Co. and the Government Development Act Committee for a grant towards the cost of the company's scheme for the electrification of the main line from London to Hatfield, Enfield, Welwyn Garden City and Hertford, and suburban lines from Finsbury Park to the Alexandra Palace, High Barnet and Edgware, a total of 60 route miles.

The Electricity Commissioners will hold an inquiry at Savoy Court, Strand, London, W.C.2, on July 24, into proposed amendments of the Order constituting the London and Home Counties Electricity District and incorporating the London and Home Counties Joint Electricity Authority. Copies of the draft Order embodying such amendments can be obtained from the Secretary, Electricity Commission, at the above address.

The ascendancy which the telephone is assuming over the telegraph, is shown in statistics published by the American Telephone and Telegraph Company. In Canada, each individual holds, on an average, 241 telephone conversations per year, but in two years sends only three telegrams. The Americans, each of whom on an average telephones 230·7 times a year, send only 1·9 telegrams each. The New Zealanders have 209·1 telephone conversations apiece per annum, Danes, 143·5, the Japanese, 56, Germans, 38·1, and the English 30·6.

LOOKING BACKWARD.

FIFTY years ago, in THE ELECTRICIAN *of June 26, 1880, it was reported that a diver working under water at Halifax, Nova Scotia, had been rendered insensible by lightning which struck the air pump.*

The award of the Volta prize of 50 000 frs. to Dr. Alexander Graham Bell for his invention of the telephone was recorded, M. Gramme receiving a second prize of 20 000 frs. for his magneto-electric machine.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of June 30, 1905, mentioned that nearly 300 members of the I.M.E.A. took part in the tenth annual convention of the association at Edinburgh. (It may be recalled that the number of registrations at the 1930 Convention exceeded 1 100.)*

The formal opening was recorded of the Pigeon House Fort generating station at Dublin (which has recently been relegated to the position of a stand-by station by the transfer of the Dublin load to the Shannon undertaking). The Pigeon House station began operating two years before the official opening.

Heavy thunderstorms occurred during the last week of June, 1905.

PERSONAL.

CAPT. A. S. Keep has been elected a director of Petters, Ltd.

Abertillery U.D.C. has advanced the salary of Mr. D. Thomas, electrical engineer, from £350 to £400.

Mr. Matthew Smith, Kilmarnock, has been elected chairman of Ayrshire Electricity Board. Mr. Smith is a member of Kilmarnock Town Council.

Miss Eva Moss, whose engagement is announced.

Miss Eva Moss, daughter of Mr. Harry Moss, and hon. secretary of the Bradford Branch of the Electrical Association for Women, has become engaged to Mr. Alfred W. Burgoyne, of Bleasley, Notts.

Worcester Town Council has decided that the salary of Mr. C. M. Shaw, electrical engineer, should be the amount (£1 080) prescribed by the scale of the Incorporated Municipal Electrical Association.

It is reported that Mr. Napier Prentice, formerly managing director of the East Anglian Electricity Co., Ltd., is lying seriously ill at the residence of his son, Mr. Courtney Prentice, Kelvedon Grange, Essex.

Mr. Ronald M. Gravatt, of the Wolverhampton Corporation electricity department staff, has been presented by his colleagues with a pewter coffee set on his marriage.

Mr. Percy James Bradford, on the occasion of his marriage at Stafford last week to Miss H. I. Stanley, was presented by the test staff at the works of the Metropolitan-Vickers Electrical Co., Ltd., with two electric fires, and an iron and toaster.

Mr. Edwin Seddon, engineer and manager of the electrical undertaking, Edinburgh, was the speaker at the weekly meeting of Edinburgh City Business Club last week. Mr. Seddon dealt with the Central Scotland Electricity Scheme.

Mr. Harry Citford Godsmark, formerly assistant rolling stock engineer of Nottingham City transport undertaking, has been appointed assistant manager. He was formerly chief technical assistant in the Manchester transport department.

Prof. Einstein, on whom the University of Oxford proposes to confer the degree of Doctor of Science, has advised the Vice-Chancellor that his medical advisers will not permit him to travel to Oxford to receive the honorary degree from Convocation.

The board of British Insulated Cables Ltd.. has appointed Sir Alexander Roger, formerly vice-chairman, as chairman of the company in succession to the late Mr. Dane Sinclair. Mr. John Ferguson, also a director of the company, will become vice-chairman.

Employees of the Warrington Corporation electricity department have presented Mr. F. V. L. Mathias, borough electrical engineer, and his wife, with a grandfather clock on the occasion of their silver wedding. The presentation was made by Mr. H. B. Jackson, deputy engineer.

Obituary.

PROF. WILLIAM HENRY BRISTOL, aged 70 years, at Newhaven, Conn. Prof. Bristol invented numerous recording instruments for pressure temperature and electricity. He played a large part in the development of the "talkie" film.

MR. ELMER AMBROSE SPERRY, on Monday, aged 69 years. At the age of 20 he founded the Sperry Electric Co. of Chicago. He then turned his attention to electric mining machinery and invented the chain undercutting machine and other apparatus. Following experiments with electric motors for tramway-cars, he founded later the Sperry Electric Railway Co., of Cleveland, which in 1894 was bought by the General Electric Co. of New York. He was the inventor of the chlorine detinning process and the electrolytic process for producing white lead from impure by-product lead, and the designer (in 1915) of a new high-intensity arc searchlight. His most important invention was the gyro-compass. Shortly before the Armistice he devised a form of wireless control for aeroplanes which, it was claimed, made it possible to direct an "aerial torpedo" against a target up to a distance of 35 miles. He was founder of the American Institute of Electrical Engineers, and of the American Electrochemical Society. Since 1910 he had been president of the Sperry Gyroscopic Co., Brooklyn.

LEGAL INTELLIGENCE.

Appeal of Oxford Electric Company Dismissed with Costs.

THE question of the amount to be paid by the Oxford Corporation for the acquisition of the Oxford Electric Co. was raised last week in an appeal by the company from a decision of Mr. Justice Bennett in the Chancery Division. The appeal was heard before the Master of the Rolls and Lords Justices Lawrence and Romer in the Court of Appeal.

The Master of the Rolls in giving judgment on Tuesday said the two points raised were, first, what was the measure of the quantum of purchase price to be paid by the plaintiff corporation to the defendant company for the purchase of their undertaking, and, secondly, the question was from what time the rights of the corporation became effective.

Having referred at considerable length to the contentions of both parties on these two questions, his Lordship said that after very careful consideration of the arguments of counsel he came to the conclusion that the contention on behalf of the corporation on the first question was right, and that the purchase price was to be ascertained by capitalising a sum of 5 per cent. upon the capital of the company properly expended on the undertaking. He thought that on that question the decision of Mr. Justice Bennett was right. With regard to the profits, there were he thought, words in the order which gave an indication of the date from which the undertaking was to be deemed to be sold so that the profits passed to the purchasers. One had to ascertain the capital which had been properly expended at the date of the notice (December 3, 1928). That clearly indicated that for certain purposes the date of the notice was the crucial date, and it appeared to him to be a clear indication of the date at which the profits came to be ascertained and measured both for the purpose of price and thereafter as belonging to the purchasers. The undertaking was to be valued and measured at the date of the notice, and thereafter the profits must be payable to the purchasers. He (the Master of the Rolls) thought the judgment of Mr. Justice Bennett was right on both questions, and that the appeal should be dismissed.

The Lords Justices delivered judgments to the same effect, and the appeal was accordingly dismissed with costs.

The "Colpitts" Patent Extended.

Judgment was given by Mr. Justice Luxmoore in the Chancery Division, on Tuesday, in an application by the Standard Telephones and Cables, Ltd., formerly called the Western Electric Co., Ltd., for an extension of the term of a patent granted to the Western Electric Company, assignees of Edwin Henry Colpitts, for an invention of "improvements relating to signalling by high-frequency currents as in wireless telephony."

His Lordship, giving his decision, said the invention was protected by letters patent in the United States, dated May 18, 1914, the date on which application for the letters patent was made in that country. It was a convention patent and therefore under the statutory provisions the date of the patent was the date of application for the patent in the foreign state in which protection had been already obtained. That date was May, 1914. The applicant company did not in fact apply for letters patent in respect of the invention covered by the American patent till March, 1920, and the question arose whether an applicant who had not applied for a patent until after the war could be said to fall within the description "patentee as such," contained in sub-section 6 of section 18 of the Consolidated Act. If the true construction of that was that the loss or damage to be suffered by reason of the war must be suffered by the person who was the owner of the particular patent at the time the loss or damage was suffered, he would have to decide this matter against the applicants. But he thought that would be to put too narrow a construction upon the sub-section. His view was that the term "patentee as such" covered not only those persons who were owners of letters patent actually granted either before or during the war, but all those persons entitled to apply for the grant of letters patent which when granted would be of a date antecedent to the date of the actual application, such date being either before or during the war period. The applicant company were entitled to make application when the war broke out, and the evidence satisfied him that almost directly after the outbreak of war they started to manufacture munitions and were a controlled establishment till November, 1919. He would extend the patent for a period of four and a half years from March 17, 1930, and he made an order accordingly.

DOMESTIC ELECTRICAL APPLIANCES.

Refrigerators for the Home—A Handy Accumulator-Operated Pocket Lamp—A New Loud Speaker—Another 4 V Filament Valve.

NOW that the summer is at all events in evidence, dealers may be interested in a few details of some of the popular makes of refrigerators. Our representative recently visited the showrooms of FRIGIDAIRE, LTD., at Chapter Street, Vauxhall Bridge Road, S.W.1, where he found a distinct improvement in the external appearance of the well-known "Frigidaire." The difference is largely due to the finish now being porcelain-enamel throughout; at the same time corners have been rounded and other minor improvements have been made. The principal feature of the 1930 Frigidaire is, however, the "Hydrator." This device is claimed to enable vegetables to be kept fresh for a fortnight; even such relatively delicate viands as lettuces and cucumbers, which had, it was stated, been in the cabinet for this length of time, were quite fresh and crisp when examined. The hydrator is very simple in construction, being little more than a porcelain-enamelled container with holes at the sides; it is arranged to slide on hangers, and in its normal position it is completely enclosed, apart from the perforations. It operates on the principle of preserving internal moisture, thus enabling the same refrigerator to provide moist cold as well as dry. Apart from its uses for keeping vegetables fresh, the hydrator is said to be most effective for rejuvenating vegetables that have become wilted.

KELVINATOR, LTD., 258, Gray's Inn Road, London, W.C.1, also announce a new range of refrigerators. These are known as the "Super-Automatic Kelvinators," and one of their most interesting features appears to be that in the larger models an interior lamp is provided, together with a red indicator to avoid any chance of the lamp being left on. Another notable improvement in the 1930 models is the provision of "Ice-O-Thermic" tubes, which we understand enable freezing to be greatly accelerated and also provide for four temperatures in one cabinet—in the neighbourhoods of 40, 30, 20 and 10 degs. respectively. The new Kelvinators are available in combinations of white and French grey, with non-tarnishable metal fittings of modernistic design. In order to minimise thermal conduction there is an absence of screws. There are nine standard models of the new Kelvinator, ranging from the D.8, which has a food storage capacity of 8 cu. ft. and a shelf area of 15 sq. ft., to the D.22, with a storage capacity of 22 cu. ft. and a shelf area of 38 sq. ft. The ice-making possibilities of the latter model are 243 cubes and one 9¼ lb. cake, and it gives 34 lb. of ice at one freezing.

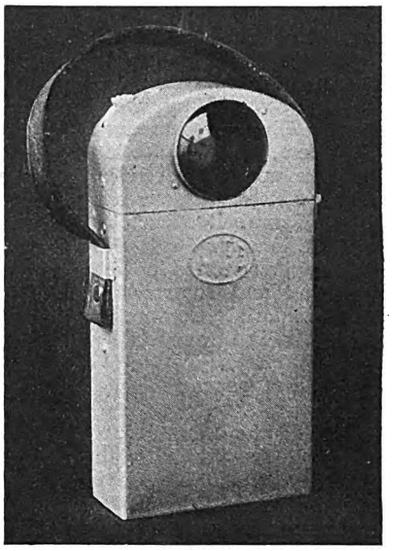
Among the various types of refrigerator produced by MARCO REFRIGERATORS (1929), LTD. (Manor Works, Streatham Vale, London, S.W.16), a recently introduced model is the "35." In this refrigerator the proportion of shelf and hanging space can be changed at will, all shelves and rails being instantly removable. The doors are stable pattern, with heavy nickel-plated brass hinges and fasteners, while the framework, exterior and jointless lining are of wood. The standard exterior finishes are varnished oak graining or white enamel; the interior is finished in white enamel, and the insulation consists of 2 in. of best quality cork slab. The dimensions of this model are as follows:—

	Height.	Width.	Depth.
Exterior	74 in.	46 in.	33½ in.
Large compartment	66 in.	27 in.	26 in.
Small compartment	27 in.	10½ in.	26 in.
Door opening (in clear) ..	59 in.	21 in.	
Shelf area	28 sq. ft.		
Wall rails	26 ft.		
Ceiling rails	4½ ft.		
Clear space between shelves— Lower two, 11 in.; others, 9 in.			

The "Marco" standard sectional cold rooms are made from selected, well-seasoned timber, with one full-length door. The exterior and interior are constructed of ¾ in. T and G board. Fittings are as follows: interior detachable hanging rails on two walls, detachable slatted wooden shelves on one wall, galvanised steel ceiling rails. The floor is lined with galvanised steel lining and fitted with a removable wooden floor grating. The exterior has heavy galvanised steel hinges and fastener, with internal and external handles. The internal capacities of these cold rooms vary from 40 to 1 000 cu. ft.

We are informed that the compressors used in Marco refrigerators are now being manufactured at the Marco works at Streatham. The standard lines of refrigerators are now vitreous-enamelled inside and out; they have catches of a new type and triple hinges.

The "Nife" pocket lamps, type A, marketed by BATTERIES, LTD., Hunt End Works, Redditch, contains a steel plate battery embodying all the principles of the "Nife" accumulator. It is shown in the accompanying illustration, and it is stated that it will "last a lifetime," and that one charge, costing a few pence, will give the same number of hours of continuous light as 10 dry batteries. As no gases are given off during discharge the cell is fitted with solid plugs, thus making it entirely leak-tight.



The "Nife" type "A" pocket lamp.

MARELLI AND CO., LTD., of Fan House, 19-20, Garlick Hill, Queen Victoria Street, London, E.C.4, have sent us particulars of their present range of electric fans. Desk fans are represented by three models of the rigid base type, and by four swivel-and-trunnion models, light pattern. Two of the latter are convertible to bracket fans without the necessity for an extra joint, while with the remaining two a knuckle joint can be introduced. There are also convertible desk and bracket, swivel and trunnion fans of heavy pattern, and convertible oscillating fans. The Marelli exhaust fans are of the open blade type with ring frames; the approximate air displacements against free intake and discharges, in cubic feet per minute, are—10 in., 400; 12 in., 1 000; 16 in., 2 000. A large number of types of ceiling fans are also manufactured.

The GRAMOPHONE CO., LTD., (363, Oxford Street, London, W.1), have introduced a new moving coil loud speaker, No. L.S. 4. This unit has been produced to satisfy the requirements of those owners of "His Master's Voice" standard electrical reproducers who have asked for a separate loud speaker comparable in quality to the original instrument, in order to extend the facilities of their equipment.

The combination of the mechanism of the automatic gramophone with the reproduction of the electrical reproducer has now been effected, and the result—the automatic electrical reproducer "Model 15"—is claimed to be an instrument which is unapproached for completeness and effectiveness as an entertainer for the home or for commercial purposes. It is stated to reveal hidden beauties in the most familiar records, and it may also be used as a super-quality loud speaker for radio reproduction, the change from radio to records being effected by a switch on the centre control panel. It will be welcomed by owners of large houses, hotel and restaurant proprietors, who require greater volume than the original acoustic model afforded. A particular feature of the new instrument is its capacity to operate additional loud speakers (not exceeding three in number) of the L.S. 4 type.

Users of wireless receiving sets that employ a 4 V accumulator or d.c. mains sets employing 4 V valves, will be interested to learn that A. C. COSSOR, LTD., of Highbury Grove, London, N.5, have extended their "new process" to their range of 4 V valves. The new valves are available in seven distinct types, to meet the requirements of all sets. The valves comprise a high efficiency screened grid (410 S.G.), a high frequency valve suitable for the type of set employing stabilised amplification and suitable for the detector stage (410 H.F.), and a valve of high amplification for resistance capacity coupling (410 R.C.). For the low frequency side are a valve for early stage use (410 L.F.), a power valve claimed to give sufficient volume to fill the average room (410 P.), a super-power valve (415 X.P.) and a pentode (415 P.T.).

EMPIRE COMMUNICATION.

Post Office Policy Under Criticism—Plea for Improvement.

AT the Conference of the Empire Press Union in Edinburgh on June 21, Mr. Norman Smith (Canada) moved that the Conference should approve the principle of the mutual interchange of cable news between component parts of the Empire.

Sir Hugh Denison (Australia) moved a resolution reaffirming the desirability of securing the cheapest possible means of communication in the interests of inter-Imperial relations by the reduction of telegraphic Press rates to the lowest possible limit, by the introduction of a deferred Press rate on all routes, and by the abolition of the terminal charges imposed by governments in respect of messages not handled by them, and requesting the Communications Committee to take up the matter with the authorities concerned. Sir Stanley Reed (India) seconded the resolution.

Sir Campbell Stuart read an address on "Empire Communications for Press Purposes." After describing the relationship, as defined in the agreement of May 29, 1929, between Imperial and International Communications, Limited and the Imperial Communications Advisory Committee (of which he is Deputy Chairman and represents the Canadian Government), Sir Campbell Stuart said that the committee was now engaged on arrangements for joint working in Australia between the Amalgamated Wireless of Australasia and the Communications Company, which would result, among other things, in the assimilation of cable rates to the wireless level. The Advisory Committee, at the request of the South African Government, had examined and made recommendations regarding the questions of policy and rates in the Union, as a result of which the ordinary rates both by cable and wireless would be assimilated and reduced.

Sir Robert Donald addressed the Conference on developments in radio and cable communications. He said they had now reached another critical stage in Empire communications, when a well-defined policy was necessary in regard to new means of rapid world-wide transmission of news, pictures, facsimile newspapers, radio-telephones and Empire broadcasting. A conflict between radio-telephones and radio-telegraphs might arise similar to that which the all-Empire Conference was called upon to consider and solve only two years ago. The outlook for Empire communication in the interest of the Press was as critical to-day as it was 21 years ago. The experimental station at Chelmsford was rented from the Marconi Company, and had been transmitting the British National programme fairly successfully. The question now was the provision of a special station broadcasting with a special programme, or several programmes, throughout the Empire. The scheme was held up because the B.B.C. had not funds available, the Post Office declined to provide funds, and the Dominions Office held aloof.

The policy of putting the Empire second was no doubt due to the fact that the Post Office at Rugby had entered into partnership with a big United States Corporation. The equipment at Rugby was mainly American. Equally effective apparatus could have been made at Chelmsford. All this time there was a system belonging to the Marconi Company, now taken over by the Imperial and International Communications Company, ready for use. The Post Office declined to use the beam stations where, without further capital expenditure, and without delay, wireless telephony could communicate with the Dominions. In a recent circular issued by the Post Office, it was stated that the transatlantic telephone service had been extended to include parts of Australia, South America and Java. It was also pointed out that "these services have now passed far beyond the experimental stage and are regarded as part of the normal long-distance services from this country." If that were so, why not give the Empire the first service? It was the duty of the Post Office to secure the best facilities for communication between this country and the United States, the greatest commercial community in the world: it was vital for the business interests of the two countries, but that was no reason why the Dominions, whose economic interests and social ties were of premier importance to the Empire, should be given second place. It was worth questioning whether the Post Office, organised as at present, was capable of managing efficiently such a changing, delicate, extremely difficult business as radio-telephony.

BRITISH INDUSTRIES FAIR.

London Section to Occupy Whole of Olympia —New Birmingham Arrangements.

THE Department of Overseas Trade announces that the British Industries Fair, 1931, will open in London and Birmingham as usual on the third Monday in February (the 16th) and will close on Friday, February 27. In a letter to manufacturers, the Comptroller-General, Department of Overseas Trade, Sir Edward Crowe, writes:—

"The London section of the Fair, which, as you are no doubt aware, is organised by this Department, will again be held at Olympia, where all the buildings, including the whole of the Empire Hall, will be available for the first time.

"His Majesty's Government have again made a grant of £25 000 for advertising the Fair, and the services of the Trade Commissioners, the Commercial Diplomatic Officers, and the Consular Service will be available for making the Fair known to trade buyers in all parts of the world.

"In view of the success of the last Fair, it is anticipated that all the available space will be taken up at an early date, and consequently no guarantee can be given that space will be available in respect of applications received later than July 31, 1930."

By the addition of two floors of the Empire Hall, Olympia, which were not available last February, the exhibiting area of the buildings is increased by 50 000 square feet to a total of 300 000 square feet. Following a recommendation by the exhibitors' advisory committee, it is announced in the official regulations that the Fair in London will open and close half an hour earlier than in previous years. That is to say, the hours will be 9.30 a.m. to 7.30 p.m., and the public, instead of being admitted from 4 p.m. to 8 p.m., will be admitted only from 4.30 p.m. to 7.30 p.m. and from 1 p.m. to 7.30 p.m. on Saturday, February 21.

In connection with the Birmingham section of the Fair service to exhibitors in the arrangements for their displays has been considerably increased by a new zone system, introduced within the last few weeks, covering the whole of Britain. From now onwards direct representatives of the Birmingham Chamber of Commerce, which is responsible for the organisation of the heavy section of the Fair, will be centrally located in various parts of the country. For this purpose, manufacturing interests in electrical and other "heavy" industries have now been divided into the following areas:—London, No. 1, extending to Bournemouth in the South-West; London, No. 2, extending from Norfolk to the Kent and Sussex Coast; Yorkshire, Lancashire and North Wales; North-East Coast; and Scotland. In these respective areas, representatives of the Birmingham section of the British Industries Fair will in future be at the immediate call of manufacturers who desire guidance on matters tending to the most effective demonstration of their products.

SHOP AND DISPLAY LIGHTING.

Preliminary Details of Special Joint E.D.A. and E.L.M.A. Conferences.

THE E.D.A. and the E.L.M.A. are arranging the details for a shop and display lighting campaign, to be held from September 15 to November 30 and a complete programme of the scheme will be published shortly.

A series of conferences is being organised and these will be held as indicated below.

Area	Date.	Time.	Place.	Members of Campaign Executive Committee in attendance.
South Midland ..	June 23	p.m. 3.15	White Horse Hotel, Congreve Street, Birmingham	Mr. C. W. Sully Mr. V. W. Dale
North West ..	June 30	3.30	Lighting Service Bureau, 4, Fountain Street, Manchester	Mr. C. W. Sully Mr. V. W. Dale
North East ..	July 2		Newcastle	Mr. V. W. Dale Mr. S. Anderson
West of Scotland..	July 2	4.0	Central Station Hotel, Glasgow	Mr. W. J. Jones
East of Scotland..	July 3		North British Hotel, Edinburgh	Mr. W. J. Jones Mr. V. W. Dale
South West ..	July 3		Electricity Offices, 7, Dorchester Street, Bath	Mr. H. Lingard
North Midland ..	July 8	7.30	Board Room, Electricity Works, Leeds	Mr. V. W. Dale Mr. W. J. Jones
London and Home Counties	July 11		E.L.M.A. Lighting Service Bureau, 15, Savoy Street, London, W.C.2.	Mr. V. W. Dale Mr. W. J. Jones
South Wales and Mon.	July 23		(Yet to be decided) ..	Mr. V. W. Dale Mr. W. J. Jones

The Conferences are open to anyone engaged in the electrical industry and it is hoped to organise a similar Conference in the E.D.A. Northern Ireland Area at Belfast.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

DONCASTER CORPORATION.—Overhauling and rewiring electrical installation at Mansion House and Municipal Offices, and electric heating installation. Particulars from Mr. T. W. Hibbert, Electricity Offices, Grey Friars Road; deposit £1 1s.

MESSRS. PREECE, CARDEW AND RIDER.—Supply, if possible by November next, of 15 000 kW, 6 600 V, 50 cycle generating plant, in one or two turbine units, with auxiliaries and boilers, or, alternatively, Diesel engine sets, for a municipal supply undertaking. Preliminary particulars to Messrs. Preece, Cardew and Rider, 8, Queen Anne's Gate, Westminster, S.W.1.

STOKE-ON-TRENT CORPORATION.—Overhead wiring and services at 284 houses on Swan Lane site and 112 houses on Sutton estate, Trent Vale. Specification from the City Electrical Engineer; deposit £2.

WEST RIDING COUNTY COUNCIL.—Electric light installation in all departments of Mexborough, Dolcliffe Road Council School. Specifications from Mr. W. H. Jones, Education Offices, Mexborough.

CENTRAL ELECTRICITY BOARD, June 27.—Supply and laying of pilot cables in connection with the Central England Electricity Scheme. Specification (C.E.-S.C.1), etc., from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

MANCHESTER CORPORATION, June 27.—Supply and erection of three-phase 6 600 V switchgear, sheet steel cubicle type, specification No. 279. Supply and delivery of supervisory control gear at Cumberland Street sub-station (Specification No. 280). Specifications, etc., from Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall, Manchester; deposit, £1 1s. for each specification, returnable.

CENTRAL ELECTRICITY BOARD, June 30.—Supply and erection of metering equipment required in the area of the Central England Electricity Scheme. Specification (C.E.-G.M.1) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

DUNDEE TOWN COUNCIL, June 30.—Supply, delivery and erection of e.h.t. switchgear and e.h.t. busbar reactors to the main generating station at Carolina Port. Specifications, etc., from Mr. D. H. Bishop, general manager and engineer, Dudhope Crescent Road, Dundee; deposit £2 2s., returnable.

METROPOLITAN WATER BOARD, June 30.—Supply and fixing of two 120 kW steam-driven electric generators, switchboard, piping, etc., at Deptford pumping station. Specification from the Chief Engineer, 173, Rosebery Avenue, London, E.C.; deposit, £1 1s.

METROPOLITAN WATER BOARD, June 30.—Twelve months' supply of electric lamps. Form of tender (No. 24) from the Chief Engineer (Room 155), 173, Rosebery Avenue, London, E.C.1. Stamped, addressed envelope to be sent.

SALFORD CORPORATION, June 30.—Electric lighting installation for new nurses' home at Hope Hospital. Tenders to Mr. H. H. Tomson, town clerk.

STOKE-ON-TRENT CORPORATION, June 30.—Electric lighting of Burslem general market and shops. Specification from the City Surveyor.

WEST RIDING EDUCATION COMMITTEE, June 30.—Electric lighting at Kippax Council School. Specifications, etc., from Mr. H. W. Powell, Education Offices, Garforth.

CARDIFF CORPORATION, July 1.—Supply of h.t. switchboard (Contract No. IV); h.t. switchboard (No. V); transformers (No. VI); and battery and charging plant (No. XV), for the Llandough Hospital, now in course of erection. Specifications from Messrs. Plevin and Jenkins, 4, Working Street, Cardiff; deposit £2 2s. for each. Only manufacturers on the King's National Roll are invited to tender.

BIRMINGHAM CORPORATION, July 1.—Electric lighting and power installation at Uffculme Mental Hospital, King's Heath; deposit £5.

EPSOM URBAN DISTRICT COUNCIL, July 1.—Sale and removal of two Lancashire boilers, by Edwin Danks, at the generating station, Church Street. Further particulars from Mr. H. W. Watts, resident electrical engineer, the Electricity Works, Church Street, Epsom.

KINGHORN CORPORATION, July 1.—Electric wiring, etc., in 40 houses to be erected on Baliol Field site. Specification from Mr. J. Gentles, surveyor, Central Chambers, Kirkcaldy.

FARNWORTH URBAN DISTRICT COUNCIL, July 2.—Supply of l.t. disconnecting boxes, frames and covers and distribution pillars. Specification from Mr. A. J. Hutchinson, engineer and manager, Electricity Department, Albert Road, Farnworth, Lancs.

KILKEEL RURAL DISTRICT COUNCIL, July 2.—Supply of 30-38 B.H.P. crude oil engine generator, booster, switchgear, etc. Specifications (5s.) from the clerk, Mr. J. J. Bell.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, July 3.—Electric lighting installation at a block of tenement dwellings. Specification, etc., from Mr. David J. Keep, town clerk, Town Hall, Cambridge Road, E.2; deposit, £2 2s. Technical inquiries may be made of Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL. July 4.—Supply and erection of (*a*) 3 000 kVA transformer, and (*b*) e.h.t. switchgear and interconnecting cables. Specification, etc., from the Engineer and Manager, 11, Staines Road, Hounslow.

LOUTH CORPORATION, July 4.—Electric lighting and power installation at Town Hall. Specification, etc., from Messrs. Burstall and Monkhouse, 14, Old Queen Street, Westminster, S.W.1; deposit £3.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, July 8.—Supply and erection of 250 kVA oil-cooled transformer. Specification, etc., from Mr. R. W. Willis, engineer and manager, Electricity Department, 37, High Street, Cheadle; deposit, £1 1s.

MANCHESTER CORPORATION, July 8.—Supply of steel girder, tramway rails. Specifications, etc., from the General Manager, Corporation Transport Department, 55, Piccadilly, Manchester.

BEDFORD CORPORATION, July 10.—Supply and erection of coal handling plant and extension of sidings at Bedford electric generating station. Specification and form of tender from the Borough Electrical Engineer, Electricity Offices, Prebend Street, Bedford; deposit £2 2s. Only British manufacturers in the United Kingdom are invited to tender.

PLYMOUTH CORPORATION, July 10.—Supply and erection of two water-tube boilers, with chimney, etc. Specification, etc., from the City Electrical Engineer, Electricity Offices, Armada Street, Plymouth.

CARLISLE CORPORATION, July 11.—Supply, erection, etc., of 11 000 V overhead transmission line, with pole mounted switchgear, in connection with a supply to rural districts. Specification (No. 30/5) from the City Electrical Engineer, Victoria Viaduct, Carlisle.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 14.—(I) 33 000 V transmission switchgear; and (II) 11 000 V distribution switchgear. Specification (No. S/S—1) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 14.—Supply, etc., of (*a*) 400/230 V disconnecting boxes, cable and service components; (*b*) 400/230 V consumers' house services; (*c*) supply and laying of 400/230 V three-phase underground cable; and (*d*) supply and erection and laying of 11 000 V overhead and underground mains. Specification (No. 11 000—440/D/1), form of tender, etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 14.—Supply and erection of two 1 000 kVA, 33 000/11 000 V, three-phase, 50 cycle, outdoor type transformers, four 25 kVA, 11 000/440/250 V ditto, and one 10 kVA, 11 000/440/250 V ditto, all with off-load tap changing switches. Specification (No. S.T.1) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £1 1s.

KENT COUNTY COUNCIL, July 17.—Sinking of well, supply of electrically-driven borehole pump and motor, water main, power cable, etc. Specification from Mr. E. A. Borg, 40, Grosvenor Place, Margate; deposit £2 2s.

D

Digitized by Google

GRANTOWN-ON-SPEY CORPORATION, July 19.—Electric lighting work of three blocks each comprising four three-roomed houses, under State-assisted housing scheme. Specifications can be seen at office of Mr. H. J. Fraser, architect and surveyor.

NORTON (STOKE-ON-TRENT) PARISH CHURCH, July 26.—Electric light installation. Estimates to the Rev. J. G. Hamlet, Norton Rectory.

CENTRAL ELECTRICITY BOARD, July 28.—Construction of foundation works for special towers carrying 132 kV transmission lines over the river Thames near Dagenham and Cross Ness. Specification (No. S.E.E.—P.F.6) and form of tender from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

EGYPTIAN PORTS AND LIGHTHOUSES ADMINISTRATION, ALEXANDRIA, June 28.—Four portable electric drills, one portable electric planer, one two-ton electric battery truck, etc. (Reference A.X. 9 676.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, June 30. — Supply and maintenance of an electric generating unit, with motors, transmission lines, etc., at Tor Quarantine, on the Gulf of Suez. (Reference B.X. 6 466.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 1.—Supply of 110 kV suspension insulators for Waitaki power scheme—section 63. (Reference B.X. 6 443.)

POWER SECURITIES CORPORATION, LTD., July 1.—Supply of (*a*) 4—3 000 kVA transformers (specification E.28, price 15s.); (*b*) indoor 11 kV switchgear (E.23, price 22s. 6d.), for Pykara, Madras, hydro-electric scheme. Specifications (on payment of above fees and 3s. 6d. for general conditions of contract), from Messrs. Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

CAPE TOWN MUNICIPALITY, July 2.—Supply of paper insulated, lead covered, impregnated, lead sheathed and armoured cable. (Reference B.X. 6 426.)

PYKHARA HYDRO-ELECTRIC SCHEME, July 5.—Indoor switchgear—Coimbatore. Specification (No. E. 29) (22s. 6d.) and conditions of contract (3s. 6d.), from Messrs. Balfour, Beatty and Co., 66, Queen Street, London, E.C.4. Fees are not returnable.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 15—Supply of v.i.r. lead covered cable (schedule No. C. 619). (Reference B.X. 6 498.)

CAPE TOWN MUNICIPALITY, July 23.—Supply of single phase and three-phase motors and startors (specification No. 499/1930). (Reference B.X. 6 497.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 31.—Supply of 84 three-phase oil-cooled transformers. (Reference A.X. 9 768.)

SOUTH AFRICAN RAILWAYS AND HARBOURS ADMINISTRATION, August 11.—Thirteen 4-ton electrically-driven portal jib cranes; tender No. 1 653. (Reference A.X. 9 683.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 11.—Supply of one 80-ton fixed electric crane, level luffing type, for Congella Wharf, Durban Harbour (tender No. 1 691). (Reference A.X. 9 727).

INDIA STORE DEPARTMENT, August 14.—Sub-station plant, for Uhl River hydro-electric project, including (1) power transformers; (2) synchronous condensers; (3) switchgear; (4) oil filtration and storage plant; and (5) cranes. Forms of tender from the Director-General, Belvedere Road, London, S.E.1.; £4, not returnable.

Tenders Accepted.

ST. BARTHOLOMEW'S CHURCH, BELFAST.—Birch and Workman, electric light installation.

FARNWORTH URBAN DISTRICT COUNCIL.—Edison Swan Cables, Ltd., supply of l.t. cables.

PORTSMOUTH CORPORATION.—Forest City Electric Co., supply of automatic signals, £140.

ROSCOMMON COUNTY BOARD OF HEALTH.—T. Keogh, electric light installation at County Home, £783.

DALKEITH CORPORATION.—Laing and Kerr, electric light installation in connection with erection of houses.

BARNSTAPLE CORPORATION.—F. Bickford, double wiring in connection with lighting of Albert Hall, £8 12s.

KENDAL CORPORATION.—P. and W. Maclellan, Ltd., supply of lathe motor; Warburton and Co., electric lift.

GENERAL POST OFFICE.—Telephone exchange equipment, Sanderstead (Croydon), General Electric Co., Ltd.

CHARLBURY (OXFORDSHIRE) PARISH CHURCH COUNCIL.—Wessex Electricity Co., electric light installation, £75.

SOUTHWELL RURAL DISTRICT COUNCIL.—Blackstone and Co., Ltd., electrically-driven unscreened sewage pumps.

DALKEITH PAVILION PICTURE HOUSE.—A. P. M'Queen, electrical work in connection with alteration of building.

JOINT ISOLATION HOSPITAL, OTTERSHAW, NEAR CHERTSEY.—E. Pollard and Co., Ltd., electric light installation, £235.

GRIMSBY CORPORATION.—Forest City Electric Co., erection of automatic traffic control signs, £458. (Recommended.)

SHEFFIELD CORPORATION.—T. B. and W. Cockayne, Ltd., electric lighting at Wincobank baths, £179 10s. (Recommended.)

CANADIAN PACIFIC STEAMSHIPS, LTD.—Edison Swan Electric Co., Ltd., supply of electric lamps and accessories for one year.

PENISTONE EDUCATION COMMITTEE.—G. Hinchcliffe and Co., electric light installation at Silkstone Common School, £62 7s. 6d.

NEWTOWNARDS GUARDIANS.—J. Dowling and Sons, Ltd., electrical plant and wiring in connection with reconstruction of hospital.

EASTBOURNE PARISH COUNCIL.—Midhurst and District Electricity Co., public lighting by 13 lamps, £83 14s. 6d. per annum.

Domestic Wiring.

PERTH CORPORATION.—McCowan and Guild, electric light installations in 150 houses at Darnhall Drive and Florence Place, Perth.

BRIDGE OF ALLAN CORPORATION.—W. Marshall and Son, electric lighting and bells, in connection with reconstruction of mineral wells.

AYRSHIRE EDUCATION AUTHORITY.—D. Macrae, electrical work in connection with erection of new school and schoolhouse at Cronberry.

AYRSHIRE COUNTY EDUCATION COMMITTEE.—Graham and Morton, electric light installation in extensions to Craigs School, Stirling.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Record Electrical Co., Ltd., replacement of battery switches, £136 10s. (Recommended.)

STEPNEY (LONDON) BOROUGH COUNCIL.—J. J. Lane, 26 in. electrically-driven self-balancing hydro-extractor, £105. (Recommended.)

IRISH FREE STATE ELECTRICITY SUPPLY BOARD.—W. E. Fischer, Ltd., dismantling generating plant at Pigeon House (Dublin) power station.

SALFORD CORPORATION.—Bertram Thomas, electric lighting installation, in new extension of Union Infirmary buildings at Hope Hospital, Salford.

SALFORD CORPORATION.—Ferguson, Pailin, Ltd., supply of metal clad switchboard, at Frederick Road sub-station, £542. (Recommended.)

OAKES WORKING MEN'S CLUB, HUDDERSFIELD.—H. C. Stringer, electricians and plumbers' work in connection with additions to premises.

HIS MAJESTY'S OFFICE OF WORKS, ETC.—South Kensington (London), generating station, installation of cables, switchgear, etc., G. E. Taylor and Co.

GLOUCESTER CORPORATION.—Derby Cables, Ltd., supply of 8 000 yards of cable, £2 585; Edison Swan Cables, Ltd., supply of 1 000 yards of cable, £472.

WINDSOR EDUCATION COMMITTEE.—Wellman Bros., electric light installation in connection with structural alterations at Victoria Street Council School, £45.

TAUNTON CORPORATION.—Babcock and Wilcox, Ltd., 25 000 lb. boiler, with auxiliary plant, £7 028; Mather and Platt, Ltd., motor-driven boiler feed pump, and accessories, £267 1s.

GLASGOW CORPORATION.—Supply of transformers, Metropolitan Vickers Electrical Co., Ltd., and Bruce Peebles and Co., Ltd., 18 400 kVA; Brush Electrical Engineering Co., Ltd., four 200 kVA.

ILFORD CORPORATION.—Crompton Parkinson, Ltd., supply of 1 000 r.p.m. convertor, £1 200, and control gear, £1 280; also supply of kiosk, with switchgear and transformer, £444 10s. (All recommended).

LEICESTER CORPORATION.—Gent, Hurley and Orringe, electric light installation at Belgrave pumping station,

Digitized by Google

£432 6s. 9d., and electric lighting installation in two cottages at Mental Hospital estate, £44 13s. 2d.

FIFE EDUCATION AUTHORITY.—J. Scott and Co., electrical work in connection with additions to Waid Academy, Anstruther; Moncrieff Bros., electrical work in new Elementary School, Sinclairtown, Kirkcaldy.

WEYMOUTH CORPORATION.—Johnson and Phillips, Ltd., supply and erection of 200 kVA transformer at foot of Overcombe terminal pole and supply and erection of transformer kiosk at Preston, £618 10s. (Recommended.)

LOUGHBOROUGH CORPORATION.—Electron Co., electric wiring of new power station and four firemen's cottages, £110. Also tendered: W. J. Furse and Co., £192; Gent, Hurley and Orringe, £166; E. L. Fisher, £131; Kemp Bros., £109.

SLOUGH URBAN DISTRICT COUNCIL.—Harland Engineering Co., Ltd., two electrically operated pumping sets, with motors, cabling equipment, control switch, distribution box, etc., and air exhauster with motor starter, for waterworks, £873 10s.

BELFAST CORPORATION.—Service Motor Works, Ltd., 10 tramcar bodies, £1 500 each, including £100 per body for contingent work; Brush Electrical Engineering Co., Ltd., 40 tramcar bodies, £1 699 10s. each, including £100 per body for contingent work.

BATTERSEA (LONDON) BOROUGH COUNCIL.—Babcock and Wilcox, Ltd., steam pipes, £4 243; Aiton and Co., Ltd., water pipes, £2 304, in connection with new 30 000 kW turbo-alternator and boilers; General Electric Co., Ltd., supply of switchgear, £410. (All recommended.)

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., switchgear for generating station, £2 248, and switchgear for Scrubs Lane sub-station, £429. (Recommended). Also tendered: Ferguson, Pailin, Ltd., £2 019 and £429; A. Reyrolle and Co., Ltd., £2 069 and £445.

LONDON COUNTY COUNCIL.—W. Wadsworth and Sons, Ltd., erection of an electric goods and bed lift at Tooting Home, Church Lane, Tooting, £618. Also tendered: Express Lift Co., Ltd., £747; Marryat and Scott, Ltd., £814; Waygood Otis, Ltd., £920; Medway's Safety Lift Co., Ltd., £1 100.

BRADFORD CORPORATION.—Bruce, Peebles and Co., Ltd., supply of two 710 kW mercury arc rectifiers, with switchgear; Devonport Engineering Co., Ltd., erection of new interior stacks for cooling towers; Ransome and Rapier, Ltd., supply of petrol electric mobile crane for Valley Road power station. (All recommended.)

GLASGOW CORPORATION.—David Henderson, electrical installation in connection with Carnwadric housing scheme, £3 135 15s.; John H. Spence and Son, provision of electric potato peeler at Ruchill Hospital, £45; R. J. Sinclair (Glasgow), Ltd., electric light installation at Anderson Welfare Centre, £100 13s. 2d. (All recommended).

MIDDLESBROUGH CORPORATION.—Annual supplies: Macintosh Cable Co., Ltd., 7·16 twin cable; British Insulated Cables Ltd., 0·1 by 0·1 by 0·06 l.t., t.c. cable; Ferranti, Ltd., 10, 20, 50 and 100 A meters; Chamberlain and Hookham, Ltd., ditto; Metropolitan-Vickers Electrical Co., Ltd., ditto.

LONDON COUNTY COUNCIL.—A. Hawkins and Sons, wiring and fittings for electric lighting, power, bells, and telephones, at Tooting Home, Church Lane, Tooting, £1 495. Also tendered: A. Dean and Co., Ltd., £1 568; J. Briggs, Ltd., £1 570; Electrical Installations, Ltd., £1 798; L. G. Tate and Co., Ltd., £2 075; Smethurst and Co. (London), Ltd., £2 200; H. J. Cash and Co., Ltd., £2 688.

MANCHESTER CORPORATION.—Berry's Electric (1928), Ltd., "Z" electric Lamp and Supplies, Ltd., Downes and Davies, Ltd., Drake and Gorham Wholesale, Ltd., S. Gratrix, Junior and Bro., Ltd., Baxendale and Co., Ltd., Falk, Stadelmann and Co., Ltd., Sloan Electrical Co., Ltd., F. G. Ride and Co., Underwood (Manchester), Ltd., J. C. White and Co., Ltd., W. E. Beardsall and Co., Ltd., Wholesale Fittings Co., Ltd., R. O'Brien and Co., and Hirst, Ibbetson and Taylor, Ltd.. supply of electric lamps.

GENERAL POST OFFICE.—Telephone exchange equipment: Rhos (Colwyn Bay area), Siemens Bros. and Co., Ltd., London Auto-Manual Operating School and Rochdale Multi-Exchange Area, Standard Telephones and Cables, Ltd. Cable-manufacture, supply, drawing in, etc.—Chester-Mold, W. T. Glover and Co., Ltd.; Stockport-Whaley Bridge, Johnson and Phillips, Ltd. Electric lifts—Salford Telephone Exchange and York Railway Station sorting office and subway, W. Wadsworth and Sons, Ltd. Short-wave telephony transmitter—Rugby radio station, Standard Telephones and Cables, Ltd. Electric lighting—Whitehall Telephone Exchange, Electrical Installations, Ltd.

TRAMWAYS, L.R. AND TRANSPORT ASSOCIATION.

Annual Conference at Hastings.

THE 20th annual conference and 33rd annual general meeting of the Tramways, Light Railways and Transport Association was held in Hastings from June 11 to 13, under the chairmanship of Mr. E. D. Edwardes (chairman of the Executive Council and general manager of the South Lancashire Transport and Power Co.) The town of Hastings was specially selected for the conference this year in order to give the members an opportunity of inspecting what must be referred to as an outstanding example of the conversion of a tramway system to a trolley bus system with excellent results. Hastings was one of the four towns (of which Torquay, Lincoln and Wolverhampton were the others) where the surface contact system of electric traction was installed many years ago but did not prove successful.

During the year the Association has changed its name from the old Tramways and Light Railways Association to its present more extended title.

The Road Traffic Bill.

The Chairman, speaking of the Road Traffic Bill, expressed some regret that, although many amendments put forward on behalf of the Association had been accepted by the Standing Committee of Parliament which was now considering this Bill, the Minister of Transport had at the last moment inserted Clause 90 which, to some extent, cut away the ground from transport undertakings in the matter of traction. This matter, however, he said was to be further discussed when the Bill came before the House of Lords. Other matters in which the Association was taking part related to electrolysis, the new Ministry of Transport regulations as to earthing guard wires and the interruption caused to broadcasting in tramway areas. In regard to the latter, members were specially asked to send to the Secretary any complaints they received, in order that they might be dealt with as a whole in discussions which are taking place with the Postmaster-General.

The report and accounts were adopted, the latter showing a small credit balance, as against a debit balance in 1928.

New Officers.

The following were elected to fill vacancies on the council:—R. S. Asher (general manager, York Corporation Tramways and Motors); W. McGibbon (general manager, Mexborough and Swinton Tramways Co.); C. R. Tattam (Messrs. Balfour, Beatty and Co., Ltd.); J. A. Forde (general manager, Isle of Thanet Electric Supply Co.); W. E. Ireland (L.C.C. Tramways).

Two papers were presented at the conference. The first, by Mr. W. Vincent Edwards (engineer and general manager of the Hastings Tramway Co.), gave a very complete story of the conversion from trolley tramways to trolley buses. Mr. Edwards stressed the point that it was not sufficient merely to take the old tramway overhead equipment and expect to apply that to trolley buses without modification.

This paper gave rise to a very long discussion. Complaints were made as to the demand of local authorities, when a tramway company asked permission to abandon a tramway line and substitute trolley buses, that the road should be reconstructed on the most modern lines, whereas under the Tramways Act of 1870 the condition was that the road should be put back into the condition it was at the time the tramway was constructed. Charges for current to tramway companies by local authorities were stated to be too high in many cases.

Those attending were particularly interested in a new form of trolley wheel which Mr. Edwards has adopted. This contains ball-bearings and only one small working part, which can be renewed at the cost of only a few pence, and has proved a great improvement.

The second paper, on "The Tramcar—Present and Future," by Mr. J. L. Burton (manager, Road Transport Department, English Electric Co.) and Mr. H. H. Andrews (sales manager of the Traction Department) went into much detail concerning directions in which tramcars could be modernised, and pleaded for greater attention to this matter.

The Chairman commented on the fact that even cities like Manchester were to-day buying cars very similar in design to those of twenty years ago. If the manufacturers of tramcars had made a standard car and demonstrated it as the bus manufacturers did, greater progress would have been made.

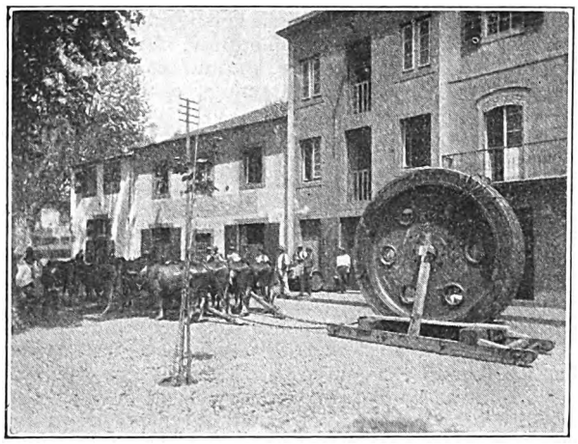
ELECTRICITY SUPPLY.

The Commissioners' Returns for May—Wallasey and the National Register—Progress at Tientsin—Overhead Lines and the Isle of Thanet—Ashton-under-Lyne Lighting.

HACKNEY (London) Electricity department is to extend the network and feeder cables at a cost of £2 800.

Blackpool electricity department is to extend the mains to the Marton district, at an outlay of over £3 000.

An application for a loan of £1 000 for assisted wiring purposes has been made by Spalding U.D.C.



IN connection with the extension of the Madeira Electric Light Co.'s generating plant at Funchal the Fraser and Chalmers engineering works of the General Electric Co., Ltd., have recently shipped to Madeira a 75 h.p. Diesel engine, the 12-ton flywheel of which is here seen in course of transportation by means which seem singularly primitive for so heavy a load.

Additional coal handling plant costing £7 500 is to be installed at the Peterborough electricity works.

Islington (London) Electricity Committee has received sanction to borrow £30 000 for mains and plant.

Lurgan U.D.C. has decided to enter into negotiations with Belfast Corporation for a bulk supply.

Mains extensions at an estimated cost of £2 095 are to be carried out by Aldershot Corporation electricity department.

East Grinstead U.D.C. has applied to the Commissioners for a Special Order to extend the area of supply to Forest Row.

Power is being sought by Pontypool Electric Light and Power Co. to acquire the electricity undertaking of Abersychan U.D.C.

Winchester Corporation has applied for a loan of £570 11s. for an electric light installation at 37 houses in Cromwell Road, Stanmore.

Shoreham U.D.C. has reserved its right to oppose a proposal by Brighton T.C. to supply electricity to certain parts of the urban district.

Salford Electricity Committee seeks sanction to borrow £1 000 for alterations and additions to the 6 600 V switchgear at the Blackfriars sub-station.

Preston and Blackburn Chambers of Commerce urge the continuance of the Mid-Lancashire Electricity Advisory Board which was formed six years ago.

Brecon T.C. has applied to the Commissioners for sanction to instal a 75 kW set and to enlarge the generating station, and for a loan of £2 375 to meet the cost.

Applications for loans of £5 100 for changing over the Lea Bridge area from d.c. to a.c., and £30 000 for mains and services, have been made by Leyton T.C.

Congleton T.C. has agreed to terms for a supply of electricity by the Joint Electricity Authority, and a loan of £26 000 for carrying out the scheme has been sanctioned.

Walsall T.C. has applied for loans of £15 000 for service cables for three years, and £7 795 for adapting premises in Upper Bridge Street for use as electricity showrooms and offices.

Whitwood (Yorks) U.D.C. is to approach Messrs. Henry Briggs, Son and Co., Ltd., in order to ascertain whether the company is in a position to give a supply of electricity in bulk to the council.

The question of lighting the whole of the town of Ashton-under-Lyne by electricity is to be discussed by the General Purposes Committee. Half the present gas lamps are adjacent to electric cables.

Bromley (Kent) T.C. is to expend £4 187 on mains extensions and £900 on a transformer station and extension of main when required for the telephone exchange to be erected at the corner of Coates Hill Road.

Walthamstow T.C. has received from the Unemployment Grants Committee a grant on approved expenditure not exceeding £112 233 in respect of laying underground mains in all uncabled roads in the district, and the equipment of sub-stations.

The Isle of Thanet R.D.C. has consented to the erection of overhead lines by the Isle of Thanet Electric Supply Co., for a supply of electricity to Birchington. The Birchington Parochial Committee, however, has intimated its disapproval of overhead cables.

Battersea (London) electricity department is to provide electricity services to 112 premises at a cost of £1 012 10s., to extend mains for private services at a cost of £356 and to replace with armoured cable old vulcanised bitumen distributors at a cost of £566.

Swanscombe Lighting Committee has approved the scheme submitted by the surveyor for electric street lighting, but has adjourned consideration of the tender of the Kent Electric Power Co. pending the receipt of a report from the Joint Electricity Authority upon the question.

St. Helens T.C. has applied for a loan of £8 154 for a supply of electricity to Bold, a part of Burtonwood area, and has received sanction to a loan of £48 150 for extensions to the generating station and plant. The Unemployment Grants Committee has approved for grant purposes the scheme for changing over the system from d.c. to a.c.

Blairgowrie and Rattray T.C. have agreed to a scheme of street lighting by the Grampian Electricity Supply Co. subject to the company's submitting plans of any proposed overhead works beyond what have already been sanctioned by the council, who also stipulate that they shall have the option of calling on the company to proceed with a scheme for lighting the entire burgh.

The official returns rendered to the Electricity Commissioners show that 818 million units of electricity were generated by authorised undertakers in Great Britain during May, 1930, compared with 753 million in May, 1929, an increase of 8·6%. During the five months of 1930, up to the end of May, the quantity generated by authorised undertakers was 4 672 million units, compared with 4 404 million for the corresponding period of 1929, an increase of just over 6%.

It has been decided that, under Wallasey Corporation's assisted wiring scheme, only registered electrical contractors shall be employed. Exception was taken at the last council meeting to the work being limited to a comparatively small number of firms in the town as it was feared this might lead to the formation of a ring. On behalf of the Electricity Committee it was pointed out that they were insisting upon the best materials and the highest standard of workmanship. Any qualified contractor could take steps to join the register by going before a local examining committee.

The report on the working of the Tientsin municipal electricity department for 1929 shows income £54 467, gross profit £22 681, after allowing £8 403 for depreciation and net surplus £17 555, after provision of £5 126 for interest. Electricity generated was 9 209 883 kWh, and sold 7 489 845, against 8 023 485 in 1928, decrease 6·6%. Consumption of coal per kWh was 3·315 lb., against 3·24 lb. The demand for heating and cooking amounted to 630 550 kWh, an increase of 15%; private lighting consumption showed a decrease of 11%, and power supplies 9·6%. A large number of different types of electric cookers have been obtained, with a view to the standarisation of a thoroughly reliable make. It is considered that this has now been attained, and that the cooker now in use is as dependable as a coal or gas cooker while being superior in every way from a cooking point of view to either of them. The satisfaction that is obtained from the use of electric cooking is evident from the fact that once this modern method has been adopted, a user will never revert to the older system.

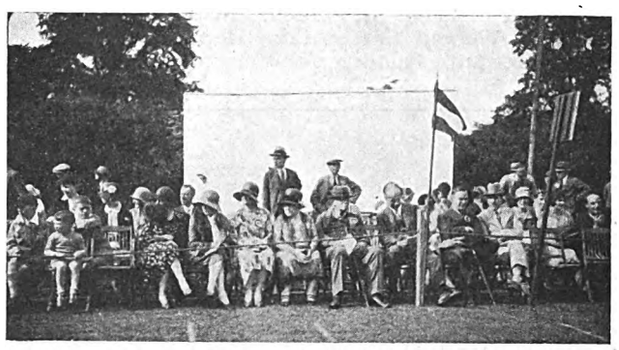
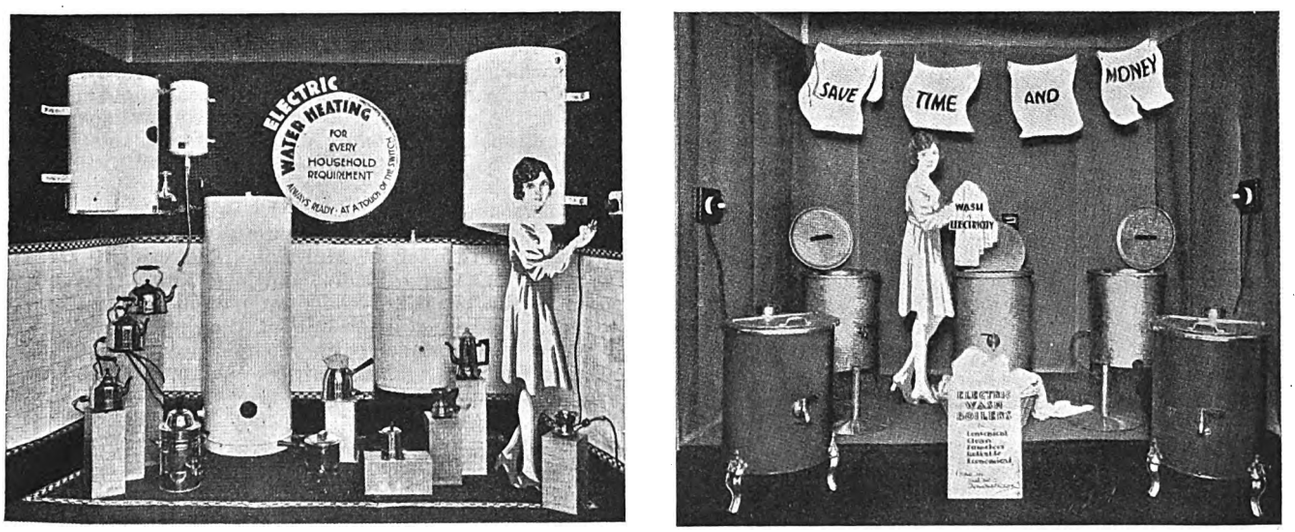
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

[*Photo: John Ralf.*]
Some of the officials photographed at the annual sports of the Enfield Cable Works, Ltd., on Saturday, June 21, at the company's ground at Brimsdown. Mrs. Plutte, wife of the managing director, distributed the prizes. (See page 836.)



On the same day, June 21, Crompton Parkinson, Ltd., held their annual sports meeting on their private ground at Chelmsford. Among the interested spectators was Col. R. E. Crompton, seen seated in the centre of this little group. (See page 836.)

The E.D.A. demonstration house at Cranleigh Gardens, Stoke Bishop, Bristol, which was closed on Saturday, June 21. Arrangements in regard to the house were carried out by the Area Office in accordance with the instructions of the members of the South-West Area Committee, and Messrs. Gough Bros., of Bristol, provided the electrical installation to the E.D.A. wiring specification, which form of wiring stimulated a considerable amount of public inquiry. It is interesting to note that whilst two adjoining houses, wired for electric lighting only, remained unsold throughout the exhibition, the demand for the E.D.A. house was so brisk that the house was sold a few days after the opening.



The window displays of the E.D.A. for July feature water heating and washing by electrical means. The water-heating window, on the left, is elaborated by the inclusion of electric kettles, saucepans, etc. A clear-cut domestic atmosphere is secured for the equipment by making use of a roll of bathroom wallpaper and a black and white border. The circular showcard gives balance and interest to the display and provides a suitable description which, if desired, can be supplemented by tickets describing the uses of the various appliances displayed. The right-hand picture is of the electric washing window. The scheme suggests to the housewife the means for dispensing with out-of-date washing methods, and the showcards are the properties employed to tell the story. The materials required comprise pale blue crêpe paper, imitation garments painted on paper, imitation towel, the electric girl and a showcard, all of which can be supplied by the E.D.A.

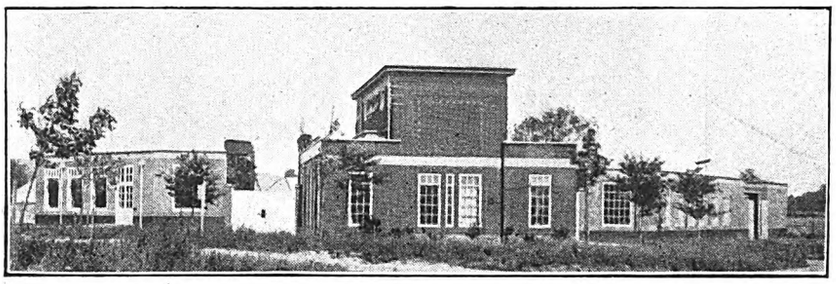
WELWYN GARDEN CITY.

Steady Progress in Development of Domestic and Industrial Loads.

THE Earl of Lytton, president of the Garden Cities and Town Planning Association, last Sunday unveiled a memorial at Welwyn Garden City, Herts, to the late Sir Ebenezer Howard, founder of Welwyn and Letchworth garden cities. From the electrical point of view Welwyn Garden City is of interest in that considerable progress is being made in developing the domestic load. The supply is taken in bulk from the North Metropolitan Electric Power Supply Co. and distributed by the Welwyn Garden City Electricity Supply Co., Ltd., with Mr. A. T. Bullen as engineer and manager. The factory area of the estate includes the studios of the British Instructional Films, Ltd., with an intermittent load of 300/350 kW; Capt. R. H. S. Birkin's racing motor stable, with a load of 180 kW; and the works of Young, Osmond and Young, while a new works is being erected by the Norton Grinding Wheel Co., the estimated load of which will be 500 kW. A transformer station has been placed in the centre of the factory area, switchgear interconnecting supplies from Brimsdown, Willesden, St. Albans, etc.



The showrooms and offices of the Welwyn Garden City Electricity Supply Co.

Last week was made an occasion for a Press view, and among the attractions offered was an exhibition house arranged on modern lines, the electrical heating and water-heating installations being fitted by the Welwyn Garden City Electricity Supply Co., Ltd., the equipment including a "Hera" electric washing machine; a "Jackson de luxe" cooker; and "Unity" tubular heating, by Young, Osmond and Young, Ltd. The electric lighting fittings were supplied by Troughton and Young, Ltd.

ACCOUNTS OF THE WELWYN GARDEN CITY SUPPLY UNDERTAKING.

Item.	Year ending Dec. 31, 1929. Actual.	Year ending Dec. 31, 1930. Estimated.
Units Purchased	3 403 560	4 500 000
Units Sold	3 085 257	4 100 000
Maximum Demand	1 083 kW	1 250 kW
Load Factor (Units purchased)	35·9%	37·5%
Consumers Connected—		
(a) Industrial and Commercial	81	120
(b) Domestic	1 997	2 300
(c) Public Lamps	250	300
Units Sold per Consumer—		
(a) Total	1 486	1 700
(b) Domestic only	640	800
Connected Load (kW)—		
(a) Power	1 678	1 900
(b) Lighting	648	750
(c) Heating and Cooking	3 915	5 250
(d) Public Lamps	16	30
Domestic Apparatus—		
(a) Cookers	512	750
(b) Water Heaters	39	80
(c) Kettles	242	600
(d) Washboilers	32	50
Total Revenue	£24 246	£27 400
Average Price per Unit Sold—		
(a) Industrial	1·37 pence	1·20 pence
(b) Commercial	2·87 ,,	2·50 ,,
(c) Domestic	2·25 ,,	1·90 ,,
(d) Public lighting	7·95 ,,	6·00 ,,
(e) Total	1·94 ,,	1·60 ,,
Total Working Costs	£15 139	£17 500
Average Cost per Unit sold—Bulk supply	0·757 pence	0·720 pence
Distribution	0·077 ,,	0·050 ,,
Public Lamps	0·020 ,,	0·010 ,,
Rents, Rates, Taxes	0·114 ,,	0·090 ,,
Management	0·175 ,,	0·135 ,,
Other Charges	0·035 ,,	0·010 ,,
Total	1·178 pence	1·025 pence

The above table gives some indication of the steady electrical progress which is being made in the Garden City, and it is being found that existing domestic consumers are adding to the load each month.

THE SOCIAL SIDE.

SIEMENS' Sports Club held its eighth annual sports meeting at the Sports Ground, Park Lane, Charlton, last Saturday. There was a large gathering of spectators, the weather was good and some excellent performances were witnessed. Special mention is due to the winner of the long jump, L. D. Butler, who covered 21 ft. 1½ in., and L. G. Parkes, who again won the 100 yards championship, in 10⅘ sec., both these performances being records for the club. Other winners were J. Brown, one mile handicap; F. W. H. Shaw, 1 000 yards championship (time 2 min. 37 sec.); A. R. T. Hadlow, 220 yards handicap (23⅕ sec.); E. Garner, Rugby Section, 440 yards handicap (58 sec.); R. G. Swales, 440 yards handicap (53⅕ sec.); Port of London Authority, 1 mile invitation relay race; Sheathing Department, inter-departmental one mile relay championship. Sir George H. Hume distributed the prizes.

Robert Hornby and Co., Ltd., held their fourth annual summer outing on June 16. This year the excursion took the form of a trip up the Thames from Windsor to Caversham in the steam launch "Queen of the Thames," chartered for the occasion. The party comprised the chairman of the company, Mr. Carson Roberts, the managing director, Mr. Robert Hornby, genial as ever, and the whole of the firm's employee's numbering in all about 75 people. The trip lasted nearly 11 hours, including an hour's stop at Marlow where many went ashore to see the church, and another stop at Sonning, where dinner was taken at the French Horn Hotel. Luncheon and tea were served on board while the launch was under way.

Col. R. E. Crompton, again attended the annual sports meeting of Crompton Parkinson, Ltd., on their private ground at Chelmsford on June 21, before a large crowd of members and friends. The occasion was favoured with fine weather and was particularly successful. In addition to prizes for some 32 events, no fewer than eight challenge cups were competed for with keen rivalry. The event of the day, however, was the inter-section competition for the new Hardie Cup presented by Lieut.-Col. C. Hardie, D.S.O., which was won by the Apprentice Section. See page 835.

Presiding at the distribution of prizes following the sports meeting of the Enfield Cable Works Social and Athletic Club, on June 21, Mr. William Fraser (deputy managing director of the company), chairman of the club, supported by Mrs. Plutte, wife of the managing director of the company, intimated an apology for absence from Mr. F. Plutte, and outlined the interest which had been shown in the welfare of all the members of the Club by Mr. Plutte. Mr. Fraser then proposed a vote of thanks to the various officials in charge of arrangements for the day, specially mentioning Messrs. F. Baker and C. Brown. Mr. D. A. S. Porteous proposed a vote of thanks to Mrs. Plutte and to Mr. Fraser. See page 835.

The personnel and friends of the British Power and Light Corporation (1929), Ltd., were entertained at a garden party on June 21, at Fir Island, Mill Hill. The resident, Mr. G. V. Twiss, the managing director, and Mrs. Twiss, received their guests in the beautifully laid out garden with its spacious grounds. Everyone made use of the opportunity afforded to renew acquaintance with their colleagues, and friends gathered from the various districts operated by the Corporation. Music was provided by Ben Brown's Salon and members of the Margaret Morris Dancing School gave excellent performances and delighted their audience. Mr. H. A. Vernet, the chairman of the Corporation, with Mrs. Vernet, were present during the afternoon.

THE ELECTRICAL ENGINEERS' BALL.

In connection with the Electrical Engineers' Ball held on February 7 last, the General Committee at their meeting on June 19 held at the Institution of Electrical Engineers, voted the sum of £90 to be equally divided between the Institution of Electrical Engineers Benevolent Fund and the Electrical Trades Benevolent Fund. The dance held in February proved as great a success as its predecessors, there being over seven hundred present. Owing to the closing down of the Hotel Cecil, it has been decided to hold the Ball next year at the Grosvenor House Hotel, Park Lane, on February 13. As usual, the date selected is the day following the annual dinner of the Institution of Electrical Engineers.

COMPANY NEWS.

Electrical Share Market Remains Quiet—Callender's Important Overseas Contracts—General Electric Meeting—Directors' Reports and Dividends.

THE recent renewed selling on the New York Stock Exchange has left its effect on the leading transatlantic electrical shares, and the quotations for Hydro-Electric Securities and Radio Corporation of America shares are both distinctly below last week's level. Radios, at the time of writing, stood at just under 37, compared with over 40 a week ago, and Hydro-Electrics at 38 contrast with 41. American Telephone and Telegraph stock remains at 220, a figure which compares with 230 a fortnight ago and 280 in the middle of April. International Telephone and Telegraph shares have declined from $50 a week ago to $45.

Cables and Wireless stocks have been steadier, the 7½% "A" ordinary stock round about 37, the "B" ordinary stock at about 17½ and the 5½% cumulative preference stock at about 88½. Marconi International Marine shares have recovered to 36s. 3d.

The manufacturing department as, indeed, all sections of the market for electrical shares—supply, equipment, communication and transport—has been very quiet during the past week. W. T. Henley's ordinary shares have lost the 1s. 3d. gained last week, and are back at £6 2s. 6d. Brush Electrical ordinary stock is a point down, at 119½.

The capital reorganisation arrangements of the English Electric Co. have been given effect in the Stock Exchange Official List, and there are now quoted 400 284 ordinary shares at 21s., compared with 1 664 000 shares previously at the nominal quotation of 3s. 9d.; and 491 784 six and a half preference shares (non-cumulative until the end of 1933) quoted at 8s. 9d., compared with 983 565 6% preference shares at 7s. 6d. The £1 295 180 6% convertible debenture stock has been marked up from 67½ to 85.

Central Electricity Board 4% stock is a point up at 83. Underground Electric Railways ordinary shares have risen 6d. to 23s. 6d. District Railway ordinary stock at 77 is also a point to the good.

Directors' Reports, etc.

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS, LTD.—Intm. div. of 3% on 6% pref. shs. for half-year endg. June 30 is announced.

NOTTING HILL ELECTRIC LIGHTING CO., LTD.—Interim dividend of 5s. p. sh. on 1s. dfd. (same as last year) will be payable on July 1.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Net pft. for year ended May 31, 1930, £10 156. Divs. 6% on pref., 10% (same) on ord., and 2s. p. sh. on dfd. shs. To res., £228, agst. £18 588. Fwd. £20 563, agst. £20 024.

MID-CHESHIRE ELECTRICITY SUPPLY CO., LTD.—Net pft. for 1929, after providg. £2 000 for depreciatn., £11 592, agst. £9 254; written off exes. of 1925 issue, £750, agst. £500; to employees' div. bonus acct., £650, agst. £350; pref. divs., £4 737. Div. on ord. shs. 7%, subject to tax, agst. 5%. Fwd. £2 464, agst. £1 833. Electricity sold, 3 190 254 kWh, agst. 2 533 956; total connections 7 836 kW, agst. 6 716.

GREENWOOD AND BATLEY, LTD.—Pft. on trading for year ended March 31, 1930, £39 272; deb. int., £4 000; directors' fees, £2 000; auditors' fees, £315, fees of trustees to deb. hldrs., £105; blce. for year carried to blce. sheet, £32 852, to wh. is added blce. of £11 397 brt. in from previous year, after paymt. of fin. divs. to March 31, 1929. To depreciatn., £6 000, intm. divs. of 3½% on pref. and 2½% on ord. were paid on Dec. 31, 1929, and fin. divs. of 3½% on pref. and 2½% on ord. are recommended. Fwd. £13 801.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Net rev. for the year ended May 31, 1930, after deductn. of exes., £261 751, makg. with blce. of £77 370 brt. fwd., £339 122. Intm. divs. of 5s. p. sh., tax free, on ord. shs., and 3s. p. sh., less tax, on pref. shs. have been paid and fin. divs. of 5s. p. sh., tax free, on ord. shs., and 3s. p. sh., less tax, on pref. shs. will be paid on June 30. Blce. fwd., £17 460. Enlarged powers of investment adopted at last gen. mtg. have enabled those funds which have bn. realised by sale of securities to be re-invested on favourable terms, but owing to changes, divs. credited in rept. are not the full amts. which will accrue in a normal year.

Company Meetings.

BERMUDA TRACTION, LTD.—At a meeting of the debenture stockholders on June 20 resolutions were passed agreeing to the issue of prior lien debentures to an amount not exceeding £100 000, carrying interest at the rate of 7% per annum, and also postponing payment of the interest on the existing stock until January 1 next.

FERRANTI, LTD.—At an extraordinary general meeting on June 18 resolutions were approved for the sub-division of the existing £1 ordinary shares into two shares of 10s. each, increasing the capital to £900 000 by the creation of 300 000 preference shares of £1 each and 600 000 ordinary shares of 10s. each, and capitalising £200 000 of the undivided profits to be distributed as a capital bonus in the form of fully paid ordinary shares to the holders of the existing 200 000 ordinary shares of 10s. each; also adopting new articles of association.

JOHN M. NEWTON AND SONS, LTD.—Mr. John Newton, chairman, stated at the meeting on June 17 that the turnover for 1929 showed an increase of approximately £25 000. The J. M. Newton Vitreo-Colloid (1928), Ltd., had had considerable difficulties to overcome in the construction of the works at Oxted, but the factory was now practically completed, and the manager hoped to start the first machine on manufacturing during the current month. The subsidiaries had not matured as quickly as one would have hoped, but the directors' confidence in the ultimate issue remained as firm as ever.

PREUSSISCHE ELEKTRIZITATS AKTIENGESELLSCHAFT.—A meeting of holders of 6% 25 year sterling bonds was held in London on June 19, to consider resolutns. (1) amendg. clause 19 (c) of the principal trust deed so as to prove that "an event of default" shall not occur if the State of Prussia ceases to own directly or to be registered as the holder of at least 51% of the voting sh. cap. of the company; and (2) waiving the breach of the principal trust deed, which has been committed by the State of Prussia having transferred the sh. cap. of the company owned by it to Vereinigte Elektrizitats and Bergeverks-Aktiengesellschaft (Veeba). As there was not the necessary quorum, the meeting was adjourned until July 4.

CALCUTTA TRAMWAYS CO., LTD.—The ordinary general meeting of this company was held at 1, Queen Victoria Street, London, E.C. Mr. John G. B. Stone (chairman) presided and said the tramway receipts showed a reduction of £5 030. The expenditure showed a decrease of £1 845. As regards the omnibuses, while the receipts showed a decrease of £3 404, there had been a saving in expenditure of £4 137, the result, after charging depreciation, showing a loss of £28 171, compared with £28 904 for the previous year. The final result was that, after providing for first and second debenture interest, second debenture sinking fund, preference share dividend, and ordinary share interim dividend, there remained an available balance of £49 834, which it was proposed to deal with by the contribution of £7 383 to the staff provident fund, the payment of a final dividend of 10d. per share, free of tax, making 1s. 2½d. for the year, free of tax, absorbing £29 166 13s. 4d., and carrying forward the balance of £13 284. The suggestion that tramway systems are obsolete and should be replaced by omnibuses had been assiduously fostered, but it seemed evident that if such substitution was made the poorer classes would have to pay more for their travel, and ratepayers generally would have to bear increased charges for the maintenance of their roads. The chairman of the Berlin Transportation Co., after studying the matter with his co-directors in the principal cities of the United States, stood convinced that the electric car would remain the chief vehicle in the movement of the masses, and that his recommendation on returning to Berlin would be the wider use of electric cars in mass transportation. The company realised that the motor omnibus was necessary to provide feeder and complementary services.

LISBON ELECTRIC TRAMWAYS, LTD.—Lt.-Col. S. H. Pollen, presiding at the meeting on Monday, said it gave the board pleasure to place before the shareholders a record of another successful year. During this period the service had been operated without a break or untoward incident, and the steady progress in the traffics had continued. The number of passengers carried was 118 824 952, with receipts of 72 251 contos, which compared with 112 874 963 passengers and 68 895 contos in the preceding year, and showed an increase of 5 949 989 passengers and 3 356 contos. The sterling value of their receipts had risen by £30 248. The expenditure had also gone up by £18 202, owing to heavier maintenance charges and other necessary provisions. The net profit was £202 551, which compared with £185 689. From the net profit was deducted the interest and redemption of the company's debentures, £24 240, which left a credit balance to profit and loss account of £178 311, to which was added the amount brought forward from last year, £16 880, giving an available balance of £195 191; £50 000 was transferred to general and depreciation reserve; £15 000 to staff benefit fund; £10 000 to exchange reserve; £25 533 to payment of the dividends on the preference shares for the year 1929; and £28 531 to payment of an interim dividend on the ordinary shares on account of the year 1929. A credit balance remained of £66 127. The directors recommended the declaration of a final dividend on the ordinary shares of 4% net, making a total dividend for the year of 7% net. The rate of exchange had remained steady throughout the year at about 108, and its firmness was due to the much improved financial position of Portugal. Work was going on in every direction, and important schemes were afloat for the development of the country, so that the outlook for the future was brighter than for some time past, and gave every prospect of some return to former prosperity, confidence being restored. Their undertaking was bound to benefit from the improvement which was taking place, and there was therefore every reason to expect that its progress would continue. The dividend was maintained at the same rate as last year, and the carry-forward had been increased from £16 000 to £28 000. The report was adopted, and the dividend approved.

GENERAL ELECTRIC CO., LTD.—Sir Hugo Hirst, presiding at the meeting on Wednesday, said it gave him great pleasure once more to open the meeting with a note of satisfaction at the further substantial progress which the company had made. It must be gratifying to shareholders that, in a year full of shocks with which they were all too familiar, the trading account of the company showed a profit of £1 179 000, an increase of over £90 000 compared with the previous year. Electrical manufacturing was not an easy business. The electrical industry was still in a state of evolution. On the generation side they had successfully undertaken the manufacture of turbo-alternators up to 30 000 kW, having a speed of 3 000 r.p.m. The company was the first in this country to obtain an order for machines to run at this speed. They had developed hydro-electric plant and supplied a number of sets to the Palestine Electric Corporation. The development of the grid scheme had called for considerable extensions at their

Digitized by Google

switchgear works, and many noteworthy achievements stood to their credit. Until quite recently the maximum size of outdoor oil circuit breakers had a breaking capacity of 1 000 000 kVA at 44 000 V. As a result of their success in the many problems of design, they were now engaged in the manufacture of outdoor breakers for the Central England scheme, having a breaking capacity of 1 500 000 kVA at 132 000 V. During the past year they had completed metal-clad switchgear units of 750 000 kVA breaking capacity, and were building gear up to 1 500 000 kVA. In transformers the new high tension works at Witton were carrying out orders for the grid for 30 000 kVA 130 000 V transformers, and could undertake with complete success the building of transformers up to 75 000 kVA in one unit. Progress has also been rapid in electric traction. Shareholders might know they obtained a contract for the Manchester-Altrincham section of the L.M.S. and L.N.E.R. Railways, which was the first order ever placed in this country for equipment for trains operating at 1 500 V, whereas previously the usual voltage for traction work was 600 V only. Other contracts included equipments for the new tube railway on the Buenos Aires Central Terminal System, and Diesel electric locomotives for India. Their position in the traction field was indicated by a contract for 1 000 motors which the London Electric Railway had placed with the company. Progress in the development of projector lamps had resulted in the production of a number of successful British films for the first time in this country by means of gasfilled lamps. High tension oil-filled cable ranked amongst the most noteworthy developments of the century, and he would refer to the contract their Pirelli-General Cable Works had obtained (they were partners in that company to the extent of 50%) for the 132 000 V oil-filled cable which linked up the North and South sections of the Grid scheme in the London area. During the past year automatic telephone equipments had been installed to the extent of about 50 000 lines in the London and Birmingham areas. A new private automatic branch exchange system, as the Auto Cord, had been developed. A great amount of energy had also been devoted to the development of carrier current systems. Their telephone works had also participated in the development of totalisators, and had done much work on talking picture apparatus. The chairman next referred to the amount of the company's wages and salary list (approaching £4 000 000 annually) and the large sums paid for coal, coke, electricity supply, gas and water, rates and taxes, income tax, unemployment insurance, national health and pension insurance, etc., and their activities in building up an export business, now running into millions. The report and accounts were adopted and a dividend of 10% per annum and a bonus of 4%, both less tax, for the year were approved.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.

Central Electricity Board Contracts—Increased Profit—Research Work—Numerous Overseas Contracts—Factories Full of Orders.

THE thirty-fourth annual general meeting of Callender's Cable and Construction Co., Ltd., was held at River Plate House, London, on June 19.

The secretary, Mr. Howard Foulds, F.C.I.S., having read the notice convening the meeting,

Sir J. Fortescue Flannery, Bart. (the chairman), in moving the adoption of the report and accounts, said that the manufacture and supply of electric cable and appliances had fluctuated during the year 1929, because, especially during the early part of the year, one of the chief sources of demand—what was known as the "grid" system—was suspended for a considerable time. The company had received a very important contract in connection with this system, but great delay, and consequent heavy cost, arose in the Electricity Board arranging the necessary wayleaves upon which the execution of the contracts depended.

The general use of electricity, not only for lighting and power, but for domestic purposes, was expanding practically in every direction, and there were few of the ordinary household operations that could not be carried out by electric-driven apparatus. One of the features of the present day was the greater use of overhead lines, and these overhead mains led to cable orders and to the wiring of factories and houses for which the company was so admirably equipped at Leigh by their Anchor Works. They had secured a very important contract for heavy underground mains which they were now laying in the London area, and much appreciated the confidence which the London Power Authorities had shown in placing this large contract in their hands. The year had been a difficult one, and, like others engaged in world-wide trade, they had had to face severe competition, especially in their export business, and they were still widening their scope and pushing their operations into new fields. They were not always allowed to do so, as, for instance, in Australia, where the Dominion Government had forced the company into a difficult position by the threat of a 35% tariff on electric wires and cables manufactured at home. The permanent cutting off of part—even of only a small part—of their produce and the consequent reduction of employment in this country was a fact of great public importance. They were looking in all directions to maintain and enlarge their markets.

Sir Tom O. Callender (deputy chairman and managing director), in seconding the resolution, said they had devoted much time and energy at their factory and on contracts to economies in their production and in the disposal of their cables, both by improved machinery and methods. The outstanding alteration was in their method of steam raising by the employment of powdered fuel, and he was fortunate in having the help of Sir Ernest Moir, who had had special experience in this new development, as also from their chairman, whose marine and engineering experience had been useful.

It was, however, less by any large outstanding change that economies resulted than by the constant small improvements that their savings could be and were being made. In this, development and progress of manufacture of cables and efficiency of their local management were of the utmost importance, and by Mr. Pipkin in the production side, and by Mr. Watson, their technical head at Erith, he was most efficiently assisted. At Leigh similar watchfulness existed, and they owed much of their wonderful success in rubber cables to the constant attention of the management under Mr. Bowyer and Mr. Smith.

India was their oldest and one of their most important fields of operation, and, in spite of internal disputes and uprisings, of riot and commotion, they were steadily pursuing their way, extending in their old districts and opening up new areas. They were carrying out an important contract for the cable system to supply the South Indian Railway in Madras. They had nearly completed the distribution mains, mostly overhead, of the network for the United Provinces electricity authorities, radiating from their hydro-electric station on the great United Provinces canal system. This supplied several towns, including Roorkhi, a well-known military centre. The Government of India, in co-operation with the Government of the Punjab, had placed with them the contract for the construction of the widespread network throughout the Punjab, spreading from the Shanar power house, situated on the Uhl River.

Their chairman had told them of the interruption to their general trade likely to follow the heavy taxes to be imposed, which were avowedly for the protection and fostering of Australian labour. The cable makers as a body were seeking to meet this difficulty by the erection of a factory in Australia for the purpose of producing certain classes of wire in that country.

He was pleased to say that the China Light and Power Co. operating from Kowloon had placed in their hands their important extension northwards. In South America their men are at work laying cables for the supply of power to the Central Argentine Railway. Their old friends in Chili had given them several excellent orders. Brazil also had come to their help, and considerable cable orders had been placed. The factories were full of orders, and more were coming in every day.

He had thought it would serve an excellent purpose, especially after his recent illness, if he visited South Africa, where, whilst they continued to get orders, the volume of municipal cable business coming to them and Great Britain was inadequate. This visit had done much good to British trade. It had bound them closer to many old friends who had worked with him in the past in this country and who now held important positions in the Union of South Africa. The first-hand information gained, whilst in the Cape, as to Rhodesian copper developments would, he considered, amply repay all the time and money spent on the voyage.

The report and accounts were adopted and the dividend was approved.

Bill of Sale.

MCNAMARA, Tom Bedford, Beaumont Crescent, St. Thomas, Swansea, wireless and electrical engineer. Dated June 6, filed June 10, £87.

Deeds of Arrangement.

DOWLING, Cyril, 12, 14 and 16, New Rents, and PRIMAVESI, Leo Alex., 4, Gilbert Road, Ashford, trading at both addresses, electrical engineers. Dated, June 16; filed June 20. Trustee, R. J. Geering, Bank Chambers, Bank Street, Ashford. Secured creditors, £18; liabilities unsecured, £1 635; assets, less secured claims, £735.

LAWSON, Robert John, and LAWSON, Robert Gibson, trading as R. H. LAWSON AND SON, 26, Pilgrim Street, Newcastle-on-Tyne, electrical and colliery stores merchants. Dated June 12, filed June 19. Trustees, G. H. Middleton, the younger, Royal Exchange Buildings, Hood Street, Newcastle-on-Tyne, and another. Secured creditors, £357; liabilities unsecured £1 326; assets, less secured claims, £737.

Receivership.

HUGHES (ALFRED H.) AND COX, LTD.—K. Peterson, C.A., of Revenue Chambers, 4, Howard Street, Sheffield, was appointed receiver and/or manager on June 11, 1930, under powers contained in debenture dated June 26, 1929.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

KING, P. T., 17, Manchester Street, Luton, electrical engineer. A meeting of the creditors in this matter was held recently when the representative of the W. T. Henley's Telegraph Works Co., Ltd. presided. A statement of affairs was submitted which disclosed liabilities of £1 580, all due to unsecured creditors, while the bank were fully secured creditors for £199, holding security valued at £200. The assets comprised book debts £1 071, valued at £990; stock in trade £3 250, estimated to produce £3 000; work in progress £106, plant and machinery put down at £200; and surplus from securities in the hands of fully secured creditors, £11, making total assets of £4 307, from which had to be deducted £205 for preferential claims, leaving net assets of £4 102, or a surplus of assets over liabilities of £2 521. It appeared that the debtor had invented a new electric motor and the patent of those motors had now been taken over by one of the creditors who intended to manufacture them on a large scale, and pay the debtor a royalty of 7½ per cent. on sales, which it was estimated would allow the debtor about £700 per annum. The present position had been brought about by keen competition, shortage of working capital, and overstocking. After considerable discussion it was decided that the debtor should be allowed to continue trading, but in order to protect the assets it was unanimously resolved that a deed of inspectorship should be executed in favour of Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C. as trustee, with a committee of inspection consisting of Mr. E. H. Hawkins, representing creditors; Mr. E. Judd, representing Drake and Gorham, Wholesale, Ltd., and the representative of W. T. Henley's Telegraph Works Co., Ltd.

PEARN, Victor, electrical engineer, trading as E. BROWN AND Co., 387, Bath Road, Bristol. A meeting of the creditors of the above was held at Bristol last week, when it was stated that the liabilities were approximately £250, whilst the assets consisted of book debts estimated to realise about £20, and plant valued at about the same amount. The business was commenced in 1924. No particulars as to the trading were available, but it was stated that the drawings had been small. Recently creditors had been pressing and the debtor attributed his position to trade depression, lack of capital and keen competition. An offer was made of a composition of 5s. in the £, payable in cash and the creditors decided to accept that offer. The following are creditors:—Sloan Electric Co., Ltd., £26; Edison Swan Electric Co., Ltd., £30; Burris, F., and Sons, £36; Russell, John, and Co., Ltd., £25; General Electric Co., Ltd., £21; Philips Lamps, Ltd., £34; and Kremner, L., £18.

TURNOCK, George, electrical engineer, 41, High Street, Aston New Town, Birmingham, and 25, Havelock Road, Handsworth. At the meeting of creditors of the above a statement of affairs was submitted which showed liabilities of £3 347, of which £1 147 was due to the trade and £2 200 to a cash creditor. After allowing £193 for preferential claims, the net assets were £608, or a deficiency of £2 740. The assets consisted of machinery, plant, tools and stock, £288; book debts, £230; estimated to realise £150; cash in hand and at bank, £2; and surplus from fully secured creditors, £361. The fully secured creditor claimed £1 614 in respect of mortgages on certain property, which for the purposes of the statement was valued at £1 975. It was stated that the principal cash creditor advanced money to the debtor some years ago and held no security. There was a second cash creditor for £200, who had obtained judgment for that amount. The debtor had been carrying on business for something like 25 years. The last balance sheet was prepared as at December, 1926, and at that date the liabilities just exceeded the assets. Since that date the turnover had been approximately £20 500, and a loss had been incurred of £1 160. The deficiency was attributed to the loss on trading and the depreciation written off the assets. A deed of assignment had already been executed and a resolution was passed confirming the deed subject to the cash claim for £2 000 being postponed or withdrawn.

London Gazette, etc.

Companies Winding-up Voluntarily.

AEONIC RADIO, LTD. By special resolution, June 16. Oscar Berry, F.C.A., F.S.S., 1, Queen Victoria Street, E.C.4, appointed as liquidator for the purpose of reconstruction.

BASSON ELECTRICAL CO., LTD. Statutory meeting of creditors at the offices of Lawson, Coppock and Hart, 18, Tib Lane, Cross Street, Manchester, on Wednesday, June 25.

LEO TAYLOR, LTD. By reason of its liabilities, June 12. W. Latham, Union Bank Chambers, Lytham, chartered accountant, appointed as liquidator.

YOUNG (C. F.), Ltd. Statutory meeting of creditors at the offices of the Leicestershire Trade Protection Society, 4, New Street, Leicester, on Wednesday, June 25.

Bankruptcy Information.

ANDERSON, Cyril Morton, 1 556, Stratford Road, Hall Green, Birmingham, trading as ROBIN HOOD ELECTRICAL CO., electrical contractor, and at Back 330, Icknield Port Road, Birmingham, as THE MAROON MOTOR CO. First meeting, July 2, 11 a.m., Official Receiver's Office, 191, Corporation Street, Birmingham. Public examination, July 16, 2.30 p.m., Court House, Corporation Street, Birmingham.

BLACKMORE, Glanville, 62, Coventry Road, Market Harborough, wireless engineer. First meeting, June 27, 3 p.m., Official Receiver's Office, 1, Berridge Street, Leicester. Public examination, July 4, 11 a.m., The Castle, Leicester.

KERSHAW, S., AND Co., Broad Lane, West Derby, and 4, Daulby Street, Liverpool, electrical and radio engineers. Receiving order, June 16. Creditor's petition. First meeting, June 27, 11.30 a.m., Official Receiver's Office, Government Buildings, Victoria Street, Liverpool. Public examination, July 15, 10 a.m., Court House, Government Buildings, Victoria Street, Liverpool.

TURNER, Harry, 20, Battersea Rise, Clapham Common, London, radio and electrical contractor. First meeting, June 30, 11.30 a.m., 29, Russell Square, W.C.1. Public examination, July 10, 12 noon, The Court House, Wandsworth.

Notice of Dividend.

READ, Roland Arthur, 9, The Pavement, Middle Lane, Crouch End, London, N.8, electrical engineer. First and final dividend, 9d. per £, payable Bankruptcy Buildings, Carey Street, London, W.C.2.

Bankruptcy Proceedings.

K. N. ELECTRICAL PRODUCTS, LTD., 5, 6 and 7, Singer Street, Tabernacle Street, London, E.C.2. Under a winding-up order made against this company on May 6 on a creditor's petition the statutory meetings were held last week at the Board of Trade offices, Carey Street. The Official Receiver said that the company was registered on July 6, 1929, with a nominal capital of £6 000 divided into shares

Digitized by Google

of £1 each and was formed to carry on business as manufacturers of and dealers in electrical appliances and to buy the business carried on by Ignatius and Francis Knowles under the style of Knowles and Son, at 87, Wardour Street, W. The whole of the capital had been issued, namely £3 000 subscribed for cash and £3 000 allotted as fully paid to the vendors. The purchase agreement provided for the sale to the company of the business, including goodwill and the rights of the vendors in two inventions relating to electric soldering irons, plant, machinery, etc., for £3 000 in shares of the company, which was also to take over the then existing liabilities of the business. In addition, the vendors were to be paid a royalty of 2d. in respect of each soldering iron sold by the company. The company carried on business at 87, Wardour Street until March of last year, in which month it removed to Singer Street. The trading also disclosed a loss of £7 807 to March last. Funds were raised by three debentures for £1 000 each and on March 26 last Mr. J. M. Ferguson, C.A. was appointed receiver for the bondholder and he carried on the business until the date of the winding-up order. He then ceased to act. The business of the company was originally restricted to the manufacture and sale of the soldering irons, but since it was found impossible to transact enough trade in those articles alone the manufacture of wireless articles was undertaken. The receiver for the bondholder continued the business in the hope of securing a large order for wireless apparatus, but this was not obtained. According to the statement of affairs filed in the liquidation the liabilities amounted to £8 900 of which £6 271 are expected to rank, and the assets are estimated to realise £2 416, absorbed, however, in preferential payments and debenture claims. With reference to the shareholders a total deficiency of £12 271 is disclosed. The failure of the company is attributed to the bad radio season of 1929–30 and to lack of enough capital to carry on until the business of the company was stabilised.

RECORDAPHONES, LTD., Radio Works, Letchworth, Herts. Under a winding-up order made against this company on May 19, on a creditor's petition, the statutory meetings were held on Wednesday at Bankruptcy Buildings, Carey Street, London. The Official Receiver reported that the company was incorporated on October 18, 1928, with a nominal capital of £200 000, divided into 300 000 8½% participating preferred shares of 10s. each and 1 000 000 deferred shares of 1s. each, and was formed to acquire the exclusive licence under British patents for the manufacture and sale of an electrical invention known as "Recordaphone." The issued capital was £181 000, of which £110 000 was subscribed in cash and £71 000 was allotted as part satisfaction of the purchase consideration. In May, 1929, Mr. A. E. Bowyer-Lowe was appointed managing director for five years at a salary of £2 000 per annum, plus 7½% of the net profits, the total remuneration not to exceed £3 000 per annum.

Under the purchase agreement the company acquired of British Telegraphones, Ltd., for £75 000 in cash and shares, the exclusive licence of the electrical invention for the recording and subsequent reproduction of sound known as "Recordaphone," and the benefit of an agreement with a firm of German manufacturers. A prospectus was issued on October 24, 1928, offering for subscription 300 000 preferred shares of 10s. and 300 000 1s. deferred shares. The Scottish Finance Co., Ltd., agreed to underwrite 200 000 preferred and 200 000 deferred shares for an underwriting commission of 4% and an overriding commission of 1% payable in cash. The Scottish Finance Co. in turn entered into a number of sub-underwriting agreements, to which the company was not a party. The public issue was not a success, applications being received from the public for approximately 60% of the number underwritten. Although the Scottish Finance Co. received payment in full of the agreed underwriting and overriding commission, it had refused to accept any liabilities for the default of the sub-underwriters to fulfil their obligations, alleging that allotment to the sub-underwriters constituted an acceptance of the sub-underwriters' application for shares and operated as a release of the Scottish Finance Co. Proceedings had been instituted by the company against many of the sub-underwriters, but a number of them were now bankrupt, and there was little prospect of anything further being recovered from any of them.

In January, 1929, with a view to having a subsidiary for manufacturing purposes, the company agreed to purchase, for £34 436 cash and shares, the undertaking of the Bowyer-Lowe Co., Ltd., of which Mr. Bowyer-Lowe was the managing director, and which carried on the business of manufacturers of high grade wireless apparatus at Radio Works, Letchworth. Contrary to the expectations expressed by the directors the company did not succeed in obtaining a sufficient demand for Recordaphones to place manufacturing with the Bowyer-Lowe Co., Ltd. In fact the company's endeavours to sell Recordaphones had proved entirely unsuccessful, and it was eventually decided to finance the Bowyer-Lowe Co. with a view to increasing that company's turnover in wireless apparatus to such an extent that Recordaphones, Ltd., would receive a revenue by way of dividend on the Bowyer-Lowe shares —all of which it held—pending a demand for Recordaphones being created and conditions of trade generally improving. The Bowyer-Lowe Co. was also in compulsory liquidation.

No statement of affairs had yet been lodged, but it was expected that the creditors would be paid in full and there would be a small surplus available for distribution among the holders of preferred shares.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

COLTRAGRAPH.—512 125. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. W. H. Colt, Ltd., Bush House, Aldwych, London, W.C.2; manufacturers.—April 15, 1930.

PHILIPS ARGENTA.—B510 116. Class 13. Electric lamps (ordinary). Naamlooze Vennootschap Philips' Gloeilampenfabrieken. Emmasingel 13d, Eindhoven, Noord-Brabant; manufacturers.—February 5, 1930. The applicants undertake that this mark, when registered, and the marks Nos. 423 539 (2 320), B424 535 (2 368) shall be assigned or transmitted only as a whole and not separately. User claimed from February 1, 1925.

LACENT.—510 887. Class 13. Electric light fittings of ordinary metal. Heyes and Co., Ltd., Water-Heyes Electrical Works, Wigan; manufacturers.—March 4, 1930.

SUPER WASP (sign).—508 891. Class 8. Wireless telephonic and telegraphic apparatus and parts thereof. Pilot Radio and Tube Corporation, 323, Berry Street, Brooklyn, New York; manufacturers. December 18, 1929.

DOUBLE EAGLE (sign).—510 448. Class 8. Electrical storage batteries (not for medical purposes). The Goodyear Tyre and Rubber Co., 1144, East Market Street, Akron, Ohio; manufacturers. February 17, 1930.

GOLDEN RAY (sign).—511 617. Class 8. Apparatus for use in wireless telegraphy and telephony. A. Rist (1927), Ltd., Waveney Works, Freemantle Road, Lowestoft; manufacturers. March 28, 1930.

ZALMA.—512 005. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching, but not including optical instruments, and not including any goods of a like kind to optical instruments. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth, Middlesex; manufacturers. April 11, 1930.

TOREX.—511 905. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but not including optical and ophthalmic lenses or apparatus for indicating the level of liquids and not including any goods of a like kind to any of these excluded goods. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth, Middlesex; manufacturers. April 8, 1930.

LYFA.—511 166. Class 13. Metal goods for electrical purposes not included in other classes. Lyfa, Ltd., 39, Lombard Street, London, E.C.3; manufacturers. March 14, 1930.

THE LEAD MARKET.

According to James Forster and Co. the only feature of the market last week was the disappearance of the contango, owing to the placing of a Russian order for early shipment. At one time a backwardation of 3s. 9d. per ton was seen, but later, owing to further declarations of Mexican and American lead, June lead was more freely offered. A little official support was given from time to time. The American price was lowered 10 points on June 17. Closing prices on June 19 were £17 17s. 6d. for all positions or unchanged on the week.

COMING EVENTS.

Friday, June 27.

ELECTRICAL CONTRACTORS' ASSOCIATION.—Town Hall, Llandudno. Annual Conference. Paper by Mr. W. Cross on "Specifications and their Problems," 9.30 *a.m.*; short address by the new President, 12 *noon*; ball and supper, Grand Hotel, 9 *p.m.*

Monday, June 30—Friday, July 4.

1880 — 1930

Jubilee History

THE TRADER AND HIS BANKER

'Keep in touch' is the rule of thumb by which many a sound enterprise has been brought to fruition.

Because it is through personal contact and friendly relationships that a Bank can best aid the prosperity of its clients.

The general services which the Westminster Bank renders its customers are a commonplace: yet how often the Trader's personal relations with his Bank Manager never get further than the arranging of an overdraft.

Is it, perhaps, this Borrower-Lender 'complex' which hinders that mutual and friendly understanding that is of such supreme value to a Trader and his Banker? This should not be. Rather the Trader should feel free whenever he is passing to call in and have a word with his Bank Manager.

Is it the question of sending the firm's traveller abroad and providing for his drawing money, easily, at defined places, and within prescribed limits? Or of discounting bills that are guaranteed by the Export Credits Department; or merely of depositing documents for safe custody? It is just in matters like these that a word with the Manager may be helpful; and it will be found that the visit will be welcomed. Why?

A Bank Manager is not a philanthropist; but he *is* interested in the prosperity of his clients. It is good business for him to be so: for on the prosperity of its customers depends the prosperity of the Bank. And it is because the Bank's welfare is inseparably bound up with the welfare of its customers that to be in personal touch with his Bank Manager is a matter of first importance for any Trader.

So a client must not feel that the glass door marked 'Manager' is a barrier between himself and the man behind it. On the contrary, it is hoped that he may be familiar with either side of it, and feel that the occasional word within is almost a matter of routine.

That is why the Manager at any Branch of the Westminster Bank is most ready to give interviews and to discuss or explain any point that might help a client to a full and straightforward use of the Bank's services.

The All-Seeing Eye

in

SUNDAY JOURNALISM

WHAT would we not give for the all-seeing eye?—To be able to sum up in the quiet leisure of Sunday afternoon, every chapter of events of the past week—events in the world of Finance, Politics, the Arts, Home and Foreign Affairs.

Weekly the Sunday Times is at your disposal for this very purpose. It gives you all this, and more. Having behind it, unseen as it were, over a hundred years of living history, the Sunday Times knows from experience exactly what the well-informed required. It knows also what powers in modern journalism can give you what you require—sober judgement, authoritative opinion, and balanced critique.

This it is that has earned for the Sunday Times throughout the best informed circles of the country the title of "A Newspaper, a Magazine, a Review." And *you* will find it so.

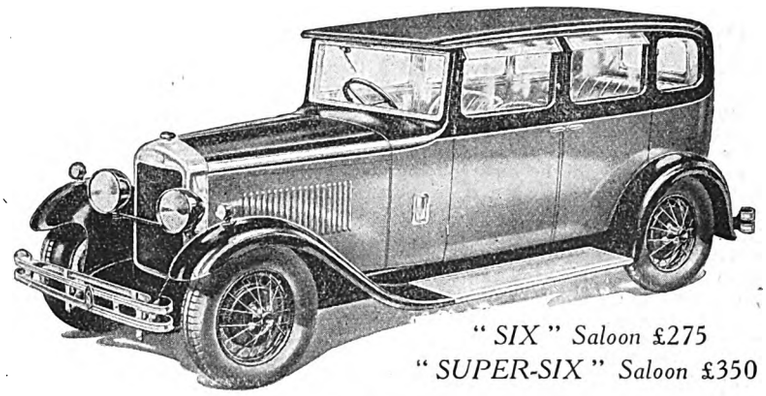
The BEST CARS for your PLEASURE

SINGER

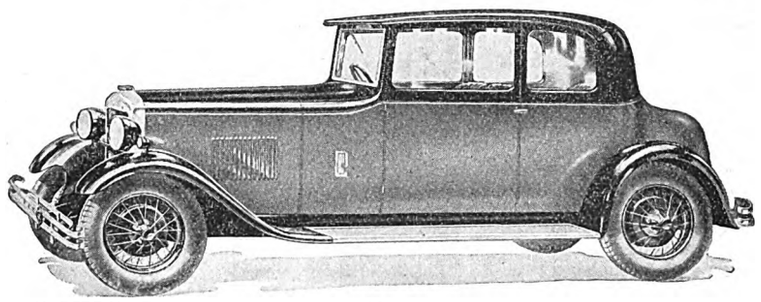
JUNIOR-SIX-SUPER-SIX

Each SINGER Model represents the BEST that the British motor industry produces. The SINGER "SIX" is a beautiful car with long sweeping lines, and genuine coach-built construction. The engine will maintain a high cruising speed, and give an outstanding top gear performance from 5 to 55 m.p.h. The SUPER-SIX has a seven-bearing crankshaft, one-shot central lubrication to all points of the chassis, four-speed gear-box, and many other exclusive features.

The SINGER "JUNIOR" is bigger and better than the usual "baby" car. The four-seater models have FOUR WIDE DOORS, and provide ample room for four adults. Petrol consumption averages 40 to 45 m.p.g. Every model completely equipped. From £135.

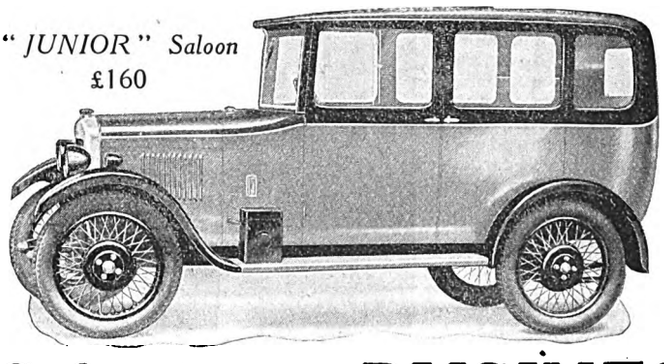


"SIX" Saloon £275
"SUPER-SIX" Saloon £350



"SIX" Coupe £270 "SUPER-SIX" Coupe £350

"JUNIOR" Saloon £160

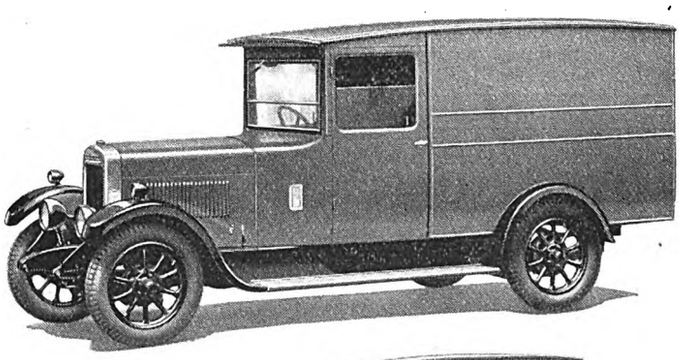


SINGER

The BEST VANS for your BUSINESS

SINGER "SIX" DELIVERY VAN

Gives a real express delivery service with economical running costs. Here are some of its special features:—
All-weather cab, winding windows, carrying 14 cwt., petrol consumption 22/24 m.p.g. Speed, fully loaded, 50 m.p.h., smooth 6-cylinder engine, "Marles" patent steering, six brakes on four wheels. Price £200.



SINGER "JUNIOR" VAN

Costs only 1d. per mile to run. It has internal expanding brakes on all four wheels. Carrying capacity 5 cwt. Petrol consumption 35 to 40 m.p.g Price £135.

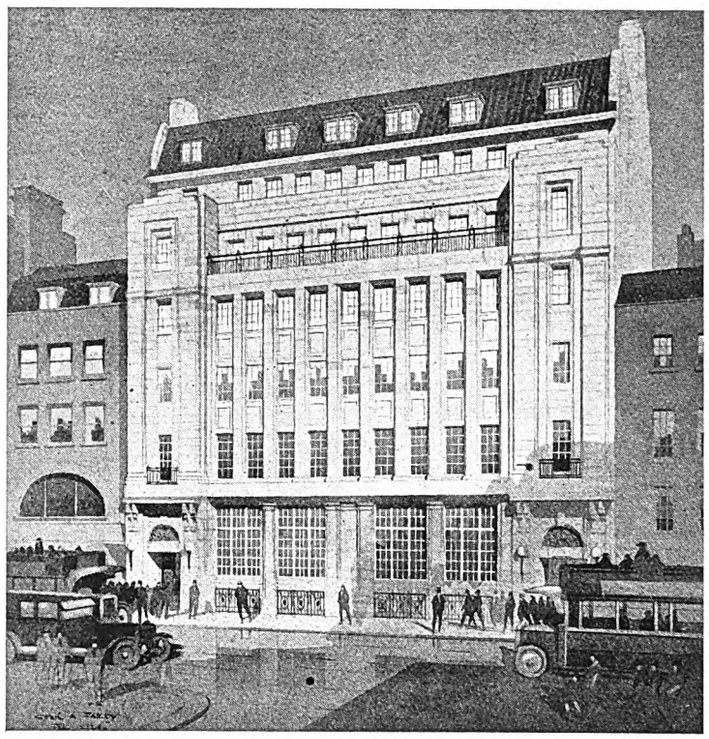
ENGRAVING

on the contrary the fact that this country can claim to be the birthplace of the modern Three Colour Process is entirely due to the farseeing generosity of the ARC ENGRAVING CO. The actual inventor was Harmann Cartheusar, a cosmopolitan craftsman of outstanding genius, and it was due solely to the encouragement and practical assistance of the "ARC" that he was enabled in their Studios and at their expense to conduct his experiments with the new collodion emulsion until Colour Type reached the stage when it became a definite commercial proposition.

Nor was this the first instance of the keen interest taken by the ARC Engraving Company in the technical development of their craft. For as far back as the days of wood engraving when this tedious process failed to keep step with the rapidly increasing demand for good illustration in Books, Periodicals and even the Daily Newspapers, this Company played a pioneer part in the production of "Line" and Half-tone Blocks by the new chemical processes which followed the invention of modern photography. That this traditional enterprise remains to-day as then is evidenced in the important commissions with which this Firm is continually entrusted and reflected in the notable results achieved.



In an article such as this, viewing as it does the development of process engraving from the standpoint of craftsmanship rather than the technical methods it employs, this special reference to the "ARC" Engraving Company is amply justified. For it is generally accepted by prominent users of commercial illustration that an "ARC Block" whether in the simplest "line" or the most intricate "colour work" provides outstanding evidence that above the present day demand for speed and, in many instances, mass production, there remains still adequate scope for that individual treatment and artistic perception without which no genuine craft as such can survive.

It is this very attitude towards their business that has earned and maintains for the "ARC" the premier position in the engraving world which they unquestionably enjoy. Indeed many of the "ARC" Reproductions, especially in Colour are regarded by experts as the finest specimens of modern process engraving in existence. The student and also those who are commercially interested in securing this class of work will need no further evidence on the point than the wonderful coloured plates issued by Messrs. Benn Brothers in their classical series of illustrated Books on Ceramic Pottery. These plates, produced in the "ARC" Studios, deal with the most complicated colour subjects and the superb skill which alone made them possible was deemed worthy of an appreciative Editorial commentary rarely vouchsafed to commercial enterprise however excellent.

With acknowledgments we quote the following significant paragraph from *The Observer*, December 30th, 1923. "So faithfully do these reproductions render the textures, glazes, and exact tones of the different subjects that the actual handling of the pieces could scarcely be more instructive." Such a tribute from such a source is praise indeed. It is equally significant to note that the production of these plates must in no sense be regarded as an isolated example or as representing a supreme effort to meet a supreme occasion. They were produced upon a strictly commercial basis and the fact that their cost was no more and no less than that often paid for work of a less satisfying nature is not only worthy of record but of immense practical importance to all who require such aid in the preparation of their Business Literature.

The "ARC" Colour Studios at Wimbledon (the offices of the Company are at 4 and 6, Farringdon Avenue, E.C.4) are equipped with every appliance required for modern colour reproduction, and these advantages coupled with the selective care exercised in the appointment of their Operatives enables the "ARC Engraving" to extend to the smallest commission the same skilful treatment that is as vital to its perfect execution as it is to the many reproductions of famous masterpieces in oils, water colours or tapestry which are continually passing through the Studios.

But, in laying stress upon the advantages of high grade colour type and the services available at the ARC Studios those who chiefly employ Black and White reproduction will be interested to know that the same degree of excellence and the same unmistakable mark of individuality is equally available in this very important, if less spectacular, branch of engraving and once again stamps the ARC Engravers as past masters of their Art.

Those concerned in "giving out" line and half-tone work know full well that however excellent the engraving may be, speed is also a factor and indeed time more often than not is the essence of the contract. It is inconceivable that the "ARC" Engraving Co. viewing with such responsibility the standard of their craftsmanship would fail to equip themselves with an adequate organisation to deal effectively and promptly with matters of urgency. It can therefore be taken as a foregone conclusion that instructions of this nature for the Press or other purposes are dealt with by a special Staff whose duty it is to see that speed is never an excuse for faulty production and that the Blocks are delivered "ON TIME."

NOTE.—This page which is an example of type and half-tone illustration produced and printed from a combined Line and Half-tone Block is issued by the **ARC ENGRAVING COMPANY, 4 and 6, FARRINGDON AVENUE, LONDON, E.C.4,** ***who will be pleased to receive your enquiries and, upon application, provide you with further specimens of their Colour Work or Black and White engraving.***

The House of Waring AND THE STORY OF A GREAT IDEAL 1695 – 1930

It was one of the ideals of the House of Waring to preserve the craft of furniture-making, as it has been handed down. And to provide a great House in London where, in spacious galleries every example shown should be a work of art, even to the humblest item ; and where it was possible to purchase articles of beauty for the home, hitherto only accessible to the wealthy, at prices within the reach of all classes

A little less than a century ago, having absorbed the Gillow firm with its historic factory at Lancaster, the House of Waring set out with the ideal of re-asserting the beauty of old English furniture ; to restore the influence, if not the precise form, of those master-workers in wood of the 18th Century whose designs in furniture and home decoration combined distinctive charm with practical utility that had no equal in the world.

THE manufacturing resources of the House produced furniture at prices which have proved a revelation. The great shop in Oxford Street was founded to demonstrate the alliance of art with economy. It is a beautiful building, on the lines of Hampton Court, by Wren. Consisting of seven floors, covering over 8 acres of space, it was conceived in the spirit of providing a huge establishment where every furnishing need would be provided to meet a large public demand.

Antiques and Reproductions are shown in a splendid series of Period apartments
Over 100 Rooms demonstrate the characteristics of individual English Period styles
Wonderful Eastern rugs, priceless in themselves, are reproduced at a trifling cost
English Chintzes and Cretonnes are reproduced from old examples, and brocades from Italy
Exquisite designs in old china are reproduced at prices for every-day use
Glass of historic character and Georgian silver is available at the price of ordinary articles

The Waring Showrooms of to-day are unique ; and are the Mecca of all interested in Art and the Home.

THE AMAZING PROGRESS OF GAS

TOTAL OUTPUT OF GAS IN BRITAIN AS PUBLISHED IN OFFICIAL REPORTS:

IN CUBIC FEET

1902-159,500 million
1917-235,297 million
1925-294,756 million
1929-321,616 million
and steadily progressing

There are over 9,000,000 gas consumers, that is to say, practically every family in an area of gas supply is using gas for some purpose.

The B.C.G.A. . . representing the British Gas Industry, is at the service of the public, without charge, for information and advice on any use of gas.

GAS
is a sound investment
A striking testimony

GAS IS KNOWN TO BE USED in approximately 3,000 trades or branches of trades in this country for an average of seven processes in each, and in more than 9,000,000 homes where heat is needed for something like a dozen household purposes.

BELOW IS GIVEN A LIST of illustrated booklets entitled "A Thousand and One Uses for Gas." These deal with some of the industrial, commercial and domestic uses of gas.

PROFESSIONAL AND BUSINESS MEN AND WOMEN are invited to write to the address given below naming the subject in which they are interested. The appropriate booklet will be sent without charge.

Metals—annealing, brazing, case-hardening, forging, tempering, rivet and bar-heating, die-casting, plate-heating and other heat-treatment processes.
Ship-building—heating-up plates and angle iron, shrinking metals, heat-treatment of heavy forgings and high-speed steel, rivet heating.
Motor Cars—heat-treatment of metals, core-drying, soldering, repairs. Equipment for motor garages. Repair of omnibuses.
Textiles—gassing, singeing, stentering conditioning, shrinking, calendering, ironing, drying silk, lighting.
Leather—lighting, heating, power, drying, melting, softening, sealing and other processes.
Printing—melting stereo metal, drying matrices, drying photographs, preparing plates, lighting, power.
Food—bread, biscuit and pastry baking, canning, bottling and drying fruit, poultry farming (incubating, heating the brooder house, etc.), ripening bananas. Milk sterilising, pasteurising, churn and bottle-washing. Refrigeration.
Catering—cooking, fish frying, heating, water-heating, etc., in hotels, restaurants and boarding houses.
Fish Frying.
Varnishes, Paints and Lacquers—gum running, oil boiling, lacquer and enamel drying.
Theatres and Cinemas—heating, ventilation, generating electricity, lighting, catering.
Shops and Business Establishments—heating, lighting, water-heating, equipment for canteens and sports pavilions, baths.
Laundries—ironing, power, lighting.
Hospitals, Clinics, Dental Surgeries, Medical Societies, Institutions—heating, catering, water-heating, laundering, laboratory and dental workship equipment.
Banks—heating of premises.
Street Lighting—high and low-pressure gas lamps.
Public Wash Baths—water heating.
Architecture and Building—Gas in housing schemes. Carcassing and fittings.
Domestic Uses—heating lighting, cooking, water-heating, incineration, refrigeration, domestic laundry equipment, garage and greenhouse heating.
Smoke Abatement—the domestic chimney, industrial smoke, damage to buildings, the Nation's loss due to coal smoke.

THERE CAN BE NO MORE STRIKING TESTIMONY to the stability of an industry than the fact that 3,000 trades and practically 9,000,000 families use its product regularly.

For those who wish to place money with assurance of a secure return there is

NO MORE ATTRACTIVE INVESTMENT THAN

GAS STOCK

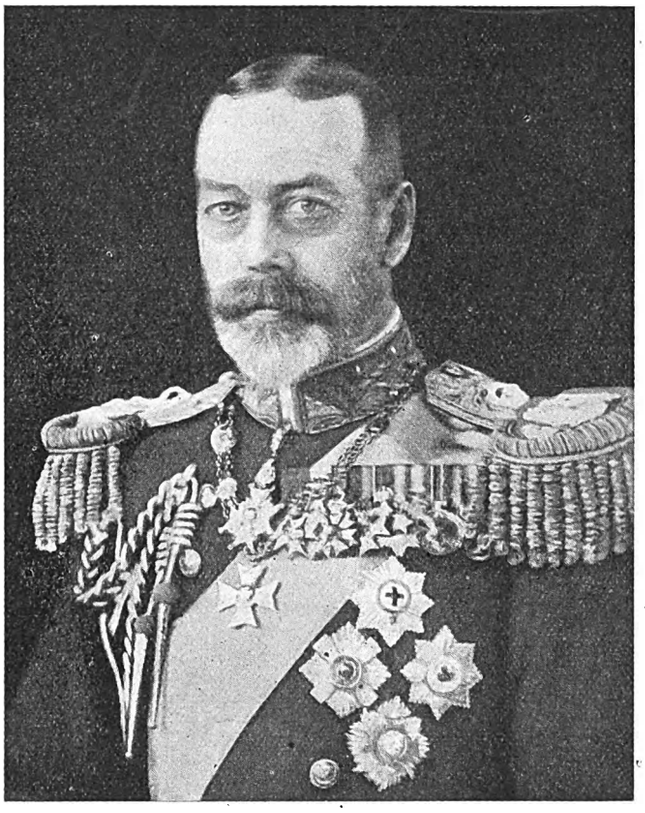
BENN BROTHERS LIMITED 1880-1930 JUBILEE HISTORY.

Fifty Years' Progress in Trade Journalism.

The ELECTRICIAN *and allied publications provide a history of British industry during fifty years of unprecedented development. The rise of gas and electric lighting, of aeronautics and of electrical engineering, are among the events recorded in their pages. The following outline of the firm's activities has been compiled by Mr. J. A. Benn.*

THE British Press is distinguished among all forms of private enterprise by the recognition that it is an essential public service. This special position has long been acknowledged in the Courts of Law, was repeatedly affirmed by the Government during the Great War, and is now graciously attested by the highest authority in the land. The King's message on the occasion of the Jubilee of Benn Brothers, Limited, expressing the hope that every success may attend the efforts of their publishing house for the development of British trade, is a landmark in the history of journalism. It gives the best of all sanctions to the claim of the trade journal to national status. The trade journal has taken far less time to reach maturity than either of the other main branches of journalism, the daily newspaper and the periodical review. Addison's SPECTATOR and Delane's TIMES had passed into the realm of legend before John Williams Benn founded the CABINET MAKER. Trade journalism was then in its infancy, eking out a precarious existence in comparative obscurity. Fifty years later the CABINET MAKER and a dozen other journals concerned with important British industries have taken their rightful place on the finest office site in Fleet Street, the acknowledged hub of the journalism of the world.

The first number of the first Benn journal was published ir July, 1880. Its founder and editor had for some years been designer to a firm of cabinet makers in the City Road, and had contributed a weekly article to a furnishing paper. A disagreement with the Editor on the policy of the articles spurred the contributor to found a journal of his own, and thus the House of Benn came into being. "The growth of an idea" was how the founder described its great expansion in later years.



H.M. KING GEORGE V

whose Jubilee Message to the Chairman of Benn Brothers, Ltd., expresses His Majesty's hope that "every success may attend the efforts of your publishing house for the development of British trade."

The biographer's practice of tracing continuity in a career is often more convenient than accurate, but in the case of John Benn it certainly happened that his earliest employment was selling newspapers. His father, the Revd. Julius Benn, led the hard life of an East End minister and took a newspaper shop to help support a large family. Young John did the round with the morning papers, until at the age of eleven he became office boy to a leather firm in Mincing Lane. His natural ability with the pencil already began to appear, for some portraits sketched on the borders of a sale catalogue were sufficiently life-like to bring him before the auctioneer, who warned the young clerk against poking fun at his seniors. And in 1866, at the Guildhall Industrial Exhibition, John was the youngest exhibitor and received an award for some prints of old coins, ingeniously executed with the aid of a copying press.

A few years later found him invoice clerk to the furnishing house of Lawes Randall and Company, and it was an ambition to outgrow this drudgery that led him to develop his taste for drawing. He soon noticed that designers were better paid and respected, and the candle in his bedroom was accordingly replaced by a paraffin lamp. "Between nine and eleven almost every night"—he wrote in some Memoirs—"I was trying to learn to draw. Twice a week I went to a South Kensington art school in order to get technical training, but I made most headway at home, and after six months got up my first sheet illustrating some of our leading lines in art furniture. I screwed up my courage and showed the sheet to the head of the firm. He looked at me for a moment—it seemed like five minutes to me—and then said: "You'll never draw, my boy; it isn't in you."

That was enough to *make* Benn draw, and before very long he was designing furniture for some of the smaller manufacturers. In 1868, at the age of 18, he was appointed draughtsman by his own employer, at a salary of twenty shillings a week. After further experiences, which included a free-lance journey through the country in the style of "John Williams Benn and Company, of Stepney Green, furniture designers to the trade," he was appointed junior partner in Lawes Randall and Company. As his acquaintance with furniture increased Benn became convinced that the industry had fallen into a rut and that the over-ornamental style of the Victorian productions must be abandoned for the classic beauty of the eighteenth-century designs. Ruskin and William Morris had been preaching similar ideas in regard to craftsmanship, and naturally enough the young partner, who owed his advancement to artistic ability, was already an ardent reformer. The obvious outlet for his ideas was the weekly article in the FURNITURE GAZETTE, but another view was taken by Dr. Dresser, the newly-appointed art editor, who already exercised a wide influence among manufacturers and was directly opposed to the Morris school. Benn was told that his contributions were no longer wanted. Once more the determination was roused that had prompted him to draw, and the outcome was a monthly paper of his own called the CABINET MAKER. The first number was issued at 5, Finsbury Square, from a room divided by a screen into editorial and business departments. It comprised sixteen foolscap pages and the price was sixpence. Of course the venture was regarded as ridiculous by John Benn's former partners—who thought him mad to give up a certain £500 a year, as by this time he had a wife and children to support. But the journal was no amateurish production. What distinguished it from the outset was a profusion of illustrations, the original issue of July, 1880, containing a six-page lithographic supplement. As the first leading article announced, the purpose was to provide "a pictorial record of the furniture of the day." It was to "supplement rather than supplant" the existing journal—actually the latter was soon to go out of business.

As his trade mark Benn designed a happy combination of the plane and the pencil, showing a carpenter at the bench and behind him the artist engaged on a design; underneath were the words from Shakespeare: "And work in their shirt, too;

Digitized by Google

as myself." The productions of the pencil were valueless, Benn contended, unless they could be turned to account by the plane. Fifty years later this view has become so generally accepted that it is worth stressing how little favour it found in 1880. The furniture at the Royal Academy of that year, illustrated in the CABINET MAKER, is sufficient evidence of the popular taste, and in the hands of the Victorian manufacturer even the Chippendale style—"the most curious revival of this reproducing age"—was open to the charge of over-ornamentation. Not that all the original furniture was free of meaningless and useless ornament; but it was honest, simple and serviceable, and in essentials it harked back to the simplicity of early Queen Anne. The new journal evidently attracted attention, for not many weeks after the appearance of a rival, the editor who had rejected John Benn's ideas was hastening to assure his readers that "the rage for Queen Anne is over, so far as the educated portion of the community and the great west-end manufacturers" are concerned. And to the little group of workers in Finsbury Square it must have seemed as if he were right. Only those who went behind the editorial screen knew how precarious the position was, and seemed likely to remain. There was little enough demand for the new paper and it met with misfortune from the outset.

The First Issue.

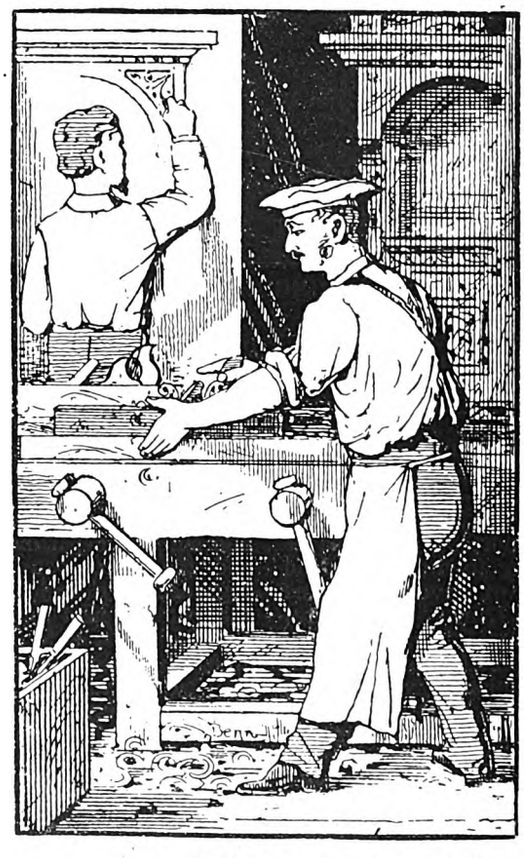
"The packing and posting of the first issue lives in my memory as a most anxious and exciting episode," writes Mr. Henry Benn, the one survivor of the original Benn brothers. "Upon the delivery of the copies from the printers, the whole staff, from the editor to the office boy, rolled up its sleeves and set to work for dear life pasting and wrapping for the post. An open one-horse van was subsequently requisitioned to take this first consignment to the General Post Office, for free distribution to the whole of the furnishing houses in the United Kingdom. On the way to the post office, owing to the doubtful stamina of the paste and the more rapid than efficient operations of the staff, many of the copies parted company with the wrappers and had to be taken back to the office for readjustment. The subsequent period of waiting for the return of subscription forms, as a nucleus of circulation, was an anxious time, and the arrival of the post was eagerly awaited. They came in at first all too slowly to evoke enthusiasm, and it required a stout heart to face those early days of fluctuating fortune and disappointment. All who had the privilege of working with the founder of the firm look back with wonder and admiration for 'the boss,' as he was affectionately though respectfully called; following his energetic lead was no light task, but his example was the inspiration of everyone on the staff. The strenuous experience of his own early years developed a feeling of sympathy and consideration for all who entered his service in after years, and a spirit of cameraderie was thus engendered which I think I may say has dominated the operations of the firm from the very first to the present time."

Paste was not the only cause of embarrassment; a subscription tout who drew commission on bogus orders was another trap which only experience could cure. But although it had to face innumerable difficulties and soon swallowed up the savings of the proprietor, the CABINET MAKER was already gaining ground within a few months of its appearance. The issue of October, 1880, was prefaced by a notice that the proprietors had been "compelled to reprint."

There were doubtless many acquaintances of the journeys which John Benn had made some years before as a furniture designer who welcomed the regular drawings in his new paper. Others came rapidly from the lectures which he now began to deliver in all parts of the country. Again his pencil stood him in good stead, for talks on Dickens, Cruickshank, and the characters of the London streets, were illustrated with blackboard sketches. Apart from the publicity which this new activity afforded, it certainly proved the means of financing the CABINET MAKER at its most difficult period. In 1885 John Benn fulfilled his thousandth engagement on the platform, while continuing to carry on the journal—which meant writing, drawing and canvassing advertisements during business hours, with often a long journey to follow for the evening's lecture. The fees he asked were sometimes ridiculously low, for he suited his demand to the purse of the audience. At a Baptist chapel in the Gray's Inn Road, for example, he charged a guinea, on the 8th December, 1886, and this was one of eleven lectures delivered in nineteen nights. The amazing energy involved is seen in true proportion from the fact that John Benn was now making £2,000 a year from his platform work. "My chalks," he wrote in after years, "formed the bridge which carried me over the turn of the tide in my journal's career." It was with good reason that forty years later Sir John included a pen and pencil in the arms which he designed for his family.

The rapid progress of the CABINET MAKER was recognised in 1881, when the editor was asked to contribute to the Official Catalogue of the first Furniture Trades Exhibition held in September. His review of past developments and future prospects remains a masterly summary of furnishing history and concludes with some lines which time has proved an accurate forecast of the success of the journal not less than of the exhibition. "Fashion in furniture," Benn wrote, "changes almost as rapidly now as fashion in dress, and he is a wise business man who scans the horizon to see what is likely to come along next. Some good houses, large and small, have gone to the wall in consequence of adhering too much to obsolete ideas and one great advantage of this exhibition is the opportunity it affords of judging the tendency of popular taste. . . . For those who strive to elevate the furnishing trades still further in the directions of art and excellence, there is plenty of scope and a prospect of good business."

Besides his brothers, Julius, Henry, and Robert, Benn's original staff included Mr. G. D. Smith, who is to-day one of the most successful exhibition managers in the country and largely responsible for the vast dimensions to which the Furniture Trades Exhibition has now grown. In 1884 the CABINET MAKER was officially entrusted with the artistic printing connected with the fourth exhibition, work for which it was particularly qualified by reason of having been the first trade paper to employ zinco engraving. It is further entitled to a place in Press history as the first journal of its class to take advantage of the Meisenbach process, which it promptly adopted to reproduce photographs of prominent members of the trade.



"And work in their shirt, too; as myself."—Shakespeare. The trade mark of the CABINET MAKER *in* 1880.

The move which Benn Brothers (J. W. Benn & Bros.) now made to larger offices at 42, City Road—the street in which the founder had obtained his first job in furnishing—was made the occasion of a permanent exhibition under the auspices of the journal. Up to this time the business had been housed in the original premises at 5, Finsbury Square, except for a temporary move to an adjoining address. The new accommodation included separate departments for printing, at 55 and 57, City Road, and anticipated to a remarkable extent the services which are provided at the firm's 1930 headquarters in Bouverie House.

The building was surmounted with a sign-board announcing "The Cabinet Makers' Exchange and Sample Rooms." Space was available to manufacturers for the display of new inventions, and there were facilities for writing and a reference library. Admittance was open to subscribers, who were presented for the purpose with members' tickets. A passage in the CABINET MAKER of May, 1885, explains the objects of the Exchange. The two hundred advertisers in the pages of the journal represented almost every branch of the trade. Numerous applications

JULIUS BENN.

All four brothers worked together in the publishing firm founded in 1880. Julius was responsible for the commercial side, Davis and Henry for the art department.

HENRY BENN.

R. DAVIS BENN.

J. W. Benn remained Chairman of the company until his death in 1922. The only survivor of the original team is Henry Benn, who retired from business four years ago.

for the display of samples had previously had to be refused, owing to limited accommodation, but now three well-lighted floors were available to advertisers, at a nominal charge, "for the display of any invention, novelty or material which has to do with furniture or cognate industries. We are not prepared to receive any ordinary furniture which is of common-place kind, because the exhibition will not be allowed to become, nor is it intended to be, a furniture shop or bazaar. . . . To steer clear of any semblance of 'going into business' and to show that our object is merely to establish a useful novelty medium between our buyers and sellers, we distinctly decline to accept any commission or consideration for orders which may be taken through the Exchange." Advertisers were further offered the publishers' assistance in distributing catalogues, booking orders, and in general supplying a complete service to the trade at the centre of the city furniture market. The Exchange was opened on the fifth anniversary, in July, large firms having already taken space, and for some years it was regularly used by manufacturers, especially visitors from the Provinces.

With the seventh volume, in 1886, the dimensions of the journal were enlarged, the original foolscap size being abandoned for the format in which the CABINET MAKER still appears in 1930. In September a serious fire at the printers' premises destroyed the complete stock of blocks and paper, none of them insured. But all this time John Benn was continuing to lecture, so maintaining the finances of his business. In 1893 the title page embodied the words "Five Journals in One." This statement heralded the change which was rapidly coming over the furnishing trade. Firms that had originally confined their production to cabinet making now opened departments for the sale of carpets, decorating materials and so forth, and the era of the giant furnishing "stores" was already in sight. In keeping with this growth and development, John Benn published regular sections on these new subjects, which he named respectively the Upholstery and Decorating Journal, the Carpet and Floor-covering Record, the Timber Yard and Woodworking Machinist, and the Furnishing Hardware Guide. In 1902 the comprehensive heading was adopted by which the journal has been known ever since—the CABINET MAKER AND COMPLETE HOUSE FURNISHER.

Art in Industry.

The improved taste which marks the English homes of to-day in contrast with those of the 'eighties is not due to the influence of small groups of craftsmen; the general level has been raised through the ordinary trade. What John Benn set out to do fifty years ago was to bring artistic ideas to the trade itself, in proving to manufacturers that the most profitable course for them lay in a return to the best English traditions of solid workmanship and good design. Some people may think that in his advocacy of the seventeenth and eighteenth century styles he was too successful, and that the modern trade devotes too much attention to reproductions. It can only be said that in the many articles he contributed to the CABINET MAKER Benn was never an advocate of slavish imitation. He had no patience with the *chinoiseries* of Chippendale and, as already stated, he often complained of the excessive ornament of this later work. What he did stress were the admirable proportions and solid workmanship of the earlier cabinet-makers. "It is well to bear in mind," Benn wrote, "that the mere reproduction of originals is bad; they should merely form the ground work of fresh thought and arrangement."

The significance of these views is recalled by Lord Waring, who was acquainted with Benn as early as 1875 and was among

Digitized by Google

his oldest friends at the time of his death in 1922. Only those who can remember the furnishing trade as it was fifty years ago can fully appreciate the great change that has since occurred. Every small manufacturer was in those days his own designer, with the result that the poverty of designs only equalled the quantities of furniture produced. The public thinks of furnishing in terms of the great West End firms, but these are only representative of the vast size of the trade that is pursued in small factories all over the country. It was while Benn was travelling for Lawes Randall that he first met Lord Waring, who attended one of his earliest lectures in Liverpool and saw the "lightning sketches" for which he soon acquired a public reputation. "By emphasising the period styles in the pages of his new journal," Lord Waring states, "the late Sir John Benn performed a service that was of the greatest value in the era of development and expansion into which the furnishing trade was about to enter."

The Second Generation.

From the outset in 1880 the firm had witnessed the co-operation of four brothers. Eleven years later they were joined by a second generation of the family. In order to prepare his sons for business, John Benn sent them to Paris in 1888 to study art. In 1891 the eldest son (the present Chairman, Sir Ernest Benn) entered the business as office boy. At the age of seventeen he was transferred to the studio to learn to draw, but soon abandoned art for the commercial side of the enterprise. Before long the second son, Wedgwood Benn, joined the staff and for some time edited the CABINET MAKER in conjunction with Robert Davis Benn. In 1902 Wedgwood was adopted Liberal candidate for the St. George's division, and finally relinquished business for politics on his election to Parliament in 1906. Meanwhile he had made a business tour in South Africa and he also conducted another journal known as the HOUSE. For more than twenty years since his main interests have been political, and he was appointed Secretary of State for India in Mr. MacDonald's Government after the 1929 election.

42, CITY ROAD, E.C.
The offices of Benn Brothers half a century ago.

Mr. Ernest Benn, after working for six years on the road selling advertisement space for the CABINET MAKER, now took the first step in expanding the business which has since been under his direction for some thirty years. In December, 1899, the HARDWARE TRADE JOURNAL was put up for sale by its proprietors, Messrs. Hazell, Watson & Viney, who offered it to Benn Brothers. "If my father had acted as I imagine most fathers would have done," Ernest Benn confesses, "he would have bought the journal, added it to his own business, and reaped for himself the benefit of any profit that might be made, keeping the son, as so many are kept, in a subordinate position, to wait for dead men's shoes. That is the usual method of procedure. My father was built of different material." While allowing his son to continue to manage the CABINET MAKER, John Benn at once gave the HARDWARE TRADE JOURNAL into his sole control. At that time the new property had a total revenue of under £2,000 a year, barely sufficient to cover production costs and sometimes equalled, in 1930, by the income of a single issue.

Just as Sir Ernest thus acknowledges his debt to his father, so the founder of Benn Brothers, writing towards the end of his life, paid tribute to the son who from 1900 onwards proceeded to develop the business. "The CABINET MAKER," he said, "was the corner-stone but the bricks for the House that Benn built have been collected and well and truly laid by my eldest son." Probably only the Benn family circle and those who were connected with the business in the early part of the present century can realise to the full how well merited the praise was. As one of the "older generation" writes: "Strength of character and a purposeful resoluteness were needed to guide the destinies of the publishing firm to the sound and pre-eminent position that it occupies to-day. The difficulties that beset a young and growing business with only limited capital available continued to arise. They were all faced and overcome by Ernest Benn, who had the satisfaction of seeing the fruits of his energy in balance-sheets which showed steady improvement during the next thirty years. As the business grew, so he emerged more and more clearly as the dominating personality, whose daring tempered with sound judgment not only created fresh activities but developed and expanded those that already existed. . . . In this way the opportunity and the man found each other."

To the founder of the firm the co-operation of his sons was increasingly valuable, for in 1889 John Benn was elected to the first London County Council, and thereafter continued to devote the greater part of his time to public work. It was in connection with the inauguration of the tramway service that a Knighthood was conferred in 1905, followed by the Baronetcy with which Sir John was further honoured in 1914.

At the outset of his career the present Chairman of Benn Brothers had to repair a disastrous failure from which he "learnt more about the publishing business than ever before or since." The HOUSE—the publication in question—was also largely responsible for keeping John Benn on a very modest income. To begin with, some of his staff had left to start a rival paper, called FURNITURE AND DECORATION—now the FURNITURE RECORD—and he had promptly countered with a costly subsidiary to the CABINET MAKER, of more popular appeal, which ran for a few months only. This soon led to Benn's putting into practice a long-cherished idea, to provide a paper dealing with all the practical matters of home equipment. During the next four years in which the HOUSE was published, it anticipated nearly every aspect of such present-day successes as GOOD HOUSEKEEPING. Even the revolutionary departure was made of enlisting the services of women journalists, Miss E. I. Benn and Mrs. Holmes joining the staff to deal with the domestic arts. As events were to show, the magazine was before its time. Perhaps it was a trifle technical in its appeal, but in view of the enormous sale of its modern counterparts, the experiment remains of permanent interest. It was not alone among pioneer publications which Benn Brothers have issued and failed to establish.

The first number of the HOUSE appeared in March, 1897, as a sixpenny monthly "for those who manage and beautify the home." "There are now dozens of journals which have to do with the dressing and adornment of the body," the editor explained; "but, strange to say, there is not one dealing exclusively or specially with the dressing of the house. . . . If we find a welcome on the doorstep we shall take possession, and peer and poke into every corner of the domicile, from the kitchen to the roof, assuming indeed the rôle of friendly critic to the family." There were articles on furniture and china, needlework, pictures, and books, as well as "The Cook's Instructions," embodying specimen menus for the month. Silver, wallpaper and home carpentering were other features—altogether a decidedly ambitious scope for an entirely new departure in publishing. Some of the best drawings in its pages were those by Mr. W. C. Baldock, who from 1895 onwards worked with the firm for over thirty years. His skill had already shown itself in the zinco-engraving process, which involved drawing directly on to the metal plate used for reproduction.

"The Hardware Trade Journal."

As manager of the HOUSE, which after four years had to be pronounced a commercial failure, Ernest Benn came to recognise that catering for the general reader requires a distinct technique. Accordingly he determined that success depended on specialisation and for the next twenty years Benn Brothers confined their activities to the special class of publication with which the firm had started—the trade and technical journal.

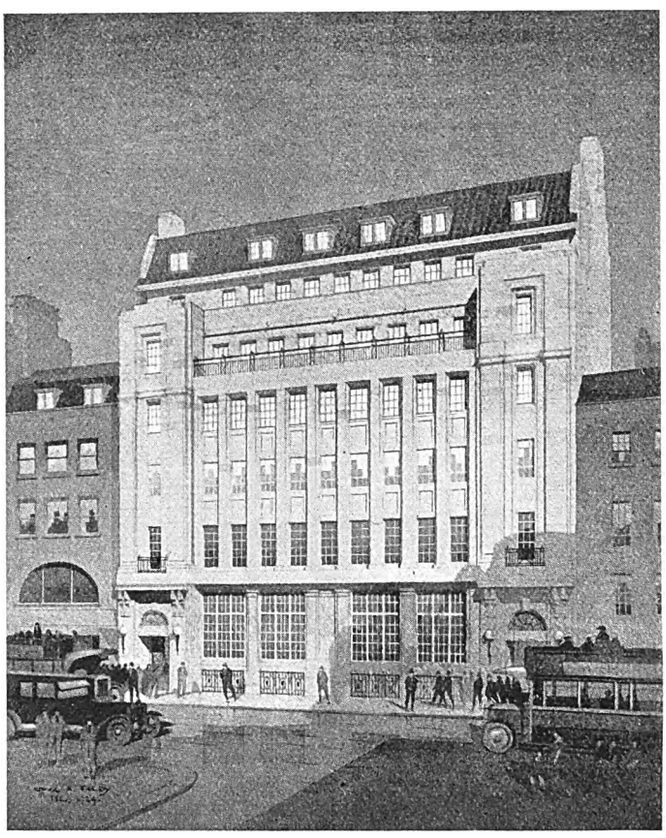
While the CABINET MAKER was now paying its way and already foreshadowing its position of 1930, the fortunes of the HARDWARE TRADE JOURNAL began to be laid. The paper had been founded in 1874 as the circular of a big factoring house

Digitized by Google

of those days, Martineau and Smith, before passing into the hands of Hazell, Watson & Viney. In December, 1899, Mr. F. J. Francis, for twenty years previously a sub-editor of the IRONMONGER, secured an option to purchase the smaller monthly, and brought the proposition to Benn Brothers.

The next steps forward in the history of the HARDWARE TRADE JOURNAL were the incorporation of IRONMONGERY in 1900 and the change from a monthly to a weekly issue in 1901—a practice that was adopted four years later for the CABINET MAKER also. From the wealth of incidents associated with the story of the second Benn journal, as of their other publications, one fact emerges as supremely important. The ideal of service that brought the journal into being has been responsible for its amazing growth, alike in size and influence. The desire of a single firm of hardware manufacturers to keep its customers regularly informed of its wares was limited, in contrast with the wider conception of disinterestedly serving one of the nation's biggest industries; but service was there just the same.

The single sheet that constituted the first issue in January, 1874, was followed next month by a number containing two illustrations—one of a coach wrench and the other of the "Scarborough" iron trunk. A paragraph published about this time makes curious reading half a century later. This was a description of "The New Game of Garden Tennis," which announced that four rackets, twelve balls, with portable poles, a net of 15 ft. by 4 ft. 6 in., with guard nets, hammer, cords, pins and book of rules, in case complete, could be acquired for the modest sum of £2 7s. 6d. In the year 1878 the journal gave space to the municipal gas exhibitions—"a decided novelty"—and interest was also roused by experiments with electric lighting which were evidently very diverse in results. Cheek by jowl with a paragraph to the effect that this innovation had proved "practically successful" at the reading room of the British Museum was another stating that the electric light at Billingsgate Market was a failure.



BOUVERIE HOUSE, FLEET STREET.
The 1930 offices of Benn Brothers, Ltd., and Associated Companies.

The Paris Exhibition, 1878.

John Benn once confessed that the idea of starting a paper of his own first took definite shape when he visited the Paris International Exhibition in 1878. It happened by a coincidence that another visitor to the same event represented the HARDWARE TRADE JOURNAL, which celebrated the occasion with an illustrated supplement. This special correspondent prefaced his report with a host of personal grievances respecting his treatment at the hands of the French, before he got down to the business in hand—the descriptive story of the Exhibition. The lot of the trade journalist provides experiences as interesting as are to be found in any career. A typical incident occurred to John Benn during one of the visits to foreign art galleries, reports of which soon became a feature of the CABINET MAKER. He had gone to Italy in search of material and was one day sketching some decorative items in the palace of King Bomba at Naples. "While thus innocently engaged," he afterwards wrote, "I found myself seized by an officer and marched off to the Bureau, charged, as far as I could understand, with making a plan of the place for military purposes. My book was taken from me and examined, but when the innocent nature of the contents was discovered it was returned and I was set at liberty. Some caricatures of Italian life, which greatly amused the curator, saved me. A few days afterwards, while sketching in the National Museum of Naples, I saw another soldier, more fierce looking than number one, approaching me, and at once concluded that he was on the same mission. I pocketed my book and proceeded to leave the apartment, but he got in front of me and offered me a piece of blue paper with some writing upon it. It looked so much like a summons that I promptly declined it in the best Italian I could command, but he persisted in offering it, so I took it from him. What was my surprise to see written thereon in a good round hand, in English, the following words: 'How is your aunt? Was she quite well when you last saw her?' etc. For a moment I could not understand why this dusky son of Mars should take such an interest in my estimable aunt. The mystery was soon explained. This soldier was very wisely employing his leisure, of which he had plenty, to learn English. Noticing my English appearance, he had applied to me for the correct pronunciation. I readily assisted him and in return he showed me some parts of that wonderful museum which I should not otherwise have seen."

On his foreign travels the Editor of the CABINET MAKER was usually accompanied by his brother, Mr. Henry Benn, who completed nearly fifty years' service with the firm before his retirement in 1926. For many years the artistic side of the journal was entirely in his control and in the course of his career he has published three books—"Characteristics of Old Furniture," "The Nation's Treasures" and "Style Schemes in Period House Furnishing."

Party politics have always been regarded as outside the sphere of trade journalism, but questions affecting the organisation of industry and the status of those engaged in its ranks were receiving attention as early as 1880. The files of the HARDWARE TRADE JOURNAL reveal that for the next ten years there was developing a keen interest in shop assistants and in the Ironmongers' Association movement, which began in April, 1879, when a few ironmongers met at Salisbury and unanimously decided to form an Association with the object of protecting the interests of the trade. Later, during the Royal Show week, a meeting was held at Anderton's Hotel in Fleet Street, London. Mr. Lindsey (who was then Editor) took a prominent part in ensuring the success of the early meetings, and striking testimony to the help received is found in a resolution passed by the Association, expressing its thanks to the proprietors "for their thoughtfulness in requesting the Editor of the HARDWARE TRADE JOURNAL to attend and report the proceedings, and especially for their generous offer to print and supply to the Association 5,000 copies of such report for distribution among the ironmongery trade throughout the country."

A few years later the HARDWARE TRADE JOURNAL took an active part in the formation of the National Hardware Association, at the time when Mr. Thomas Coates was editor. Later still the journal gave prominent attention to the Ironmongers' Federated Association, the national trade body that to this day continues to grow in influence and in membership.

Price Maintenance.

While discussing the interests of the retailer, a word may be said about a movement known as "price maintenance" in which the HARDWARE TRADE JOURNAL played a leading part about this time. Strange as it may sound to-day, the difficulty in the early part of the century was to get the shopkeeper to make sufficient profit and in some cases any profit at all. In his desire to serve his customers the tendency was to cut the price of an article to a point at which it was worth nobody's while to touch it. In self-defence manufacturers at length initiated "price maintenance," an endeavour to force merchants and retailers to preserve a fixed price in the selling of these articles. For a young and inexperienced publisher Ernest Benn did a very daring thing in this connection. A big firm of drapers in the provinces, with a reputation for price-cutting, bought quantities

Digitized by Google

of hardware goods—branded lines that had been well advertised—and offered them to the public at prices less than the actual wholesale figures. On the principle of throwing a sprat to catch a mackerel, these drapers were by this means attracting custom to their drapery wares.

"I sought out a drapery expert," Sir Ernest writes, "and induced him to visit the various establishments of this great drapery firm and make purchases of smaller lines, not so well-known to the public and upon which the margin of profit or loss was not so obvious. My expert came back with a bunch of receipted bills and a bag full of drapery sundries—half a yard of veiling; a yard of delaine; a boy's shirt; a pair of braces; a pair of corsets; and, I think, some shoes. On each of these articles the drapers in question had made a profit which varied from 200 per cent. in the case of the corsets, to something over 700 per cent. in the case of the veiling. I published a series of articles explaining how these people were persuading the public that they were real agents of economy when, as a matter of fact, at the expense of my hardware manufacturers, they were securing exorbitant profits upon most of their own merchandise. It brought me very near to a law suit, but we made the most of it. We published double-column advertisements in the local newspapers, offering to subscribe £200 to the hospitals if our statements should prove unfounded." Another case occurred a year later, when the HARDWARE TRADE JOURNAL convicted one of its biggest advertisers of similar practices. The case cost the paper a good customer and lost advertising revenue it could ill afford, but it was good journalism and undoubtedly good service to the trade as well.

From 1900 onwards the management of the journal was undertaken by Mr. Ernest Benn, who also edited the paper personally for some years. In 1907 Mr. E. E. Starke was appointed manager, having entered the business some ten years before as office boy. When the writer of fiction takes a successful man of business as his hero he always makes him start in this junior position and the majority of readers, smiling indulgently, say that these things happen in books but not in real life. They happen, however, in Benn Brothers, for it was in response to an advertisement in the DAILY TELEGRAPH that Edgar Starke applied for the job at eight shillings a week, which started him on the ladder to his present position. A period of addressing wrappers and filling the office coal-scuttles was followed by work on subscriptions, which in turn led to his appointment as representative of the Benn Brothers' journals in the provinces. Very soon the results of his energy and initiative began to show, and when in 1907 he was given control of the HARDWARE TRADE JOURNAL's advertisement department, the foundations of its present success were laid. When the CHEMICAL AGE was founded in 1919 it was established on the business side by Mr. Starke, and his numerous activities led to his appointment as a director of Benn Brothers in 1923.

Daily Trade Papers.

The foundation of the Institute of Metals in 1908 was marked by a special extra issue of the HARDWARE TRADE JOURNAL, published on the day following the ordinary weekly issue. Hitherto the non-ferrous metal interests of Britain had possessed no central organisation, and this journal was the first trade publication to deal with the activities of the new body. The pages of that first issue contain articles by metallurgists whose names have since become world-famous—among them Walter Rosenhain, B.A. (now Director of Metallurgy at the National Physical Laboratory) and Professor Cecil Desch. A similar enterprise in the subsequent history of the journal was the publication of a daily issue, which before the war was undertaken during the Ironmongers' Federation Conference week, giving a full account of each day's proceedings, with sketches by its own artists. For many years illustrations, in particular of the "lighter side" of the hardware business, have been a prominent feature of the paper. A continuance of this policy was witnessed after the war, when the first page of weekly "news pictures" appeared in 1923 and has since been adopted by most of the leading trade papers. Credit for this last development is due to the enterprise of the present Editor, Mr. Norman French, who had a wide experience in the newspaper field before joining Benn Brothers in 1918. An interesting link with the firm had occurred many years before, when at the age of fifteen he was already sending paragraphs to the CABINET MAKER in such hours as he could spare from work as a junior reporter on the BRADFORD POST.

Perhaps the most striking indication of the position in recent years was the £1,000 prize—believed to be the biggest ever offered by the trade press—which the HARDWARE TRADE JOURNAL paid in 1924. The competition was designed to estimate the volume of the nation's business represented by hardware and was keenly competed for throughout the country. Retail ironmongers were invited to keep a record of their purchases from advertisers and others, from which it became clear that the hardware shops throughout the country were doing an annual business of not less than £80,000,000. In the attainment of this large turnover the hardware press can claim to play no small part, and the total serves to emphasise a point stressed before in this story—how large a share of the national trade budget is accounted for by the often despised "middle man."

Move to Larger Offices.

The twenty-fifth anniversary of the CABINET MAKER on July 1, 1905, was marked by conversion of the monthly into a weekly publication, the price being reduced from sixpence to one penny per copy. Already the journal had grown to substantial proportions, carrying more than fifty pages of advertisements. Some years before, the editorial staff had been joined by Mr. H. P. Shapland, who had a wide practical experience of furniture besides an architectural training. Until his retirement from the business in 1927, he continued to act as editor, introducing many vigorous ideas and generally developing the artistic side of the paper. In his wider capacity as a director of Benn Brothers, Mr. Shapland guided the editorial policy of all the journals, and his experience was also of invaluable aid during the building of the Company's latest premises—Bouverie House, Fleet Street. But that is to anticipate events, for we must here note the move which occurred in 1906, when the expansion of the business made it necessary to seek larger offices.

A site was purchased in Christopher Street, Finsbury, and a six-storey building erected that was to be the home of Benn Brothers for the next ten years. The firm moved in September, 1906. The autumn issue brought out that month created a record at the time as the largest periodical ever issued to the furnishing trade. The circulation was 10,000 copies. Special rooms in the new building were again available for readers, as had been the case at the City Road premises. The "Cabinet Maker Rendezvous" was opened on November 27 by Lord Monkswell. As a colleague of Sir John Benn on the London County Council, he took a keen interest in the trade, and when Chairman of the Council two years before had attended the inaugural dinner of the Furnishing Trades Provident and Benevolent Association. The need for this charity had been apparent for some time to leading members of the trade and its practical realisation was largely due to Mr. Sol Lebus and Mr. Samuel (now Lord) Waring. Only after repeated efforts was the necessary finance procured, the project being assisted through the columns of the CABINET MAKER. The enthusiastic support of the publishers has been continued throughout its first quarter-century. As the latest endeavour, in the spring of 1930, Benn Brothers' dramatic circle gave a performance at the Scala Theatre in aid of the Association's funds.

The close connection of the journal with this aspect of the trade has been maintained until the present time, and no one devoted more energy to its development than Mr. H. B. Crole-Rees, who was appointed manager in 1911. From the moment of joining the staff of Benn Brothers in 1909, when he sold advertisement space for the EXPORT WORLD, H. B. Crole-Rees has been tireless in his enthusiasm for everything connected with the Company, while establishing intimate friendships with members of the furnishing trade and in advertising circles generally. At the Olympia exhibitions since the War, the successful conduct of Benn Brothers' interests has rested mainly with Mr. Crole-Rees, and at the 1929 International Advertising Convention held in Berlin he represented the firm in conjunction with Sir Ernest Benn. It was no surprise to the staff when "C.-R."—as he is affectionally called—was appointed a Director in 1925. The management of the CABINET MAKER is now in the able hands of Mr. N. B. Mellor. The Editor, Captain E. W. Gregory, has had an unusually wide experience of the trade and was for some years in charge of the FURNITURE TRADE ORGANISER. His artistic abilities are not confined to cabinet-making, and high prices are paid for the water-colour drawings which he occasionally exhibits.

After Sir John Benn's election to the L.C.C., the direction of business was left mainly to his brother Julius. Davis and Henry also were actively engaged in editorial work, with Mr. Ernest Benn responsible for the commercial side. Early in May, 1907, the original "team" of Benn Brothers was impaired by the death of Davis Benn, at the early age of thirty-seven. In his brief career he had acquired a reputation in art that extended beyond the sphere of trade journalism. A book which Messrs. Longmans Green commissioned him to write became a

Digitized by Google

standard work on "Style in Furniture" and at once established him as an expert in this subject. Davis also acquired considerable ability at the piano and for some years assisted John Benn in his professional lectures.

"The Export World."

Having successfully established two papers and failed with a third, Benn Brothers next founded the EXPORT WORLD, in 1907. The principal paper in the field at that time was the BRITISH TRADE JOURNAL (now amalgamated with the EXPORT WORLD), but there was ample scope for the new monthly, which soon became widely known as the "shop window of British commerce." Encouraged by this experience, the publishers followed it by another important endeavour in the interests of overseas trade. The ideal method of advertising British goods in foreign countries was to do so in the local language, and accordingly the publication was commenced in Buenos Ayres of a monthly journal, printed in Spanish, with the title EL COMERCIANTE ARGENTINO. In this connection Sir John Benn visited the Argentine in 1910, where he was received as a guest of the Republic. A wonderful opportunity was afforded to secure an insight into the fundamentals of South American commerce. Accompanied by Lady Benn, he visited all the principal centres from Buenos Ayres to Valparaiso. Some years later this Spanish journal had to be discontinued owing to the War, but in the short period of its existence it established claims to being the most successful publication of its kind ever produced. The enterprise has its modern counterpart in the Spanish edition of the BRITISH TRADE JOURNAL, with the distinction that this is printed in London and afterwards distributed abroad. A similar idea in regard to the Chinese market was in contemplation when war broke out, and it may possibly be revived among the future endeavours of the publishers. In 1912 the EXPORT WORLD was strengthened by the acquisition of COMMERCIAL INTELLIGENCE. Benn Brothers had already added to their foreign connections by acting as agents for INTERNATIONAL MARINE ENGINEERING. This journal was published in New York, and naturally the War made its discontinuance necessary so far as the London end was concerned.

CAPTAIN OLIVER BENN.
Before the war Manchester representative of Benn Brothers, Ltd.; killed in Gallipoli, June, 1915

Everyone remembers the slogan which made its appearance on the outbreak of war. Once it was seen that the nation was in for a prolonged struggle, "Business as usual" appeared in every shop window, traders realising that renewed efforts must be made if supplies were to be maintained. This duty in the new emergency was promptly recognised by the CABINET MAKER, which in a leading article of August 15, 1914, named among the King's Enemies not only those who hoarded gold and food but "the employer who discharges a man except from the direct necessity, the man who does anything to disturb the normal condition of business, the man who thinks of his profits before his country, the man who needlessly cancels a contract." Though itself already reduced in size, the journal ten days later came out with the headline "Capture German Trade," over an article urging British manufacturers to tackle in particular the carpet trade. Full details were published of the exports of carpets, rugs, etc., from Germany and Austria-Hungary to the neutral markets of the world, coupled with the slogan "Fight the Enemy from your Office Desk." In pursuance of this plan, a German Trade Register was initiated in September, merchants being invited to send the Editor confidential particulars of goods previously bought from the hostile powers, also of sales made abroad and now available for British markets. The information was registered by the journal and used to effect introductions, thus retaining within the country the import and export trade hitherto carried on with Germany.

Normal trade operations became increasingly restricted, but business men as a whole were slow to admit that the War would be of long duration. Once again the initiative rested with the trade journals, which foresaw the need for adapting factories to military requirements. Among the first steps in this direction were the special Aircraft Issues published by the CABINET MAKER. A huge demand for aeroplanes had suddenly been created and could only be satisfied by every available woodworking plant being converted for their manufacture. Raw materials for domestic products were strictly controlled and supplies diverted for the production of propellors, wing-frames and other aeroplane parts. Twice a month, from early in 1915, the journal devoted its pages to the new subject and this information was of great service to the "mobilised" industry.

Long before conscription came into force, the staff of Benn Brothers was already diminishing in numbers. Mr. Oliver Benn, the youngest son of Sir John, who for some years had represented the firm in Lancashire, was among the earliest to enlist, having already obtained a commission in the Territorial Army. Another director, Mr. C. E. Hughes, joined the East Indies and Egypt Seaplane Squadron, of which he has written the history under the title "Above and Beyond Palestine." Very soon many principal posts were vacated and came again under the personal control of Sir John Benn, who resumed active work in the business. While remaining Chairman, he had previously left its direction to Mr. Ernest Benn, who now gave part of his time to work at the Ministry of Munitions.

Many casualties in the ranks of the firm occurred in the next few years. None was more keenly felt by the staff as a whole than the loss of "Mr. Oliver," who was reported missing in Gallipoli in the spring of 1915. For two years the family made exhaustive enquiries but without definite news, and it then became necessary to assume his death, which had occurred at the early age of 28. From boyhood he had good health, but in 1911-12 he was obliged to winter in Switzerland. On the outbreak of war he at once attempted to join the Army, but the doctors declared him unfit and he was thus kept in civil life for a few weeks. But nothing could dissuade him from repeated efforts to join up, and in October, 1914, he was gazetted to the 9th Somerset Light Infantry. Previous military experience in the 7th Manchesters proved useful to him, and he soon secured his third star.

Early in 1915 a draft of officers was required for Gallipoli and, with a dozen others, only one of whom has returned, he set sail from Plymouth on May 10. On May 29 he arrived at the Peninsula, and was given command of the X Company of the 1st Essex Regiment. Within a week he led an attack on trenches in front of Achi Baba, and on the night of June 5-6 was reported missing. The Company lost three captains in a fortnight, and Oliver Benn was one of them. It is therefore not surprising that no authentic details are available of the manner of his death. Survivors of the battle who were traced in hospitals in England and in Egypt gave varying stories, but all agree on one point, that he led his men into action with a fearlessness and cheer worthy of the "regulars" whom he had the honour of commanding.

Advertising the Army.

"Oliver Benn was one of the keenest of men," a colleague wrote. "He gave of his best in whatever he undertook; nothing could daunt or discourage him. It will be hard to find his equal as an advertising man. He was a keen yachtsman, and some years ago in company with his brother Wedgwood, he cruised across the North Sea in a seven-ton smack. As showing his love for the Army, a circumstance should be recorded which is of special interest in view of later developments. Two years before the War he prepared a memorandum on 'Advertising the Army' in which he argued that the Territorial Force could be enlarged and encouraged by this means. The document was submitted to his superiors in the Manchester Regiment and to other authorities, but in those days it was considered unthinkable that the War Office could descend to advertising. Most of his ideas were afterwards adopted in the famous recruiting campaign for 'Kitchener's Army.'"

As the War progressed, Benn Brothers had to face an

Bleriot's machine as it appeared on landing in the field behind Dover Castle, after the first cross-Channel flight, July 25, 1909. (Photograph reproduced from AERONAUTICS, *August,* 1909.)

increasing shortage of staff in common with other businesses. It was not surprising that the opportunity soon arose to acquire some smaller publications that were experiencing even greater difficulties. The first of these was a pioneer flying paper known as AERONAUTICS, founded in 1907 and first edited by Major B. Baden Powell and Mr. J. H. Ledeboer. The journal had been started two years before the first flight over the Channel and was devoted from the outset to the technical aspects of aviation. Gradually it grew from a monthly of slim proportions to an established weekly and it was among the few publications that received an immediate benefit from the War. No science developed so rapidly as aeronautics and many experts hitherto regarded with mild amusement on account of their eccentric hobby, at once found their value recognised.

The First Hundred Aviators.

The copyright of AERONAUTICS was acquired by Benn Brothers in 1917, and the most important event in its history occurred in July, 1920, when a dinner was organised to the first hundred British aviators and pioneers of British aviation. When the plan to hold the function was announced it met with such an immediate and widespread response that a committee of hosts was formed, which included Lord Desborough, Major-General Seely, Sir Charles (now Lord) Wakefield, Mr. Ernest Benn and the Editor, Major C. C. Turner. The pioneer character of the journal made it well fitted to organise this function, and another qualification existed in the presence on its staff of Major Blake, the first Englishman to fly round the world. The principal guest was the Duke of York, himself an experienced pilot.

The speakers at the banquet included Mr. H. G. Wells, whose claim to pay tribute to the pioneers of flying was that he had advocated the aeroplane and the airship in his writings over a quarter of a century before. An eloquent tribute was paid in this speech to the international value of aviation, Mr. Wells expressing the view that flying had gained all it would ever get out of war and that its future progress rested entirely on the peaceful development of air routes throughout the world. Captain Wedgwood Benn, D.S.O., D.F.C., supported this prophesy. "No doubt," he said, "incredible things were achieved under the urgent incentive of war, but I think we should utterly lack perspective if we regarded the work of the pioneers of aviation merely as a preparation for that or for any war. Flying annihilates space and is the greatest civilising agent that has ever been known."

AERONAUTICS continued to flourish during the period when flying was gradually passing out of the control of the Government into private hands. But with the return to peace, the demand for aeroplanes diminished rapidly, and the journal was among the first enterprises to feel these effects. Had its pages catered for purely popular flying the position might have been otherwise, but the purpose had been from the outset to provide a technical review. In 1921 AERONAUTICS ceased publication as a separate entity and was amalgamated with the EXPORT WORLD.

Another enterprise acquired by Benn Brothers in 1917 was the ELECTRICIAN Printing and Publishing Company, which besides the journal of that name issued the FRUIT GROWER. The printing business was separately disposed of and the two papers added to Benn Brothers' list.

Although dealing with a science which is generally regarded as a new one, the ELECTRICIAN was founded in 1861, and is thus the oldest of the trade and technical papers published by Benn Brothers. An early proprietor was Sir John Pender, and the first issues were edited by Mr. Desmond Fitzgerald. At that time application of electricity was practically confined to telegraphy, the first efficient submarine telegraph cable having been laid between Dover and Calais in 1851. No celebration in the life of a journal connected with electrical science would be complete without mentioning the name of Faraday. In 1861 Faraday was still living, though his great work on electromagnetism had been done some thirty years before, and he was at that time enjoying an honourable retirement. It is a matter of interest and congratulation that he was an early contributor, and special attention may be drawn to an article from his pen on "Electrical Illumination for Lighthouses," which appeared in the issue of August 22, 1862. There are now few lighthouses that are not electrically lighted.

This first series of the ELECTRICIAN ended in May, 1864, and a new series was commenced in May, 1878, when electric lighting provided a more extended field for journalistic enterprise than was available during the former life of the paper. The telephone was also coming into use at this time, and the invention and development of these two important aids to the conduct of affairs coincides with the Jubilee period of Benn Brothers. It was nearly thirty years after the establishment of the journal before that great expansion in the use of electric power for the propulsion of tramcars and the operation of electric railways took place, a growth which has continued on an increasing scale ever since.

An Editor's Foresight.

The earlier editors deserve commendation for their foresight in recognising the prospective value of theoretical papers, which were destined to become of great practical value in after-years. An instance of this was the publication of Mr. Oliver Heaviside's long series of articles on "Electromagnetic Theory," which was not dealt with in any other publication at the time. Actually it was to prove of invaluable application in the era of telephony and electric power transmission about to begin. For all practical purposes, the theory had been scoffed at by the electrical authorities of his time, including no less a person than Sir William Preece, for many years chief telegraphic engineer to the Post Office. The main subject on which the fame of Heaviside rests, and which aroused bitter controversy, was his development of the theory of cable signalling. This theory was begun by Lord Kelvin, whose work had rendered possible the Atlantic Cable of 1865, after the failure of the 1858 cable, but it was incomplete. It remained for Heaviside to recast and remodel the theory in a more general form. Briefly, he

Digitized by Google

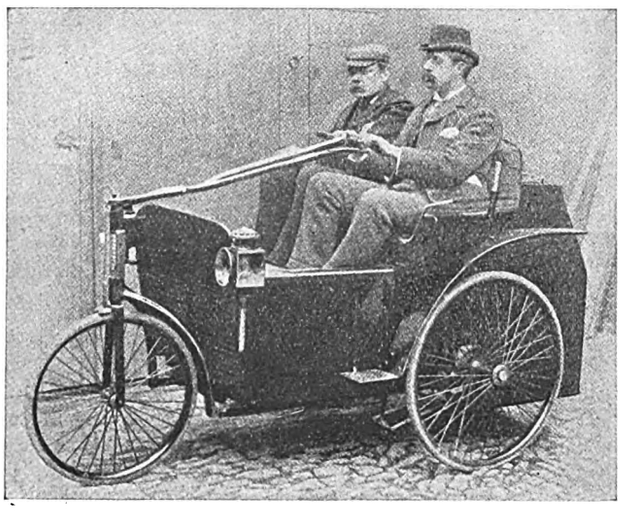
showed that the laws governing propagation of signals along wires were in many essential respects identical with the laws for electric waves in free space, thus paving the way for long-distance and wireless telephony.

In the period of his adversity, Heaviside found a staunch friend in C. H. W. Biggs, then editor of the ELECTRICIAN. Like every genuis, Heaviside was apt to exhibit idiosyncrasies. He had almost a passion for having his work published exactly as it was written, and he once went so far as to say that experience had taught him that "the refusal of a paper by any journal, for unconvincing conventional reasons, implies that the paper is unusually original and good." He was undoubtedly a "difficult" contributor, and the editor's recognition of his work was all the more creditable. In the opinion of Mr. Rollo Appleyard (author of "Pioneers of Electrical Communication"), the stalwart support of Heaviside by Biggs—amidst strife, satire and probable financial loss—remains the finest action to the credit of technical literature in our time. It ought also to be recorded that it was in the pages of this journal that Heaviside introduced and built up the new terminology needed for the development of his epoch-making theory.

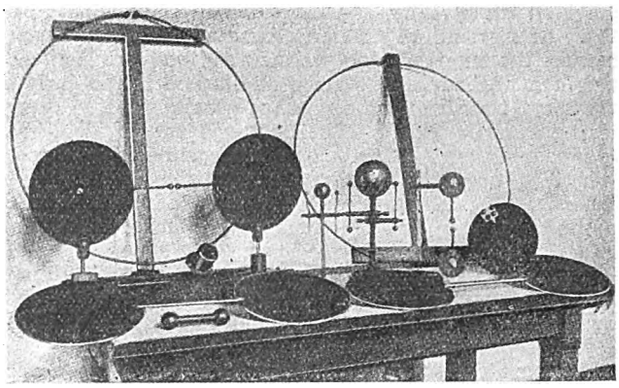
Among other notable contributions published in the early volumes of the ELECTRICIAN was Dr. (now Sir) Oliver Lodge's "Signalling across Space without Wires." This pioneer treatise was first issued in 1894 under the title "The Work of Hertz and his Successors," and it comprised the lecture given by the author before the Royal Institution on June 1 of that year. The subject was further developed a few months later at Oxford, at the annual meeting of the British Association, when Dr. Lodge gave the first public demonstration of wireless telegraphy. In the amazing progress of subsequent years, when the subject was taken up on a commercial scale by Marconi, it was the ELECTRICIAN that once more championed a pioneer inventor. In the issue of September 17, 1897, an abstract of the Patent Specification granted that year to Marconi was followed by a note drawing attention to the earlier work in England.

"In connection with the patent of Signor Marconi," the Editor stated, "we are able to present our readers with two illustrations taken from photographs of some Hertzian-wave apparatus shown by Dr. Lodge at the Oxford meeting of the British Association in 1894. . . . In fact, Dr. Lodge published enough three years ago to enable the most simple-minded 'practician' to compound a system of practical telegraphy without deviating a single hair's-breadth from Lodgian methods. Both at Oxford and at the Royal Institution, Dr. Lodge described and exhibited publicly in operation a combination of sending and receiving apparatus constituting a system of telegraphy substantially the same as that now claimed in the patent we have referred to.

"It is reputed to be easy enough for a clever lawyer to drive a coach and four through an Act of Parliament. If this patent be upheld in the courts of law it will be seen that it is equally easy for an eminent patent-counsel to compile a valid patent from the publicly described and exhibited products of another man's brain. No longer is it necessary to devise even so much as 'a novel combination of old instrumentalities,' and the saying



"New Machinery," 1896. *With this title, the above picture of the new "horseless carriage" appeared in the* BRITISH TRADE JOURNAL. *Its maximum speed was* 13 *miles per hour.*



Some of the apparatus used for the first wireless demonstration by Sir Oliver Lodge at Oxford in 1894, *photographed by the* ELECTRICIAN.

ex nihilo nihil fit evidently was not intended to apply to English patents at the end of the nineteenth century."

In reprinting these paragraphs it is not intended to revive the controversy that was settled by Marconi's acquisition of the Lodge patent in 1911. But the facts emphasise the important part played by the trade press in the story of scientific invention. The publication of technical research continues to be an important plank in the policy of the paper, which is now edited by Mr. G. H. Lepper and managed by Mr. R. D. Savage. Both men have had practical experience in the electrical industry, as well as in journalism. The Editor was for some years attached to telephone companies in the United States, and in South Africa, and served in the signals branch of the Royal Engineers during the War.

In a recent message of congratulation to the publishers, Mr. Thomas Edison said that notwithstanding the marvellous progress of the past half-century "we have only just stepped over the threshold and are entering into still more wonderful developments beyond the scope of prediction. The grateful thanks and appreciation of those interested are due to the ELECTRICIAN for the faithful service it has rendered during all these years, and I trust its days may be prolonged to record the ever onward progress of electrical science and industry."

Transport Problems.

As has been noted, the Electrician Publishing Company was also responsible for a second journal at the time when its interests were acquired by Benn Brothers. This was the FRUIT GROWER, which had been established in 1895 under the title of the GREENGROCER, FRUITERER AND MARKET GARDENER. The nearest approach to a periodical of this kind has been the HORTICULTURAL TIMES, which did not profess to be a trade journal in the full sense of the term and was closed down about the year 1891. In the trades embraced by the new journal there were "probably more persons employed than in any other group of businesses in the country." That this original claim was scarcely exaggerated is evident when it is remembered that the publication embraced commercial agriculture and all the interests, both wholesale and retail, concerned in the distribution of produce to the general public.

The FRUIT GROWER was not merely concerned with things as they were. It kept a shrewd lookout for beneficial innovations. In 1896, when motoring was in its infancy, the journal predicted the supreme value of motor transport, and published a series of articles on its application to agriculture. The development of long distance carriage brought into prominence the question of cold storage facilities on board ship. Again the details published in the technical press went far to develop this new transport from all parts of the world. The "compression" system of cooling now in general use was first applied commercially in 1880, when the *Strathleven* brought a small cargo of frozen meat to this country from Australia, but the transport of fruit raised entirely new problems. It was not until 1901 that the *Port Morant* brought her first cargo of cold stored bananas from the West Indies. As recently as 1922, about one quarter of the 2,000,000 cases of apples shipped from Australia reached England in a damaged condition. This experience was mainly responsible for the extensive study since made at the Low Temperature Research Station at Cambridge. The subsequent progress in this branch of industry is evident from the increasing range of overseas fruits that now find their way on to the British home market at all seasons of the year.

Digitized by Google

The kind of advisory assistance which is now part of the Ministry of Agriculture's technical and educational scheme for promoting the interests and welfare of food production, had its origin in the advisory service established in the early days of the journal and is continued at the present time. Answers to correspondents in regard to horticultural and legal difficulties were supplemented by a pathological department, to which any grower who found his plants affected by disease could send specimens for examination. This service commenced with the appointment of Mr. W. F. Emptage as technical adviser, a position he retained until he assumed the general editorship. The success attending these efforts was so great that personal advice was requested from all parts of the United Kingdom. The visiting of markets was accordingly undertaken by Mr. W. Vestey, who has since become manager of the journal. It may be added that the staff in recent years has travelled abroad extensively, the countries visited including France, Holland, Belgium, Denmark, Algeria, Morocco and Spain.

War Food Campaign.

The Great War proved a searching time for the FRUIT GROWER, since the industries it serves were virtually nationalised. It continued to appear, however, and in 1917 on the death of its proprietor, Mr. W. Tucker, the journal passed into the hands of Benn Brothers. The new imprint was used on March 22, 1917, and a year later Mr. Herbert Wardle was appointed editor on Mr. Emptage's retirement. In February, 1918, when the need for increased home production of foodstuffs was an urgent problem, a Food Production Number was published, which comprised 104 pages and was by far the largest trade paper enterprise ever attempted, up to that time, on behalf of the fruit and vegetable industry. A letter of commendation was printed from the late Lord Rhondda, then Food Controller. On another occasion Mr. Lloyd George, as Prime Minister, contributed an autographed appeal for increased production, as part of the national food campaign.

Throughout its career the journal has taken every opportunity of advocating the better organisation of the industry. The London and Home Counties Retail Fruiterers' Association was first suggested by Mr. Vestey, and the scheme for its organisation drawn up in conjunction with Mr. Frank Mash. Later on, the formation of the Fruiterers' and Florists' Benevolent Fund was also initiated by Mr. Vestey, and with the valuable help of Mr. John Poupart was carried through successfully.

In 1920 the FRUIT GROWER published its first Empire Trade Number, anticipating by a year the first Imperial Fruit Show of 1921. An article on the three provincial shows urged that the reputation and prosperity of the industry would gain immensely by a national show. Since 1927 the paper has been even more closely identified with the Imperial Fruit Show by means of "Grower's Day," financed by the proprietors and originated by the enterprise of the editor. This annual function comprises two conferences and a luncheon, and has increased in importance in both aspects, the guests having grown in two years from 80 to 350.

To Bouverie Street.

In the restricted conditions of personnel in 1917, a third publishing concern joined forces with Benn Brothers. This was John Allan & Co., the proprietors of the GAS WORLD. The offices of this old-established journal were located at 6-8, Bouverie Street, where further space was available in the building owned by the NEWS OF THE WORLD. As the premises at Christopher Street were no longer large enough, Benn Brothers accordingly moved their original publications to this new address.

In thus introducing the trade and technical press into the heart of the newspaper area, it was anticipating by a few years the next big step, when the firm built its own premises on the most prominent site in Fleet Street. That belongs to a later part of this story but the remarkable rise in the status of the trade journal in recent years may be remarked here. Before the war the journalist's profession was generally regarded as among the least reputable—witness how in plays the reporter is made to vie in ridicule with the policeman. Among the members of the press themselves, the most humbly regarded were those connected with trade papers. Why such an attitude was adopted it is difficult to say, since those engaged in technical work deal with highly specialised matters, of more rather than less ultimate value to the community than much of the material in the daily press. Probably its origin was connected with the contempt, until comparatively recent years attached to everything to do with "trade," in contrast with professional occupations. However that may be, a significant change has come about since the War, and among the factors contributing to the improved status of the trade paper, Benn Brothers' move to Fleet Street may claim a predominant place.

A Pioneer Development.

A passage from the CABINET MAKER of April 7, 1917, shows that the move was consciously a pioneer development. Some opening notes on the associations of Fleet Street remarked that the histories written about it record many failures as well as brilliant successes. "We frankly confess that if we were newcomers to the newspaper world we should regard our entry into the Fleet Street area as a very risky adventure indeed at the present time. But as our readers know, the position is otherwise. . . . Development is the reason for our change of address. We hold the view that trade journalism of the future must of necessity be of greater importance and assistance to the trading community than it has been in the past, and no effort to this end will be spared by us at No. 8 Bouverie Street. The developments noted above are naturally a source of strength. From the point of view of readers, the benefit accruing therefrom can hardly be calculated—a publishing house of such dimensions enjoys facilities which a single journal, working a lone furrow, cannot hope to obtain." The article might have added that the original trade papers of 1880, whatever may have been their quality from the trade point of view, cannot be considered as serious publishing propositions in the modern sense of the term.

Looking back on their history it will be noticed that they were in the control of men who, while able to claim some knowledge of the trade they were concerned with, knew for the most part nothing about the trade of publishing. Students of these matters may be a little puzzled on studying Benn Brothers' present list to notice that no two papers have very much in common from the trade point of view. The secret of the firm's success is that they recognised early the need for publishing knowledge as well as technical knowledge. They are primarily publishers and are thus able to put at the back of a trade paper the expert machinery of a large organisation. The technical excellence of the old paper remains, and is able to develop in a way which would be impossible without the strength of adequate publishing arrangements.

In the twelve years since Benn Brothers moved to Fleet Street, not only has trade journalism ceased to be regarded as the "poor relation" of the daily press but prominent figures in the latter field have actually abandoned it in favour of trade and technical publishing. For some time past the staff of Benn Brothers has been considerably strengthened in this way, and without naming particular instances, it may be safely asserted that certain leading editors who adopted this course have done so with advantage to themselves and to the firm they serve.

One of the latest recruits in this matter is the present deputy-chairman of Benn Brothers, Mr. Gordon Robbins, who resigned an important position on THE TIMES to take up his present occupation. The eldest son of Sir Alfred Robbins, he entered journalism on leaving the City of London School, and on his twenty-first birthday was already in charge of the Leeds office of the YORKSHIRE OBSERVER with four reporters under him. In 1906 a bigger opening occurred on the TRIBUNE and was soon followed by an appointment to THE TIMES, with which newspaper he was connected for over twenty years before joining Benn Brothers. During this period Mr. Robbins had a unique experience in all branches of this leading national newspaper and before he was appointed Day-Editor by Lord Northcliffe, he had worked side by side with his father as Lobby Correspondent in the House of Commons. The esteem in which he is held by everyone at Bouverie House may be best expressed in the words of the Editor of THE TIMES, who in making a presentation to Mr. Robbins on behalf of his colleagues, said that Sir Ernest Benn was "wise and fortunate" in adding to his board a distinguished member of a distinguished Fleet Street family.

"The Gas World."

Without any great stretch of the imagination the GAS WORLD may be said to have originated in a little general printing shop in the Grassmarket, Edinburgh, beneath the shadow of Edinburgh Castle. From that little printing shop the late John Allan, the founder of the journal, issued in the 'seventies a little weekly called LIGHT, which dealt mainly with Scottish gas affairs. Perhaps Allan was attracted to the subject by his intimate friendship with William Young, for many years the

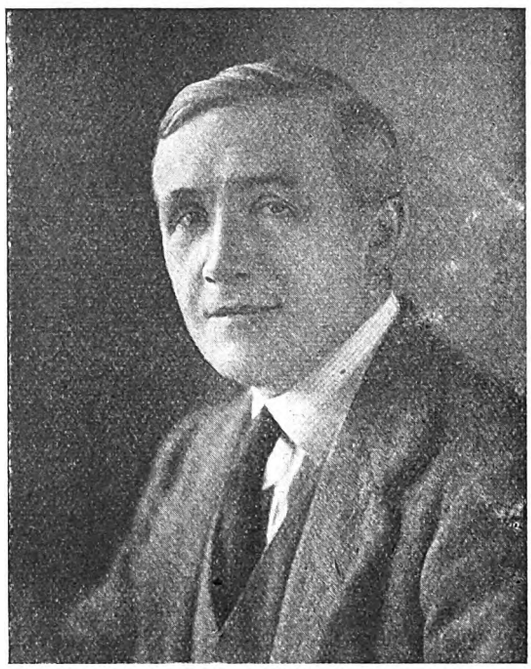
grand old man of the Scottish gas industry, and to whose memory the North British Association of Gas Managers have founded an annual lecture. Perhaps, too, he found in it relaxation from the somewhat dreary work of reporting law cases in the Court of Session for a Scottish daily newspaper. The journal was short-lived but later Allan found an opportunity to embark upon gas journalism on a wider scale, and in 1884 he came to London and founded GAS AND WATER, the direct forerunner of the present-day GAS WORLD. Offices were taken in Crane Court, off Fleet Street, nearby the house of the Scottish Corporation. At one time it seemed likely that the staff would be obliged to fall back upon this charitable institution, but the storm was weathered, and eventually there developed a robust and growing journal. Gas and water were probably associated in the title because some companies supplied both materials, but after two years' existence it was decided to drop the latter and to devote exclusive attention to gas supply and gas uses. The title was then altered to its present form, and the GAS WORLD appeared. When Mr. Allan died in 1894 the journal was taken over by a private partnership, the principal partners being two of his journalistic friends, Mr. James Stewart and Mr. John Douglas, with whom was associated Mr. E. P. Haslam, a well known figure in the advertising world. At the beginning of 1917, John Allan & Co., as the proprietors continued to be styled, amalgamated with Benn Brothers.

Forty years ago trade and technical journalism was a somewhat stodgy and slow affair. If a meeting was held on a Wednesday, readers of any particular journal had often to wait until the next Saturday week for a report. If a conference extended over two or three days the reports in the trade journals took the form of a serial in a weekly paper, the only difference being that the break was not so abrupt as in the serial novel. Nevertheless, the method was equally tantalising. The reader interested in a big conference early in the summer did not get to the end of it until late in the autumn. The GAS WORLD started out to alter this. Perhaps it was the first trade journal to make use of telegraphy to report a meeting, as was done for the first number of what was then GAS AND WATER. On another occasion a full report of an important meeting held at noon on the Friday was on subscribers' breakfast tables on the Saturday morning. Judgment was given in the famous Welsbach patent cases on a Friday morning in 1896. The GAS WORLD had two special men in court. One man went straight from the court to the printers with one judgment, the second man followed with the second judgment, and the results appeared in that week's paper. That was pretty brisk weekly journalism in those days. For many years the paper has given full reports of three-day conferences, beginning on the Tuesday morning and ending on the Thursday afternoon, in the same week's issue published on Saturday. Whether the conference is held in London, Dublin, Belfast, Glasgow, or Aberdeen makes no difference.

Readers of the daily press will no doubt reflect that matters occurring on the other side of the world are reported the following morning, but this is not an accurate analogy. The staff of a weekly trade journal is in no way comparable in size with that of a daily newspaper, moreover the matters dealt with are invariably of technical character and demand expert knowledge in reporting. Proofs have often to be checked half-a-dozen times and in the case of gas reports there are invariably substantial sections of chemical formulæ.

No one connected with the GAS WORLD did more to improve its service in these respects than the late Peter Robertson, who joined the staff in the 'eighties and edited the paper from 1918 to 1928. Starting his career in the offices of the GLASGOW HERALD, he eventually joined John Allan & Co. and remained in charge after the amalgamation. He was succeeded in the editorial chair by Mr. A. C. Slaughter, who ably carries on this tradition in co-operation with the manager, Mr. E. H. Hallows.



THE RT. HON. WEDGWOOD BENN, D.S.O., M.P.
Secretary of State for India.

From its earliest days the GAS WORLD had devoted much space to chemistry. As the War progressed, the value of chemistry as a weapon in the struggle became increasingly realised. Many processes hitherto carried out in Germany had to be operated in this country and remarkable developments took place in the industrial applications of the science. It was not surprising that the need arose for a new trade journal to reflect this extended activity, nor that it should be promptly founded by the proprietors of the leading gas publication.

"The Chemical Age."

As soon as conditions allowed, not many months after the Armistice, the CHEMICAL AGE was started by Benn Brothers as "a weekly journal devoted to industrial and engineering chemistry." It was launched with the warm recommendations of eminent public men and scientists, among them the Rt. Hon. H. A. L. Fisher, Minister of Education, Lord Sydenham, President of the British Science Guild, Sir Edward Thorpe, and Lord Brotherton. The first number appeared on June 21, 1919, and on December 28, 1929, its Annual Review Number was the largest published in its history. The enterprise was a natural outcome of the immense debt that the nation owed to applied science in the final victory of the Allied Forces.

How successfully the original aims of less than eleven years ago have been realised may be judged from the bare mention of some principal achievements. Before the War Great Britain imported about 80 per cent. of its essential dyestuffs, mainly from Germany, and during the War the great textile industries found themselves suddenly deprived of the colours on which they depended. To-day the position is almost reversed. We import rather less than 20 per cent. of foreign dyestuffs and the remainder are manufactured in this country, providing, incidentally, a school of organic chemists and essential reserves should a similar time of national emergency unhappily recur. During the War, again, while we were laboriously and at a great risk and cost, shipping natural nitrate from Chile for the manufacture of fertilisers and explosives, Germany was obtaining her supplies of nitrogen from the air, by the synthetic process perfected by two of her great chemists, Drs. Bosch and Fritz Haber. To-day our country is producing ample supplies both for the home market and for the Empire, at the great works established by Imperial Chemical Industries at Billingham-on-Tees for the fixation of atmospheric nitrogen.

Chemical engineering, which a decade ago was little more than a name, is to-day a vigorous applied science, with a well-established Institution of Chemical Engineers, and an enormous field in the design and construction of chemical plant. In the same period our former dependence on Germany for scientific glassware and laboratory furnishings has been ended. In the important field of fine chemicals, British chemists have also made immense strides and British products are not only being produced in great variety but have already attained a reputation throughout the world for their standards of purity and dependability.

In the period covered by the comparatively short life of the CHEMICAL AGE, this industry has undergone an amazing transformation, in which the journal may claim to have played a notable part. Its history has demonstrated how a great publishing house, with its resources for news collection, for the instruction of public opinion and the stimulation of enterprise, may bring even into a difficult scientific field like chemistry the spirit and atmosphere of progress. The journal has not only interpreted chemistry to the public and helped to make the nation sensible of its debt to it; it has interpreted chemistry to chemists themselves and put new heart into them by emphasising the vital importance of their work. From the outset the paper has been edited by Mr. F. E. Hamer, now a director of Benn Brothers, who had a distinguished career in journalism before joining the company. Many years with the MANCHESTER

GUARDIAN culminated in his election in 1914 as President of the National Union of Journalists. During the War his assistance was constantly sought in press matters, one of his achievements being an important amendment of the Defence of the Realm Regulations. Mr. Hamer's mementoes of this active period include a telegram from the King and letters from King Albert and M. Poincaré. The manager of the CHEMICAL AGE is Mr. L. J. Moolenaar, who is steadily improving its position.

Since the science of chemistry is international, its industrial applications are largely international also. The journal has become an international centre for enquiries from points as far distant as Leningrad, the Malay States, India, Australia, South Africa, and especially Canada and the United States.

The international character of the Benn journals generally, is largely due to Sir Ernest Benn's policy, not merely of travelling widely himself, but of enabling editors, advertisement managers and heads of departments to refresh their minds and methods by periodical visits to overseas countries. His eldest son, Mr. John Benn, was a student for some time at Princeton University, where he studied chemistry before joining the firm. His second son, Mr. Glanvill Benn, gained an inside knowledge of American newspaper ways on the staff of the NEW YORK TIMES, and visits to Canada have made him acquainted at first hand with Canadian publishing enterprise. Mr. F. E. Hamer, attending the annual convention in New York of the Associated Business Newspapers of America, has met personally the leading representatives of the American trade and technical press, and learnt all that a visitor can learn of the amazing enterprises of American firms.

The result is that the firm of Benn Brothers and its publications are known to publishing and newspaper firms throughout the vast continent of the States and the great Dominion of Canada almost as well as their own firms and productions. Both sides benefit from this close international contact. They both learn the best that their overseas rivals can teach, and readers and advertisers get the benefit of this vast organisation. Beyond all this, there is the broad national advantage of a mutual understanding of conditions and of personal friendships, which help to safeguard the good relations essential to the peace of the world.

"Ways and Means."

Another publishing enterprise that was the outcome of the War was not so successful. WAYS AND MEANS appeared a few months after the Armistice as a weekly review of industry, commerce and social progress, and was conducted somewhat on the lines of the SPECTATOR. It was not strictly speaking a trade journal, but in so far as its interests were common to the business community at large, the publishers felt the enterprise to be justified. More than a decade after the events it is difficult to recall the atmosphere of uncertainty which prevailed, while vast industries like iron and steel were endeavouring to readjust themselves to peace-time requirements, and other trades were still in process of denationalisation. Thousands of men were being demobilised and had again to be absorbed in business. Mr. Ernest Benn was at the time an active member of the Ministry of Reconstruction and while enthusiastic in its work was among the first to recognise the limitations of the bureaucracy, with which nearly every department of the national life was still surrounded.

The new weekly was issued on March 8, 1919, under his personal editorship, assisted by Mr. Henderson Pringle (now Principal of the Birmingham Commercial College). The atmosphere of hope that prevailed after the enormous struggle of the previous five years was reflected in the opening pages. "WAYS AND MEANS," we read, "starts its career at the beginning of a new era; it will be working on new ground; its purpose is to establish a new point of view. It aims at being the organ of industry and it makes its appeal to the great public, a bold and exceptional thing to do and one which a few years ago would have been regarded as entirely impossible. . . . The universal demand is for an improvement in the standard of living and that demand can only be satisfied by industry. The man who produces a few tons of rubber or leather or jam is doing far more to 'win the peace' than the government that establishes a Ministry of Something, or the inventor of another pension or dole panacea which accentuates instead of removing a bit of need." In the same article the editor admitted that the journal was in the nature of an experiment, which might not succeed for many years to come. As events turned out, only three volumes of WAYS AND MEANS were published, yet in the paragraph just quoted there was a prescience which was truly remarkable. Without entering here into the controversies of

politics, its conclusion may be emphasised ten years later, when a Minister of the Labour Government has been obliged to admit that there is no magic cure for the revival of trade.

But WAYS AND MEANS did not confine itself to criticism. Its pages were crammed with constructive proposals in regard to every aspect of industry. Perhaps its failure was accounted for by making too wide an appeal. The early issues contained contributions from the Rt. Hon. J. H. Whitley, who explained the Industrial Councils which were then being set up in the leading industries of the country, and were soon to exercise a profound influence in the cause of industrial peace. Benn Brothers were closely allied with the movement and through their trade journals also took an active part in promoting this new instrument in industry. Another writer was Mr. J. R. Clynes, the present Home Secretary, who took as his subject the responsibility of trade unions.

National Service.

Only in perspective can any period be accurately judged, and it is still not generally realised how perilous the situation was in 1919. Apart from the vast problems of reconstruction, the natural tendency to reaction from the efforts and strain of war had to be combated. WAYS AND MEANS not only forms a permanent record of this period but at the time it undoubtedly performed an important national service. If its sphere of influence was limited, the journal attracted considerable attention among the leaders of industry and those engaged in all ranks of trade and commerce. It was to the forefront in supporting every movement to promote the better relations of employers and employed—work that was to bear full fruit during the succession of strikes and lock-outs shortly after the "boom" period, which were singularly free from the bitterness characteristic of earlier struggles.

Having started WAYS AND MEANS to deal with the problems of industrial reorganisation at home, Benn Brothers soon followed this with a similar effort on an international scale. This was known as the EUROPEAN COMMERCIAL and was published in Vienna from the autumn of 1922 till early in 1924. The first years of peace had seen a succession of conferences on reparations, with indifferent results owing to the political animosity that still prevailed. Leaders of business were beginning to realise that international settlement did not demand further elaborate machinery, so much as mutual trust and good will. "The new spirit of to-day," said the EUROPEAN COMMERCIAL, "demands that more definite steps be taken to ensure that, free from bias toward any country whatsoever, and honestly in the interests of Europe as a whole, facts regarding the commercial and economic position of the various business centres of Europe should be made available to all concerned." The first number published reports from its own representatives in Brussels, Sofia, Prague, Copenhagen, Amsterdam, Budapest, Trieste, Warsaw, Constantinople, Bucharest, Stockholm—and even Moscow—besides from London, Paris and Berlin, and it met with enthusiastic approval in all countries. The British Prime Minister sent his congratulations on the enterprise, as did the leaders of commerce throughout the Continent.

Apart from its mission of reconstruction, the new journal was following a tradition already established by Benn Brothers, such as EL COMERCIANTE, for promoting British trade abroad. It was therefore of direct value to the publishing business as a whole. The circulation on the Continent which the trade journals enjoyed before the War was slowly being recovered, and the EUROPEAN COMMERCIAL was in the nature of a traveller for every Benn publication. More important still, its representatives in every large centre provided an organisation covering the whole of Europe, for the provision of facts required by the journals issued in London. The English staff in Vienna numbered six, and was strengthened by four Austrian journalists and experts. The Editor was Mr. T. Mortimore Sparks, who for some time had been financial editor of the SHEFFIELD TELEGRAPH before joining Benn Brothers to conduct the HARDWARE TRADE JOURNAL. Shortly afterwards he was selected by Sir Ernest for Vienna, when he also visited the principal European capitals. The manager of the new enterprise was Mr. F. Kirby, who had joined the firm many years previously when VANITY FAIR ceased publication.

Readers will remember the rent restriction measures to which Vienna was subject at this time. One effect was that the new journal occupied a magnificent office in the Hohenstaufengasse, which seemed like a palace to the London staff who had been sent out to run the enterprise. The building was situated in the banking quarter of the city, with frontages on two streets. The printing arrangements were complicated by the fact that the compositors did not understand English, and every line of copy had thus to be typewritten. But the work was carried out in premises described by visitors as "the finest of its class that we have seen anywhere in the world." In spite of strikes and uncertainty, Vienna was already putting itself in the forefront as regards industrial welfare—work that was assisted by the depreciated currency. "A typical staff restaurant, not very far from our offices, serves 850 dinners every day, from beautiful modern kitchens, attached to a sort of roof-garden restaurant of the most attractive description. A plate of meat, vegetables and a sweet are daintily served to this vast army of employees, at the price of 5,000 crowns, or the equivalent of about 3½d. each."

THE LATE SIR JOHN BENN.
From the portrait by Sir William Orpen.

When figures like these are quoted, it is not surprising to learn that the EUROPEAN COMMERCIAL had to be abandoned in 1924, largely owing to the unstable conditions that continued to prevail. But in the history of journalism and the "post-war period" the enterprise was unique and the publishers look back on it with nothing but pride. The connections formed on the Continent have proved of lasting value.

It has been convenient to describe the activities of the War and its outcome in a consecutive story. We must now consider other landmarks in the period. The first of these unhappily was the death in 1919 of Mr. Julius Benn, the first partner in the firm which for fifty years has been able to justify literally its designation as "Benn Brothers." One of his early successes was in the production of furniture trade catalogues. In the days when the arts of advertising were not so highly developed as they now are, Julius Benn was responsible for the production of the largest volumes that had, up to that time, appeared. Notable among these was the Whiteley catalogue, which he personally arranged for many years in succession. His reputation spread overseas, and he was entrusted with the issuing of an important periodical for a firm in Cape Town, a commission which he held until his retirement from business. When in 1889 his elder brother entered political life, Julius became the senior director of the firm.

Until the day of his death he was always proud of his ability to take a shorthand note, having been one of the first to learn the Pitman system. Julius used this shorthand in social work, and for forty years held regular classes in connection with men's clubs, where he trained hundreds of pupils. For neatness and accuracy his own hand was unsurpassed, and there must be many people still working in the City to-day who owe their skill to his training. If an explanation were needed for this philanthropy, it would be found in the deep-seated love of his fellows that was characteristic of the man. Like Sir John, moreover, he never forgot his early struggles and throughout life it was to helping others to

Digitized by Google

rise from the ranks that Julius devoted his leisure and skill, "Mr. Julius was in a sense the father confessor to many in the trade," said a memoir writer in the CABINET MAKER. "If it was a question of partnership or a financial rearrangement, or the development of a new department at home or overseas, or even of the engagement of a manager or traveller, they would seek his advice and assistance. The measure of his success in obtaining the confidence and affection of his contemporaries is in no way better shown than in the fact that it was the exception to add the word Benn to Mr. Julius."

A Business Romance.

In the two years after the move to Bouverie Street the facilities of Benn Brothers for dealing with a group of publications had steadily improved, but the firm had confined its activities to trade journalism. A departure from this policy now occurred, in 1919, when two papers having a popular as well as a technical appeal were acquired—GARDENING ILLUSTRATED and FARM AND HOME. The latter dealt with agriculture from the standpoint of the small farm-owner, but mainly owing to an endeavour to cover interests that were too ambitious for a single paper, it had to be discontinued. By contrast with this failure, GARDENING ILLUSTRATED was a romantic success.

"My horticultural guide, philosopher and friend," was how Sir Rider Haggard described GARDENING ILLUSTRATED, a tribute typical of the affection in which this paper is held by the more advanced amateur and professional gardeners. As the first penny gardening journal, it had instantly achieved a memorable success. William Robinson, its founder and first editor—the author of "The English Flower Garden," "The Vegetable Garden" and other horticultural classics—discovered that there was a big public waiting for an attractive paper at a popular price, and in the short space of nine months after its foundation on March 15, 1879, this new weekly acquired a very large circulation. The newsagents described it as "the penny startler," so sensational was its success. On the personal side the enterprise was not less romantic. Robinson had started life as a garden boy, and in the course of time was to purchase Gravetye Manor, a grand Elizabethan mansion in the heart of Sussex, where he is now living in retirement in his ninety-fourth year. Not that he regards himself as an old man; he looks forward with confidence to his hundredth birthday, and is meanwhile making plans for the further development of the gardens. The Gravetye Manor Estate comprises many hundreds of acres, including some of the finest timber in the county, and is a source of joy every year to thousands of visitors from all parts of the world.

From the outset Robinson's enterprise attracted the support of the biggest gardening celebrities. Dean Hole, Gertrude Jekyll, Peter Barr, and many others dipped their pens assiduously for him in propaganda for the betterment of English gardens. The paper's practical features, experienced writers, and unique illustrations gave it a foremost place in amateur gardening journalism, and even the professionals welcomed it as a paper they could make their own. Early readers will also remember the colour plates by Moon, which no gardening paper has ever surpassed in standard. The editorial policy has been consistent, and the founder's right-hand man and disciple, William Thomson, who succeeded him as editor in 1893, faithfully carried on the Robinson traditions until he died in 1927 after forty years' prodigious service to the paper. He was awarded the Veitch Memorial Gold Medal in 1926 for his contributions to horticultural journalism. The present editor, Mr. H. Cowley, widely known as a plant-hunter, is a popular figure in gardening circles, as also is the manager, Mr. H. W. Duck.

SIR ERNEST BENN, BART.
From the portrait by Sir William Orpen.

We are dealing with events in chronological order and the next to be noted is the presentation to Sir John Benn which was made by the staff on his seventieth birthday (November, 1920). A book containing over two hundred names conveyed the congratulations of those to whom the "Chairman" was a familiar figure. Since his entry into public life, Sir John had remained a frequent visitor to the office. Every year he made a point of handing the Christmas bonus personally to each member of the staff. His renewed activity during the war period brought him into further touch with Bouverie Street. On his seventieth birthday it had been intended to hold a complimentary luncheon, to commemorate his thirty-two years of consecutive service on the London County Council, but Sir John's health at the time made it impossible to proceed with the idea.

The function accordingly took place in the following spring, in April, 1921, when the Marquis of Lincolnshire presided over a large company of business and political acquaintances gathered to honour the "Father" of the L.C.C. A telegram was received from Lord Stamfordham stating that His Majesty was "interested and pleased to hear of this recognition of Sir John Benn by his friends and admirers for his long service in the government of London."

Proposing the chief toast, the chairman said that although there were many present at the luncheon who could look back a long time, Sir John Benn was the only original member of the L.C.C. who was now a member. In reply Sir John said that the question would naturally be asked: "What did these people do for London?" The Council (he stated) was preceded by the Metropolitan Board of Works, which left them a glorious legacy in the shape of the Thames Embankment.

What memorials had the old L.C.C. left? Sir John continued. "One of the most important was the Strand improvement. In the early days it was one of the most disgraceful slum areas in London, but it had been removed and the most remarkable transformation scene in any city in the world had been effected. A rateable value of £92,000 had already become one of £117,000, and when all the buildings were up it would reach £360,000. When the whole scheme was completed the ratepayers would possess one of the greatest municipal assets in the world." He referred with pride to what the Council had accomplished for the health of London, the reduction of the death rate, the provision of tramway services and housing schemes. On the latter they had spent nearly £300,000 and these were paying their way on economic rents. Many acres were added to the parks, and the amusements of the Metropolis had been purified and made more popular by their wholesome policy. "The record of the L.C.C.," Sir John claimed, "would bear examination and was a source of justifiable pride. Those present should preserve as a precious heritage the ideals of those early days."

The Joy of Work.

In the following spring (1922) Sir John contested yet another election and was returned again for Kennington. Side by side with his work on the L.C.C. he had in earlier years been a Member of Parliament. At the 1892 election he gained St. George's-in-the-East for the Liberal cause, defeating the Conservative candidate, Mr. C. T. Ritchie, by 398 votes. The victory set up a record in the election, as Mr. Ritchie was President of the Local Government Board and was the only Cabinet Minister to suffer defeat—and that at the hands of a newcomer among aspirants for Parliamentary honours. During his membership of the House of Commons Sir John Benn consistently fought for the cause that he had supremely at heart—the new and brighter London. He was defeated at the

Digitized by Google

1895 election and two years later contested the Dartford by-election. He was again unsuccessful at Bermondsey in the "Khaki Election" of 1900, but in another by-election he provided in 1904 a foretaste of the great landslide of 1906, by winning Devonport with a majority of 5,179. He easily retained his seat in 1906, but lost it in 1910 by 140 votes. Thenceforward he confined his efforts to municipal government.

Commenting on the 1922 election result a writer in SPACE took the opportunity to discuss the Joy of Work, and the latest example of the unceasing effort of Benn Brothers' Chairman. "The man who started in the City as an office boy at the tender age of eleven and who can fight a strenuously contested election in his seventy-second year, is made of the real stuff—the stuff that success is composed of, the stuff which is essential to every live newspaper enterprise. Sixty-one years of unceasing effort in journalism and politics is more than most of us will achieve; but it does give to all of us an example to live up to. Our Chairman has for three or four years past been under something of a cloud. The serious illness which attacked him in the middle of the War robbed us of the active young man that he was up to sixty-eight—for there surely never was a younger sixty-eight. The County Council election, with its canvassing, its meetings and all its strenuous effort, is delightful proof that the effects of the illness are passing and that being so, there is no telling what new standards of effort our rejuvenated chief may not be setting for us."

But the fulfilment of these hopes was a brief one, for a month later Sir John was taken suddenly ill at his home at Limpsfield. In April, 1922, he died after ten days' struggle to regain consciousness. He had always been a fighter and those of his family who watched his last brave struggle for life could only conclude that the end was a fitting close to his career. Sir John had died in harness, for two days before his illness he was actively engaged in Council matters and on the same morning had played his accustomed round of golf.

Business and Politics.

Although for twenty years Sir John had devoted the greater part of his time to public work, he had never ceased to be a business man, and yet so admirably and truly was he able to balance matters that there was no confusion or connection between his public and his private work. Sir John was immensely proud of his business and particularly of the developments which he lived to see in the last years of his life. At the same time he never tried to disguise the fact that he regarded it as a stepping-stone to public life; once it was established and others had been trained to carry it on, he soon gave his major attention to the London County Council. As Mr. T. P. O'Connor said in a Memoir in the DAILY TELEGRAPH, most of Sir John's public and political associates were unaware of his business activities. It was, of course, impossible to keep his business associates in ignorance of his public life, and not a few of them followed his fortunes with interest and personal assistance, for example, in election work. But a simple illustration of the consistent line which he followed in these matters may be found in the fact that in the early days of the London County Council he declined to allow any of the official announcements of that body to appear as advertisements in his paper.

The question soon arose as to what form a memorial to Sir John Benn might most fittingly take. While his name will be remembered most widely on account of political activities, he was also the founder of an important business, and something commemorating both aspects of his career was desirable. The solution of the question came in 1924, when Mr. J. J. Mallon, Warden of Toynbee Hall, obtained an option to purchase the Barnardo Building in Stepney. The proposal was brought to Sir Ernest Benn that he should take this over as a hostel for working boys—in the district where John Benn had rendered much political service and where he had lived as an "office boy" himself in 1860. With the aid of the Carnegie Trustees and subscriptions from many friends, Sir Ernest bought the freehold and work was put in hand to make the building suitable for a resident hostel for boys. In 1927 the Prince of Wales honoured this new activity by opening the "John Benn Hostel," which provides a home in every sense of the word for about eighty boys between the ages of 14 and 18, who have no home or parents of their own, or who are "on probation" as first offenders.

Of the cost of running this valuable institution, which is entirely dependent on voluntary support, the boys themselves contribute £2,000 a year towards the budget of £6,000. No better tribute to its success can be mentioned than that the Prince felt justified in visiting the Hostel again in 1928, thus maintaining the personal interest in its work which had prompted His Royal Highness to perform the opening ceremony.

Book Publishing.

Among the romances of post-war business must be numbered the rapid rise to prominence of the book publishing company formed by Sir Ernest Benn in 1923. For some years a series of technical books had been issued by Benn Brothers, later a series of volumes on Ceramics and Oriental Art was added, and the rapid growth of this department made it advisable to launch it as a separate organisation. In less than seven years, all classes of production have been successfully undertaken, from art books priced in many guineas at one extreme to the famous Sixpenny Library at the other, with works of biography, fiction, history and *belies lettres* in between. Factors which led to the creation of a separate company included organisation and finance, in which there are considerable differences between a journal and a book. The one is produced and published in seven days, the other may involve work extending over many months and even years.

Ernest Benn, Limited, arose out of Benn Brothers and the closest co-operation has continued to exist between the two companies. The CABINET MAKER, for example, was the parent of Mr. H. P. Shapland's classic work on "The Practical Decoration of Furniture," while from its earliest days the ELECTRICIAN had published many standard volumes, notably Heaviside's monumental "Electromagnetic Theory." The TIMBER TRADES JOURNAL, again, had built up a library of books like "Shipping Marks on Timber" and the "Zebra Code," which are known and used by the timber industries the world over. These several series were brought together and enlarged by Ernest Benn, Ltd., and other departments of technology developed, always with the idea of providing expert help for those engaged in the leading industries. Thus the chemical engineering list includes Stanley Green's "Industrial Catalysis." Under the heading of mining and metallurgy is Mr. Clements' great work on "Blast Furnace Practice." Agriculture, horticulture and fruit growing form another important section of the scientific list, which besides technology comprises important books on pure science, like Sir Oliver Lodge's "Atoms and Rays."

Before the end of their first year's trading, Ernest Benn, Ltd., had taken a full-page advertisement in THE TIMES, the first space of the size to be reserved in this newspaper by any publisher. A dominant position had been reached in a field where the Continental art publishers were previously unchallenged. Art books demand the most skilled typography obtainable and the closest attention to the pictorial aspects of production—the selection of originals suitable for the block-maker, the process to be employed, the passing of the proofs (sometimes requiring six operations), the choice of paper and ink. All these factors are vital to success. Ernest Benn, Ltd., was fortunate in having from the outset the services of Mr. C. E. Hughes, a director of the older company, and the author of several books on painting. For many years he had collected and studied pictures, and was recognised as an authority on water-colour. Mr. Hughes was therefore already *persona grata* with the officials of the principal art galleries and museums, before the new business made their co-operation invaluable. It is no secret among his colleagues that the art books owe their success on the production side to his unusual qualifications.

"The Eumorforpoulos Catalogue."

To name the art books issued by Ernest Benn would require several columns. Highly specialised subjects like Mediæval Wall Painting have appeared in the firm's list, but perhaps the most notable contribution to the permanent literature of art is the "Catalogue of the George Eumorfopoulos Collection." It is generally agreed among orientalists that the collection owned by Mr. George Eumorfopoulos, the doyen of the Greek community in London, is the most wonderful of its kind in the world. Pictures, sculpture, jewellery, metalwork, jade, glass and ceramics comprise the principal departments, in which every branch of Chinese art is represented by material of the first importance. The volumes which Ernest Benn have undertaken now number fourteen. The initial series was devoted to Ceramics, and the services of Mr. R. L. Hobson of the British Museum were enlisted as editor. A scholarly introduction to each volume is followed by ample coloured plates of the finest specimens, with illustrations of others in collotype. Nothing of importance is omitted, and by turning its pages the reader can view practically the whole collection, besides reading a description of every piece. Ceramics was followed by other volumes on paintings, bronzes, jades and sculptures, and the Catalogue, now nearing completion, is agreed to be the most sumptuous publication on Chinese art ever issued in any country.

By a happy coincidence one of the first volumes of a general character which the firm produced was Mr. A. G. Gardiner's

Biography of Sir John Benn. Apart from giving a full account of the early activities of the founder of the firm, this book made an important contribution to contemporary history. The title was "John Benn and the Progressive Movement," and in its pages the story of the London County Council was told for the first time.

The book which may be said to have established the reputation of Ernest Benn, Limited, as publishers of biography was, however, published in 1926, when the first two volumes of the now famous "Intimate Papers of Colonel House" appeared. Since then many important biographies and memoirs have been offered to Ernest Benn, Limited, and of the subsequent publications may be mentioned the "Life of Lord Curzon," by Lord Ronaldshay (now Marquis of Zetland), "The Memoirs of Mr. T. P. O'Connor," and "The Letters of Gertrude Bell."

In addition to Sir Ernest Benn, the directors of the company are Mr. Gordon Robbins (vice-chairman), Mr. C. E. Hughes, Mr. J. A. Benn, Mr. E. G. Benn (general manager), and Mr. K. E. Hughes. The sales manager is Mr. G. Gilman, and the technical book department is in charge of Mr. L. P. Shapland and Mr. E. G. Hawke.

The next addition to Benn Brothers' list in 1924 was the journal known as DISCOVERY. Founded in 1920 and first published by Mr. John Murray, this "popular journal of knowledge" was established under a Trust, of which the present members are Sir J. J. Thomson, the Master of Trinity College, Cambridge; Sir Frederic Kenyon, director of the British Museum; Professor A. C. Seward (Cambridge), and Professor R. S. Conway (Manchester). To safeguard the editorial policy and to secure the co-operation of expert writers, a committee representing the principal learned societies and scholastic associations was formed, and from the outset has met twice yearly to promote the interests of the enterprise.

Perhaps the most spectacular of the discoveries so far published in its columns was the achievement of television, first announced by the inventor in the issue of April, 1925. At that time Mr. John Baird was transmitting outline images on an apparatus that the editor described as "astonishingly crude." The optical system was composed of bicycle lamp lenses and the framework could only be termed "an unimpressive erection of old sugar boxes." When the Editor (at that time Major Pollard) was asked to inspect the new invention, it had just been placed on view by Messrs. Selfridge's at their Oxford Street premises. The scope for television had long been recognised as enormous, but it needed great courage to predict early success for the Baird method. Nothing more than shadow outlines could be transmitted and the inventor lacked any financial support. Major Pollard foresaw the possibilities of the apparatus, which less than five years later sufficiently developed to justify an experimental service through the B.B.C. station. Since 1926 DISCOVERY has been edited by Mr. J. A. Benn, and the manager is now Mr. G. P. Grieve.

The popular papers in Benn Brothers' list were augmented in 1927 by another entitled the NURSERY WORLD. This weekly periodical had been founded in 1925 by Messrs. Faber & Gwyer, to meet the problems of mothers and nurses but in less technical terms than the professional papers; at the same time there were pages of recreational interest. The staff was enlisted from the ranks of trained nurses and a principal feature was the enquiry bureau, to give readers free advice on all matters of child welfare. By June, 1927, it became obvious that a larger publishing organisation was required to maintain the paper, and the copyright was sold to Benn Brothers. At that time its advertisement pages numbered only one-sixth of the contents. The subsequent improvement, under Mr. Washington Flatt's management, has been such that about one-half of each issue is now devoted to advertisements. The editor is Miss Cody.

"The Timber Trades Journal."

The next trade journal to come to Bouverie Street was bought in 1925, when the old-established business of William Rider and Son was amalgamated with Benn Brothers. THE TIMBER TRADES JOURNAL had been founded in 1873, and was issued from Bartholomew Close where J. & W. Rider, as the proprietors were styled at the time, had carried on a printing business for more than a hundred years. During the first half of the nineteenth century all imported timber was dutiable with a tariff in favour of the Colonies; the importing business was in the hands of a few firms who conducted it on very conservative lines. The outlay attaching to the payment of the duty and the necessity of passing the entries before the delivery of the goods prevented the small buyer from meddling with the import trade, to the advantage of the large merchant. Not until the abolition of the duty in 1866 did appreciable expansion occur; the free importation of Scandinavian wood then brought about great developments, which continued apace until the Franco-Prussian War of 1870. For the next few years the timber market positively boomed, in common with the trade generally in Europe. In 1873—when the TIMBER TRADES JOURNAL was founded—the softwood timber imported was alone estimated at £17,000,000, an increase of five millions over the preceding year. Free Trade in wood had increased the number of firms engaged in the business and new methods were being introduced. At this transitional period the need was felt for a trade paper as an independent medium between exporters, importers, and merchants. The first volume was scarcely concluded when the trade reaction of 1874 occurred, making the continuance of the journal no easy task.

At the outset, in the early seventies, much of the timber trade of the metropolis was concentrated above London Bridge, on the south bank of the river. Half of the population of Lambeth is said to have been employed in this work; wharves

were numerous and extended at intervals from Blackfriars to Stansgate in Essex. At that time shipbuilding had not finally left the Thames, house-building was going ahead rapidly in all the outer suburbs, and the timber trade shared in the general prosperity. Most of the wood coming to London was disposed of to merchants who possessed waterside premises, on the river or canals, and provincial firms filled their requirements from London stocks. Gradually a new element entered the trade, when certain merchants moved to offices in the City. In the course of time the Surrey Commercial Docks, where shedding accommodation was provided, became the timber yard of the City firms.

The predominant importance of overseas trade in timber was recognised from the start, and representatives of the journal have paid regular visits to the Scandinavian countries, to Russia and to the United States. The most recent tour was made by Sir Ernest Benn in 1929 to the Baltic States, where he lectured extensively before the Chambers of Commerçe and other business organisations. Perhaps the most vigorous traveller on behalf of the enterprise was Mr. Edwin Haynes, who almost from the beginning had guided its destinies. His early adventures included being among the few English people to escape from Paris just before the siege by the Prussians, and he soon became an equally popular figure with the timber traders abroad, as among his colleagues in this country. It was, indeed, to the unfailing energy of Mr. Haynes during more than fifty years' service as editor and director that the TIMBER TRADES JOURNAL owed its strong position in 1925, when Benn Brothers acquired the business. Soon after the amalgamation the editorship was taken over by Mr. T. Mortimore Sparks. Like Mr. Roland Webb, who has ably managed the journal for many years, the Editor already enjoys a wide circle of friends in the trade.

It was the late Sir James Ball, when Government Timber Controller during the War, who remarked to a deputation that "he found the TIMBER TRADES JOURNAL was the timber merchant's bible."

Bouverie House.

By 1924 it had become clear to Sir Ernest Benn that new premises were required if the development of his various businesses was to continue. The advantages of a situation in the Fleet Street area had been proved beyond question during the previous seven years. A careful survey of existing premises led to the conclusion that adequate accommodation could only be secured by erecting a new building. Accordingly Nos. 154-160, Fleet Street were purchased and the several offices and shops demolished to provide a site large enough for the purpose. The next eighteen months were a period of ceaseless activity on the part of the contractors, and there emerged the seven-storeyed building known as Bouverie House, to which Benn Brothers, Ltd., and its associated companies moved in the spring of 1926. A feature of the Portland stone façade is the balcony on which trees are planted—now generally referred to as the "Four Trees of Fleet Street"—and from the roof of Bouverie House a unique view of the Metropolis is obtained, extending for thirty miles to the south. The significance of placing trade journalism in Fleet Street has been remarked on already; the erection of a special building on the finest site in what was previously the preserve of the leading newspapers, was a gesture that finally removed trade journalism from the "side street" atmosphere in which it had been born and nurtured for seventy years.

The move to Bouverie House coincided with the entry of the third generation of Benn Brothers into the business. Mr. John Benn, who joined the staff in 1925, was elected to the Board of William Rider and Son, publishers of the TIMBER TRADES JOURNAL and on its amalgamation with Benn Brothers became a director of the parent company. After a year's work with THE CHEMICAL AGE, he took over the editorship of DISCOVERY, and later of The Sixpenny Library also. Mr. Glanvill Benn entered the business in 1927, and has devoted his main attention to Ernest Benn, Ltd., of which, on Mr. Gollancz's resignation a year later, he was appointed general manager. In this connection he visited the United States and Canada in the autumn of 1929. Sir John Benn's third grandson, Mr. Keon Hughes, joined the firm in 1927 and was appointed a director of Ernest Benn, Ltd., in the following year. The family tradition in the business had already been strengthened in 1923 when Mr. A. Richard Pain, brother-in-law to Sir Ernest, resigned an important practice as solicitor to become secretary of the various companies. His legal knowledge proved invaluable in subsequent business developments and in 1927 Mr. Pain was elected to the Board of Benn Brothers.

Shortly before the firm moved into Bouverie House the General Strike of May, 1926, was declared. For the first time in the history of the publications the weekly issue had to be suspended. On the declaration of the Trade Union Council, the first move made by the Benn staff was to pass a resolution of confidence in the directors.

The steps which have always been taken to ensure the welfare of the staff have been one factor in the sense of goodwill prevailing during half a century. In 1916 a "five-day week" was instituted. The office was closed on Friday night, and for fourteen years past the office boy, in common with the managing director, has been able to enjoy the leisure of a full Saturday at home. A personal link between all those working in the company was the institution of a house magazine called SPACE in 1921.

For many years Benn Brothers have provided pensions for superannuated members of the firm, and the facilities for looking after the interests of the retired list are being augmented this year (1930) by the institution of a Jubilee Pension Fund. For this purpose the directors have allocated a sum of £5,000, from which various pensions and allowances will now be paid. In future years the Board hopes to make an annual allocation to this fund, subject to the approval of the shareholders.

In January, 1928, on the occasion of the Silver Wedding of Sir Ernest and Lady Benn, the staff presented Sir Ernest with his portrait, which was painted by Sir William Orpen. This choice was a particularly good one, since the artist had painted Sir John some ten years before on the private commission of his family. At a gathering in Bouverie House, which was attended by Elizabeth Lady Benn, the chairman was also presented with an album containing the congratulations and signatures of every member of the staff.

It sometimes happens that a business which has remained largely in the control of a single family for a considerable period, does not offer the same scope for those outside the family circle as is available in other organisations. Sometimes families continue to own a business without taking an active interest in the management of its affairs. Neither of these criticisms is ever heard in regard to Benn Brothers. The family takes pride in the fact that its members during three generations have worked in the business, but not less in the fact that half of the seats on the board are filled by others who have earned their positions by their own enterprise and endeavour. The latest recruits from the staff are Mr. F. E. Hamer (Editor of THE CHEMICAL AGE) and Miss Florence Robinson (secretary to Sir Ernest), who were elected to the Board in January, 1930. The election of Miss Robinson to the Board should finally

dispel the notion still prevalent in some quarters that the same opportunities are not open to women as to men. Not only as secretary to Sir Ernest, but as the person more than anyone else responsible for the welfare of the staff, Miss Robinson fills her post with untiring efficiency. She is equally qualified as being one of the first women recipients of the Oxford M.A. degree. At the end of the War Miss Robinson conducted the propaganda of the Industrial Reconstruction Council, and was for a time on the staff of King's College for Women.

"The British Trade Journal."

The close of 1928 saw the most recent expansion in Benn Brothers' activities, when the firm acquired the interests of William Agnew, Ltd., proprietors of the BRITISH TRADE JOURNAL, THE MILLER, and the LEATHER TRADES REVIEW.

The BRITISH TRADE JOURNAL was established in 1863 by the export firm of Morgan Brothers, and the first number consisted of eighty pages. The Civil War was then raging in the United States, and one result was seen in the rising prices of cotton and wheat. Ten years later Mr. W. Agnew Pope acquired an interest in the proprietorship and the name "William Agnew" appeared as publisher. Up to this time the manufacturers and exporters of this country, although told to appeal to foreign buyers in their native language, had no trade publication to assist them in such methods. This disability was removed in 1881 when the journal issued the first number of its "Supplemento Espanola" for circulation among the business men of Spanish-speaking countries. It was immediately successful.

Encouraged by this enterprise, at the time controlled by Mr. George Evans, the management initiated further efforts of the kind, and issues were accordingly printed in the Dutch language for distribution in the Netherlands Indian Colonies, and in Italian. In 1888 Mr. W. J. Rivington acquired an interest in the business and two years later became managing proprietor on the death of Mr. Pope. Shortly afterwards a Japanese edition known as "Zasshi" was established, being translated and printed at Tokio. In the interests of this project a visit was paid by Mr. Rivington to Japan, and as the result of another journey to Russia in 1897 a Russian issue, the "Vestnik," was brought out from offices at Moscow. Ten years later a Chinese edition was published at Shanghai. With the exception of the "Supplemento Espanol," which has continued to progress and is now one of the most valuable features of the BRITISH TRADE JOURNAL, the foreign interests had to be abandoned on the outbreak of war. On the death of Mr. W. J. Rivington in 1914 the business passed into the hands of his son, Mr. W. G. Rivington, who for the next four years held a commission in the Coldstream Guards.

The editors are Mr. Heuner, who has given able service to the BRITISH TRADE JOURNAL for many years, and Mr. A. R. Edge. The manager is Mr. F. Buckingham. On the change of proprietorship in 1929 the first Portuguese edition was published.

Fifty Years' Progress.

The next of the Agnew journals, THE MILLER, was founded in 1875 by William Dunham, a practical miller and millstone engineer who had a thorough knowledge of the trade. The first issue appeared at the time of the great crisis when the 10,000 small mills of the country were faced with the problem of combating the importation of flour ground on the new roller system. On every hand there was a keen desire for knowledge of this new process, and of its chances of sweeping the old millstones out of existence. It was then that the founder, in response to urgent requests, decided to publish a technical journal of the craft, to spread knowledge of the new machinery and of the attempts to improve the old.

Almost from the first William Dunham had the assistance of Mr. Edward Martin, who joined the staff in 1881, and since his retirement in 1929 has remained advisory editor. "In my opinion," Mr. Martin writes of the early days, "there is not the slightest doubt that flour milling as a British industry would have, at that period, received a most crushing blow, had not the MILLER come into existence at the psychological moment. It is an old axiom that in most emergencies the man needed appears on the scene, and unquestionably the new journal saved the situation. It is pleasing to recognise in our columns of that period, several of the good old names who are still regular advertisers, as they have been, without a break, for a period of over fifty years."

Shortly after this crisis there arose the urgent necessity of forming a trade association and the MILLER once more took the lead in doing the spade work which led to the foundation of the National Association of British and Irish Millers. The present Editor of the journal is Mr. H. G. Catchpool, and the Manager Mr. J. H. Waterfall.

The LEATHER TRADES' REVIEW, although the junior of Bouverie House, was founded in 1867 and is the oldest leather trade journal in the world. Like several of its associates, it was "born in the trade," its founder and first Editor having been Mr. Cleeve Hooper, a leather and tanning material merchant of Bermondsey. All its editors since have been men who have given practical service in the trade, and Mr. J. C. Harrington, the present occupier of the chair, is no exception to that tradition. It is a coincidence that the first number was published at 75, Fleet Street, a position very near to where Bouverie House now stands.

The tanning and manufacture of leather in 1867 differed greatly from the methods followed to-day. There were no large tanneries employing hundreds of men, on the other hand every small town and many a village had its little tanyard, where the hides from cattle killed in the district were dealt with, and the resultant leather was to a large extent consumed locally. One modern tannery will produce more leather in a day than some of the country tanneries of 1867 could produce in a year. From the outset the LEATHER TRADES REVIEW urged the application of scientific principles, long before the thought had been seized by the trade mind. It was uphill work, but thanks largely to the splendid support of the late Professor Procter—the father of leather chemistry—in the articles which appeared in the paper, success was gradually achieved, and culminated in the establishment of the Procter Research Laboratory at Leeds University. The value of the achievement is shown by the numerous research institutions in France, Australia and the United States, which have since been modelled on the Procter Laboratory.

The King's Message.

On February 1, 1930, the Jubilee banquet of Benn Brothers was held in London and attended by distinguished leaders in journalism, industry, and politics. The company was honoured by a telegram from the King, sent in reply to a loyal message from the Chairman. "The King is interested to hear that to-day you are commemorating the fiftieth anniversary of the foundation of your firm, and that on this auspicious occasion representatives of so many important trades are joining in the celebration. I am commanded to convey to all present the sincere thanks of His Majesty for your message of loyal greetings and to express the hope that every success may attend the efforts of your publishing house for the development of British trade."

No more gratifying tribute to the past endeavours of Benn Brothers or greater encouragement for their future could be desired. His Majesty has recognised with unerring insight the important service which trade journals render to industry, stimulating, guiding, and truthfully reflecting the activities of thousands of men and women engaged in commercial pursuits. The message sent from Sandringham shows how deep is his concern for British trade and how sincere his wishes for the continued success of an organisation whose very existence is bound up in the progress of industry. Every speaker at the Jubilee banquet reflected the unanimous sentiments of the four hundred guests of the firm, in testifying to the sincerity of purpose which has guided the policies of the house since its inception by Sir John Benn fifty years ago. It has been a record of unbroken progress and has been achieved on lines which had their origin in personal enterprise and endeavour.

One of the greatest characteristics of British commerce it its idea of permanence, its vision of continuance from generation to generation, in a word, its tradition. All that is best in British industry has this great respect for the past and this belief in continuity of purpose in the future. From the Throne downwards the support of old institutions is part and parcel of British policy, and the House of Benn to-day stands as an example of what can be achieved by two or three generations of consistent activity carried on from father to son.

Rapid as has been the rise of the trade and technical journal, no limit can be set to its prospects of expansion. Vast areas of publicity are still untapped, and an increasing demand for the co-operation of the trade journal will arise not only from old industries rejuvenated, but from new industries eager for markets. The King, in his stimulating message, looks forward to no uncertain goal—the development of British trade. The influence of the trade journal will grow in the ratio in which British trade develops, and each will be the more secure for the unqualified co-operation of the other.

CITY OF BATH.

ELECTRICITY DEPARTMENT.

TENDERS are invited for the supply of the following plant and cables:—

1. One 60 000 lb. Boiler.
2. One 7 000 Kilowatt Turbo-Alternator.
3. E.H.T., H.T. and L.T. cables, required over a period of twelve months.

Specifications and Forms of Tender may be obtained from the undersigned upon application with a deposit of £2 2s. for each section.

Deposits will be returned only after receipt of a *bona fide* tender by the appointed date.

Sealed tenders endorsed: "Tender for Boiler," "Tender for Turbo-Alternator," or "Tender for Cables," as the case may be, must be delivered to the undersigned not later than 12 noon on Wednesday, January 22nd, 1930.

The Corporation does not bind itself to accept the lowest or any tender.

J. W. SPARK,
City Electrical Engineer.

Electricity Offices,
7, Dorchester Street,
Bath.
January 1st, 1930.

ELECTRICAL INSTALLATION.

THE Committee of Visitors of the Mental Hospital, Barming Heath, Maidstone, invite Tenders for an electrical installation for lighting, heating, etc., at the above-mentioned hospital.

Electrical energy will be supplied from the mains of the Maidstone Corporation.

Specification, conditions of contract, and tender form may be obtained on application to the Consulting Engineer, Mr. E. E. Hoadley, Corporation Electricity Works, Maidstone.

Plans of the Mental Hospital may be inspected at the office of the Consulting Engineer by appointment.

Applications for specifications must be accompanied by a cheque for two guineas, payable to Mr. E. E. Hoadley.

This sum will be returned on receipt of a *bona fide* tender.

Tenders, in a sealed envelope endorsed "Tender for Electrical Installation," are to be delivered to Mr. H. J. Bracher, 44, Earl Street, Maidstone, before 11 a.m. on Thursday, January 16th, 1929.

The Committee does not bind itself to accept the lowest or any tender.

H. J. BRACHER,
Clerk to the Committee.

44, Earl Street, Maidstone.

NOTICE.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

SCARBOROUGH CORPORATION.

NOTICE is given of the existence of a difference between the above Corporation and the Association relative to the dismissal of a member, which difference has been referred to the National Joint Board.

CONSEQUENT UPON this Dispute, and pending a settlement, MEMBERS OF THE ASSOCIATION ARE ENJOINED TO REFRAIN FROM APPLYING FOR OR ACCEPTING ANY APPOINTMENT WITH THE ABOVE CORPORATION.

W. ARTHUR JONES, A.M.I.E.E.,
General Secretary.

102, St. George's Square,
London, S.W.1.

APPOINTMENTS VACANT.

FULHAM BOROUGH COUNCIL ELECTRICITY DEPARTMENT

LADY Showroom Assistant and Demonstrator Required (temporary staff appointment). Experienced in demonstrating use of electric cookers and other electrical apparatus at consumers' houses as well as in showrooms essential. Applications, stating age, qualifications, experience, and salary required, with copies of recent testimonials, to be delivered not later than January 11, to Town Clerk, Town Hall, Fulham, S.W.6. Canvassing strictly prohibited.

£275/325 ACCORDING to Qualifications.—A man, age about 30, is required by a firm of Ironmongers in the Midlands to take charge of an Electrical Showroom, including estimating for wiring and small power installations.—Applicants should state age, qualifications, and experience to Box A.U.K., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

APPLICATIONS are invited for the posts of Technical Assistant in the Admiralty Technical Pool to fill the vacancies at the Admiralty Compass Department, Slough.

Practical knowledge of, and training in, light mechanical engineering with workshop and drawing office experience are required. An elementary knowledge of electrical principles and their applications in electrical test rooms are essential qualifications. The scale of salary is £140, rising by annual increments of £10 to £190, plus Civil Service bonus, making a present commencing total of £219 per annum. Preference will be given to ex-Service men. Applications, together with copies of testimonials, should be forwarded to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1, not later than January 13th, 1930. No application forms are required.

APPLICATIONS are invited for the post of Senior Technical Assistant in the Admiralty Technical Pool to fill a vacancy at the Admiralty Compass Department, Slough.

Candidates should have had workshop experience in light mechanical engineering, and preferably in a supervisory or inspecting capacity. A knowledge of low-power electrical machinery and of the testing methods applicable thereto, together with ability to read and interpret mechanical and electrical drawings, are also required.

The scale of salary is £200, rising by annual increments of £10 to £290, plus Civil Service bonus, making a present commencing total of £299 per annum.

Preference will be given to ex-Service men.

Applications, together with copies of testimonials, should be forwarded to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1, not later than January 13th, 1930. No application forms are required.

MAINS SUPERINTENDENT.

THE Barnes Urban District Council invite applications for this post. Candidates must have had a sound technical training, a thorough knowledge of and experience in H.T. Transmission, Rotary Converter Sub-stations and Low Tension D.C. 3-wire distribution.

The selected candidate will be required to undergo medical examination and to contribute to the Council's superannuation scheme.

National Joint Board's conditions, Class "D," Grade 3.

Applications, in own handwriting, stating age and giving full and concise particulars of training and experience, together with copies of recent testimonials, to be sent to the ENGINEER AND MANAGER, Electricity Works, Mortlake, S.W.14.

COUNTY BOROUGH OF WEST HARTLEPOOL.

APPOINTMENT OF BOROUGH ELECTRICAL ENGINEER.

APPLICATIONS are invited from qualified Electrical Engineers, who must have sound commercial ability and experience, for the position of Borough Electrical Engineer, upon forms to be obtained from me, which must be delivered duly completed and endorsed "Borough Electrical Engineer," at the Municipal Buildings, West Hartlepool, not later than Saturday, January 11th, 1930.

The salary, which will be in accordance with the National Minimum Scale of Salaries for Chief Electrical Engineers of authorised Electricity Supply Undertakings, amounts to £1,125 for the current year.

The person appointed will in all probability be appointed to the position of Transport Manager, which would carry with it an additional salary of £150 per annum.

Canvassing directly or indirectly will be a disqualification.

HAROLD W. STANTON,
Town Clerk.

Municipal Buildings,
West Hartlepool.
December 20th, 1929.

ARMY CONTRACTS.

NOTICE is hereby given that tenders for quantities of the undermentioned manufactured goods are invited from time to time, as required :—

METAL TRADES :—

Aluminium ingot, Brass, Brass rod and sheet, Bronze stampings, Copper ingot and sheet, Lead, pig and sheet, Metal rod, Nickel, Pig-iron, Steel plate, rounds, sheets, etc. Shell steel, Tin ingot, Tinplates, Zinc ingot and sheets.

Baths, Bicycles, Building Materials and fitments, Cutlery (including safety razors and blades), Enamelled ware, Hollow-ware, Horse Shoes, Ironmongery, Machinery, Pipes, steel and cast iron, Stable Fitments, Stoves and Ovens, Sanitary Appliances, Tinware, Tools, Vehicles, Wire, Wire Rope.

ELECTRICAL AND SCIENTIFIC INSTRUMENT TRADES :—

Cables, Electrical Plant, Electrical and Wireless Stores, Scientific Instruments.

TEXTILE TRADES :—

Blankets and Rugs, Braid and Lace, Canvas and Canvas Goods, Clothing (made up from department's own materials), Cotton Piece Goods and Cotton Goods, Cordage, Flannel (Union), Headdresses, Horse Rugs, Hosiery, Linen Piece Goods, Silk Cloth and Webbing and Sewing Silk, Towels, Woollen Cloths.

FOODSTUFFS, COAL AND COKE.

OTHER TRADES :—

Badges and Buttons, Basketware, Bedding, Boots and Shoes, Brooms and Brushes, Chemicals and Gases, China and Earthenware, Furniture, Harness and Saddlery, Leather and Leather Goods, Linoleum, Medical Supplies, Oils and Spirits, Paints and Varnishes, Rubber Boots and Clothing, Timber, Woodware.

Manufacturers who are not already on the War Office List of Tenderers, and who may wish to be invited to tender for Army requirements of the above stores, should apply to the Director of Army Contracts at the address given below for Form 1, on which formal application for inclusion on the list of tenderers may be made. The services of an intermediary are unnecessary in approaching the Department for this purpose.

Before being placed on the lists of tenderers, firms will have to satisfy the Department that they actually manufacture goods for which they wish to be noted, and will be required to furnish the names of at least two well-known firms or public bodies who have purchased from them and are in a position to certify as to the quality of their productions. They will further have to give an undertaking that they will comply with the Fair Wages Resolution of the House of Commons.

Attention is called to the following resolution passed by both Houses of Parliament on February 16th, 1926 :—

"That, in the opinion of this House, it is the duty of the Government in all Government contracts to make provision for the employment to the fullest possible extent of disabled ex-service men, and to this end to confine such contracts, save in exceptional circumstances, to employers enrolled on the King's National Roll."

SALES.

From time to time the Department has for sale surplus Army stores of various descriptions, among which may be mentioned Machinery, Steel Girder Bridges, Scrap Metals, Hutting, Motor Vehicles, Drugs, Medical and Dental Stores, Veterinary Stores, Optical and Scientific Instruments, Electrical and Wireless Stores Clothing, Boots, Textile Goods, Paint.

Firms who wish to be invited to tender for the purchase of surplus stores should apply as directed below.

All applications should be in writing and should be addressed to the Director of Army Contracts, Caxton House (West), Tothill Street, Westminster, London, S.W.1. No application is necessary from firms whose names are already on the War Office lists, unless they have extended the range of their manufactures.

FRANCIS OSBORN,
Director of Army Contracts.

COUNTY BOROUGH OF DEWSBURY.

THE Corporation of Dewsbury invite Tenders for the supply, delivery and erection of Rotary Converter Plant (1 500 kWt and 500 kWt).

Specification and Form of Tender may be had on application to R. W. Grubb, Esq., M.I.E.E., Borough Electrical Engineer, Bradford Road, Dewsbury.

Tenders, endorsed "Rotary Plant," and addressed to the undersigned, must be delivered not later than 12 noon, on Monday, January 13th, 1930.

The Corporation does not bind itself to accept the lowest or any tender.

T.I.G.B. TRAINING FOR RESULTS.

WHATEVER be your aim—a Better Technical Equipment; a Professional Examination Qualification; Advancement to a Responsible Post—you can select T.I.G.B. Correspondence Training with complete confidence.

Here is proof in the form of Typical Tributes from Successful Examination Candidates:—

A.M.I.E.E. Exam.

B. W., Stoke.—"I have passed the A.M.I.E.E. Exam. The happy issue of this attempt was very largely due to your efficient training."

A.M.I.Mech.E. Exam.

H. W. M., Rochdale.—"Have passed. I was surprised to find so many questions similar to those set during the course."

A.M.Inst.C.E. Exam.

T. N., Sutton.—"I beg to say that I sat for the recent A.M.Inst.C.E. Exam., Part C., and have passed."

Write TO-DAY for a FREE copy of "The Engineer's Guide to Success," 124 pages, containing the widest selection of engineering courses in the world, and state the *Qualification, Post or Branch that interests you.*

The T.I.G.B. guarantees training until successful.

THE TECHNOLOGICAL INSTITUTE OF GREAT BRITAIN (Established 1917), 10, TEMPLE BAR HOUSE, LONDON, E.C.4

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. Estd. 1906).—Advice, PROSPECTUS, and full particulars of Individualised Correspondence Courses FREE from ADVISORY BUREAU, UNIVERSITY ENGINEERING COLLEGE, Westgate-on-Sea, Kent.

REGISTERED ELECTRICAL INSTALLATION CONTRACTORS

TENDERS INVITED.

METROPOLITAN BOROUGH OF HAMMERSMITH.

GENERAL ELECTRICITY STORES, ETC.

THE Borough Council invites Tenders for the supply of Stores and Materials, and the execution of the works, set out hereunder, for a period of twelve calendar months, commencing April 1st, 1930:—

1. Electrical Lighting Sundries.
2. Files.
3. Firebricks and Clay.
4. Insulated Wires.
5. Metals (Solder, Lead Pipe, etc.)
6. Iron and Steel.
7. Bolts, Nuts and Metal Screws.
8. Steam Tubes and Fittings.
9. Steam Packings.
10. Tools (Small Engineers').
11. Ironmongery (Hardware).
12. Joint Boxes and Connections.
13. Cast Iron Draw Box Frames and Covers.
14. Public Lamp Columns.
15. Meters (Ordinary and Prepayment).
16. Stoneware Conduit.
17. Insulating Compound for Joint Boxes.
18. High and Low-Tension Concentric Paper Insulated Cables.
19. Lubricating and Diesel Fuel Oils.
20. Broad Salt for water softening purposes.
21. Disposal of Ashes and Flue Dust.
22. Sundry Cartage work.
23. Plywood Meter Boards.

Forms of Tender and particulars may be obtained from the Borough Electrical Engineer, 85, Fulham Palace Road, W.6, upon receipt of a stamped addressed brief envelope, and where duplicate copies are required, a remittance of 2s. 6d. must be made.

Sealed Tenders, endorsed "Tender for Electricity Stores," must be delivered to the undersigned at the Town Hall, Hammersmith, W.6, not later than 12 noon, on Wednesday, 26th February, 1930.

The Council does not bind itself to accept the lowest or any Tender.

HUGH ROYLE, Town Clerk.

Town Hall, Hammersmith, W.6.
20th January, 1930.

METROPOLITAN BOROUGH OF BETHNAL GREEN.

ELECTRICAL INSTALLATION WORK.

THE Bethnal Green Borough Council invites Tenders for Electric Lighting Installations at a block of tenement dwellings in Bethnal Green.

Copies of the form of tender, conditions and specification may be obtained from me on payment of two guineas, returnable after receipt of a *bona fide* tender. Technical inquiries may be made of Mr. Harold W. Couzens, M.I.E.E., of 9, Old Queen Street, S.W.1.

The Contractor will be required to pay such rates of wages and observe such hours of labour as are recognised by the trade unions in the locality where the work is done.

Tenders, endorsed "Wiring Scheme—Huntingdon Buildings," must be addressed to me and reach my office at the Town Hall, Cambridge Road, Bethnal Green, E.2, before noon on Thursday, January 30th, 1930.

The Council does not bind itself to accept the lowest or any tender.

DAVID J. KEEP,
Town Clerk.

CLEETHORPES URBAN DISTRICT COUNCIL.

THE above Council invite Tenders for the supply and installation at the Cleethorpes Bathing Pool of a Gramophone and Microphone Equipment, including Microphone Gramophone Amplifier (output 200 watts), Electric Gramophone Turn-table and Loud Speakers (Electricity Supply A.C. 230 volts, 50 cycles.)

Also Tenders for the above together with a Wireless Receiver.

Tenders, with full detailed particulars of the apparatus proposed to be installed, to be delivered to the undersigned not later than 5 p.m. on February 5th, 1930.

A. S. BAXTER.
Clerk to the Council.

Council Offices,
Cleethorpes.
January 20th, 1930.

APPOINTMENTS VACANT.

TRACTION.—Junior traction engineer required by large manufacturing firm. Technical graduate with experience run curve, etc., calculations preferred.—Write Box A.Z.K., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

TECHNICAL ASSISTANT required by, say, February 3rd, for Committee work and to translate technical articles from German and French. Electrical engineering degree or equivalent desirable. Commencing salary from £250 according to qualifications.—Apply by letter stating age, qualifications and salary required.—ELECTRICAL RESEARCH ASSOCIATION, 36 and 38, Kingsway, W.C.2.

Digitized by Google

ELECTRICAL LABORATORY requires Research Assistant with Electrical or Physics Degree. Salary, £200-£250 per year, according to qualifications and experience.—Apply to Box A.V.K., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

SENIOR and Junior Draughtsmen required for High and Low Tension Switchboards; also for Automatic Sub-station Control Gear and Metal-clad Switchgear.—Apply, stating age, full experience, and salary required, to SWITCHGEAR DEPARTMENT, GENERAL ELECTRIC Co., LTD., Witton, Birmingham.

CIVIL SERVICE COMMISSION.

FORTHCOMING EXAMINATION.—Assistant Examiners in the Patent Office (20-25 with extension in certain cases).

Regulations and particulars, together with the forms on which applications must be made, will be sent in response to requests (preferably by postcard) addressed to the SECRETARY, Civil Service Commission, Burlington Gardens, London, W.1. The latest date for the receipt of application forms is March 6th, 1930.

SUDAN GOVERNMENT RAILWAYS require the services of an ELECTRICAL FOREMAN for quay machinery at Port Sudan. Candidates should be capable of carrying out repairs and maintenance of motors, wiring, electrical equipment of cranes, transporters and general quay machinery. Should be used to outside work and climbing of high structures. Only candidates used to similar employment will be considered. Special consideration to men capable of making lead joints on large single and concentric cables. Age 25 to 30, single preferred. Starting rate of pay £E.300 to 360 per annum according to age and qualifications (£E.1 = £1 0s. 6d.). Probationary contract for eighteen months. Permanent and progressive post to successful candidates. Free second-class passage. Liberal leave on full pay if retained in the service.

Apply by letter stating age, qualifications and experience to: ADVISORY ENGINEER, Sudan Government London Office, Wellington House, Buckingham Gate, S.W.1, marking envelope "Electrical Foreman."

MUNICIPALITY OF SINGAPORE, STRAITS SETTLEMENTS.

ELECTRICITY DEPARTMENT.
ASSISTANT POWER STATION SUPERINTENDENT.
ADVERTISEMENT.

THE Municipal Commissioners of Singapore require an Assistant Power Station Superintendent, age not exceeding 40 years, for service at their New Power Station, the appointment being on the permanent staff of their Electricity Department, and being, in the first instance, upon a three years' agreement.

The capacity of the plant is over 20 000 kilowatts.

Candidates should have a thorough experience in extra high tension three-phase generation, steam turbines, water-tube boilers and mechanical stokers, and must have held a similar position previously. Preference will be given to Corporate Members of the Institution of Electrical Engineers, and the possession of a first-class Board of Trade Engineer's Certificate is desirable.

The selected candidate will be required to deputise for the Power Station Superintendent and will be expected to take shifts when necessary.

Strict medical examination.

Salary, $6,240, $6,720 and $7,200 per annum respectively for the three years of the agreement, and rising thereafter, if service be continued, in accordance with the Commissioners' Salary Scheme. The Exchange value of the dollar is 2s. 4d. sterling, at which rate the salary for the first year would amount to £728. There is at present no Income Tax. Free partially furnished quarters provided, with an allowance for lighting.

Free passage will be provided, with half salary during the voyage out, and if the selected candidate is married, passages will be provided for his wife and family (if any). Eight months' leave with full pay is normally granted after four years' service. Liberal Provident Fund.

Applications, stating whether married or single, and giving age and birthplace with details of education, training and experience and referring particularly to the qualifications mentioned above, and accompanied by copies (not originals) of testimonials, to be lodged with Messrs. Peirce and Williams, M.M.Inst.C.E., 1, Victoria Street, London, S.W.1, Agents to the Commissioners, not later than Monday, January 27th, 1930.

Further particulars, if desired, can be obtained from the Agents.

BOROUGH OF CAERNARVON.

THE Caernarvon Corporation invites applications for the post of Engineer and Manager of its Electricity Undertaking.

Terms and conditions with forms of application may be obtained from the undersigned on receipt of a stamped addressed foolscap envelope.

JOHN WILLIAMS,
Town Clerk.

Caernarvon.

CANNOCK URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

APPOINTMENT OF METER DEPARTMENT ASSISTANT.

APPLICATIONS are invited for the above appointment and should be made on form obtainable from the undersigned on receipt of a stamped addressed envelope.

The official appointed must have had a sound technical and practical training in the repair, testing and calibration of all types of alternating current meters and indicators. He must have a knowledge of meter room routine and installation inspection. He will be required to assist in the Distribution Department if called upon.

Preference will be given to candidates who have had a general testing experience in connection with high tension mains, transformers, etc.

The salary offered is in accordance with the E.P.E.A. schedule Class B, Grade 8, the present value of which is £246 0s. 5d. per annum.

Canvassing in any form will be deemed a disqualification.

Completed application forms must reach the undersigned on or before February 8th, 1930.

H. L. THOMSON, A.M.I.E.E.,
Chief Engineer and General Manager,
Cannock Urban District Council,
Electricity Department,
Wolverhampton Road,
Cannock, Staffs.

AIR MINISTRY.

DIRECTORATE OF TECHNICAL DEVELOPMENT.

THE following Draughtsmen are required at the Royal Aircraft Establishment:—

REFERENCE No. A. 392.—One Draughtsman, Grade II, for work in connection with aircraft. Salary £125 plus Civil Service Bonus per annum, giving a present total starting remuneration of £199 16s. per annum, on the basic scale £125—£7 10s.—£150 plus bonus.

REFERENCE NOS. A. 373-390 AND 403.—Three Draughtsmen, Grade III. One (A.373) for work on plant and ground equipment, requiring general experience in mechanical and structural work, and preferably some surveying experience. One (A.390) for detail work in the design of wireless apparatus. One (A.403) for detail work in the design of small mechanical apparatus, such as indicating and recording instruments.

Salary:—40s. to 52s., plus Civil Service Bonus per week, depending on experience; present equivalent of 40s. to 52s., plus bonus, is £3 6s. 2d. to £4 2s.

Candidates should have had good technical training and experience appropriate to the position for which application is made. Preference given, other things being equal, to ex-service men.

Write (quoting appropriate reference Number), stating age and full particulars of training and experience, to the Chief Superintendent, Royal Aircraft Establishment, South Farnborough, Hants.

T.I.G.B. TRAINING FOR RESULTS.

WHATEVER be your aim—a Better Technical Equipment; a Professional Qualification; Advancement to a Responsible Post—you can select T.I.G.B. Correspondence Training with complete confidence.

I.E.E., I.Mech.E., Inst.C.E., I.Struct.E., B.O.T., C. and G., etc. At the 1928 and 1929 Examinations (according to available results) T.I.G.B. students achieved THE RECORD PASS FIGURE OF 94·7%.

Write TO-DAY for a FREE copy of "The Engineer's Guide to Success," 124 pages, containing the widest selection of Engineering Courses in the world, and state the *Qualification, Post, or Branch that interests you.*

The T.I.G.B. Guarantees Training until Successful.

ANNUAL CONTRACTS FOR STORES.

THE Leeds Corporation invite Tenders for the supply of the following goods required for the Electricity Department during the year ending March 31st, 1931:—

C. Castings of Gunmetal, Copper and Iron.
D. Bolts, Nuts, Screws, etc.
E. Gas and Weldless Steel Tubes.
G. Lead Sleeves and other Plumbers' Materials.
H. Tinners' and Ironmongers' Sundries and Engineers' Furnishings (including Packings, Rubber Goods, Files and Sundry Metals).
J. Oils and Chemists' Sundries.
K. Cotton Waste and Wipers (bleached rags).
L. Ropes, Twines, Tarpaulin Goods, etc.
N. India-rubber Covered Cables, Mains Boxes and Fittings, Jointing and Insulating materials, Fittings and Sundries.
P. Wood Bushes, Hammer Shafts, etc.
Q. Building Materials—Fire and other Bricks, etc.
R. India Grey Tapes.

Schedules, Conditions of Contract and Forms of Tender may be had on application to Mr. C. Nelson Hefford, General Manager, Electricity Department, 1, Whitehall Road, Leeds, stating the section for which the applicant desires to tender.

Tenders in sealed envelopes, endorsed "Electricity—Tender for Stores," must be delivered to me at my office, 26, Great George Street, Leeds, on or before Tuesday, February 18th, 1930.

The Corporation do not bind themselves to accept the lowest or any of the Tenders sent in.

THOS. THORNTON,
Town Clerk.

Leeds.
January 25th, 1930.

NOTICES.

ELECTRICITY (SUPPLY) ACT, 1926.

NORTH-EAST ENGLAND ELECTRICITY SCHEME, 1929.

NOTICE is hereby given that in exercise of the powers conferred upon them by Section 4 of the Electricity (Supply) Act, 1926, the Central Electricity Board have adopted (subject to certain modifications) the scheme intituled "North-East England Electricity Scheme, 1929," and transmitted to them by the Electricity Commissioners, and have published the Scheme as so adopted.

Copies of the Scheme may be obtained at the price of one shilling and sixpence each from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, and 120, George Street, Edinburgh.

Dated this 24th day of January, 1930.

RICHARD H. FOX,
Secretary and Solicitor.

Trafalgar Buildings,
1, Charing Cross, London, W.C.2.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

SCARBOROUGH CORPORATION.

NOTICE is given of the existence of a difference between the above Corporation and the Association relative to the dismissal of a member, which difference has been referred to the National Joint Board.

CONSEQUENT UPON this Dispute, and pending a settlement, MEMBERS OF THE ASSOCIATION ARE ENJOINED TO REFRAIN FROM APPLYING FOR OR ACCEPTING ANY APPOINTMENT WITH THE ABOVE CORPORATION.

W. ARTHUR JONES, A.M.I.E.E.,
General Secretary.

102, St. George's Square,
London, S.W.1.

APPOINTMENTS VACANT.

DRAUGHTSMEN, Senior and Junior, required, with good experience on Electric Control Apparatus.—Write fullest particulars of training, experience, age and salary, Box 724, SELLS, Fleet Street, E.C.4.

WANTED, a Junior Electrical Test Engineer, of good athletic type. Technical Graduate preferred. Excellent opportunity for acquiring good electrical experience.—Box A. D. L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, E.C.4.

GOOD OPPORTUNITIES FOR PROGRESSIVE MEN.

SEVERAL vacancies exist for men with practical experience in planning, installing and testing modern telephone equipment. Permanent positions for men of proved ability.—Apply, stating details of previous experience, to Box A.A.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

SENIOR and Junior Draughtsmen required for High and Low Tension Switchboards; also for Automatic Sub-station Control Gear and Metal-clad Switchgear and Contractor Gear.—Apply, stating age, full experience, and salary required, to SWITCHGEAR DEPARTMENT, GENERAL ELECTRIC CO., LTD., Witton, Birmingham.

REQUIRED.—Experimental Assistant (male, under 21).

Applicants should hold a Matriculation or equivalent certificate, including mathematics and a scientific subject.

Scale of pay, according to age—

From 17s. per week, plus Civil Service Bonus at 16 years of age.

To 26s. per week, plus Civil Service Bonus at 20 years of age.

The present total emoluments of the above rates, including Civil Service Bonus, are 28s. 11d. and 44s. 3d. per week respectively.

Normal hours of duty—42 a week.

Applications should be made in writing to the SUPERINTENDENT, Air Defence Experimental Establishment, Biggin Hill, near Westerham, Kent, stating qualifications and giving two personal references.

CITY OF BIRMINGHAM ELECTRIC SUPPLY DEPARTMENT.

APPOINTMENT OF CHIEF ASSISTANT ELECTRICAL ENGINEER.

APPLICATIONS for the vacant position of CHIEF ASSISTANT ELECTRICAL ENGINEER are invited from fully qualified Electrical Engineers who have had experience in the design and operation of large Generating Stations, Extra High Tension Transmission Systems, Sub-stations and Low Tension Distribution Networks.

Salary will be at the rate of £1 200 per annum, payable monthly.

The successful candidate will be required to undergo an approved medical examination and contribute to the Corporation's Superannuation Scheme.

Forms of application and particulars of duties may be obtained from the undersigned and will require to be returned, with copies of not more than three recent testimonials, by Saturday, February 15th, 1930, endorsed "Chief Assistant Electrical Engineer."

Canvassing either directly or indirectly will disqualify.

E. J. JENNINGS,
Secretary and Commercial Manager.

14, Dale End,
Birmingham.
January 25th, 1930.

METROPOLITAN BOROUGH OF HAMMERSMITH.

ELECTRICITY DEPARTMENT.

APPLICATIONS are invited for the following appointments on the Clerical Staff:—

1. SECOND ASSISTANT CLERK.—Salary £280 per annum, rising, subject to satisfactory service, by annual increments of £15, to £340 per annum. Applicants must have had experience in a responsible position in an Electricity Supply Department, and preference will be given to those also in possession of a certificate of a recognised professional Institute.

2. ENQUIRIES CLERK.—Salary £210 per annum, rising, subject to satisfactory service, by annual increments of £10, to £250 per annum. Applicants must have had experience in interviewing consumers and of schemes for Assisted Wiring and Hire of Domestic Electrical Apparatus.

3. JUNIOR CLERK.—Salary £52 to £65 per annum, according to age and qualifications of selected applicant.

Each appointment will be subject to the provisions of the Council's Grading and Superannuation Schemes, and to the selected applicant passing a medical examination.

Form of Application for each appointment can be obtained from the undersigned upon receipt of a stamped addressed foolscap envelope, and must be returned suitably endorsed not later than 2 noon on Friday, February 14th, 1930.

Canvassing will disqualify.

HUGH ROYLE,
Town Clerk.

Town Hall, Hammersmith, W.6.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY.

APPLICATIONS are invited by letter only for the post of Electrical (Traction) Engineer, for service on the above Railway. The Bombay Surburban Section operated by electric traction is about 26 route miles in length, and the equipment comprises 40 four-coach trains operating at 1 500 Volts D.C., 3 rotary converter substations and the overhead track equipment.

The successful candidate must have had sufficient experience to enable him efficiently to take charge of the operation and maintenance of the foregoing equipment.

The appointment is on the permanent staff of the Railway and the agreement in the first instance will be for three years, extensible by mutual consent.

SALARY.—The salary will depend upon the candidate's age and qualifications, but will be approximately Rs. 1 150 per month, plus £30 per month "Overseas pay," plus "Bombay allowance" of Rs. 135 per month. The salary is payable from the date of departure from this country. Provident Fund, gratuity and leave will be in accordance with the rules applicable to the Company's Officers. A free first class passage to India and a return passage on the termination of the agreement are provided.

The selected candidate will be required to pass a strict medical examination, and should preferably be not less than 35 years of age or more than 45.

Applications should give full details of education and career to date, stating age, salary required, and whether married or single.

Applications accompanied by copies only of testimonials should be addressed to Messrs. MERZ AND PARTNERS, 32, Victoria Street, London, S.W.1. not later than February 21st, 1930.

VACANCIES FOR TWO JUNIOR TECHNICAL OFFICERS.

APPLICATIONS are invited for two vacant posts of Junior Technical Officer in the Admiralty Technical Pool at an Admiralty Experimental Establishment. The work will consist chiefly of design in connection with acoustical and electrical apparatus, including the preparation of specifications, etc., or of research in connection with electrical apparatus.

Candidates should possess either an honours degree or its equivalent in Engineering, together with workshop experience, or an honours degree or its equivalent in Physics, together with some research or works' experience.

The Admiralty Technical Pool includes the following grades:—

Chief Technical Adviser (£800 by £50 to £1 000 per annum).
Principal Technical Officer (£650 by £25 to £750 per annum).
Senior Technical Officer (£500 by £25 to £600 per annum).
Technical Officer (£250 by £20 to £450 per annum).
Junior Technical Officer (£175 by £15 to £235 per annum).

In addition to the above scales Civil Service bonus is paid. Entry will be made at the bottom of the scale for Junior Technical Officer, the bonus on which at present is approximately £91. Promotion to the higher grades is governed entirely by merit and is dependent upon the existence of vacancies.

Applications should be made to the SECRETARY OF THE ADMIRALTY C.E. Branch), Whitehall, London, S.W.1, not later than 28th February, 1930. No application forms are required.

GOOD OPPORTUNITIES FOR PROGRESSIVE MEN.

SEVERAL vacancies exist for men with practical experience in planning, installing and testing modern telephone equipment. Permanent positions for men of proved ability.—Apply, stating details of previous experience, to Box A.A.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

REQUIRED.—Experimental Assistant (male, under 21).

Applicants should hold a Matriculation or equivalent certificate, including mathematics and a scientific subject.

Scale of pay, according to age—

From 17s. per week, plus Civil Service Bonus at 16 years of age.
To 26s. per week, plus Civil Service Bonus at 20 years of age.

The present total emoluments of the above rates, including Civil Service Bonus, are 28s. 11d. and 44s. 3d. per week respectively.

Normal hours of duty—42 a week.

Applications should be made in writing to the SUPERINTENDENT, Air Defence Experimental Establishment, Biggin Hill, near Westerham, Kent, stating qualifications and giving two personal references.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY.

APPLICATIONS are invited by letter only for the post of Electrical (Traction) Engineer, for service on the above Railway. APPLICATIONS are invited for two vacant posts of Junior Technical Officer in the Admiralty Technical Pool at an Admiralty Experimental Establishment. The work will consist chiefly of design in connection with acoustical and electrical apparatus, including the preparation of specifications, etc., or of research in connection with electrical apparatus.

Candidates should possess either an honours degree or its equivalent in Engineering, together with workshop experience, or an honours degree or its equivalent in Physics, together with some research or works' experience.

The Admiralty Technical Pool includes the following grades:—

Chief Technical Adviser (£800 by £50 to £1 000 per annum).
Principal Technical Officer (£650 by £25 to £750 per annum).
Senior Technical Officer (£500 by £25 to £600 per annum).
Technical Officer (£250 by £20 to £450 per annum).
Junior Technical Officer (£175 by £15 to £235 per annum).

In addition to the above scales Civil Service bonus is paid. Entry will be made at the bottom of the scale for Junior Technical Officer, the bonus on which at present is approximately £91. Promotion to the higher grades is governed entirely by merit and is dependent upon the existence of vacancies.

Applications should be made to the SECRETARY OF THE ADMIRALTY C.E. Branch), Whitehall, London, S.W.1, not later than 28th February, 1930. No application forms are required.

CIVIL SERVICE COMMISSION.

FORTHCOMING EXAMINATIONS.—Male Assistant Superintendent of Traffic (Class II) in the London Telephone Service and Male Assistant Traffic Superintendent in the Provinces, General Post Office (18–23, with extension for service in H.M. Forces).

Regulations and particulars, together with the forms on which applications must be made, will be sent in response to requests (preferably by postcard) addressed to the SECRETARY, Civil Service Commission, Burlington Gardens, London, W.1. The latest date for the receipt of application forms is March 6th.

PLACE YOUR INSTALLATION WORK WITH FIRMS ON THE NATIONAL REGISTER OF ELECTRICAL INSTALLATION CONTRACTORS.

REGISTERED ELECTRICAL INSTALLATION CONTRACTORS

THE National Register is an independent institution representing all bodies connected with the Electrical Industry, and grants to contracting firms satisfying its requirements the right to use this sign.

Particulars on application to Secretary, 1, Lincoln's Inn Fields, London, W.C.2.

TENDERS INVITED.

METROPOLITAN BOROUGH OF BETHNAL GREEN.

ELECTRIC CABLES, PIPES, ETC.

THE Bethnal Green Borough Council invites Tenders for the supply, delivery and laying of low tension cables, pipes, etc., in Bethnal Green.

Copies of the Form of Tender, Conditions and Specifications may be obtained from me on payment of two guineas, returnable after receipt of a *bona fide* Tender. Technical enquiries may be made of Mr. Harold W. Couzens, M.I.E.E., of 9, Old Queen Street, S.W.1.

The Contractor will be required to pay such rates of wages and observe such hours of labour as are recognised by the Trade Unions in the locality where the work is done.

Tenders, endorsed "Cables," must be addressed to me, and reach my office at the Town Hall, Cambridge Road, Bethnal Green, E.2, before noon on Monday, 17th March, 1930.

The Council does not bind itself to accept the lowest or any Tender.

DAVID J. KEEP,
Town Clerk.

CARDIFF CORPORATION.

ELECTRICITY DEPARTMENT.

TENDERS are invited from manufacturers on the King's National Roll for the following:—

Supply and delivery of E.H.T. and L.T. Paper-insulated Cable during 12 months commencing April 1st, 1930.

Further particulars, specifications, and forms of tender may be obtained from the City Electrical Engineer, The Hayes, Cardiff.

Tenders, duly endorsed, and addressed to the undersigned must be delivered on or before 10 a.m. on Thursday, March 20th.

The Corporation do not bind themselves to accept the lowest or any tender.

CECIL G. BROWN,
Town Clerk.

City Hall, Cardiff.
February, 1930.

CENTRAL ELECTRICITY BOARD.

NORTH WEST ENGLAND AND NORTH WALES ELECTRICITY SCHEME, 1928.

THE Central Electricity Board invite tenders for the supply, delivery and erection of Metering Equipment required in the area of the North West England and North Wales Electricity Scheme.

Copies of the Specification No. N.W.E.–G.M. 1 and form of tender may be obtained from the offices of the Board on application to the undersigned on or after Monday, March 3rd, 1930, on payment of a deposit of Two Guineas for the first copy and One Guinea for each subsequent copy.

Sums paid for any number of copies up to three will be refunded on receipt of a *bona fide* tender.

Tenders on the form supplied, endorsed "Tender for Specification No. N.W.E.–G.M. 1," must be delivered to the offices of the Board not later than 12 o'clock noon on Monday, March 31st, 1930.

The Board do not bind themselves to accept the lowest or any tender.

ERITH URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

THE above Council invite Tenders for the supply and delivery of the following materials during the twelve months ending March 31st, 1931 :—

HIGH TENSION AND LOW TENSION UNDERGROUND CABLE, JOINT BOXES AND OTHER ACCESSORIES.

The successful Tenderer will be required to enter into a Contract which will contain a "Fair Wages Clause."

Particulars and Form of Tender may be obtained from the Electrical Engineer, Walnut Tree Road, Erith.

Sealed Tenders, endorsed "Tender for Cables, etc.," must be addressed to and reach the undersigned not later than 12 noon on Friday, March 7th, 1930.

The Council do not bind themselves to accept the lowest or any Tender.

Council Offices, Erith.

DOUGLAS S. TWIGG, Clerk to the Council.

NOTICES.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

SCARBOROUGH CORPORATION.

NOTICE is given of the existence of a difference between the above Corporation and the Association relative to the dismissal of a member, which difference has been referred to the National Joint Board.

CONSEQUENT UPON this Dispute, and pending a settlement, MEMBERS OF THE ASSOCIATION ARE ENJOINED TO REFRAIN FROM APPLYING FOR OR ACCEPTING ANY APPOINTMENT WITH THE ABOVE CORPORATION.

W. ARTHUR JONES, A.M.I.E.E., General Secretary.

102, St. George's Square, London, S.W.1.

APPOINTMENTS VACANT.

ELECTRICAL Contractor requires the assistance of a respectable Lad as an Apprentice. Small premium, returned as wages. —Apply stating age to—48, Earls Court Road, London, W.8.

SKILLED Test Room Assistants required.—Apply by letter, stating experience, to W. G. PYE AND Co., "Granta Works," Newmarket Road, Cambridge.

ELECTRICAL DRAUGHTSMAN required with experience of steel tower design and overhead transmission lines. State age, full experience and salary required.—BOX A.F.L. THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, E.C.4.

WANTED.—Thoroughly experienced and efficient controlling ELECTRICAL ENGINEER for Power Station, Transmission Lines and the application of electricity to collieries. State age, salary required, and give copies (only) of testimonials.—Apply Box A. H. L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

REQUIRED, Junior Assistant in Electrical Engineers' Office in London, with experience in small switchgear, to deal with enquiries and quotations. Electrical knowledge and Commercial experience essential. Age 20 to 25. Write, giving full particulars of age, experience, and salary required.—Box A.E.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, E.C.4.

THE Brush Electrical Engineering Co., Ltd., of Loughborough, invites applications for the position of Works Superintendent of their Engineering Department. The manufacture embraces steam turbo-generators and electrical machinery of all types. Applicants must have had experience in similar capacity. Letters, giving full particulars of career and salary required (which will be treated confidentially), should be addressed to the SECRETARY OF THE COMPANY, Falcon Works, Loughborough.

APPLICATIONS are invited for the post of Junior Technical Assistant in the Admiralty Technical Pool to fill a vacancy in the Experimental Section of an Admiralty establishment at Portsmouth.

Qualifications must include a sound technical training in electrotechnics and practical experience in manufacture and testing of delicate electrical instruments.

The salary of a Junior Technical Assistant is £85 by £7½ to £130, plus Civil Service Bonus. Entry will be made at the bottom of the scale, the bonus on which at present is approximately £59 10s.

Applications should be made within ten days of the appearance of this notice to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1. No application form is required.

PENMAENMAWR URBAN DISTRICT COUNCIL.

THE above Council invite applications for the post of Resident Electrical Engineer. Commencing salary £260 per annum. Terms and conditions, with Form of Application, may be obtained from the undersigned on receipt of a stamped addressed envelope.

GEORGE J. HUGHES, Clerk to the Council.

Council Offices, Penmaenmawr, North Wales.

VACANCIES FOR ELECTRICAL INSPECTORS OF MINES.

THE Secretary for Mines invites applications from Electrical Engineers for the following posts :—

1 Deputy Electrical Inspector of Mines and Quarries. Scale of salary £550:25:750 per annum, plus cost of living bonus, which, on the current basis of cost of living figure of 70 above pre-war, amounts to £165 on a salary of £550 per annum.

3 Junior Electrical Inspectors of Mines and Quarries. Scale of salary £350:20:500 per annum, plus cost of living bonus, which, on the current basis of cost of living figure of 70 above pre-war, amounts to £135 on a salary of £350 per annum. In certain circumstances candidates with special qualifications or experience may be allowed to enter the scale at a salary above the minimum, but not exceeding £400 per annum.

The posts are permanent and pensionable, but the successful candidates will be regarded as on probation for a period of two years and their appointment will be confirmed only on satisfactory performance of their duties during that time.

Applicants for the post of Deputy Electrical Inspector should be not more than 45 years of age on the 24th March, 1930, the last date for receipt of applications, though applications from Electrical Engineers over that age with exceptional qualifications will be considered, and must

(*a*) hold a degree in Electrical Engineering, or have passed the examination of the Institution of Electrical Engineers; and

(*b*) have had not less than five years' practical experience, including substantial experience in a responsible position in the applications of electricity to mining.

Applicants for the post of Junior Electrical Inspector must be between the ages of 27 and 35 on the 24th March, 1930, the last date for receipt of applications, and

(*a*) hold a degree in Electrical Engineering, or have passed the examination of the Institution of Electrical Engineers, or be able to show that they gave been regularly trained as electrical engineers, and

(*b*) have had at least two years' practical experience in the applications of electricity to mining.

Forms of application, which must be returned not later than the 24th March, 1930, together with a memorandum on the conditions of appointment, can be obtained from the Under Secretary for Mines, Establishment Branch, Mines Department, Dean Stanley Street, London, S.W.1.

T.I.G.B. TRAINING FOR RESULTS.

WHATEVER be your aim—a Better Technical Equipment; a Professional Examination Qualification; Advancement to a Responsible Post—you can select T.I.G.B. Correspondence Training with complete confidence.

Here is proof in the form of Typical Tributes from Successfu Examination Candidates :—

A.M.I.E.E. Exam.

B. W., Stoke.—"I have passed the A.M.I.E.E. Exam. The happy issue of this attempt was very largely due to your efficient training."

A.M.I.Mech.E. Exam.

H. W. M., Rochdale.—"Have passed. I was surprised to find so many questions similar to those set during the course."

A.M.Inst.C.E. Exam.

T. N., Sutton.—"I beg to say that I sat for the recent A.M.Inst.C.E. Exam., Part C., and have passed."

Write TO-DAY for a FREE copy of "The Engineer's Guide to Success," 124 pages, containing the widest selection of engineering courses in the world, and state the *Qualification, Post or Branch that interests you.*

The T.I.G.B. guarantees training until successful.

CENTRAL ELECTRICITY BOARD.

MID-EAST ENGLAND ELECTRICITY SCHEME, 1929.

THE Central Electricity Board invite Tenders for the supply, delivery and erection of 66 Kilovolt and Lower Voltage Transformers.

Copies of the Specification, No. M.E.E.-G.T.1, and Form of Tender, may be obtained from the offices of the Board on application to the undersigned on or after Monday, March 10th, 1930, on payment of a deposit of Two Guineas for the first copy and One Guinea for each subsequent copy.

Sums paid for any number of copies up to three will be refunded on receipt of a bona fide Tender.

Tenders on the form supplied, endorsed "Tender for Specification No. M.E.E.-G.T.1," must be delivered to the Offices of the Board not later than 12 o'clock noon on Monday, April 7th, 1930. The Board do not bind themselves to accept the lowest or any Tender.

RICHARD H. FOX,
Secretary and Solicitor.

Trafalgar Buildings,
1, Charing Cross, W.C.2.

CITY OF LIVERPOOL.

ELECTRIC SUPPLY DEPARTMENT.

SUPPLY OF TWELVE 1 000 kVA STEP-DOWN TRANSFORMERS.

THE Corporation of Liverpool invite Tenders for the supply of Twelve Step-down Transformers.

Copies of Tender Form and Specification may be obtained on application to the City Electrical Engineer, 24, Hatton Garden, Liverpool.

Sealed Tenders, endorsed "1 000 kVA Transformers" are to be addressed to the Town Clerk, Municipal Offices, Liverpool, and must be forwarded by post to him so as to be delivered not later than the first postal delivery on Friday, March 28th, 1930.

The Corporation do not bind themselves to accept the lowest or any tender.

WALTER MOON,
Town Clerk.

Town Clerk's Office,
Liverpool.
March, 1930.

NOTICES.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

SCARBOROUGH CORPORATION.

NOTICE is given of the existence of a difference between the above Corporation and the Association relative to the dismissal of a member, which difference has been referred to the National Joint Board.

CONSEQUENT UPON this Dispute, and pending a settlement, MEMBERS OF THE ASSOCIATION ARE ENJOINED TO REFRAIN FROM APPLYING FOR OR ACCEPTING ANY APPOINTMENT WITH THE ABOVE CORPORATION.

W. ARTHUR JONES, A.M.I.E.E.,
General Secretary.

102, St. George's Square,
London, S.W.1.

APPOINTMENT WANTED.

ELECTRICIAN seeks employment. Maintenance or Constructional; 25 years' experience.—GUBB, 1, Churlwood Road, Putney.

EMPLOYMENT wanted by woman graduate (Hons. Maths.), with technical training in Wireless, Electrical and Optical Engineering. Reads German and French.—OMEGA, Box A.L.L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, E.C.4.

WANTED.—Position in Electrical line. Experienced in all branches.—Box A. G. L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

APPOINTMENTS VACANT.

REQUIRED the services of an experienced switchboard draughtsman.—Apply Box A. J. L., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

DESIGNER required with experience in the design of medium and large Induction Motors.—Apply, giving full particulars of training, career and salary required to Box A. K. L., THE ELECTRICIAN, Bouverie House, 154, Fleet Street, London, E.C.4.

EXPERIENCED SALES ORGANISER required by Domestic Electrification, Ltd., manufacturers of high-class electric cookers, fires and other domestic appliances. Must have a thorough knowledge of the trade and influential connection, with practical experience in representation and sales organisation. Applications will be treated in strict confidence.—Reply, stating age, previous experience and salary required, to MEASUREMENT, LTD., Townsend House, Greycoat Place, Westminster, S.W.1.

ENGINEERS, Novice or Expert, £300, £400, £500 per year or more is within your grasp. In our Handbook, "Engineering Opportunities," Prof. A. M. Low explains where the good posts abound. This Handbook has shown the way to better things to over 20 000 of your fellows. It contains details of A.M.I.Mech.E., A.M.I.E.E., A.M.I.C.E., A.M.I.A.E., A.M.I.Struct.E., Matric., C. & G., G.P.O., etc. Exams, outlines home study courses in all branches of Electrical, Mechanical, Motor and Wireless Engineering, and shows the unique advantages of our Appointments Department. Why stay in the "Hammer and File Brigade"? Send for our free Handbook at once, stating Branch, Post or Exam., which interests you.—BRITISH INSTITUTE OF ENGINEERING TECHNOLOGY, 43, Shakespeare House, 29-31, Oxford Street, London, W.1.

1929 EXAMINATION RESULTS.

THE T.I.G.B. MAINTAINS ITS SPLENDID EXAM.-SUCCESS RECORD.

AT all the 1929 PROFESSIONAL EXAMINATIONS—A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., etc. — the candidates who were trained by the T.I.G.B. obtained a Pass Percentage of over 90%.

The T.I.G.B.'s policy of furnishing the highest possible standard of Tutorial Service has brought about a large increase in enrolments both from *bona fide* exam.-candidates and from other keen students.

T.I.G.B. TRAINING IS BEING CHOSEN BECAUSE IT IS OBVIOUSLY PRODUCTIVE OF SATISFACTION AND SUCCESS. Therefore, whatever your aim may be—a Recognised Professional Qualification, or the Special Technical Knowledge needed in a responsible post—you can select the appropriate T.I.G.B. course with complete confidence.

WRITE TO-DAY for FREE copy of "The Engineer's Guide to Success," 124 pages, containing the widest selection of home-study engineering courses in the world, and mention the branch, post or qualification that interests you, to

THE TECHNOLOGICAL INSTITUTE OF GREAT BRITAIN
(Established 1917),
10, TEMPLE BAR HOUSE, LONDON, E.C.4.

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. Estd. 1906).—Advice, PROSPECTUS, and full particulars of Individualised Correspondence Courses FREE from ADVISORY BUREAU, UNIVERSITY ENGINEERING COLLEGE, Westgate-on-Sea, Kent.

EDUCATIONAL NOTICES.

EXAMINATIONS HELD BY THE INSTITUTION OF ELECTRICAL ENGINEERS.

MR. A. J. ANIDO, B.Sc., A.C.G.I. (late R.E.), specialises in the personal preparation of candidates in all subjects of the above examinations. Arrangements are made to suit those engaged in business.

60, Chancery Lane, W.C.2. Telephone: Holborn 5776.

PLACE YOUR INSTALLATION WORK WITH FIRMS ON THE NATIONAL REGISTER OF ELECTRICAL INSTALLATION CONTRACTORS.

REGISTERED ELECTRICAL INSTALLATION CONTRACTORS

THE National Register is an independent institution representing all bodies connected with the Electrical Industry, and grants to contracting firms satisfying its requirements the right to use this sign.

Particulars on application to Secretary, 1, Lincoln's Inn Fields, London, W.C.2.

TENDERS INVITED.

METROPOLITAN BOROUGH OF BETHNAL GREEN.

TRANSFORMERS.

THE Bethnal Green Borough Council invites Tenders for the supply, delivery and erection of one 1 000 K.V.A. and two 500 K.V.A. three-phase Transformers.

Copies of the Form of Tender, Conditions and Specification may be obtained from me on payment of two guineas, returnable after receipt of a *bona fide* tender. Technical enquiries may be made of Mr. Harold W. Couzens, M.I.E.E., of 9, Old Queen Street, S.W.1.

The Contractor will be required to pay such rates of wages and observe such hours of labour as are recognised by the trade unions in the locality where the work is done.

Tenders, endorsed "Transformers," must be addressed to me and reach my office at the Town Hall, Cambridge Road, Bethnal Green, E.2, before noon on Monday, March 31st, 1930.

The Council does not bind itself to accept the lowest or any tender.

DAVID J. KEEP,
Town Clerk.

COUNTY OF LONDON.

THE London County Council invites Tenders from manufacturers only for the supply and delivery in the London area of High and Low Tension Electric Cables and for the reconstruction of existing low tension Cables.

The specification, form of tender, etc., may be obtained on application to the General Manager of Tramways, Tramways Offices, 23, Belvedere Road, S.E.1, upon payment of £2. This amount will be returnable only if the tenderer shall have sent in a *bona fide* tender and shall not have withdrawn the same. Full particulars of the work may be obtained and the contract document inspected on personal application before payment of the fee.

The Contractor will be bound to observe the provisions of a fair wages clause, the terms of which are set out fully in the instructions for tender and in the form of contract and in *The London County Council Gazette*.

No tender received by the Clerk of the Council, The County Hall, Westminster Bridge, S.E.1, after 4 p.m. on Monday, April 14th, 1930, will be accepted.

The Council does not bind itself to accept the lowest or any tender.

MONTAGU H. COX,
Clerk of the London County Council.

CITY OF LIVERPOOL.

BOROUGH OF SWINDON.

ELECTRICITY DEPARTMENT.

SALE OF COMPLETE GENERATING STATION EQUIPMENT.

THE Corporation of Swindon invite Tenders for the purchase and removal of the plant installed in their Generating Station in Corporation Street, Swindon, which is now out of commission.

The plant includes :—

Four—Babcock and Wilcox Water Tube Boilers, working pressure 200 lb., complete with superheaters and chain grate stokers.

One—Green's Cast Iron Tube Economiser. Feed pumps, induced draught fan, etc.

Two—1 000 kW Brush Ljungstrom Alternators, 440 volts 50 cycles, with 1 250 kVA Transformers, 440/3, 300 V complete with condensing plant, switchgear, etc.

One—1 000 kW Howden Zeolly Impulse Type Turbine, gear coupled to 1 000 kW Mather and Platt D.C. Generator, 440/520 V, complete with condensing plant, switchgear, etc.

One—500 kW Brush Parsons Mixed Pressure Turbo-Generator, 440/520 V D.C., complete with condensing plant, switchgear, etc.

Three—200 kW Browett Lindley High Speed Engines, direct coupled to Siemens Generators, 440/520 V D.C.

One—300 kW Westinghouse Rotary Converter, complete with transformer and A.C. and D.C. switchgear.

One—500 kW British Thomson-Houston Rotary Converter, complete with transformer and A.C. and D.C. switchgear.

One—Tudor Battery, consisting of 220 cells type H.Q. 25 (wood boxes), capacity 990 ampere hours.

One—Tudor Battery, consisting of 252 cells type H.E.15 (glass boxes), capacity 315 ampere hours.

Full particulars of the above and other plant for disposal can be obtained from the Electrical Engineer, Mr. A. NICKLIN, Electricity Works, Swindon, by arrangement with whom the plant may be inspected.

Tenders (endorsed "Tender for Plant"), which may be for the purchase of the whole or of any part of the plant, to be delivered to me at my office on or before Saturday, March 29th, 1930.

W. H. BENTLEY,
Town Clerk.

Town Hall, Swindon.
March 5th, 1930.

GREAT WESTERN RAILWAY.—The Directors of this Company are prepared to receive Tenders for the supply of the undermentioned Stores :—

*20.—Electrical Wires and Cables.

21.—Telegraph Ironwork.

Samples and Patterns may be seen at Swindon, from Monday, March 24th, to Friday, March 28th (inclusive) between 10 a.m. and 5 p.m. on application at the Offices of the Stores Superintendent, Swindon. Samples and Patterns for articles on List No. 21 may also be seen at the Pattern Room, corner of Gt. Charles Street, adjoining Birmingham Snow Hill Station, on the same days between 10 a.m. and 5 p.m., except Monday, when the exhibition will be from 1 p.m. to 5 p.m.

Specifications, with Forms of Tender (upon which alone Tenders can be received) may be obtained at the Office of the Stores Superintendent, Swindon.

* Forms of Tender for List No. 20 will be issued on Monday April 14th, 1930.

Tenders addressed to the undersigned, and marked outside "Tender for General Stores," will be received not later than 10 a.m. on Friday, April 4th, 1930.

* Tenders for List No. 20 will be received not later than 10 a.m. on Thursday, April 24th, 1930.

The Directors do not bind themselves to accept the lowest or any tender.

Clerk of the London County Council.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council requires, as soon as possible, a full time graduate assistant master with practical experience, to teach in the electrical engineering and physics departments at the School of Engineering and Navigation, High Street, Poplar. The candidate appointed will be required to teach in the junior day technical school, the senior day departments and in the evening classes. Scale of salary for graduates £276—£15—£528. Commencing salary according to experience.

Apply, Education Officer (T.1.), The County Hall, Westminster Bridge, S.E.1 (stamped addressed foolscap envelope necessary), for form to be returned by March 31st. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

COUNTY BOROUGH OF BRIGHTON.

ELECTRICITY DEPARTMENT.

APPOINTMENT OF ENGINEER AND MANAGER.

APPLICATIONS are invited for the office of Engineer and Manager of the Corporation's Electricity Undertaking.

Candidates must have held the appointment of Chief Engineer, Deputy Engineer or Chief Engineering Assistant in the Generating Station of a local authority or power company.

The inclusive salary will commence at £1 600 per annum.

Form of application and the particulars of the duties of the office can be obtained from the undersigned.

Applications, on the prescribed form, must be addressed to the undersigned at the Town Hall, Brighton, endorsed "Electrical Engineer," and delivered on or before 12 noon on Saturday, the 26th day of April, 1930.

Canvassing in any form is strictly prohibited, and will disqualify.

JAS. H. ROTHWELL,
Town Clerk.

Town Hall, Brighton.
March 21st, 1930.

CITY OF NOTTINGHAM.

APPOINTMENT OF CHIEF ENGINEER AND GENERAL MANAGER, ELECTRICITY SUPPLY DEPARTMENT.

THE Nottingham City Council invite applications from qualified Electrical Engineers for the position of Chief Engineer and Manager of their Undertaking.

The person appointed will be responsible to the Electricity Committee and the City Council for the control and management of the undertaking, and he will be required to devote his whole time to the duties of the office, and will not be allowed to engage, either directly or indirectly, in private work of any kind. He will be expected to have, in addition to high technical qualifications, a considerable capacity for business and to show proof of an enterprising disposition.

The appointment will be subject to the provisions of the Local Government and other Officers' Superannuation Act, 1922, and the successful candidate will be required to pass a medical examination.

The salary will be £1,750 per annum, subject to the scale of remuneration adopted from time to time by the Standing Joint Committee of the Incorporated Municipal Electrical Association and the Chief Engineers' Association.

Applications, accompanied by copies of three recent testimonials, must be delivered to me in a sealed envelope, endorsed "Chief Engineer, Electricity Department," not later than May 12, 1930. An applicant may, if he so desires, forward to me not more than 20 copies of his application and testimonials for the use of the members of the Committee.

Canvassing members of the Council, either directly or indirectly, is prohibited and will be a disqualification.

PLACE YOUR INSTALLATION WORK WITH FIRMS ON THE NATIONAL REGISTER OF ELECTRICAL INSTALLATION CONTRACTORS.

REGISTERED ELECTRICAL INSTALLATION CONTRACTORS

THE National Register is an independent institution representing all bodies connected with the Electrical Industry, and grants to contracting firms satisfying its requirements the right to use this sign.

Particulars on application to Secretary, 1, Lincoln's Inn Fields, London, W.C.2.

TENDERS INVITED.

STAFFORDSHIRE EDUCATION COMMITTEE.

INSTALLATION OF ELECTRIC LIGHT.

TENDERS are invited from firms whose names appear on the National Register of Electrical Installation Contractors, for the installation of electric light in the existing Infants' Council School, Pelsall (near Walsall), which is to be enlarged and converted into a Senior Mixed Council School. A specification and drawings may be obtained by application to Messrs. Moffett, Rosher and Mann, Consulting Engineers, Union Chambers, Temple Row, Birmingham, with a cheque for deposit of £5 5s., which will be returned upon the submission of a *bona fide* tender. Tenders endorsed "Lighting Installation—Pelsall Senior Mixed Council School" must be delivered by May 24, 1930, to the undersigned.

F. A. HUGHES,
Director of Education.

County Education Offices,
Stafford.
April 16, 1930.

CITY AND ROYAL BURGH OF DUNDEE.

ELECTRICITY DEPARTMENT.

THE Corporation invites Tenders for the supply of: Extra High-tension and Low-tension Paper Insulated, Lead Covered and Double Steel Tape Armoured Cable, all to B.E.S. Specification for working pressures up to 6 600 V and 660 V respectively. Specifications, quantities, etc., may be obtained on application to the undersigned.

Tenders (sealed in envelopes provided) to be lodged with the Town Clerk, City Chambers, Dundee, not later than by Monday, May 12, 1930.

The Corporation does not bind itself to accept the lowest or any Tender.

D. H. BISHOP, B.Sc., M.I.E.E.,
General Manager and Engineer.

Electricity Supply Department,
Dudhope Crescent Road, Dundee.
April 28, 1930.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY.

IRONBRIDGE GENERATING STATION.

TENDERS are invited by the above-named Authority for the supply, delivery and erection at their Ironbridge generating station of Storage Battery Equipment, comprising emergency stand-by lighting storage battery, 15 kW motor generator set battery-trickle charger, milking booster and spare parts.

Copies of specification (No. 10) and form of tender may be obtained from Mr. E. F. Hetherington, M.I.E.E., M.I.Mech.E., Chief Engineer and Manager, at the offices of the Authority, on payment of a deposit of one guinea, which will, after the Authority have come to a decision on the tenders received, be returned to the tenderer, providing he shall have sent in a *bona fide* tender and shall not have withdrawn it.

Additional copies of the specification may be obtained on payment of half a guinea per copy, which will not be returned.

Tenders must be forwarded under sealed cover, endorsed "Tender for Contract No. 10, Ironbridge Generating Station," so as to reach the undersigned not later than noon on Wednesday, June 4, 1930.

The Authority do not bind themselves to accept the lowest or any tender.

H. F. CARPENTER,
Clerk and Treasurer.

Offices of the Authority:
Phœnix Buildings,
Dudley Road,
Wolverhampton.
April 28, 1930.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY.

IRONBRIDGE GENERATING STATION.

TENDERS are invited by the above-named Authority for the supply, delivery and erection at their Ironbridge generating station, of works supply sub-station 3 300 V and 400 V metal-clad Switchgear.

Copies of specification (No. 9) and form of tender may be obtained from Mr. E. F. Hetherington, M.I.E.E., M.I.Mech.E., Chief Engineer and Manager, at the offices of the Authority, on payment of a deposit of one guinea, which will, after the Authority have come to a decision on the tenders received, be returned to the tenderer provided he shall have sent in a *bona fide* tender and shall not have withdrawn it.

Additional copies of the specification may be obtained on payment of half a guinea per copy, which will not be returned.

Tenders must be forwarded under sealed cover, endorsed "Tender for Contract No. 9, Ironbridge Generating Station," so as the reach the undersigned not later than noon on Wednesday, June 4, 1930.

EPSOM URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

THE Council are prepared to receive Tenders for the following:—
Section I.—Kiosks and converting plant.
Section II.—E.H.T. and L.T. cable and laying.
Section III.—Supply only L.T. cables.

A Specification and Form of Tender can be seen and afterwards obtained at the offices of H. W. Watts, Electrical Engineer, Electricity Works, Depot Road, for which a fee of two guines will be charged. This fee will be refunded on receipt of a direct *bona fide* tender. Only one copy of the Specification will be issued to any one firm.

Tenders on the form supplied, endorsed "Tender for Section —" "Electricity Department," must be delivered to the undersigned at his offices, 49, Church Street, Epsom, by noon on Monday, May 12, 1930.

P. E. WHITEOAK COOPER,
Clerk and Solicitor.

NOTICES.

ELECTRICITY (SUPPLY) ACT, 1926.

EAST ENGLAND ELECTRICITY SCHEME, 1930.

WHEREAS the Electricity Commissioners have prepared and transmitted to the Central Electricity Board a Scheme bearing the above short title and relating specifically to—

The Administrative County of Norfolk:
Parts of the Administrative Counties of East Suffolk and West Suffolk;
The City and County of the City of Norwich; and
The County Borough of Great Yarmouth;

and dealing with the matters mentioned in Section 4 (1) of the Electricity (Supply) Act, 1926.

Notice is hereby given that the Central Electricity Board have caused the said Scheme to be published and that any authorised undertakers or other persons interested in the said Scheme and desiring to make representations thereon may do so by forwarding the same by registered letter addressed to the undersigned and posted not later than the ninth day of June, 1930. Copies of the said Scheme and of a volume of Particulars supplementary thereto may be obtained at the prices of One Shilling and Sixpence and Three Shillings and Sixpence each respectively, or if sent by post One Shilling and Sevenpence and Three Shillings and Eightpence each respectively from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, and 120, George Street, Edinburgh.

Dated this 5th day of May, 1930.

RICHARD H. FOX,
Secretary and Solicitor
to the Central Electricity Board.

Trafalgar Buildings,
1, Charing Cross,
London, W.C.2.

APPOINTMENTS VACANT.

DRAUGHTSMAN required with experience of large High Tension Transformers. State age and salary expected, with full particulars of experience.—Apply Box A.U.L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

DESIGNERS with experience in the design and construction of light precision mechanical or electrical machinery are required for an Admiralty establishment near London. Workshop experience is essential and should preferably have been in this type of work. Candidates should have a wide interest in Engineering Science.

The duration of these appointments will be for a period not exceeding one year in the first instance, and the posts will be reviewed at the end of that time. The salary will be on the scale of £200–10–£290, plus Civil Service bonus, i.e., at present from £299–13–£410 approximately, inclusive, but the initial rate of remuneration will depend upon the ability of the candidates.

Candidates must be natural-born British subjects.

Candidates should apply, giving full particulars as to age, qualifications, etc., to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1, within ten days of the appearance of this notice. No application forms are required.

SENIOR DRAUGHTSMAN.—Domestic Electrification, Ltd., have a vacancy for a Senior Draughtsman. Must have had previous experience in the design and construction of electric cooking and heating appliances of all types.—Apply, stating age, experience and salary required, to Box A. T. L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

ENGINEER required for telephone company operating in South America, to take charge of line construction and maintenance. Apply stating age and full particulars of experience in overhead and underground work, to Box A.S.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

CITY OF NOTTINGHAM.

APPOINTMENT OF CHIEF ENGINEER AND GENERAL MANAGER, ELECTRICITY SUPPLY DEPARTMENT.

THE Nottingham City Council invite applications from qualified Electrical Engineers for the position of Chief Engineer and Manager of their Undertaking.

The person appointed will be responsible to the Electricity Committee and the City Council for the control and management of the undertaking, and he will be required to devote his whole time to the duties of the office, and will not be allowed to engage, either directly or indirectly, in private work of any kind. He will be expected to have, in addition to high technical qualifications, a considerable capacity for business and to show proof of an enterprising disposition.

The appointment will be subject to the provisions of the Local Government and other Officers' Superannuation Act, 1922, and the successful candidate will be required to pass a medical examination.

The salary will be £1,750 per annum, subject to the scale of remuneration adopted from time to time by the Standing Joint Committee of the Incorporated Municipal Electrical Association and the Chief Engineers' Association.

Applications, accompanied by copies of three recent testimonials, must be delivered to me in a sealed envelope, endorsed "Chief Engineer, Electricity Department," not later than May 12, 1930. An applicant may, if he so desires, forward to me not more than 20 copies of his application and testimonials for the use of the members of the Committee.

Canvassing members of the Council, either directly or indirectly is prohibited and will be a disqualification.

W. J. BOARD,
Town Clerk.

Guildhall, Nottingham.
April 16, 1930.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council invites applications for appointment in the department of the Chief Officer of the London Fire Brigade of a technical assistant for inspectorial and advisory duties connected with fire and safety matters in buildings licensed by the Council for public entertainment.

Candidates must be under 26 years of age on May 5, 1930. They will be required to produce evidence of a thorough training in electrical and mechanical engineering, including practical experience in both, and must be able to write lucid reports. Experience of engineering work under commercial conditions will be an additional qualification.

The commencing salary will be £280 a year, rising to £360 a year.

Applications must be made on the official form, copies of which (with full particulars) may be obtained by sending a stamped addressed foolscap envelope (marked "Technical Assistant, Fire Brigade") to the Clerk of the Council, The County Hall, Westminster Bridge, S.E.1. Forms must be returned by May 5, 1930. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. Estd. 1906).—Advice, PROSPECTUS, and full particulars of Individualised Correspondence Courses FREE from ADVISORY BUREAU, UNIVERSITY ENGINEERING COLLEGE, Westgate-on-Sea, Kent.

F. A. HUGHES,
Director of Education.

County Education Offices,
Stafford.
April 16, 1930.

CENTRAL ELECTRICITY BOARD.

SOUTH EAST ENGLAND ELECTRICITY SCHEME, 1927.

THE Central Electricity Board invite Tenders for the Supply, Delivery and Erection of 33 Kilovolt Transformers.

Copies of the Specification No. S.E.E.-G.T.1 and Form of Tender may be obtained from the offices of the Board on application to the undersigned, on or after Wednesday, May 21, 1930, on payment of a deposit of Two Guineas for the first copy and One Guinea for each subsequent copy.

Sums paid for any number of copies up to three will be refunded on receipt of a *bona fide* tender.

Tenders on the form supplied endorsed "Tender for Specification No. S.E.E.-G.T.1" must be delivered to the Offices of the Board not later than 12 o'clock noon on Wednesday, June 11, 1930. The Board do not bind themselves to accept the lowest or any Tender.

RICHARD H FOX,
Secretary and Solicitor.

Trafalgar Buildings,
1, Charing Cross, W.C.2.

CITY OF GLOUCESTER.

THE Electricity Committee is prepared to receive Tenders for the supply of cooking apparatus from firms with substantial experience in its manufacture, for the purposes of its Hire Purchase Scheme.

Further particulars may be obtained on application to:

THE CITY ELECTRICAL ENGINEER,
Commercial Road,
Gloucester.

APPOINTMENTS VACANT.

DRAUGHTSMAN required with experience of large High Tension Transformers. State age and salary expected, with full particulars of experience.—Apply Box A.U.I., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

DESIGNERS with experience in the design and construction of light precision mechanical or electrical machinery are required for an Admiralty establishment near London. Workshop experience is essential and should preferably have been in this type of work. Candidates should have a wide interest in Engineering Science.

The duration of these appointments will be for a period not exceeding one year in the first instance, and the posts will be reviewed at the end of that time. The salary will be on the scale of £200–10–£290, plus Civil Service bonus, i.e., at present from £299–13–£410 approximately, inclusive, but the initial rate of remuneration will depend upon the ability of the candidates.

Candidates must be natural-born British subjects.

Candidates should apply, giving full particulars as to age, qualifications, etc., to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1, within ten days of the appearance of this notice. No application forms are required.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council requires in September, 1930, an instructor in the Electrical Engineering and Physics Department at the School of Engineering and Navigation, High Street, Poplar, E.14. Candidates should have graduate qualifications and should have had both teaching and practical electrical experience. The work includes day and evening classes from junior technical standard to that of advanced national certificates, together with electrical engineering for Engineer Officers of the Mercantile Marine. Graduate scale—£276—£15—£528. In addition to the scale the instructor appointed will receive an allowance in respect of special responsibility. The first increment accrues after two years' teaching service.

Apply Education Officer (T.1), The County Hall, S.E.1 (stamped addressed foolscap envelope necessary) for form to be returned by June 7th, 1930. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

SENIOR DRAUGHTSMAN.—Domestic Electrification, Ltd., have a vacancy for a Senior Draughtsman. Must have had previous experience in the design and construction of electric cooking and heating appliances of all types.—Apply, stating age, experience and salary required, to Box A. T. L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

ENGINEER required for telephone company operating in South America, to take charge of line construction and maintenance. Apply stating age and full particulars of experience in overhead and underground work, to Box A.S.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

CIVIL SERVICE COMMISSION.

FORTHCOMING EXAMINATION.—Probationary Assistant Engineers in the Engineering Department of the Post Office (20–25, with extension in certain cases).

Regulations and particulars, together with the forms on which applications must be made, will be sent in response to requests (preferably by postcard) addressed to the SECRETARY, CIVIL SERVICE COMMISSION, Burlington Gardens, London, W.1, *giving the title of the situation*. The latest date for the receipt of application forms is July 10th.

APPLICATIONS are invited for the post of Technical Officer in the Admiralty Technical Pool which is now vacant in an Admiralty establishment in London. Candidates should possess a university degree in Engineering, or its equivalent, with experience in the design of telephones, bells, buzzers and similar electrical instruments used in low power signalling systems. A knowledge of the instruments and circuits employed and of the methods of installing them in ships, is also desirable.

The Admiralty Technical Pool includes the following grades:—
Chief Technical Adviser (£800 by £50 to £1,000 per annum).
Principal Technical Officer (£650 by £25 to £750 per annum).
Senior Technical Officer (£500 by £25 to £600 per annum).
Technical Officer (£250 by £20 to £450 per annum).
Junior Technical Officer (£175 by £15 to £235 per annum).

In addition to the above scales Civil Service bonus is paid. Entry will be made at the bottom of the scale for Technical Officer, the bonus on which at present is approximately £111, making a total initial remuneration of £361 per annum. Promotion to the higher grades is governed entirely by merit and is dependent upon the existence of vacancies.

Candidates, who must be British subjects, should make application, stating their qualifications, etc., within ten days of the appearance of this notice, to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1. No application forms are required.

THE CHINA LIGHT AND POWER COMPANY (1918), LTD., KOWLOON, HONG KONG.

ASSISTANT DISTRIBUTION ENGINEER.

THE China Light and Power Co. (1918), Ltd., require an Assistant Distribution Engineer, who must be unmarried.

Applicants should have a sound technical training and experience in the laying, erection and maintenance of cables and overhead lines (E.H.T. and L.T.), equipping of E.H.T. Sub-stations, preparation of estimates, and designs of cable lay-outs, sub-station switchgear, etc.

The commencing salary will be H.K. Dollars 450.00 (Dollars 450 Hong Kong currency) per month, rising to a maximum of Dollars 550.00 per month, with annual increments of Dollars 25.00 per month. The present sterling value of the Hong Kong Dollar is 1s. 6d.

The first agreement will be for a period of five years. After five years' service, six months' home leave on full pay will be granted, subject to the agreement being renewed.

Second class passage out and home will be provided, and half pay from the date of sailing until arrival in Hong Kong.

The successful candidate will be provided with free medical attendance, quarters, light and fuel.

The selected candidate will be required to pass a medical examination.

Applications, together with full particulars stating age, education, training, subsequent experience and present occupation, together with copies of not more than three recent testimonials, should be forwarded to MESSRS. PREECE, CARDEW AND RIDER, 8, Queen Anne's Gate, Westminster, S.W.1, not later than May 29th.

May 13th, 1930.

DRAUGHTSMEN, Senior, required for metal clad switchgear. Good mechanical experience essential.—Apply, stating experience and salary required, to SWITCHGEAR DEPARTMENT, GENERAL ELECTRIC CO., LTD., Witton, Birmingham.

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. APPOINTMENTS VACANT.

ASSISTANT STATION ENGINEER required at Power Station, Royal Arsenal, Woolwich. Experience in running and maintenance of modern power station plant, including water tube boilers, turbine and reciprocating engines with a.c. and d.c. electrical systems essential. Age not exceeding 45. Preference for ex-Service men.

Salary, 60s.-4s.-to 85s. per week plus variable bonus (present total £4 12s. 7d. to £6 5s.). Post will be pensionable, on the usual conditions, if services are satisfactory after a probationary period.

Application forms, returnable by May 30, 1930, from CHIEF SUPERINTENDENT OF ORDNANCE FACTORIES, Royal Arsenal, Woolwich, S.E.18.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council requires in September, 1930, an instructor in the Electrical Engineering and Physics Department at the School of Engineering and Navigation, High Street, Poplar, E.14. Candidates should have graduate qualifications and should have had both teaching and practical electrical experience. The work includes day and evening classes from junior technical standard to that of advanced national certificates, together with electrical engineering for Engineer Officers of the Mercantile Marine. Graduate scale—£276—£15—£528. In addition to the scale the instructor appointed will receive an allowance in respect of special responsibility. The first increment accrues after two years' teaching service.

Apply Education Officer (T.1), The County Hall, S.E.1 (stamped addressed foolscap envelope necessary) for form to be returned by June 7th, 1930. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

CITY OF BIRMINGHAM ELECTRIC SUPPLY DEPARTMENT.

APPOINTMENT OF CHIEF ASSISTANT ELECTRICAL ENGINEER.

APPLICATIONS for the vacant position of Chief Assistant Electrical Engineer are invited from fully qualified electrical engineers who have had experience in the design and operation of large Generating Stations, Extra High Tension Transmission Systems, Substations and Low Tension Distribution Networks.

Salary will be at the rate of £1,200 per annum, payable monthly.

The successful candidate will be required to undergo an approved medical examination and contribute to the Corporation's Superannuation Scheme.

Forms of application and particulars of duties may be obtained from the undersigned and will require to be returned with copies of not more than three recent testimonials by Monday, the 9th June, 1930, endorsed "Chief Assistant Electrical Engineer."

Canvassing either directly or indirectly will disqualify.

E. J. JENNINGS,
Secretary and Commercial Manager.

14, Dale End, Birmingham.
May 16, 1930.

DRAUGHTSMAN required with experience of large High Tension Transformers. State age and salary expected, with full particulars of experience.—Apply BOX A.U.L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

ENGINEER required for telephone company operating in South America, to take charge of line construction and maintenance. Apply stating age and full particulars of experience in overhead and underground work, to BOX A.S.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

CIVIL SERVICE COMMISSION.

FORTHCOMING EXAMINATION.—Probationary Assistant Engineers in the Engineering Department of the Post Office (20–25, with extension in certain cases).

Regulations and particulars, together with the forms on which applications must be made, will be sent in response to requests (preferably by postcard) addressed to the SECRETARY, CIVIL SERVICE COMMISSION, Burlington Gardens, London, W.1, *giving the title of the situation*. The latest date for the receipt of application forms is July 10th.

APPLICATIONS are invited for the post of Technical Officer in the Admiralty Technical Pool which is now vacant in an Admiralty establishment in London. Candidates should possess a university degree in Engineering, or its equivalent, with experience in the design of telephones, bells, buzzers and similar electrical instruments used in low power signalling systems. A knowledge of the instruments and circuits employed and of the methods of installing them in ships, is also desirable.

The Admiralty Technical Pool includes the following grades:—
Chief Technical Adviser (£800 by £50 to £1,000 per annum).
Principal Technical Officer (£650 by £25 to £750 per annum).
Senior Technical Officer (£500 by £25 to £600 per annum).
Technical Officer (£250 by £20 to £450 per annum).
Junior Technical Officer (£175 by £15 to £235 per annum).

In addition to the above scales Civil Service bonus is paid. Entry will be made at the bottom of the scale for Technical Officer, the bonus on which at present is approximately £111, making a total initial remuneration of £361 per annum. Promotion to the higher grades is governed entirely by merit and is dependent upon the existence of vacancies.

Candidates, who must be British subjects, should make application, stating their qualifications, etc., within ten days of the appearance of this notice, to the Secretary of the Admiralty (C.E. Branch), Whitehall, London, S.W.1. No application forms are required.

THE CHINA LIGHT AND POWER COMPANY (1918), LTD., KOWLOON, HONG KONG.

ASSISTANT DISTRIBUTION ENGINEER.

THE China Light and Power Co. (1918), Ltd., require an Assistant Distribution Engineer, who must be unmarried.

Applicants should have a sound technical training and experience in the laying, erection and maintenance of cables and overhead lines (E.H.T. and L.T.), equipping of E.H.T. Sub-stations, preparation of estimates, and designs of cable lay-outs, sub-station switchgear, etc.

The commencing salary will be H.K. Dollars 450.00 (Dollars 450 Hong Kong currency) per month, rising to a maximum of Dollars 550.00 per month, with annual increments of Dollars 25.00 per month. The present sterling value of the Hong Kong Dollar is 1s. 6d.

The first agreement will be for a period of five years. After five years' service, six months' home leave on full pay will be granted, subject to the agreement being renewed.

Second class passage out and home will be provided, and half pay from the date of sailing until arrival in Hong Kong.

The successful candidate will be provided with free medical attendance, quarters, light and fuel.

The selected candidate will be required to pass a medical examination.

Applications, together with full particulars stating age, education, training, subsequent experience and present occupation, together with copies of not more than three recent testimonials, should be forwarded to MESSRS. PREECE, CARDEW AND RIDER, 8, Queen Anne's Gate, Westminster, S.W.1, not later than May 29th.

May 13th, 1930.

COUNTY BOROUGH OF BELFAST.

ELECTRICITY DEPARTMENT.

THE Electricity Committee invite Tenders for :—
The manufacture, supply, delivery and erection of :—

(*a*) H.T. Armourclad Switchgear (Specification No. W.108) and the manufacture, supply and delivery of :—

(*b*) Transformer Kiosks with H.T. and L.T. Switchgear (Specification No. W.109)

(*c*) Static Transformers (Specification No. W.110).

Specifications, with Forms of Contract, may be obtained from Mr. F. H. Whysall, City Electrical Engineer and General Manager, East Bridge Street, Belfast, on deposit of Two Guineas for each specification. (Cheques to be made payable to the Belfast Corporation Electricity Department). This deposit will be refunded provided a *bona fide* tender has been sent in and not withdrawn. Extra copies may be obtained at one guinea each, which sum will not be returnable.

Sealed Tenders, endorsed with the name and address of the firm tendering, and marked "Tender for ————, Electricity Department," to be lodged in, or posted so as to arrive at, my office not later than Saturday, 5th July 1930.

The lowest or any tender will not necessarily be accepted.

An official receipt should be obtained for every tender delivered by hand. Tenders sent by post should be registered.

R. MEYER,
Town Clerk.

June 3, 1930.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY COMPANY, LIMITED.

TENDERS are invited for the supply, delivery and erection, at the Company's Power Station, Dunston-on-Tyne, of a complete Boiler Equipment, consisting of 12 Water-tube Boilers, designed for a working pressure of 625 lbs. per sq. in. gauge, complete with Economisers, Air-heaters, Stokers, and Pulverised Fuel Plant.

Copies of the Form of Tender and Specification (No. N.243) may be obtained from the Company, at Carliol House, Newcastle-upon-Tyne, on the payment of a deposit of £2 2s. per copy, but not more than three copies will be supplied to any one applicant.

After a decision has been made with regard to the tenders received, deposits will be returned to those who have submitted *bona fide* tenders and have not withdrawn them.

Tenders, on the forms supplied, contained in envelopes endorsed "Tender for Specification No. N.243," must reach the Secretary of the Company at Carliol House, Newcastle-upon-Tyne, not later than 12 o'clock noon on Monday, the 14th July, 1930.

The Company does not bind itself to accept the lowest, or any tender.

C. SKIPSEY,
Joint Secretary.

Carliol House,
Newcastle-upon-Tyne.
June 6, 1930.

COUNTY BOROUGH OF SUNDERLAND.

ELECTRICITY DEPARTMENT.

THE Corporation of Sunderland are prepared to receive Tenders from ACTUAL MAKERS ONLY, for the supply of the following items for the twelve months ending September 30, 1931.

Specifications and Forms of Tender may be obtained from the General Manager, Electricity Offices, Dunning Street, Sunderland, upon payment of a deposit of ten shillings for each specification and Form of Tender (in duplicate), which deposit will be returned after a *bona fide* tender has been received and adjudicated upon.

In writing for Specifications, applicants should state for which of the following sections they are required, viz. :—

Paper Insulated, Lead Sheathed Cable, for General main-laying requirements.
Rubber Insulated Wire.
Consumers' Meters.
Incandescent Lamps, Gas Filled and Vacuum.

Sealed tenders (which must be made upon the forms provided with the specifications) addressed to the "Town Clerk, Town Hall, Sunderland," and endorsed "Tender for Electricity Supplies," must be delivered at my office not later than first post on Monday, July 7, 1930.

The Corporation do not bind themselves to accept the lowest or any tender.

H. CRAVEN,
Town Clerk.

II. 11 000 volt distribution switchgear.

Copies of specification (No. S/S-1) and form of tender may be obtained from Mr. E. F. Hetherington, M.I.E.E., M.I.Mech.E., Chief Engineer and Manager, at the offices of the Authority, on payment of a deposit of one guinea, which will, after the Authority have come to a decision on the tenders received, be returned to the tenderer, provided he shall have sent in a *bona fide* tender and shall not have withdrawn it.

Additional copies of the specification may be obtained on payment of half a guinea per copy, which will not be returned.

Tenders must be forwarded under sealed cover endorsed "Tender for Sub-Station Switchgear, Contract No. S/S-1," so as to reach the undersigned not later than noon on Monday, 14th July, 1930.

The Authority do not bind themselves to accept the lowest or any tender.

H. F. CARPENTER,
Clerk and Treasurer.

Offices of the Authority:
Phœnix Buildings,
Dudley Road,
Wolverhampton.
23rd June, 1930.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY.

SHROPSHIRE DISTRIBUTION SCHEME—SUB-STATION TRANSFORMERS.

TENDERS are invited by the above-named Authority for the supply, delivery and erection of the following static step-down transforming plant:—

Two 1 000 kVA 33 000/11 000 volt, three-phase, 50 cycle, outdoor type transformers, complete with off-load tap-changing switches.

Four 25 kVA 11 000/440/250 volt, three-phase, 50 cycle, outdoor type transformers, complete with off-load tap-changing switches.

One 10 kVA 11 000/440/250 volt, three-phase, 50 cycle, outdoor type transformer, complete with off-load tap-changing switches.

Copies of specification (No. S/T-1) and form of tender may be obtained from Mr. E. F. Hetherington, M.I.E.E., M.I.Mech.E., Chief Engineer and Manager, at the offices of the Authority, on payment of a deposit of one guinea, which will, after the Authority have come to a decision on the tenders received, be returned to the tenderer, provided he shall have sent in a *bona fide* tender and shall not have withdrawn it.

Additional copies of the specification may be obtained on payment of half a guinea per copy, which will not be returned.

Tenders must be forwarded under sealed cover endorsed "Tender for Sub-Station Transformers, Contract No. S/T-1," so as to reach the undersigned not later than noon on Monday, 14th July, 1930.

The Authority do not bind themselves to accept the lowest or any tender.

H. F. CARPENTER,
Clerk and Treasurer.

Offices of the Authority:
Phœnix Buildings,
Dudley Road,
Wolverhampton.
23rd June, 1930.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY COMPANY.

THE Directors are prepared to receive up to noon on Wednesday, July 16, Tenders for the Supply of

SIGNALLING CABLES.

Tenders must be made on forms, copies of which, with specification, can be obtained at these offices on payment of £1 each (which will not be returned).

The Directors do not bind themselves to accept the lowest or any tender.

S. G. S. YOUNG,
Secretary.

Offices: The White Mansion, 91, Petty France,
Westminster, S.W.1,
June 23, 1930.

SALE BY AUCTION.

17, WHITECROSS STREET, LONDON, E.C.1.

SALVAGE.

STOCK OF A.E.G. PRODUCTS
IN PRACTICALLY PERFECT CONDITION.
250 MOTORS AND DYNAMOS, A.C. AND D.C.
ALL VOLTAGES, FROM 1–17 H.P.
350 SMALL MOTORS AND SEWING MACHINE MOTORS, TRANSFORMERS,
100 MOTOR STARTERS, VARIOUS; 1 000 PULLEYS, 750 ELECTRIC HEATERS; 400 ELECTRIC FANS,
500,000 YDS. CABLE, SINGLE, TWIN AND TRIPLE CORD.
200 VAMPIRE ELECTRIC VACUUM CLEANERS, 100 HOBBY FLOOR POLISHERS, 75 LARGE AND MEDIUM SIZE "DANDY" FLOOR POLISHERS, 350 ELECTRIC BEDWARMERS, 250 ELECTRIC HOT WATER BOTTLES, 200 ELECTRIC HAIR DRYERS, 500 ELECTRIC TONG HEATERS.
50 ELECTRIC VIBRO MASSAGE SETS, 500 ARMATURES, QUANTITY EBONITE PANELS, PLUGS, ROSES, SWITCHES, RESISTANCES.

FRANK G. BOWEN, LTD.,
will sell by Auction on the Premises, as above, on WEDNESDAY, July 2, 1930, at 11 o'clock.

On View two days prior. Catalogues may be had of the Auctioneers, 62A, Aldersgate Street, London, E.C.1.

APPOINTMENTS VACANT.

DRAUGHTSMEN, Senior and Junior, required for high and low tension switchboards, cubicles, etc. Apply, stating age, full experience and salary required to SWITCHGEAR DEPARTMENT. GENERAL ELECTRIC CO., LTD., Witton, Birmingham.

WANTED.—Supervising Electrical Engineer for large A.C. insulation. Capable of doing own installing and maintenance in rapidly enlarging plant. Excellent opportunities for advancement.—Write, stating age, education, experience and salary to "A. O," c/o J. W. Vickers and Co., Ltd., 24, Austin Friars, E.C.2.

ADMINISTRATIVE COUNTY OF LONDON.

THE London County Council requires in September, 1930, at the Hackney Technical Institute, Dalston Lane, E.8, visiting teachers of electrical engineering for two evenings weekly.

Fee for an attendance of about three hours will be 16s. or 22s., according to the standard of the class to which the teacher is assigned.

Apply Education Officer (T.1) The County Hall, S.E.1 (stamped addressed foolscap envelope necessary) for form to be returned by July 18. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

BOROUGH OF WATFORD.

ELECTRICITY DEPARTMENT.

APPOINTMENT of Mains Assistant.—Applications are invited for the vacant position of Mains Assistant at a salary in accordance with Class F, Grade 8a, N.J.B. Scale of Salaries, plus 5% (approximately £330 per annum). Candidates should have a thorough knowledge and experience of E.H.T. and L.T. three-phase distribution and the construction and maintenance of Static Transformer sub-stations. Successful candidates will be required to pass a medical examination by the Corporation's Medical Officer, and undertake to contribute to the Corporation's Superannuation Fund. Applications, giving full particulars of training, experience and qualifications, together with three copies of recent testimonials, to be addressed to

A. W. BARHAM,
Borough Electrical Engineer.

Electricity Works,
Cardiff Road,
Watford.

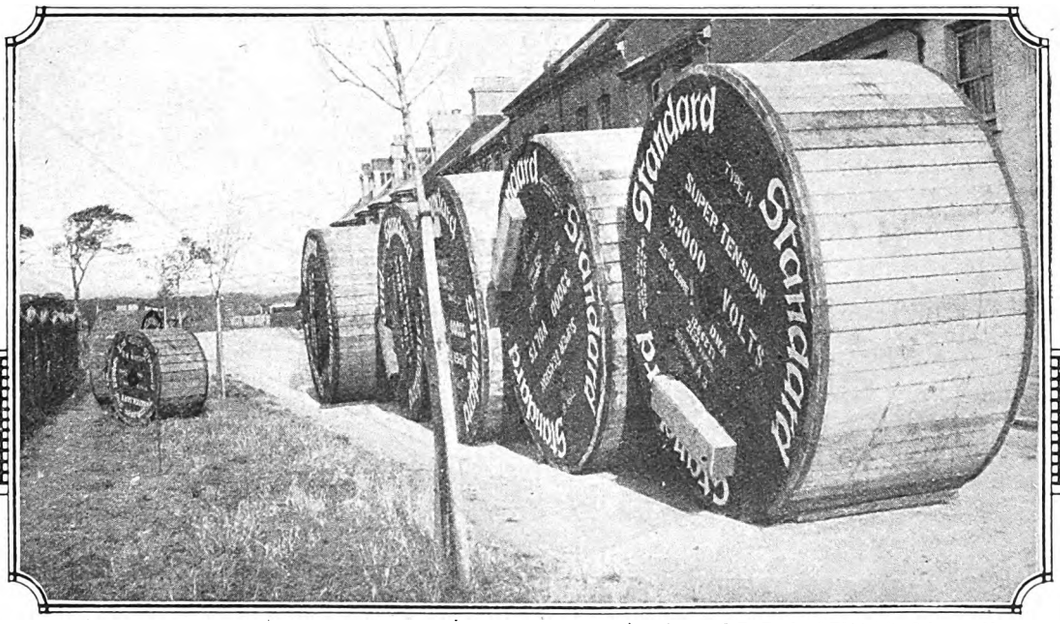
Standard

33,000 VOLT CABLES

FOR S.E. ENGLAND ELECTRICITY SCHEME

AT DESTINATION



S.E. England Electricity Scheme—No. 3.

Five drums of Submarine 33,000 volt Cable delivered and ready for installation. Each drum contained 263 yards of ·25 3-core "H" type lead covered and double wire armoured cable, and weighed 10½ tons.

The advice of our cable experts is at your disposal for solving any of your super tension cable problems.

Standard Telephones and Cables Limited

COLUMBIA HOUSE, ALDWYCH, LONDON, W.C.2.

OVERHEAD EARTH WIRES OF "COPPERWELD"

Continuous earth wires of steel, run above the conductors on a power line are a potential source of trouble. Their life cannot be as long as that of the copper conductors. Some day the earth wire will need renewal, or it will break and cause serious interruption of the supply.

"Copperweld," with its steel core and its copper covering welded to it, combines the strength of steel with the non-rusting properties of copper.

Play for safety and install "Copperweld," which will last as long as the conductors.

May we send you a copy of pamphlet C. 101 which gives particulars of "Copperweld" and the range of sizes in which we manufacture it?

BRITISH INSULATED CABLES LTD

CABLE MAKERS AND ELECTRICAL ENGINEERS

AT YOUR ELBOW

The B.I. Catalogue of Mining Cables and Accessories should be at the elbow of every mining engineer. Though compact in size it is comprehensive in scope and sets clearly before you a vast amount of general information which you will find extremely useful.

It contains detailed descriptions of the principal products of British Insulated Cables Ltd.—thus simplifying your task when ordering.

Bound in red, well printed on good paper and abundantly illustrated, it costs you nothing.

Write for it—it will be sent by return, post free.

WANTED.—A Temporary Substation Attendant during holiday period (about three months). Must have had previous experience with A.C. 6 600 volts and D.C. 480 volts supply, La Cour Motor Converters, etc. Applications, stating age, experience and enclosing *copies only* of recent testimonials, to ENGINEER AND MANAGER, Stepney Electricity Supply Undertaking, 27, Osborn Street, E.1, not later than Monday, June 30, 1930, endorsed on envelope "Substation Attendant."

DRAUGHTSMEN, Senior and Junior, required, for contract work.—Apply, stating age, full experience, and salary required, to Switchgear Department, The General Electric Co., Ltd., Witton, Birmingham.

INDIAN INSTITUTE OF SCIENCE, BANGALORE.

CHAIR OF ELECTRICAL TECHNOLOGY.

APPLICATIONS are invited for the Professorship of Electrical Technology in the Indian Institute of Science, Bangalore. Experience in teaching and research work an essential qualification. Salary Rs. 1 250–50–1 500 per month with an overseas allowance of Rs. 500 per month (together about £1 500, rising to £1 700 p.a.), free quarters, a retiring allowance of 10 per cent. of the total salary and allowance towards first passage. The appointment will be made for six years in the first instance. Applications should be addressed to DR. M. O. FORSTER, F.R.S., c/o Messrs. Jeremiah Lyon and Co., Ltd., 4, Corbet Court, London, E.C.3, before July 28.

ADVANCEMENT Professionally, also earliest success at A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., B.Sc.Eng., C. & G., G.P.O. Exams, etc., is what "U.E.C." spare time training offers you! (Many thousands successful. Estd. 1906).—Advice, PROSPECTUS, and full particulars of Individualised Correspondence Courses FREE from ADVISORY BUREAU, UNIVERSITY ENGINEERING COLLEGE, Westgate-on-Sea, Kent.

1929 EXAMINATION RESULTS.

THE T.I.G.B. MAINTAINS ITS SPLENDID EXAM.-SUCCESS RECORD.

AT all the 1929 PROFESSIONAL EXAMINATIONS—A.M.I.E.E., A.M.I.Mech.E., A.M.Inst.C.E., etc. — the candidates who were trained by The T.I.G.B. obtained a Pass Percentage of over 90%.

The T.I.G.B.'s policy of furnishing the highest possible standard of Tutorial Service has brought about a large increase in enrolments both from *bona fide* exam.-candidates and from other keen students. T.I.G.B. TRAINING IS BEING CHOSEN BECAUSE IT IS OBVIOUSLY PRODUCTIVE OF SATISFACTION AND SUCCESS. Therefore, whatever your aim may be—a Recognised Professional Qualification, or the Special Technical Knowledge needed in a responsible post—you can select the appropriate T.I.G.B. course with complete confidence. The T.I.G.B. guarantees Training until Successful.

WRITE TO-DAY for FREE copy of "The Engineer's Guide to Success," 124 pages, containing the widest selection of home-study engineering courses in the world, and mention the branch, post or qualification that interests you, to

THE TECHNOLOGICAL INSTITUTE OF GREAT BRITAIN
(Established 1917),
10, TEMPLE BAR HOUSE, LONDON, E.C.4.

REPRESENTATIVE WANTED.

SALES Representative required by London Company manufacturing all types of electrical condensers, previous experience and technical knowledge essential. Full particulars should accompany applications to Box B.A.L., ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

PATENT AGENTS, &c.

PATENTS, TRADE MARKS.

KINGS PATENT AGENCY, LTD. (B. T. King, Regd. Pat. Agent, G.B., U.S. and Can.), 146A, Queen Victoria Street, London, E.C.4. Phone: Cent. 0682. Advice Handbook and Consultations free. 43 years' refs.

IMPROVEMENTS in galvanic cells with gas depolarisation. The Owners of the British Patent No. 203 067 are willing to enter into working arrangements for exploitation of the same in Great Britain. For particulars apply Box No. A.Y.L., THE ELECTRICIAN Offices, Bouverie House, 154, Fleet Street, London, E.C.4.

AN Improved Process for the Manufacture of Brake Linings and the like. The Owners of British Patent No. 262 084 are willing to enter into working arrangements for exploitation of the same in Great Britain. Particulars obtainable from TECHNICAL RECORDS, LIMITED, 59–60, Lincoln's Inn Fields, London, W.C.2.

THE Proprietor of British Patent No. 204 831, dated August 15, 1922, relating to "Tone Clarifying and Interference Eliminating Means," desires to arrange by licence or otherwise on reasonable terms to exploit the above patent and ensure its practical working in Great Britain.—Inquiries to B. SINGER, Steger Building, Chicago, Illinois.

THE Proprietor of the Patent No. 250 987 relating to "Improvements in an Electro-therapeutic Device," desires to enter into arrangement by way of license or otherwise for the purpose of exploiting the same and ensuring its full development and practical working in this country.

For particulars apply:—COPE AND CO., 65, Victoria Street, London, S.W.1.

EDUCATIONAL NOTICES.

EXAMINATIONS HELD BY THE INSTITUTION OF ELECTRICAL ENGINEERS.

MR. A. J. ANIDO, B.Sc., A.C.G.I. (late R.E.), specialises in the personal preparation of candidates in all subjects of the above examinations. Arrangements are made to suit those engaged in business.

60, Chancery Lane, W.C.2. Telephone: Holborn 5776.

UNIVERSITY OF LONDON.

SCHOOL OF LIBRARIANSHIP.

SESSION 1930–31.

Honorary Visitor – – Sir FREDERICK GEORGE KENYON, G.B.E., K.C.B., D.Litt., LL.D.
Director – – – E. A. BAKER, Esq., M.A., D.Lit.

AS an alternative to the ordinary course of training for the University Diploma, the School of Librarianship has now instituted a post-graduate course of one session (two sessions for part-time students) for training librarians for work in Special Libraries and Information Bureaux. This will be open to graduates in other faculties than that of Arts. Courses in Special Library Services, the History of Science, Library Economy, and modern foreign languages are being provided as additions to the ordinary curriculum. The new course will begin on Monday, October 6, 1930, if sufficient students are enrolled.

Applications should be sent not later than July 15 next, as the starting of the new course next session depends upon the number of applicants for admission. For further information apply to the SECRETARY, University College, London (Gower Street, W.C.1).

MANCHESTER MUNICIPAL COLLEGE OF TECHNOLOGY.

Principal:
B. Mouat Jones, D.S.O., M.A. (Oxon.).

UNIVERSITY OF MANCHESTER.
(Faculty of Technology.)

DEGREE COURSES IN TECHNOLOGY.

THE Prospectus gives particulars of the courses leading to the Manchester University Degrees (B.Sc.Tech., M.Sc.Tech., and Ph.D.) and Certificates in the Faculty of Technology, in the following Departments:—

MECHANICAL ENGINEERING.
(Prof. Dempster Smith, M.B.E., M.Sc.Tech., M.I.E.E.)

ELECTRICAL ENGINEERING.
(Prof. Miles Walker, M.A., D.Sc., M.I.E.E.)

MUNICIPAL ENGINEERING.
(G. S. Coleman, D.Sc.Eng., A.M.Inst.C.E., A.M.Inst.M. and Cy.E., F.R.San.I.).

APPLIED CHEMISTRY, including General Chemical Technology, Metallurgy and Assaying, Fermentation Processes (including Brewing), Electro-Chemistry, Photography, Colouring Matters, Foodstuffs and Fuels.
(Prof. James Kenner, D.Sc., Ph.D., F.R.S.).

TEXTILE CHEMISTRY (Bleaching, Dyeing, Printing and Finishing), Paper Manufacture.
(F. Scholefield, M.Sc., F.I.C.).

TEXTILE TECHNOLOGY.
(Prof. W. E. Morton, M.Sc.Tech.).

INDUSTRIAL ADMINISTRATION (Post-Graduate Certificate Course).
(J. A. Bowie, M.A., D.Litt.).

Prospectus will be forwarded free on application to the Registrar, College of Technology, Manchester.

HERIOT-WATT COLLEGE, EDINBURGH.

DEPARTMENTS OF ELECTRICAL ENGINEERING AND MECHANICAL ENGINEERING.

ELECTRICAL ENGINEERING: PROFESSOR F. G. BAILY, M.A., M.I.E.E.

MECHANICAL ENGINEERING: PROFESSOR A. R. HORNE, O.B.E., B.Sc., M.I.MECH.E., A.M.I.CE..

FULL TIME DAY DIPLOMA COURSES
leading to professional recognition.

Classes commence October 14.
Full particulars from the College.

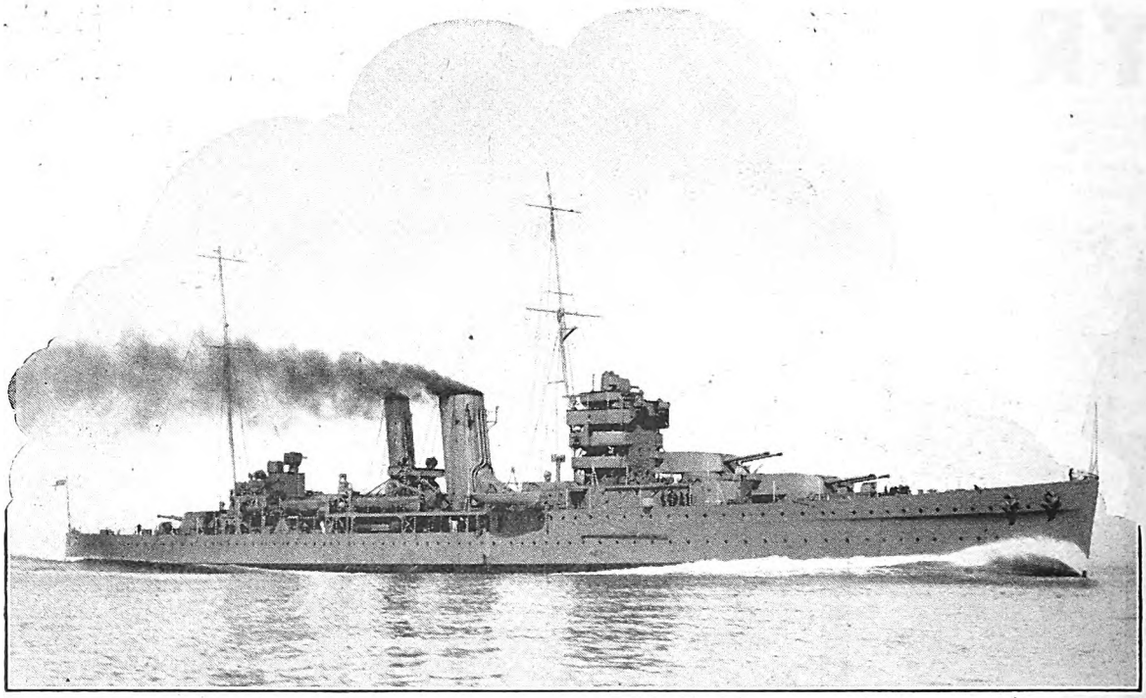
ONE OF THE J.&P. PAGES



H.M.S. YORK AT SEA

In this first-class fighting ship, one of the finest vessels of the Fleet, built by Palmers Shipbuilding and Iron Co., Ltd., Jarrow-on-Tyne, the electrical equipment comprises some

30 Miles of J. & P. Cable,

including half-a-mile of Ring Main and several miles of multicore cables.

We have been supplying cables to the British Admiralty and the leading shipbuilders for half a century. The exacting conditions met with on shipboard call for quite special features in quality and design, which only experience can provide.

The mileage of J. & P. Cables installed in British ships, naval and mercantile, in 1929 broke all records. 1930 is beating 1929. Quality tells! Experience counts!

Ohm's Law and Optimism

C equals E over R is a law. There's no luck about it. And it's no good—Einstein notwithstanding—hoping that in your case it will ever be different. Call C the capacity of your business : let R be the business resistance or competition you encounter : let E be the efficiency of the gear you install. The equation still holds good. Fit the best gear, make E a maximum and C will be a maximum.

Don't hope. Be sure. Fit and recommend Pritchett & Gold and E.P.S. Batteries. Their E is the greatest possible. Because there are fifty odd years of battery making experience behind them.

There's a type for every purpose. They cost no more than ordinary accumulators. Send for details and specifications.

Insulators for Empire switch gear.

THIS group shows clearly the means taken to ensure the absolute security of the mechanical fixing of the insulators on "Empire" switch gear.

The forged steel stem, flanged at the bottom for a rigid four-bolt fixing, has at the top two rings and four keys which give an abnormally strong engagement with the cement.

Similar provision is made within the cap, while the insulators themselves have the very effective keying visible on the top of the insulator. This consists of small particles of porcelain fired on to the glaze of the insulator. It gives an excellent grip of the cement.

All "Empire" insulators are "steam-set" in jigs, which ensures interchangeability on all "Empire" switchgear standards. This steam-setting eliminates troubles due to expansion and contraction. The results of destruction tests, showing the extraordinary degree of adhesion obtained, has been shown in another advertisement.

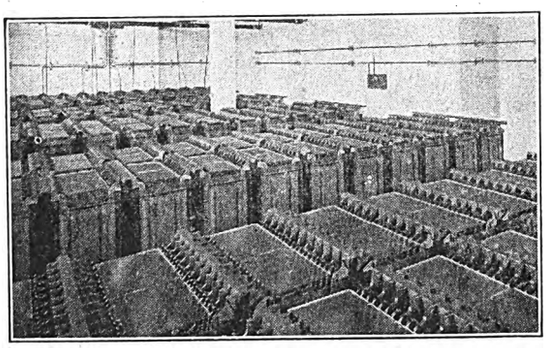
The illustration shows the old houses in Holborn, which mark the site of the Western Boundary of the old City of London of Tudor times.

Craftsmanship...



A Tudor Installation at Portishead, 1929.

The master craftsman is no man of many parts. His single ideal is to give his art to the world—to express his mind in his masterpiece.

Craftsmanship is embodied in our famous old buildings, and they are sought out to-day and admired by a grateful world.

Tudor Batteries are made by craftsmen who give of their best to produce one thing—the best Battery for all conditions of service.

Reliability, steady performance and long life are Tudor qualities, and the severest tests will only enhance their reputation.

Whatever the demands of service may be—and there are many—Tudor Batteries will always give absolute satisfaction.

Tudor
BATTERIES
FOR
Country House Lighting, Electric Vehicles, Radio, etc.

Have you considered the possibilities of batteries for Emergency Lighting in Cinemas, Hospitals, etc.?

TUDOR BATTERIES ARE IDEAL FOR THIS PURPOSE.

ELECTRICAL INSULATION

Mica

from our own Mines in India and other sources of production. Large and comprehensive stocks held in London, including all grades and qualities of Raw Mica, Splittings, Block, machined or made-up Mica in the form of Discs, Washers, Commutator Separators, Condenser Plates, etc.

Micanite

the World's standard built-up Mica Insulation. Manufactured and supplied in every commercial form, including Commutator and Moulding Micanite, Flexible Micanite, Mica Tape, Micafolium, Heat-Resisting Micanite, Commutator Rings and Tubes.

Paxolin

the leading Bakelite Varnish-Paper Insulation. Supplied in the form of Boards, Panels, Tubes, Cylinders, Insulators and Bushings. Paxolin Insulation is eminently suitable for use under hot oil in transformers and switchgear, and maintains its high electric strength at high temperatures.

High Tension Terminals and Bushings for Indoor and Outdoor Service

Condenser or Bulk Type Paxolin Insulators and Bushings for all voltages are manufactured to standard or special designs to meet every condition of service, and are supplied complete with metal fittings ready for assembly on transformers and oil circuit breakers.

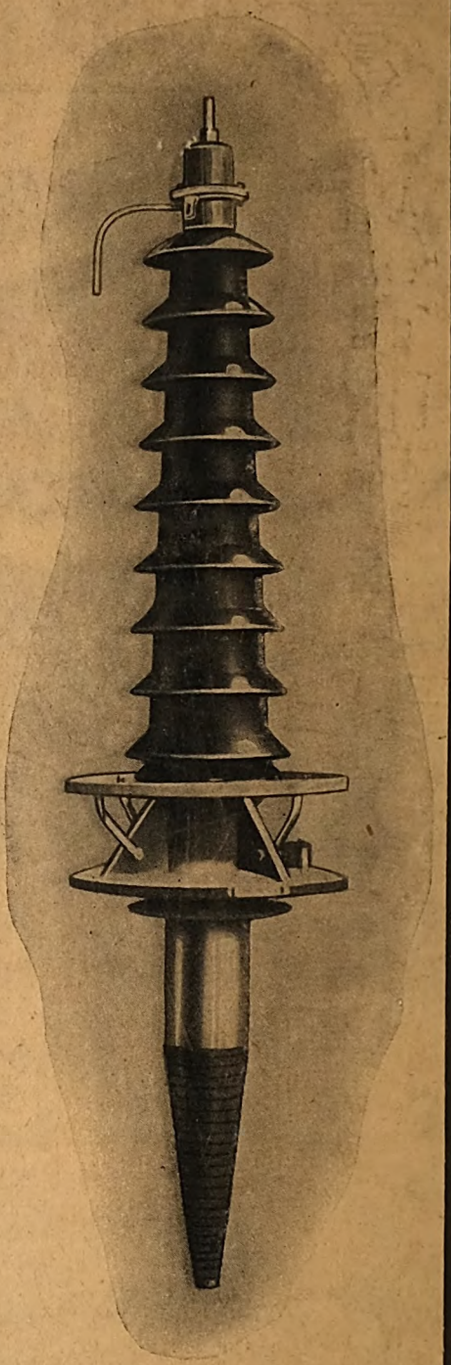
Empire Cloths and Tapes

Highest grade Varnished Cloths and Cambrics, yellow or black, Bias Cut Tapes, sewn or seamless, Varnished Silks, Papers and Canvas of every description are stocked to meet all requirements.

Empire Varnished Cotton or Silk Tubing

specially designed and manufactured to maintain its flexibility, elasticity and strength.

Leatheroid, Vulcanised Fibre, Presspahn, Adhesive Tapes, &c.



Photograph of 132 kV Outdoor Condenser Type Transformer Bushing, of which over 500 have been supplied for, or are in course of manufacture for, the National Grid Scheme.
